SÜT TEKNOLOJİSİNDE BİTKİSEL PROTEAZLARIN KULLANIMININ TEKNOLOJİK VE BİYOAKTİF ÖZELLİKLER ÜZERİNE ETKİSİ

Öğretim Görevlisi Dr. Sinan AKBAL

Pamukkale Üniversitesi, Acıpayam MYO, Gıda İşleme Bölümü, Denizli

Email: sakbal@pau.edu.tr

ORCID: 0000-0001-5928-1917

ÖZET

Süt teknolojisinde, sütü pıhtılaştırmak amacıyla genellikle hayvansal ve mikrobiyal kaynaklı enzimler kullanılmaktadır. Bitkisel proteazlar ise süt teknolojisinde alternatif pıhtılaştırıcılar ve fonksiyonel bileşen üreticileri olarak ön plana çıkmaktadır. Dünyada farklı bölgelerde bitkisel pıhtılaştırıcılarda peynir yapımında kullanılabilmektedir. Yüksek proteolitik aktivite göstermeleri sebebiyle farklı tip peynir üretiminde kullanımını sınırlı kalmaktadır. Bu nedenle çoğunlukla yumuşak peynir üretiminde kullanılabilmekte ve sert tip peynirlerde kullanımı önerilmemektedir. Ayrıca peynirde tekstür sorunları, düşük randıman ve acı tata sebep olabilmektedir. Fakat yine de hem teknolojik hem de biyoaktif özellikler açısından bitkisel pıhtılaştırıcı kullanımı dikkat çekmektedir.

Bitkisel proteazlar hemen hemen her türlü bitki dokusunda bulunur. Bitkisel pıhtılaştırıcıların hemen hemen hepsi aspartik proteazlara aittir, ancak sistein ve serin proteazları gibi diğer gruplardan enzimler de bildirilmiştir ve uygun koşullar altında sütü pıhtılaştırma yeteneğine sahiptir. Aktinitin, bromelain, papain, ricin ve fisin gibi bitkisel proteazlar süt proteinlerinin pıhtılaştırılmasında kullanılabilmektedir. Ayrıca enginar (*Cynara* spp.), zencefil (*Zingiber officinale*) ve altın çilek (*Physalis peruviana*) gibi çeşitli bitkilerden elde edilen proteazlar, gelecekte daha farklı özelliklere sahip süt ürünü üretiminde kullanılabilecek alternatif enzim kaynakları arasında yer almaktadır.

Süt ve ürünleri biyoaktif peptit üretimi için önemli bir protein kaynağı olarak bilinmektedir. Bu nedenle bitkisel proteazlar kullanılarak süt proteinlerinin parçalanması sonucu daha düşük alerjeniteye ve daha yüksek biyoaktiviteye sahip ürünlerin üretilmesini mümkün olmaktadır. Bu kapsamda, antimikrobiyal, antioksidan ve antihipertansif etkiler gösteren biyoaktif peptitlerin üretimi, hem gıda teknolojisi hem de nutrasötik uygulamalar açısından büyük bir potansiyele sahiptir.

Bitkisel proteazların süt teknolojisindeki kullanımı, ürün fonksiyonelliğinin artırılması açısından önemli potansiyeli ile dikkat çekmektedir. Ayrıca peynir üretiminde sürdürülebilir/erişilebilir kaynak sağlaması ve yenilikçi üretim teknikleri ile birlikte kullanımı önemli faydalar sağlayabilir. Bu çalışmada da süt teknolojisinde bitkisel proteazların teknolojik ve biyoaktif özellikler üzerindeki olası etkilerine yer verilmiştir.

EFFECT OF USE OF PLANT-BASED PROTEASES IN DAIRY TECHNOLOGY ON TECHNOLOGICAL AND BIOACTIVE PROPERTIES

ABSTRACT

In dairy technology, enzymes of animal and microbial origin are generally used to coagulate milk. Plant-based proteases are gaining prominence as alternative coagulants and functional component producers. Plant-based coagulants can also be used in cheesemaking in various regions around the world. Due to their high proteolytic activity, their use in different types of cheese is limited. For this reason, it is mostly used in soft cheese production and is not recommended for hard cheeses. Additionally, it can cause texture problems, low yields, and a bitter taste in cheese. However, the use of plant-based coagulants still attracts attention, both in terms of technology and the bioactive properties they create.

Plant proteases are found in almost all plant tissues. Almost all plant-based coagulants belong to aspartic proteases, but enzymes from other groups, such as cysteine and serine proteases, have also been reported and are capable of coagulating milk under appropriate conditions. Plant-based proteases such as actinidin, bromelain, papain, and ficin can be used for the coagulation of milk proteins. In addition, proteases obtained from various plants such as artichoke (*Cynara* spp.), ginger (*Zingiber officinale)* and golden strawberry (*Physalis peruviana*) are among the alternative enzyme sources that can be used in the production of dairy products with different properties in the future.

Milk and its products are known as an important protein source for the production of bioactive peptides. Therefore, the breakdown of milk proteins using plant-based proteases allows the production of products with lower allergenicity and higher bioactivity. In this context, the production of bioactive peptides that exhibit antimicrobial, antioxidant and antihypertensive effects has great potential for both food technology and nutraceutical applications.

The use of plant-based proteases in dairy technology is notable for its significant potential for enhancing product functionality. In addition, it is important to provide sustainable/accessible resources in cheese production and their use with innovative production techniques can provide benefits. In this study, the possible effects of plant proteases on bioactive properties and technological properties in dairy technology are included.

Keywords: Plant-based proteases, Dairy technology, Bioactivity, Cheese quality, Rennet

1. GİRİŞ

Süt, insan beslenmesi için gerekli olan çeşitli fonksiyonel bileşikler (protein, yağ, karbonhidrat, mineral ve vitaminler) sağlar. Farklı hayvanlardan elde edilen sütler kullanılarak dünyada kendine özgü lezzetlere, dokulara ve formlara sahip çok çeşitli peynirler üretilmektedir. En eski peynirin M.Ö. 5000 yıllarına dayandığı düşünülmekte ve o zamandan beri, buzağı şirdeninden elde edilen enzim (kimozin), sütü pıhtılaştırmadaki yüksek verimliliği ve uygun bir teleme dokusu sağlaması nedeniyle tercih edilen esas pıhtılaştırıcı enzim olmuştur. Ancak, peynir üretimindeki artış ve doğal kaynaklarından kimozin tedarikindeki azalma, süt pıhtılaştırıcı enzimlere olan talebi artırmış ve bu da buzağı mayasının yerine mikrobiyal ve bitkisel kaynakların kullanılmasını teşvik etmiştir. *Rhizomucor miehei*, *Rhizomucor pusillus* ve *Cryphonectria parasitica* gibi seçici fungal suşlarının kullanıldığı fermantasyon süreçleri, kimozinin yapısı ve katalitik özellikleri açısından yüksek benzerlik gösteren proteazların üretilmesi için yeterli sonuçlar vermiştir(Mazorra-Manzano ve ark., 2018). Bu sorunun üstesinden gelmek için, rekombinant kimozin (genetiği değiştirilmiş mikroorganizmalardan) piyasaya sürülmüş ve 1989 yılında peynir yapım uygulamaları için FDA onayı almıştır (Fernandez-Salguero ve ark., 2003; Alavi ve Momen, 2020). Buzağı şirdeninin kimozin genini taşıyan *Escherichia coli*, *Aspergillus niger* ve *Kluyveromyces lactis*'in genetiği değiştirilmiş suşları, rekombinant kimozin üretmek için başarıyla kullanılmıştır (Andrén ve ark., 2011). Günümüzde dünya çapında üretilen peynirlerin çoğu (yaklaşık %80'i), süt pıhtılaştırıcı enzim olarak standartlaştırılmış rekombinant kimozin kullanmaktadır. Bununla birlikte, bitki proteazları cazip bir seçenek sunmakta ve son zamanlarda peynir yapımında yeni süt pıhtılaştırıcı maddeler olarak ortaya çıkmaktadır. Bazı ülkelerde hayvansal kaynaklı bileşenlerin veya genetiği değiştirilmiş gıdaların tüketimine yönelik siyasi, dini veya kültürel kısıtlamalar, bitki proteazlarının araştırılmasını ve kullanımını teşvik etmektedir (Roseiro ve ark., 2003).

Bitkisel proteazlar, sütün jelleşmesinden ayrıca süt proteinlerinden farklı özelliklere sahip biyoaktif peptitler sentezlenmesi açısından oldukça önem taşımaktadır. Bitkisel proteazların kazein ve peyniraltı suyu proteinleri üzerine etki ederek üretilen ürünün hem duyusal özelliği hem de biyolojik değeri üzerine etkisi olduğu birçok çalışma tarafından ortaya konmuştur (Matkawala ve ark., 2022) Bu derlemede de bitkisel proteazların peynir teknolojisinde ürün özellikleri ve biyoaktif özellikler üzerine etkisi tartışılmıştır.

2. BİTKİSEL PROTEAZLAR

Peynir üretiminde kimozin ve benzeri etki gösteren sütü pıhtılaştıran enzimler kullanılmaktadır. Giriş bölümünde bahsedildiği gibi genellikle hayvansal kaynaklı olan ve buzağılardan elde edilen şirden mayası tercih edilmektedir. Fakat alternatif olarak mikrobiyal ve bitkisel kaynaklı enzimlerden de sütü pıhtılaştırmak amacıyla yararlanılmaktadır. Meyve, çiçek, sap, lateks vb. gibi farklı dokulardan elde edilen bitkisel proteazlar, sütü pıhtılaştırmak için kullanıldıklarında optimum pH ve sıcaklıkta önemli katalik aktivitelere sahip olabilmektedir (Mazorra-Manzano ve ark., 2018).

Bitkisel proteazlar, çiçek, gövde, yaprak ve kök gibi çeşitli bitki dokularından maserasyon ve ardından ham ekstraktın saflaştırılması yoluyla ekstrakte edilebilir. Proteaz üretiminin kalitesi ve miktarı kuraklık, aşırı yağış ve toprağın bileşimi gibi değişen çevresel koşullardan etkilenebilmektedir. Ekim ve hasat arasındaki uzun yetiştirme süreleri yüksek verim elde edilmesini zorlaştırabilmekte ve üretim maliyetlerinin artmasına neden olur (Shah ve Mir, 2019; Matkawala ve ark., 2022).

Bitkisel proteazlar, katalitik mekanizmalarına göre çeşitli gruplara ayrılırlar. Genellikle sütün pıhtılaştırılması amacıyla kullanılan proteazlar aspartik, serin ve sistein proteazlar olarak sınıflandırılmaktadır (Shah ve Mir, 2014). Enginar bitkisinin farklı türlerinden (*C. cardunculus* ve *C. scolymus*), kimozine benzer katalitik özellikler gösteren ve sütün pıhtılaşmasını sağlayan proteazlar (kardosinler ve sinarazlar) elde edilebilmektedir. Bu enzimler, kimozin ile aynı gruba (aspartik proteinaz, EC. 3.4.23) aittir (Yegin ve Dekker, 2013). Peynir üretiminde aspartik proteazlardan ayrıca diğer katalitik gruplardan proteazlarda kullanılabilmektedir. Papaya, ananas, zencefil ve kividen sırasıyla papain, bromelain, zingibain ve aktinidin gibi sistein proteazları (EC. 3.4.22) ile kavundan (yani cucumisin) serin proteazları (EC. 3.4.21) bu amaçla kullanılan bazı enzimlere örnek olarak verilebilir (Mazorra-Manzano ve ark., 2018).

2.1. Aspartik proteazlar

Aspartik proteazlar, birçok bitki türünde bulunur (Ben Amira ve ark., 2017). Bu enzimler, bitkilerin sindirim/çeşitli gelişimsel süreçlerinde, stres tepkileri sırasında, patojenlere karşı ve hücre yaşlanmasında protein bozunmasında rol oynar (González-Rábade ve ark., 2011) Katalitik aktiviteden sorumlu iki aspartik kalıntıya sahiptir ve bunların etki özgüllüğü, hidrofobik amino asit kalıntıları arasındaki peptit bağlarının kesilmesidir (Domingos ve ark., 2000). Bu enzimler genellikle 28-35 kDa'lık büyük alt birim ve 11-16 kDa'lık küçük alt birim içeren heterodimerik proteinlerdir (Mutlu ve Gal, 1999). Aspartik proteazlar, çoğunlukla β-tabakasından ve düşük miktarda α-sarmal yapıdan oluşmaktadır (Nugent ve ark., 1996). Bu proteazlar, *Citrus aurantium* çiçekleri, *Withania coagulans* meyvesi ve *Cirisium vulgare* çiçekleri gibi birçok bitki dokusundan izole edilmiştir (Mazorra-Manzano ve ark., 2013; Salehi ve ark., 2017; Lufrano ve ark., 2012). En iyi bilinen aspartik proteaz *C. cardunculus*'tan elde edilen kardosinlerdir (Veríssimo ve ark., 1995). Kardosinler kardosin A ve kardosin B başta olmak üzere farklı formlarda (kardosin E, F, G ve H) bulunmaktadır (Veríssimo ve ark., 1995; Sarmento ve ark., 2009). Genellikle Kardosin B'in daha az seçici olmasından dolayı kardosin A kimozin, kardosin B ise pepsinle karşılaştırılmaktadır (Almeida ve Simões, 2018).

McSweeney (2022), aspartik proteaz grubunda peynir mayasına alternatif enzimler olduğunu belirtmiştir. Aspartik proteazlar düşük pH'da aktiftir. Bu proteazlar, mükemmel süt pıhtılaştırıcı özellik göstermekle beraber genellikle düşük proteolitik aktiviteye sahiptir. Phe105–Met106 bağını keserler, bu da kimozinin katalitik özelliklerine benzerdir (Kumar ve Sasmal, 2020; Murlidhar ve ark., 2017; Yegin ve Dekker, 2013).

2.2. Serin Proteazlar

En büyük proteaz gruplarından biri olan Serin proteazlar (SP'ler), aktif bölgelerinde serin kalıntılarına sahiptir. Bitkilerdeki ana rolleri çoğunlukla aspartik proteazlarla aynıdır. Bitkilerin (özellikle meyvelerden) çeşitli kısımlarından elde edilir (Shah ve Mir, 2014) Sistein proteazları veya tiyol proteazları, aktif bölgelerinde bir sistein grubu içeren katalitik bir mekanizmaya sahiptir (Shah ve Mir, 2014; González-Rábade ve ark., 2011) Kovalent enzim/substrat kompleksleri oluştururlar. Katalitik bölgelerinde güçlü nükleofilik amino asit kalıntılarına sahip olduklarından substratın peptit bağının karbonil grubuna nükleofilik bir etki gerçekleştirirler (Dunn, 2001).

Bilinen ilk serin proteaz Cucumisin (EC 3.4.21.25)'dir. *C. melo* L. varr. *Prince*'den elde edilir. Bu enzimin peptit dizilimi, bu gruptaki bitki proteazları incelemek için tercih edilir (Kaur, 2024). Wrightin gibi serin proteazlar 7,5–10 pH aralığında ve 70°C sıcaklıkta aktiftir (Tomar ve ark., 2008); bu nedenle yüksek sıcaklık gerektiren ticari uygulamalarda kullanılabilirler. Sütü pıhtılaştırabilen bir başka serin proteaz, geniş bir pH değeri aralığına (4,0–11,0) ve sıcaklık

aralığına (20–90 °C) karşı çok kararlı olan ve *Solanum dubium*'dan elde edilen dubiumin'dir (Ahmed ve ark., 2009). Sütü pıhtılaştırabilen diğer bitki serin proteazları, *Ficus religiosa*'dan elde edilen religiosin ve *Streblus Asper*'den elde edilen streblindir (Kumari ve ark., 2012; Tripathi ve ark., 2011). Hayvansal maya yerine bir alternatif, rezene (*Foeniculum vulgare*) dokularından elde edilen serin proteazdır. Bu enzim, 6-7,5 pH aralığında ve 40-60 °C arasındaki sıcaklıklarda aktif ve stabil kalmaktadır (Bey ve ark., 2018).

2.3. Sistein proteazlar

Sistein proteazları, tiyol-proteazlar olarak da bilinirler ve aktif bölgelerindeki sistein grubu aracılığıyla reaksiyonları katalize ederler (Mazorra-Manzano ve ark., 2013; Shah ve Mir, 2019). Murlidhar ve ark. (2017), geniş bir pH ve sıcaklık aralığına karşı iyi tolerans gösterdikleri için ticarileştirme için sistein proteazlarının kullanılmasının tercih edildiğini bildirmişlerdir. Ancak, şelat oluşturucu maddeler ve indirgeyici maddeler gerektirirler ve bu da maliyet etkinliğini etkileyebilir (Tripathi ve ark., 2011). *Ananas comosus*, *Carica papaya, Zingiber officinale, Actinidia deliciosa* ve *Ficus carica* Bitki örneklerinden sırasıyla bromelain, papain, zingibain, aktinidin ve ficin yer alır. Bu bitki proteazları arasında papain ve fisin, farklı peynir türlerinde pıhtılaştırıcı olarak bildirilmiştir (Mohsin ve ark., 2024). Bu proteazlar, geniş bir pH ve sıcaklık aralığına dayanabilir. Bu nedenle gıda, ilaç ve biyoteknoloji endüstrilerinde büyük bir uygulama potansiyeline sahip olmaktadır.

Bir sistein endopeptidaz olan papain, proteinlere ve kısa zincirli peptitlere karşı güçlü bir proteolitik aktivite gösterir. Ticari olarak en çok kullanılan bitkisel proteazlardan biridir. Öncelikle Arg-Phe, Arg-Lys ve Phe-Lys arasındaki peptit bağlarına etki eder (Mamboya ve Amri, 2012). Papain geniş bir pH (3.0–9.0) ve sıcaklık (37–70°C) aralığında oldukça stabildir. Organik çözücüler ve denatüre edici ajanların varlığında aktivite gösterebilir (Shouket ve ark., 2020). Papaya bitkisinin lateksinden elde edilebilir. Elde edildiği tropikal meyve (*Carica papaya*) tüm yıl boyunca kolayca bulunur ve sürekli üretim yapılmasını sağlayabilir (Fernández-Lucas ve ark., 2017).

Bir tiyol endopeptidaz olan bromelain, ananasın (*Ananas comosus*) meyvesinden/sapından elde edilir. 1875'ten beri tıbbi amaçla da kullanılmaktadır (Pavan ve ark., 2012). Ucuz bir atık ürün olan sap, meyvelerden daha yüksek konsantrasyonda proteaz içerir (Rathnavelu ve ark., 2016). Bromelain, 3.0–9.0 gibi geniş bir pH aralığına aktiftir ve 37-70°C arasında optimum sıcaklığa sahiptir. Polipeptit zincirindeki peptit bağlarının hidrolizini katalize eder. Hidrofobik ve nonpolar amino asit kalıntıları için özgüllük gösterir (Pavan ve ark., 2012). Ancak, bromelainin kesin etki mekanizması hala bilinmemektedir.

Ficin incirin (*Ficus carica*) lateksinde bulunan endoproteolitik bir enzimdir (Zare ve ark., 2013). Ficinin çeşitli aktif formları veya izoformları, ağacın sağlığına, meyve olgunlaşmasına, sulamaya ve büyüme sırasındaki çevresel koşullara bağlı olarak bitkide bulunur. Ficin aktivitesi için optimum sıcaklık 50-60°C ve pH aralığı ise 6-7' dir (Morellon-Sterling ve ark., 2020).

Kivi meyvesinden elde edilen aktinidin (EC 3.4.22.14), 220 amino asitli bir tiyol proteazdır ve molekül ağırlığı 23,5 kDa'dır (Baker ve ark., 1980). Aktinidin ve papainin amino asit dizilerinde, substrat özgüllüğünde ve üçüncül yapılarında kapsamlı bir homoloji bulunmuştur (Baker ve ark., 1980; Carne ve ark., 1978). Aktinidin amino asit dizisi toplam yedi sistein içerir, bunlardan biri aktif bölgede bulunurken altısı üç disülfür köprüsünün oluşumunda rol oynar.

Kimomeksician ve Meksika sistein proteazları gibi diğer sistein proteazları, *Jacaratia Mexicana* meyvesinin lateksinden elde edilir. Yüksek pH ve sıcaklık stabiliteleri nedeniyle kazein substratlarına karşı proteolitik aktivite gösterir (González-Rábade ve ark., 2011).

3. BİTKİSEL PROTEAZLARIN PEYNİR ÜRETİMİNDE DEĞERLENDİRİLMESİ VE KALİTE ÜZERİNE ETKİSİ

Sütün enzimatik koagülasyonu, peynir yapımında önemli bir adımdır. Bitkisel proteazların enzim aktivitelerinin değerlendirilmesi ve bunların kimozin ile karşılaştırılması, uygun bir rennet seçilmesinde önemlidir (Nicosia ve ark., 2022). Dünyada farklı lezzet, doku ve görünüşe sahip çeşitli peynir ürünleri üretilmektedir. Bu peynirlerin çok az bir kısmında bitkisel proteazlardan yararlanılmaktadır. Bitkisel proteazlarda ancak geleneksel yöntemle üretilen ev yapımı peynirlerde kullanılabilmektedir. Fakat bitkisel proteazlar ile yarı endüstriyel olarak üretilen peynirlere serra da estrela ve torta del casar peyniri örnek verilebilir(Mohsin ve ark., 2024).

Bitkisel proteazların reolojik özellikler, duyusal özellikler (doku, aroma, tat ve renk) ve peynir verimi üzerindeki etkisini belirlemek ve geliştirmek için çalışmalar gerçekleştirilmektedir. Çalışmaların büyük bir bölümü Akdeniz ülkeleri, Batı Afrika ve Güney Avrupa'da bulunan küçük mandıralarda veya çiftliklerde geleneksel prosedürlerle üretilen peynir türleri üzerinde gerçekleştirilmiştir (Nicosia ve ark., 2022). Batı Afrika'da wara ve wangashi peynirlerinin üretiminde *C. procera*'nın sırasıyla yaprakları ve saplarından elde edilen enzimler değerlendirilmiştir. Endonezya, Sudan, Meksika ve Mısır'da sırasıyla dangke peyniri, yumuşak beyaz peynir, asadero peyniri ve domiati peynirini içeren özel yapım peynirler bitkisel proteazlar kullanılarak üretilmiştir (Ahmed ve ark., 2009; Chávez-Garay ve ark., 2016; Darwish, 2016; Rana ve ark., 2017). Dahası, *W. coagulans* enzim ekstraktının ve kısmen saflaştırılmış ekşi portakal çiçeği enzim ekstraktının İran'da inek sütünden İran beyaz peyniri üretiminde kullanımınınuygun olduğu bildirilmiştir (Nasiri ve ark., 2020; Pezeshki ve ark., 2011). Çeşitli bitkisel proteazlar kullanılarak üretilen bazı peynirler Tablo 1'de verilmiştir.

Tablo 1. Bitkisel proteazlar kullanılarak üretilen bazı peynirler (Mohsin vd., 2024)

Peynir türü/menşei	Süt kaynağı	Bitkisel proteaz	Referans
Serra da Estrela cheese/ Portekiz	Koyun	*Cynara spp.*. çiçekleri (Yabani enginar)	Roseiro ve ark. (2003)
Torta del Casar cheese/İspanya	Koyun	*Cynara spp.* çiçekleri (Yabani enginar)	Ordiales ve ark. (2014)
Fresco/İspanya	Keçi	*Cynara cardulus* (Yabani enginar)	García ve ark. (2012)
Dangke/Endonezya	İnek	*Carica papaya* ağacının lateksi	Rana ve ark., (2017)
Wara/ Güney Afrika	İnek	*Calotropis procera* yaprakları	Rajagopalan ve ark., (2019)
Wagashi/ Güney Afrika	İnek	*Calotropis procera* sapları	Aboudoulaye ve Kaya, (2020)

Yumuşak beyaz peynir/ Sudan	Keçi/koyun	*Solanum dubium*	Ahmed ve ark. (2009)
Asadero/Meksika	İnek	*Solanum elaeagnifolium* meyveleri	Chavez-Garay ve ark., (2016)
Domiati/Mısır	Manda/inek	*Abizia lebbeck ve Helianthus annuus*	Darwish (2016)

Peynir üretimi, ısıl işlem, pıhtı işleme, haşlama, tuzlama, ambalajlama vb. faktörlerin etkili olduğu bir prosestir. Sütün pıhtılaşması peynir üretiminde en önemli adımlardan biridir. Bu nedenle enzim seçimi peynirin verimi, dokusu ve duyusal özellikleri üzerinde direkt bir etkiye sahiptir (Zikiou ve Zidoune, 2019; Zhang ve ark.,2023).

Garay ve ark. (2016), bitki kaynaklı maya (*S. elaeagnifolium)* ile üretilen peynirinin daha yüksek verim sağladığını bildirmiştir. Kivi bitkisinden elde edilen enzim ekstraktları ile yapılan peynirlerde acılık olmadığı bildirilmiştir (Puglisi ve ark., 2014). Minyatür peynirler yapmak için *Silybum marianum* çiçeklerinden elde edilen bitkisel preoteaz ile kimozin karıştırılmış ve peynir/ peynir altı suyunda antioksidan özellik ve aroma oluşumu daha yüksek bulunmuştur (Colombo ve ark., 2018). Bir başka çalışmada, bitkisel (örneğin, Enginar makrokarponu) enzim kullanımının kimozine göre daha iyi sonuç verdiği ve mozzarella/diğer peynirlerin üretiminde kullanılabileceği ifade edilmiştir (Manuelian ve ark., 2020),

Ham enginar çiçeği özütüne ait bitkisel proteaz ve ticari peynir mayasının peynir üretiminde kullanımı karşılaştırılmıştır. Bitkisel proteaz ile üretilen peynirin yumuşaklık ve kremsilik özellikleri panelistler tarafından daha yüksek puan almıştır (Zikiou ve Zidoune, 2019). Alavi ve Momen (2020), deve dikeni (*Silybum marianum*) pıhtılaştırıcılarının kimozine göre daha düşük sertlik ve kremsilik özellik kazandırılması bakımından UF peynirinde daha iyi dokusal özellikler sergilediğini bildirmiştir. Endonezya'da üretiminde papain (*Carica papaya*) kullanılan Dangke peynirinde, farklı papain konsantrasyonlarıyla hazırlanan peynirlerin aroması değerlendirilmiş ve sonuçlar, daha düşük miktarda pıhtılaştırıcı ile elde edilen peynirin daha iyi bir aromaya sahip olduğunu açıkça göstermiştir (Rana ve ark., 2017). Hashim ve ark. (2011) tarafından Peşaveri peynirinin hazırlanmasında zencefil özütü (*Zingiber officinale*) kullanılarak elde edilen peynirlerde acıma olmadığı ve şirden mayası ile üretilen peynirden daha iyi duyusal özellikler sergilediğini ifade etmiştir.

4. BİTKİSEL PROTEAZLARIN BİYOAKTİVİTE ÜZERİNE ETKİSİ

Süt proteinlerinin enzimatik hidrolizi sonucu farklı biyoaktif özelliklere sahip peptitler elde edilebilmektedir. Bu peptitler beslenme, bağışıklık sistemi (antimikrobiyal peptitler ve immünomodülatör peptitler), sinir sistemi (opioid peptitler) ve kardiyovasküler sistemde (antihipertansif peptitler ve antitrombotik peptitler) önemli rol oynayabilmektedir (Silva ve Malcata, 2005).

Bitkisel proteazlar kullanılarak süt proteinlerinin biyoaktivitesi üzerine birçok çalışma yapılmıştır. Papain ve bromelain kullanılarak biyoaktif peptitlerin üretildiğini bildirmiştir. Bu proteazlar, yüksek hidroliz derecesine ve düşük molekül ağırlığına sahip peptitlerin salınmasını sağlamaktadır (David Troncoso ve ark., 2022; Mazorra-Manzano ve ark., 2018; Matkawala ve ark., 2022). Tablo 2'de süt proteinlerinin biyoaktif özellikleri üzerine bitkisel proteazların etkisini gösteren bazı çalışmalara yer verilmiştir.

Tablo 2. Bitkisel proteazlar kullanılarak süt proteinlerinin biyoaktivitesi üzerine gerçekleştirilen bazı çalışmalar

Proteaz	Süt kaynağı	Biyoaktif özellik	Referans
Papain	Deve sütü	Antidiyabetik ve antiobezite	Mudgil ve ark., (2019)
Papain	Manda skimmilk retentantı	Antihepatotoksik ve antioksidan	Abdel-Hamid ve ark., (2019)
Fisin	Keçi sütü	Antimikrobiyal	Esmaeilpour ve ark., (2016)
Salpichroin	Peynir altı suyu	Antioksidan	Rocha ve ark., (2017)
Pomiferin	İnek sütü	ACE inhibitör	Corrons ve ark., (2017)
Asian pumpkin	Peynir altı suyu	dipeptidil peptidaz-IV, alfa-glukozidaz ve ACE inhibitörü	Konrad ve ark., (2014)
Dregea sinensis Hemsl.	Manda sütü	Antimikrobiyal	Zhao ve ark., (2020)
Maclura pomifera	Peynir altı suyu	Antioksidan ve ACE inhibitör	(Corrons ve ark., 2012)

Anjiyotensin dönüştürücü enzim (ACE) inhibitör peptitleri, anjiyotensin II'nin vazokonstriksiyonunu sınırlayarak kan basıncını düşürme yeteneğine sahiptir. Bromelain, yarım yağlı ve UHT sütle kullanıldığında ACE inhibitör aktivitesinde sırasıyla yaklaşık %36 ve %44 oranında önemli bir artışa neden olmuştur (Medeiros ve ark., 2013). *M. pomifera* ait proteaz ekstraktı ile kazeinden ACE inhibitör peptitler elde edilmiştir (Corrons ve ark., 2017). Bertucci ve ark. (2015)'de aynı proteaz özütü ile peyniraltı suyu proteininden de ACE inhibitör peptitleri sentezlemişlerdir.

Oksidasyon hücresel metabolizmada önemli bir rol oynamaktadır. Fakat yüksek oranda serbest radikaller apoptozu indükleyerek ve hücrenin yaşamsal faaliyetleri için gerekli enzimleri/ proteinleri oksitleyerek zarar görmesine neden olmaktadır. Liu ve ark. (2016), 400-2000 Da molekül ağırlığına sahip, 4-16 aminoasit içeren ve gastrointestinal sindirime uğramadan hedef bölgeye kolayca ulaşabildiklen peptitleri antioksidan peptitler olarak tanımlamıştır. Bu nedenle peptitlerin amino asit bileşimi antioksidan özelliklerini belirlemede önemli bir rol oynar (Mora ve ark., 2018). Bueno-Gavilá ve ark. (2019), *Cynara scolymus*'un ait bitkisel ekstraktı kullanarak sığır kazeinini hidrolize etmiş ve diğer proteazlarla (hayvansal ve mikrobiyal) karşılaştırıldığında daha yüksek ACE inhibitör ve antioksidan aktivitelere sahip biyoaktif peptitler elde etmişlerdir. Başka bir çalışmada, papain ve bromelain ile elde edilen deve sütü hidrolizatına ait peptitlerin (<14 kDa), kontrollerine kıyasla antioksidan aktivitede önemli düzeyde daha yüksek olduğu bildirilmiştir (Al-Shamsi ve ark., 2018). Luo vd. (2014) tarafından yapılan başka bir çalışmada ise, papain tarafından kazeinin hidrolizinin DPPH temizleme aktivitesinde ve ACE inhibitör aktivitesinde kontrole

kıyasla daha yüksek bulmuşlardır. Kumar ve ark. (2016), 6 saatlik işlemden sonra deve sütü proteini hidrolizatlarının papain ile önemli ölçüde daha yüksek ABTS radikal süpürücü aktivitesi olduğunu bildirmişlerdir.

DPP-IV (dipeptidil peptidaz-IV), glikoz homeostazında rol oynayan bir enzimdir. Bu enzim endokrin, bağışıklık ve inflamatuar sistem bozukluklarına yol açabilmektedir (Abd-El-Salam ve ark., 2009). Boots (2013) tarafından bitki proteazları da dahil olmak üzere farklı enzimlerle kazein hidrolizazyonu gerçeleştirilmiş ve hidrolizatların fraksiyonlanmasından sonra elde edilen permeatın önemli DPP-IV inhibitör aktivitesi gösterdiğini (peptidin N-terminalinde en az 1 prolin kalıntısı bulunduğunu) göstermiştir.

20-46 amino asit kalıntısı uzunluğunda, molekül ağırlığı 10 kDa'dan az, bazik (lizin veya arginin açısından zengin) ve amfipatik olan peptitler antimikrobiyal peptitler olarak kabul edilir (Sanchez ve Vázquez, 2017). Çok sayıda gıda bozulmasına neden olan mikroorganizmayı ve patojenleri inhibe edebilirler ve bu nedenle terapötik ajanlara umut verici bir alternatif olmaktadır (Hayes ve Bleakley, 2018).

5. SONUÇ VE ÖNERİLER

Bitkisel proteazlar genel olarak yüksek proteolitik aktiviteye sahiplerdir. Farklı özgüllüklere sahip olduklarından ürün geliştirmede oldukça önem arzetmektedir. Bitkisel proteazlar kullanılırken peynirin duyusal özellikleri dikkate alınmalıdır. Ayrıca üretimde kullanılan bitkisel proteaz konsantrasyonu da peynir kalitesi üzerinde etkilidir. Bitkisel proteazların serum proteinleri ve kazeine etki ettiği düşünüldüğünde farklı özelliklere sahip birçok peptitin oluşabileceği unutulmamalıdır. Bu peptitler ürünün biyoaktif özelliklerini iyileştirmede oldukça önemli olabilmektedir. Burada dikkat edilmesi gereken önemli hususlardan birisi alerjik reaksiyonlara sebep olup olmadıkları ve sindirilebilirlikleridir. Sonuç olarak bitkisel proteazlar fonksiyonel özellikleri artırmak amacıyla kullanılabilir. Bu amaçla ürünün duyusal özellikleri çok etkilenmeden hayvansal veya mikrobiyal kaynaklı kimozin ile kombine şekilde farklı peynir çeşitlerinde kullanılması üzerine daha fazla araştırma yapılarak değerlendirilmesi araştırılmalıdır. Ayrıca kremleştirme özelliklerinden yararlanarak biyolojik değeri yüksek farklı duyusal özelliklere sahip yeni tip peynirlerde geliştirilebilir.

ÖZET

Bu çalışmada, ülkemizde ve özellikle Konya bölgesi koşullarında kullanımı gün geçtikçe artan doğrusal hareketli yağmurlama sulama sistemlerinin planlama aşamaları incelenmiştir. Çalışma, Konya bölgesinde sulama etkinliğini artırmak, sulama işçiliğini azaltarak tarımsal üretim sonucunda elde edilen net geliri artırmanın yanı sıra daha geniş alanların sulanmasını sağlamak amacıyla kullanılan doğrusal hareketli sulama sistemlerinin planlanmasının doğru bir şekilde yapılmasını sağlamak amacıyla ele alınmıştır. Özellikle işgücü gereksiniminin çok az olması, farklı sulama zamanlaması ve sulama miktarlarının hızlı ve kolayca uygulanabilmesi, yüksek su uygulama randımanlarının olması ve yüksek bir eş su dağılımı sağlaması gibi avantajları nedeni ile doğrusal hareketli sulama sistemleri üreticiler tarafından sıklıkla tercih edilmektedir. Son yıllarda kullanımı yaygınlaşan doğrusal hareketli sulama sistemlerinin tekniğine uygun planlanması ve kullanılabilmesi ile sistemden beklenen faydaların sağlanması, bölgenin su kaynaklarının etkin kullanımı bakımından önemli olduğu değerlendirilmektedir. Sistemin hız ayarlarına göre ilerleme hızlarının ve bu hızlarda uyguladığı su miktarlarının bilinmesi, sistemin uygun bir şekilde planlanması ve işletilmesi açısından büyük önem taşımaktadır. Çalışmada 10, 12.5 ve 15 ha büyüklüğündeki araziler için yapılan örnek planlamada, uygun başlık debileri belirlenerek ideal maksimum ilerleme hızları tespit edilmiştir. Yapılan hesaplamalar, sistemlerin farklı ilerleme hızlarında saatte 2.2 ila 65.7 mm sulama suyu uygulanabileceğini göstermiştir. Bu değerler ilerleme hızlarının azalmasıyla artarken, artan ilerleme hızları ile azalmıştır. Yapılan hesaplamalar sonucunda, sistemlerin ideal ilerleme hızlarında yağmurlama hızları 12.6 ile 14.5 mm/h arasında değişmiştir. Özetle, sistemler planlanırken kullanılacak nozul çapının ve uygulanacak ilerleme hızlarının belirlenmesinde toprağın infiltrasyon hızının dikkate alınması ve doğrusal hareketli sulama sistemlerinde başlık debisinin ve sistemin ilerleme hızlarının bu değerlere göre optimize edilmesi gerektiği sonucuna varılmıştır. Ayrıca, yatırım maliyetleri göz önüne alındığında, yerli üretimin tercih edilmesinin işletmeler için ekonomik açıdan daha avantajlı olacağı anlaşılmaktadır.

Anahtar Kelimeler: Doğrusal hareketli sulama sistemi, sulama sistemi planlaması, sulama sistemleri.

PLANNING OF LINEAR MOVE IRRIGATION SYSTEMS

ABSTRACT

This study examines the planning stages of linear moving sprinkler irrigation systems, whose use is increasing day by day in our country and especially in the Konya region. The study was undertaken to ensure the proper planning of linear moving irrigation systems used in the Konya region to increase irrigation efficiency, reduce irrigation labor, increase net income from agricultural production, and irrigate larger areas. Linear moving irrigation systems are frequently preferred by producers due to their advantages, such as minimal labor requirements, the ability to quickly and easily apply different irrigation schedules and rates, high water application efficiency, and high uniformity of water distribution. It is considered important for the effective use of water resources in the region that linear moving irrigation systems, which have become extensively used in recent years, are planned and used in accordance with the appropriate technique to ensure that the expected benefits from the system are achieved. Knowing the advance speeds according to the system's speed settings and the amount of water applied at these speeds is of great importance for the proper planning and operation of the system. In the study, ideal maximum advance speeds were determined by determining the appropriate head flows in the sample planning for 10, 12.5, and 15 ha fields. Calculations show that irrigation water can be applied at rates ranging from 2.2 to 65.7 mm per hour at different advance speeds. These values increase as advance speeds decrease and decrease as advance speeds increase. As a result of the calculations, the sprinkling rates at the ideal advance speeds of the systems varied between 12.6 and 14.5 mm/h. In summary, it was concluded that when planning systems, the soil infiltration rate should be taken into account when determining the nozzle diameter to be used and the advance speeds to be applied, and that the head discharge and advance speeds of linear moving irrigation systems should be optimized according to these values. Furthermore, considering the investment costs, it is understood that preferring domestic production is more economically advantageous for businesses.

Keywords: Linear move irrigation system, irrigation system planning, irrigation systems.

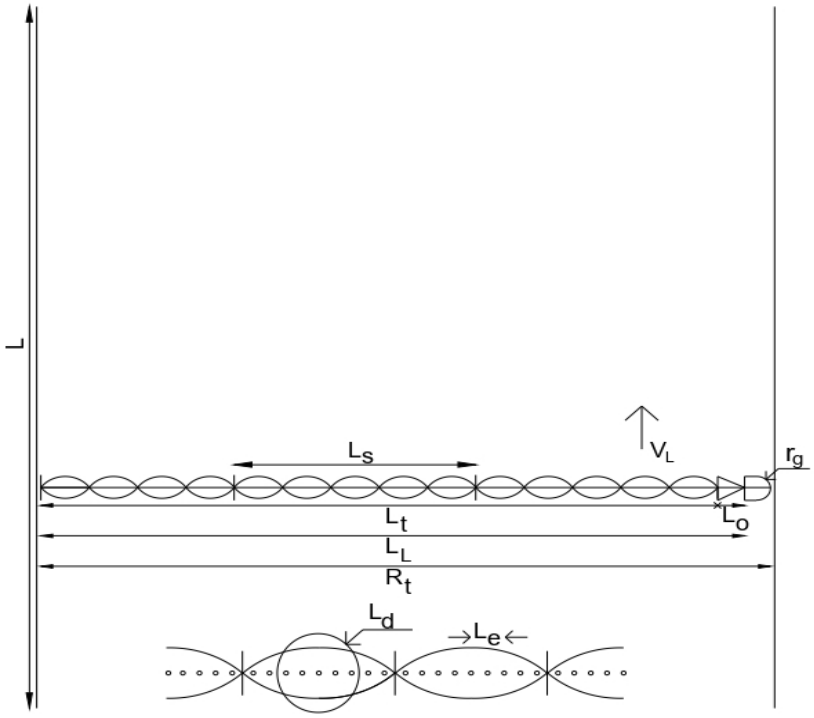
1. GİRİŞ

Küresel iklim değişikliğinin neden olduğu aşırı iklim olaylarının artmasıyla tarımsal üretimin önemli ölçüde etkilenmesinin yanı sıra su kıtlığı özellikle ciddi bir sorun oluşturmaktadır (Dinar ve ark., 2019; Praveen ve Sharma, 2019). Kurak ve yarı kurak bölgelerde, suyun mevcudiyeti bitkisel üretim için önemli bir sınırlayıcı faktördür (Er-Raki ve ark., 2007). Yarı kurak iklim kuşağında yer alan Konya kapalı havzasında son yıllarda yeraltı suyu seviyelerinde bariz bir düşüş olduğu gözlenmektedir (Başçiftçi ve ark., 2013; Demir ve ark., 2021; Göçmez ve ark., 2022) ve bu durum, bu bölgede hem tarımsal üretimin sürdürülebilirliğine hem de su kaynaklarının yönetimi açısından önemli zorluklar meydana getirmektedir. Artan gıda talebi yakın gelecekte tarımın su kullanımını muhtemelen kısıtlayacaktır. Mevcut su kaynakları azaldıkça, maksimum ekonomik getiri ve su kaynaklarının sürdürülebilirliği için suyun verimli kullanımı çok daha önemli hale gelmektedir (Irmak ve ark., 2011). Bu nedenle, su arzı ile tarımsal su ihtiyacı arasındaki dengeyi sağlamak ve yeraltı suyunun aşırı kullanımını azaltmak için Konya kapalı havzası ve benzeri su kıtlığı olan kurak ve yarı kurak bölgelerde optimum su tasarrufu sağlayan sulama uygulamalarına ihtiyaç vardır.

Bitkisel üretimde su kaynaklarının verimli kullanımı için basınçlı sulama sistemlerinin yaygınlaştırılması büyük önem taşır. Ülkemizde sulanan alanların %38'i basınçlı sulama sistemleri ile sulanırken, bunun %21.5'i yağmurlama sulama sistemleri ile sulanmaktadır (ICID, 2025). Konya'da mevcut tarla sulama sistemlerinin modernizasyonu ve iyileştirilmesi çalışmaları, tarımsal sulamanın optimizasyonu için temel bir strateji olmuştur. Bu amaçla Tarım ve Orman Bakanlığı tarafından Konya'da kırsal kalkınma destekleri kapsamında bireysel sulama sistemlerinin desteklenmesi ile basınçlı sulama sistemlerine son beş yılda (2021-2025) toplamda 312 milyon lira tutarında hibe ödemesi yapılmıştır (KTOM, 2025). Su uygulama verimliliğini ve homojenliğini yükselten sulama sistemlerinin tasarlanması, su verimliliğini ve yapılan yatırımın getirisini en üst düzeye çıkarmak için önemlidir (Oker ve ark., 2020). Dolayısıyla bu sistemleri planlayan ve işleten kişilerin hareketli sulama sistemlerinin öncelikle tarla ölçeğinde nasıl çalışacağını ve nasıl performans göstereceğini anlamaları gerekmektedir. Dairesel ve doğrusal hareketli sulama sistemlerinin teknik performanslarının belirlenmesi amacı ile yapılan bazı çalışmalarda, homojen bir sulama için sistemlerin istenilen düzeyde bir performans sergilemediği ve istenilen düzeyde eş su dağılımı sağlamadığı bildirilmiştir (Çalgıcı, 2011; Kılıç, 2019).

Alternatif sulama sistemleri arasında, hareketli yağmurlama sulama sistemleri yüksek su uygulama verimliliğine ulaşma potansiyeline sahip olan ve Konya bölgesinde son yıllarda yaygın olarak kullanılmaya başlanan basınçlı sulama sistemleridir. Özellikle işgücü gereksiniminin çok az olması, farklı sulama zamanlaması ve sulama miktarlarının hızlı ve kolayca uygulanabilmesi, geniş alanların sulanabilmesi, otomasyona uygunluğu ve yüksek bir eş su dağılımı sağlaması gibi avantajları nedeni ile hareketli sulama sistemleri üreticiler tarafından sıklıkla tercih edilmektedir (McKnight, 1986; Keller ve Bliesner, 1990; Alliance, 2015; Waller ve Yitayew, 2016; Sinobas, 2017). Doğrusal hareketli sulama sistemleri dikdörtgen şekilli arazilerin sulanmasında kullanılırlar (Kanber, 2010). Sistem sulanacak arazinin kısa kenarına paralel olacak şekilde yerleştirilir ve tarlanın uzun kenarı boyunca doğrusal olarak hareket ederek sulama yapar.

Bu çalışmada, tarla ölçeğinde doğrusal hareketli sulama sistemlerinin tekniğine uygun bir şekilde planlanarak işletilmesi için bir metodoloji sunulmuştur. Bu amaçla örnek sistem parametreleri kullanılarak, sistemlerin hız ayarlarına göre ilerleme hızlarının ve bu hızlarda uyguladığı su miktarlarının belirlenmesi için gerekli hesaplama aşamaları verilmiş ve sistemlerin ideal ilerleme



hızlarının tespiti için hesaplamalar örnek sistemler üzerinden yapılmıştır. Çalışmamız etkili ve çevre dostu sulama uygulamaları için faydalı olacaktır.

2. PLANLAMA ESASLARI

Doğrusal hareketli sulama sistemlerinin planlama aşamaları aşağıda maddeler halinde özetlenmiştir;

1) Sistem elemanlarının arazinin boyutlarına göre ölçülendirilmesi,
2) Sistemin ilerleme hız ayarlarına göre ilerleme hızlarının hesaplanması,
3) Yağmurlama başlığı seçimi,
4) Yağmurlama hızlarının hesaplanması,
5) Sistemin ideal maksimum ilerleme hızının belirlenmesi.

Bir sulama sistemi planlanırken öncelikle arazideki tertip biçimi göz önünde bulundurulur. Daha sonra sistemin tertip biçimine göre malzeme seçimi ve kapasite hesaplamaları yapılır. Doğrusal hareketli sulama sistemlerinin arazideki tertip biçimi şekil 1'de verilmiştir.

Şekil 1. Doğrusal hareketli sulama sisteminin arazideki tertip biçimi

$$L_L = L_t + L_o \quad (1)$$

$$L_t = L_{s1} + L_{s2} + \cdots + L_{sn} \quad (2)$$

$$R_t = L_L + r_g \quad (3)$$

Şekil 1'de ve eşitliklerde; L_s: Span uzunluğu (m), L_t: Spanların toplam uzunluğu (m), L_o: Uzatma borusu (overhang) uzunluğu (m), L_L: Sistemin uzunluğu (m), R_t: Sistemin toplam iş genişliği (m), r_g: Son başlığın (endgun) ıslatma yarıçapı (m), V_L: Sistemin ilerleme hızı (m/h), L_d: Yağmurlama başlıklarının ıslatma çapı (m), L_e: Yağmurlama başlıklarının aralığı (m), L: Arazinin uzunluğu (m).

Sulama sistemleri, arazi yüzeyine uygulanan sulama suyunun toprak yüzeyinde göllenmeden toprak içerisine girmesini sağlamalıdır. Bunun için sistemin yağmurlama hızı (mm/h), toprağın infiltrasyon hızından (mm/h) küçük ya da eşit (Eşitlik 4) değer aralıklarında olacak şekilde planlanmalıdır. Böylece, göllenme ile oluşacak buharlaşma ve arazi şartlarına göre yüzey akışla meydana gelecek su kaybının önüne geçilmiş olacaktır. Doğrusal hareketli sulama sistemlerinin yağmurlama hızı Eşitlik 5 ile hesaplanabilir.

$$I_f \leq I_s \tag{4}$$

$$I_f = \frac{q_e}{L_e \times V_L} \tag{5}$$

Eşitliklerde; I_f: Yağmurlama hızı (mm/h), q_e: Yağmurlama başlığı debisi (l/h), L_e: Yağmurlama başlıklarının aralığı (m), V_L: Sistemin ilerleme hızı (m/h), I_s: Toprağın infiltrasyon hızı (mm/h).

Sistemde kullanılacak yağmurlama başlığı debisi belirlenirken su kaynağı debisi ve sistemin uzunluğuna göre toplam başlık sayısı dikkate alınır. Bu şekilde hesaplı başlık debisi belirlenmiş olur. Ancak piyasa şartlarında işletme basıncına göre başlıkların vereceği debiler meme çaplarına göre tasnif edilmiştir. Bu yüzden sistemin planlanmasında üretici firma kataloglarından, kullanılacak başlığın debisi, hesaplanan başlık debisine eşit ya da yakın değerdeki debiye sahip bir başlık seçilmelidir (Eşitlik 6). Kullanılacak başlık debisi Eşitlik 7 ile hesaplanabilir.

$$q_e \leq cq_{ei} \tag{6}$$

$$cq_e = \frac{Q_{ws}}{n_e} \times 1000 \tag{7}$$

Eşitliklerde; q_e: Yağmurlama başlığının gerçek (piyasa koşullarında bulunan) debisi (l/h), cq_e: Yağmurlama başlığının hesaplanan debisi (l/h), Q_{ws}: Su kaynağı debisi (m^3/h), n_e: Yağmurlama başlığı sayısı (adet).

Başlık debisini belirlemek üzere sistemde kullanılacak yağmurlama başlığı sayısı aşağıdaki eşitlik yardımı ile hesaplanabilir.

$$n_e = \frac{L_{s1}}{L_{e1}} + \frac{L_{s2}}{L_{e2}} + \cdots + \frac{L_{sn}}{L_{en}} + \frac{L_o}{L_{eo}} \tag{8}$$

Eşitlikte; n_e: Yağmurlama başlığı sayısı (adet), L_s: Span uzunluğu (m), L_o: Uzatma borusu (overhang) uzunluğu (m), L_e: Yağmurlama başlığı sıklığı (m).

Sistemin farklı hızlarda uygulayacağı yağmurlama hızını hesaplamak üzere sistemin ilerleme hızı aşağıdaki eşitlikle hesaplanabilir.

$$V_L = n \times \frac{1}{G_m} \times \frac{1}{G_w} \times 60 \times u \tag{9}$$

Eşitlikte; V_L: Sistemin ilerleme hızı (m/h), n: Motorun dakikadaki devir sayısı (dev/dk), G_m: Motor redüktör oranı (1:n), G_W: Tekerlek dişlisi oranı (1:n), u: Yük altında tekerlek çevre uzunluğu (m).

Sistemin sulama yapacağı arazinin başlangıç noktasından bitiş noktasına varış süresine sistemin tur süresi denir. Sistemin tur süresi aşağıdaki eşitlik ile hesaplanabilir.

$$t = \frac{L}{V_L} \tag{10}$$

Eşitlikte; t: Tur süresi (saat), L: Arazinin uzunluğu (m), V_L: Sistemin ilerleme hızı (m/h).

Sistemin farklı ilerleme hızlarına göre uygulayacağı yağmurlama hızları hesaplanarak bir liste oluşturulmalıdır. Toprağın infiltrasyon hızı dikkate alınarak sistemin ideal maksimum ilerleme hızı belirlenmelidir. İşletme safhasında sistem en fazla bu hızlarda çalıştırılarak sulama yapılmalıdır (Eşitlik 11). Aksi taktirde sistemin yağmurlama hızı toprağın infiltrasyon hızını geçerek uygulanan sulama suyunun arazi yüzeyinde göllenmesine neden olacaktır. Sistemin ideal maksimum ilerleme hızı Eşitlik 12 ile hesaplanabilir.

$$V_i \leq V_L \tag{11}$$

$$V_i = \frac{q_e}{I_s \times L_e} \tag{12}$$

Eşitliklerde; V_L: Sistemin ilerleme hızı (m/h), V_i: Sistemin ideal maksimum ilerleme hızı (m/h), q_e: Yağmurlama başlığının debisi (l/h), I_s: Toprağın infiltrasyon hızı (mm/h), L_e: Yağmurlama başlığı sıklığı (m).

3. ÖRNEK SİSTEM PLANLAMASI

Örnek bir planlama yapmak için oluşturulan üç ayrı (A, B ve C) doğrusal hareketli sulama sisteminin bazı teknik parametreleri Tablo 1.'de verilmiştir.

Tablo 1. Sistemlerin bazı teknik parametreleri

*Sistem parametreleri	Örnek sistemler		
	A	**B**	**C**
1. Span uzunluğu (m)	47.8	59.6	59.6
2. Span uzunluğu (m)	47.6	59.4	59.4
3. Span uzunluğu (m)	47.6	59.4	59.4
4. Span uzunluğu (m)	-	-	47.6
Sistemin uzunluğu (m)	143	178.4	226
Uzatma borusu (overhang) uzunluğu (m)	12.6	18.6	18.6
Sistemin toplam uzunluğu (m)	155.6	197.0	244.6
Son başlık ıslatma yarıçapı (m) (270^0)	12.2	12.2	12.2
Sistemin toplam iş genişliği (m)	167.8	209.2	256.8
Son başlık (endgun) debisi (m^3/h)	9.3	9.3	9.3
Başlık aralığı (m)	3.0	3.0	3.0
Başlıkların ıslatma yarıçapı (m)	6.0	6.0	6.0
Arazi uzunluğu (m)	600	600	600
Sulanan toplam alan (ha)	10.1	12.6	15.4

*Firma kataloglarından faydalanılmıştır.

Doğrusal hareketli sulama sistemleri, arazinin kısa kenarına paralel olacak şekilde yerleştirilen ve arazinin uzun kenarı boyunca hareket ederek arazinin sulanmasını sağlayan sistemlerdir. Dolayısıyla sistemin uzunluğunu arazinin kısa kenar uzunluğu belirlemektedir. Planlamada span uzunluğu ve sayısı, uzatma borusu (overhang) uzunluğu ve gerekli durumda kullanılacak son

başlığın (endgun) ıslatma yarıçapı değerleri belirlenerek arazinin tamamının eşit bir şekilde sulanması sağlanmalıdır.

Tablo 1.'de A, B ve C olarak isimlendirilen üç ayrı doğrusal hareketli sulama sisteminin teknik parametreleri verilmiştir. Bu sistemlerden A ve B sistemleri üç spanlı, C sistemi ise dört spanlı olacak şekilde planlanmıştır. A sisteminin arazide yer işgal eden toplam uzunluğu 155.6 m, B sisteminin 197 m ve C sisteminin ise 244.6 m'dir. Her üç sistem için de 12.2 m ıslatma yarıçaplı son tabanca kullanılmış, böylece sistemlerin toplam iş genişlikleri (ıslattığı toplam uzunluk) sırasıyla; 167.8 m, 209.2 m ve 256.8 m olarak planlanmıştır. Örnek sistemlerin kurulacağı arazinin uzunluğu 600 m olarak eşit bir değer alınmıştır. Böylece, A sistemi 10.1 ha, B sistemi 12.6 ha ve C sistemi ise 15.4 ha alanı sulayacak şekilde bir planlama yapılmıştır.

Kendinden hareketli sulama sistemlerinin planlanabilmeleri için öncelikli olarak arazideki ilerleme hızlarının hesaplanması gerekir. Esas amaç bu sistemlerin klasik sabit veya yarı sabit yağmurlama sulama sistemlerinde olduğu gibi su uygulama oranlarını, yani yağmurlama şiddetlerini hesaplamaktır. Tablo 2.'de sistemlerin ilerleme hız ayarlarına (%V_s) göre; motorun dakikadaki devir sayısı, motor redüktör oranı, tekerlek dişlisi oranı ve 14.9 x 24 ebatlarındaki lastiğin yük altında tekerlek çevre uzunluğu değerleri verilmiştir.

Tablo 2. Sistemin ilerleme hızı hesabı

%Vs	n (rpm)	G_m (1:n)	G_W (1:n)	u (m)	İlerleme hızı (V_L) (m/h)
100	1450				162.2
95	1378				154.1
90	1305				146.0
85	1233				137.8
80	1160				129.7
75	1088				121.6
70	1015				113.5
65	943				105.4
60	870	1:40	1:50	3.728	97.3
55	798				89.2
50	725				81.1
45	653				73.0
40	580				64.9
35	508				56.8
30	435				48.7
25	363				40.5
20	290				32.4

15	218	24.3
10	145	16.2
5	73	8.1

$\%V_s$: İlerleme hız ayarı, n: Motorun dakikadaki devir sayısı, G_m: Motor redüktör oranı, G_W: Tekerlek dişlisi oranı, u: Yük altında tekerlek çevre uzunluğu (m).

Tablo 2.'deki parametrelerden; sistemin hız oranları, tam kapasitede motorun dakikadaki devir sayısı, motor redüktör oranı, tekerlek dişlisi oranı ve kullanılacak lastiğin yük altında tekerlek çevre uzunluğu değerleri üretici firma kataloglarından alınabilir. Öncelikle hız ayarlarına göre motorun tam kapasitede dakikadaki devir sayısının oranları hesaplanarak motorun tüm devir sayıları hesaplanır. Sonrasında bu devir sayılarının motor redüktör oranı ve tekerlek dişlisi oranları hesaplanır. Çıkan değerler yük altında tekerlek çevre uzunluğu değeri ile çarpılarak sistemin ilerleme hızları hesaplanmış olur. Örnek sistemlerde tam (%100) kapasiteden en düşük (%5) hız ayarına kadar değişen oranlarda hız hesaplamaları yapılmıştır. Buna göre arazide kurulacak bu sistemler en yüksek (%100) hız ayarında saatte 162.2 m, en düşük (%5) hız ayarında ise saatte 8.1 m yol kat edecektir.

Yağmurlama sulama sistemlerinin planlanmasında en önemli aşama yağmurlama başlıklarının seçimidir. Başlık seçiminde en önemli kriter, su kaynağı debisine uygun sayıda başlığın, uygun işletme basıncında çalıştırılarak toprağın infiltrasyon hızını aşmayacak oranda yağmurlama hızını verecek uygunlukta başlık debisinin sağlanmasıdır. Örnek sistemler için ortalama başlık debisi ve uygun başlık debisinin belirlenmesi ile ilgili hesaplamalar Tablo 3.'te verilmiştir.

Tablo 3. Yağmurlama başlığı seçimi

Örnek sistem	Span no	Span			Overhang			$\sum n_e$ (adet)	q_g (m^3/h)	$\sum Q_{ws}$ (m^3/h)	Q_{ws} (m^3/h)	cq_e (l/h)	$^*q_e$ (l/h)
		L_s (m)	L_e (m)	n_e (adet)	L_o (m)	L_e (m)	n_e (adet)						
A	1	47.8	3.0	16	12.6	3.0	4	52	9.3	95	85.7	1648	1597
	2	47.6		16									
	3	47.6		16									
B	1	59.6	3.0	20	18.6	3.0	6	66	9.3	95	85.7	1298	1225
	2	59.4		20

C	1	59.6	3.0	20	18.6	3.0	6	82	9.3	95	85.7	1045	1058
	2	59.4		20									
	3	59.4		20									
	4	47.6		16									

* Tablo 4.'den alınmıştır. L_s: Span uzunluğu, L_e: Başlık aralığı, n_e: Başlık sayısı, L_o: Overhang uzunluğu, $\sum n_e$: Toplam başlık sayısı, q_g: Son başlık debisi, $\sum Q_{ws}$: Su kaynağı debisi, Q_{ws}: Son başlık hariç debi, cq_e: Ortalama başlık debisi, q_e: Seçilen başlık debisi.

Sistemde kullanılacak başlığa karar verme aşamasında öncelikle spanlarda ve uzatma borusunda kaç adet başlık kullanılacağı hesaplanır. Tablo 3. İncelendiğinde, span uzunlukları başlık yerleştirme sıklığına (3m) bölünerek her bir spanda kaç adet başlık kullanılacağı hesaplanmıştır. Aynı şekilde uzatma borusunda da kaç adet başlık kullanılacağı bu şekilde hesaplanmıştır. Böylece sistemlerin her birinde toplamda kullanılacak başlık sayısı belirlenmiştir. Örneğin 155.6 m uzunluğundaki A sisteminde toplamda 52 adet, 197 m uzunluğundaki B sisteminde 66 adet ve 244.6 m uzunluğundaki C sisteminde ise toplamda 82 adet başlık kullanılacaktır. Sistemlerin her biri için su kaynağı debisi 95 m^3/h olarak alınmış, yine son başlık debisi her bir sistem için 9.3 m^3/h olarak belirlenmiştir. Sistemlerde kullanılacak ortalama başlık debisini hesaplamak üzere su kaynağının debisinden son başlık için kullanılacak debi değeri düşülerek diğer başlıklar için kullanılacak su kaynağı debisi belirlenmiştir. Tablo 3.'ten görüleceği üzere bu değer her bir sistem için 85.7 m^3/h olarak hesaplanmıştır. Bu değer her sistemin toplam başlık sayılarına bölünerek ortalama başlık debileri hesaplanmıştır. A sisteminin ortalama başlık debisi 1648 l/h, B'nin 1298 l/h ve C sisteminin ise ortalama başlık debisi 1045 l/h olarak hesaplanmıştır. Piyasa koşullarında standart başlık debileri firma katalogları incelenerek belirlenebilir. Kullanılacak standart başlık debileri, meme çapı ve işletme basınçlarına göre Tablo 4.'te verilmiştir.

Tablo 4. Meme çapları ve basınç değerlerine göre başlık debileri (Komet, 2025)

Meme çapı (1/128")	**Rengi**	**Basınç (bar)**			
		0.41 (6psi)	**0.69 (10 psi)**	**1.03 (15 psi)**	**1.38 (20 psi)**

Tablo 4. incelendiğinde meme çaplarına göre farklı işletme basınçlarında elde edilecek debi değerleri verilmiştir. Örnek sistemler için hesaplanan debi değerlerine (Tablo 3.) en yakın debi değerleri başlık debisi olarak belirlenmiştir. Örneğin A sistemi için hesaplanan 1648 l/h başlık debisine en yakın değer Tablo 3.'ten 1597 l/h (1.03 bar işletme basıncında) başlık debisi olarak belirlenmiştir. B sistemi için hesaplanan 1298 l/h debi değeri tablodan 1225 l/h (1.03 bar) ve C sistemi için ise hesaplanan 1045 l/h debi değeri tablodan 1058 l/h (1.03 bar) olarak belirlenmiştir. Böylece sistemde kullanılacak başlık debileri, meme çapları ve işletme basınçları tespit edilmiştir.

Doğrusal hareketli sulama sistemlerinin planlanmasında başlık debisinin belirlenmesinden sonraki önemli bir başka aşama, sistemin ilerleme hızlarına göre su uygulama oranları yani yağmurlama hızlarının hesaplanmasıdır. Örnek sistemler için hesaplanan yağmurlama hızları Tablo 5.'te verilmiştir.

Tablo 5. Yağmurlama hızı

5	8.1	65.65	50.36	43.49

%V_s: İlerleme hız ayarı, V_L: İlerleme hızı, L: Arazi uzunluğu, L_e: Başlık aralığı, q_e: Başlık debisi, d: Su uygulama oranı (yağmurlama hızı).

Tablo 5.'ten de görüleceği gibi örnek sistemlerin hız ayarlarına göre saatlik ilerleme hızları ve bu hız değerleri için her bir sistemin saatlik su uygulama oranları, yani yağmurlama hızları hesaplanmıştır. Sistem A için tablo incelendiğinde, sistemin tam kapasitede (%100) saatlik ilerleme hızında (162.2 m/h) yağmurlama hızı 3.28 mm/h saat olarak hesaplanmıştır. Yine aynı sistemin en yavaş hız (%5) ayarında 8.1 m/h yol kat ederek saatte 65.65 mm su uygulayabileceği hesaplanmıştır. B sistemi için aynı değerler 2.52 mm/h ve 50.36 mm/h olarak hesaplanırken, C sistemi için ise 2.17 mm/h ve 43.49 mm/h olarak hesaplanmıştır. Bu değerler, yağmurlama hızının sistemin ilerleme hızının azalmasıyla arttığını, artan ilerleme hızları ile de azaldığını göstermektedir. Böylece farklı ilerleme hızları ile sistemin yağmurlama hızı değiştirilebilmektedir. Bu özelliği ile doğrusal hareketli sulama sistemleri klasik yağmurlama sistemlerine göre önemli ölçüde avantajlar sağlayabilmektedir.

Doğrusal hareketli sulama sistemlerinin bir diğer önemli planlama safhası, sistemin ilerleme hızlarından, toprağın infiltrasyon hızı dikkate alınarak en uygun olan hız değerinin belirlenmesidir. Zira bu parametre sulama randımanını doğrudan etkilemektedir. Örnek sistemlerin ideal maksimum ilerleme hızları Tablo 6.'da verilmiştir.

Tablo 6. Sistemin ideal maksimum ilerleme hızı

10	16.2	37.0		32.83		25.18		21.75
5	8.1	74.0		65.65		50.36		43.49

$\%V_s$: İlerleme hız ayarı, V_L: İlerleme hızı, t: Tur zamanı, L_e: Başlık aralığı, I_s: İnfiltrasyon hızı, q_e: Başlık debisi, d: Su uygulama oranı (yağmurlama hızı), V_i: İdeal maksimum ilerleme hızı.

Örnek sistemlerin ideal maksimum ilerleme hızlarını hesaplamak için toprağın infiltrasyon hızı 15 mm/h olarak alınmıştır. Bu durumda A sisteminin ideal maksimum ilerleme hızı 35.5 m/h, B sisteminin 27.2 m/h ve C sisteminin ise 23.5 m/h olarak hesaplanmıştır. Yapılan örnek çalışmada olduğu gibi hesaplanan hız değerlerinin sistemin ilerleme hızları ile örtüşmediği durumlarda, toprağın infiltrasyon hızı ve sistemin yağmurlama hızları da dikkate alınarak en yakın hız değeri ya da bir üst hız değeri ideal maksimum ilerleme hızı olarak belirlenmelidir. Tablo 6. incelendiğinde, A sisteminin ideal maksimum ilerleme hızı 35.5 m/h olarak hesaplanmış ancak sistemin bu değere en yakın ilerleme hızı 40.5 m/h'dir. Bu hızda sistemin yağmurlama hızı 13.13 mm/h olup, bu değer toprağın infiltrasyon hızından (15 mm/h) küçüktür. Böylece, A sisteminin ideal maksimum ilerleme hızı, sistemin %25 ilerleme hız ayarında 40.5 m/h olarak belirlenmiştir. Eğer bu sistem %20 hız ayarında çalıştırılırsa, sistemin yağmurlama hızı 16.41 mm/h olacak, bu durumda yağmurlama hızı toprağın infiltrasyon hızının (15mm/h) üzerine çıktığı için uygulanan sulama suyu toprak yüzeyinde göllenecektir. Aynı şekilde B ve C sistemleri için yapılan hesaplamalara göre, B sistemi maksimum %20, C sistemi ise maksimum %15 hız ayarlarında çalıştırılmalıdır.

Örnek sistemlerin tur süreleri incelendiğinde, sistemler %100 hız ayarında 600 m uzunluğundaki araziyi 3.7 saatte turlarken, %5 hız ayarında ise bu süre 74 saattir. A sistemi ideal maksimum ilerleme hızında araziyi 14.8 saatte turlarken, B sistemi 18.5 saatte ve C sistemi ise 24.7 saatte turlamaktadır (Tablo 6.).

Sistem planlanması yukarıda özetlenen şekilde yapıldıktan sonra sistemlerin işletilmesi ile ilgili programlar yapılmalıdır. Yetiştiriciliği yapılacak bitkilerin sulama programlarına göre sistemlerin hız ayarları, tur sayıları, toplam sulama süreleri ve sulama aralıkları gibi sulama işletmeciliği ile ilgili hesaplamalar yapılmalı, gerektiğinde geriye dönük sistem planlamaları revize edilmelidir.

Sulama işletmeciliği ile ilgili kısa bir örnek vermek gerekirse, sulama aralığı 10 gün olan ve her sulamada 80 mm sulama suyu uygulanan bir bitki ekili arazinin, örnek sistemlerle sulandığını varsayalım. A sisteminde ideal maksimum ilerleme hızında, saatte 13.13 mm sulama suyu uygulanmaktadır. Dolayısıyla 80 mm sulama suyunun uygulanabilmesi için sistemin 80/13.13= 6 tur çalıştırılması gerekmektedir. Böyle bir durumda her bir tur 14.8 saatten, toplamda 14.8x6= 88.8 saat sulama yapılacaktır. Günlük çalışma süresinin 18 saat olduğu varsayımı ile A sistemi bu araziyi yaklaşık 5 günde sulamaktadır. Sulama aralığının 10 gün olduğu düşünüldüğünde sistemin doğru bir şekilde planlandığı görülmektedir. Aynı şekilde B sistemi bu araziyi 6 tur'da toplamda 111 saatte ve 6 günde sulayabilmektedir. C sistemi ise bu araziyi 5 tur'da toplamda 123.5 saatte ve 7 günde sulayabilmektedir.

Doğrusal hareketli sulama sistemlerinin planlanması ve işletilmeleri ile alakalı planlamaların yanı sıra ilk yatırım maliyetlerinin de belirlenmesi bir işletme için hayati öneme sahiptir. Zira yapılacak yatırımın ekonomik olarak değerlendirilmesi işletme için teknik planlamalar kadar kritik süreçlerdir. Bu nedenle örnek sistemler için piyasa araştırması yapılarak maliyetleri belirlenmiştir. Sistemlerin ithal veya yerli ürün olarak temin edilmelerinin maliyetleri, birim alan maliyetleri ve oluşan maliyet farkları Tablo 7'de verilmiştir.

Tablo 7. İthal ve yerli sistemlerin birim alan maliyetleri ve farkları

Örnek sistem	Span sayısı (adet)	Sistemin toplam uzunluğu (m)	Sulanan toplam alan (ha)	İthal ürün		Yerli ürün		İthal/yerli ürünün birim alandaki maliyet farkı (bin ₺/ha)	İthal/yerli ürünün birim alandaki maliyet farkı (%)
				Sistem maliyeti (milyon ₺)	Sistemin birim alan maliyeti (bin ₺/ha)	Sistem maliyeti (milyon ₺)	Sistemin birim alan maliyeti (bin ₺/ha)		
A	3	155.6	10.1	1.90	0.188	1.10	0.109	0.079	42.1
B	3	197.0	12.6	2.45	0.194	1.40	0.111	0.083	42.9
C	4	244.6	15.4	3.10	0.201	1.75	0.114	0.088	43.5

Tablo 7. incelendiğinde, 3 spanlı 155.6 m uzunluğundaki A sistemi 10 ha alan sularken ithal olarak temin edildiğinde 1.90 milyon liraya, yerli olarak temin edildiğinde ise 1.10 milyon liraya mal olmaktadır. Bu sistemin birim alan maliyeti ithal üründe ha başına 188 bin lira iken yerli üründe 109 bin liradır. İthal ve yerli üründe ha başına maliyet farkı 79 bin lira olup ithal/yerli ürün arasında %42.1 maliyet farkı vardır. B sistemi için maliyetlere bakıldığında, 3 spanlı 197 m uzunluktaki sistemin maliyeti ithal üründe yaklaşık 2.45 milyon lira, yerli üründe ise 1.40 milyon liradır. Sistemin birim alan (ha) maliyeti ithalde 194 bin lira, yerli üründe ise 111 bin liradır. İki ürün

arasındaki fark 83 bin lira olup %42.9 maliyet farkı vardır. Son olarak 4 spanlı 244.6 m uzunluğundaki C sisteminin maliyetleri sırasıyla; 3.10 ve 1.75 milyon lira olup iki ürün arasında birim alanda %43.5 (88 bin lira) maliyet farkı vardır. Bu farklar yerli ürünlerin tercih edilmesi ile yapılacak yatırımın daha ekonomik olacağını göstermektedir.

4. SONUÇ

Yapılan bu çalışmaya göre, doğrusal hareketli sulama sistemlerinin planlanmasında yağmurlama başlıklarının meme çapı ve işletme basıncının, su kaynağı debisi ile uyumlu olacak başlık debisini sağlayacak şekilde seçilmesi gerektiği anlaşılmaktadır.

Toprağın infiltrasyon hızı dikkate alınarak sistem uygun ilerleme hızlarında çalıştırılmalıdır. Toprağın infiltrasyon hızının düşük olduğu arazilerde kurulacak sistemlerde daha düşük debili başlıklar tercih edilmeli veya yüksek ilerleme hızlarında çalıştırılmalıdırlar.

Yerli üretimin muadili ithal ürünlere göre 10, 12.5 ve 15 ha büyüklüğündeki araziler için sırasıyla; % 44.1, %43.3 ve %42.6 daha düşük maliyetli olduğu dikkate alındığında, yerli üretimlerin tercih edilmesinin işletmeler için ekonomik açıdan daha avantajlı olacağı anlaşılmaktadır.

ORCID: 0000-0002-4221-7449

ÖZET

Bu derlemede oğlak beslemede süt ikame mamalarının kullanımının büyüme performansı ve çiftlik karlılığı üzerindeki etkileri incelenmektedir. Özellikle süt verimi yüksek keçi ırklarında yavruların doğal emzirme ile beslenmesi pazarlanabilir süt miktarında önemli azalmaya ve ekonomik kayıplara yol açmaktadır. Oğlakların erken gelişim döneminde, yüksek kaliteli protein ve enerji gereksinimi, bağışıklık sisteminin güçlendirilmesi ve rumen gelişiminin desteklenmesi açısından besleme stratejileri büyük önem taşımaktadır. Bu kapsamda formüle edilen süt ikame mamalarında süt tozu ve peynir altı suyu başta olmak üzere balık unu, kan unu ve yumurta tozu gibi hayvansal kaynaklı bileşenler; yüksek biyolojik değere sahip protein fraksiyonları ve kolay sindirilebilirliği ile büyüme hızını desteklemektedir. Buna karşılık kavrulmuş soya fasulyesi, soya küspesi, buğday küspesi ve nişasta türevleri gibi bitkisel kaynaklar, maliyet etkinliği ve sürdürülebilir hammadde tedariki açısından avantajlar sunmaktadır. Literatürdeki bulgular, uygun besin madde kompozisyonu ve sindirilebilirlik düzeyine sahip süt ikame mamalarıyla beslenen oğlakların, anne sütü emen akranlarıyla karşılaştırıldığında vücut ağırlığı artışı, bağışıklık göstergeleri ve rumen fonksiyonlarında benzer sonuçlar elde ettiğini göstermektedir. Ayrıca, süt ikame mamalarının kullanımı, pik laktasyon döneminde insan tüketimine yönelik süt arzının artmasına olanak tanıyarak doğrudan gelir artışı sağlamaktadır. Araştırmalar hayvansal ve bitkisel içeriklerin dengeli kombinasyonlarının besin yeterliliği ve maliyet etkinliği açısından anne sütü ile beslemeye göre daha üstün olduğunu göstermektedir. Ekonomik değerlendirmeler bu uygulamanın doğal laktasyona kıyasla daha yüksek karlılık sağladığını doğrulamaktadır. Sonuç olarak, süt ikame mamalarının rasyonel formülasyonu ve uygun yönetim uygulamalarıyla entegrasyonu, hem oğlakların büyüme ve sağlık parametrelerini güvence altına almakta hem de pazarlanabilir süt verimini maksimize ederek çiftlik ekonomisine anlamlı katkı sunan stratejik bir yaklaşımdır.

Anahtar Kelimeler: Keçi sütü, oğlak besleme, büyüme performansı, süt ikame mamaları

A WAY TO INCREASE MARKETABLE MILK IN GOAT BREEDING: USE OF MILK REPLACERS

ABSTRACT

This review examines the effects of using milk replacers in kid rearing on growth performance and farm profitability. In high-yielding dairy goat breeds, feeding offspring by natural suckling significantly reduces the volume of marketable milk and leads to economic losses. During the early developmental period, nutritional strategies are essential to meet the kid's requirements for high-quality protein and energy, strengthen the immune system, and support rumen development. In milk substitute foods formulated in this context, animal-derived ingredients such as fish meal, blood meal and egg powder, primarily skim milk powder and whey powder, support growth rate with protein fractions of high biological value and easy digestibility. On the other hand, vegetable sources such as roasted soybeans, soybean meal, wheat meal and starch derivatives offer the advantages in terms of cost efficiency and sustainable raw material supply. Findings from the literature indicate that kids fed milk replacers with appropriate nutrient composition and digestibility achieve outcomes comparable to those of counterparts suckling maternal milk in body weight gain, immune indicators, and rumen function. Moreover, the use of milk replacers increases the amount of milk available for human consumption during peak lactation, directly raising producer income. Studies further show that balanced combinations of animal and plant ingredients can surpass natural suckling in both nutrient adequacy and cost-effectiveness. Economic evaluations confirm that this practice yields higher profitability compared to natural lactation. In conclusion, the rational formulation of milk replacers and their integration with appropriate management practices safeguard growth and health parameters in kids while maximizing marketable milk yield, thus constituting a strategic approach that delivers substantial benefits to farm economics.

Keywords: Goat milk, kid nutrition, growth performance, milk replacers

1. INTRODUCTION

As with the nutrition of all mammals, the nutrition of kids after birth begins with the intake of colostrum. It is important that newborn kids suckle within the first few hours after birth and consume an amount of colostrum equivalent to about 10% of their body weight per day. This practice plays a crucial role in strengthening their immune system and, consequently, in determining their performance parameters. The reason why colostrum in ruminants must be ingested as soon as possible after birth is due to the epitheliotic structure of the placenta (Hernandez-Castellano et al., 2014). Due to this type of placenta, antibodies cannot be transferred to the fetus during gestation, leaving newborns highly susceptible to pathogenic challenges at birth. Colostrum not only fulfills the nutritional needs of the newborn, but also provides essential immunological support, thereby influencing disease resistance, enzymatic activity, growth, and other biological functions at later stages of development (Hernandez-Castellano et al., 2014). For this reason, it is essential that newborn kids consume adequate amounts of colostrum secreted by their mothers in the first three days after birth.

In Turkey, where goat farming is predominantly carried out in extensive system, a significant proportion of the milk produced during lactation (especially during peak milk production periods) is used to feed the kids. While this is essential to ensure adequate nutrition for kids of local or meat-oriented breeds with low milk yields, it reduces the amount of marketable milk for dairy breeds such as Saanen, Damascus or Alpine. As a result, farms that breed high-yielding exotic goat breeds are faced with a significant decrease in the amount of saleable milk, which in turn leads to economic losses. Goat's milk is considered better than other types of milk due to several special characteristics: Its composition is more similar to human milk, it contains less lactose, its αs1-casein protein content is lower and its smaller fat globules improve digestibility. Due to these properties, goat's milk is often preferred in human nutrition, as it causes less bloating and colic in infants, causes fewer digestive problems in lactose intolerant individuals, has a lower allergenic potential, and is easier to digest. In addition, goat's milk can be processed into high-quality dairy products such as cheese, cream, butter, and ice cream, offering significant profit margins.

Given these benefits, early weaning of kids of goat breeds with high milk yields and rearing them with special milk replacers can be a practical strategy. Several studies have shown that kids reared with milk replacers have comparable growth and development to those suckled with natural milk (Keskin & Biçer, 2002; Sarker et al., 2015). Shortening the traditional two-month milk feeding period by replacing breast milk with nutritionally balanced milk replacers can therefore increase the amount of saleable milk and have a positive impact on farm profitability. To be a suitable alternative, milk replacers must be formulated in such a way that they are very similar to the composition of natural milk. In addition to their high protein and energy requirements, kids also need an adequate supply of vitamins and minerals. In the period, before weaning, vitamins A, D, E, and K should be supplied. As the rumen is not yet fully functional, B-complex vitamins must also be supplied. Minerals such as Ca, P, Mg, Cu, Fe, Zn, I, Se, and Mn are also important and should be included in the diet. For this purpose, replacement diets are usually made from cow’s milk or milk by-products, grains, and vegetable oils (Zamuner et al., 2023). Consequently, their formulation can be based either on purely animal components or on a combination of animal and plant components.

This review, examined the effects of the use of milk replacers in kid feeding over the last thirty years on the growth performance of kids and the profitability of farms.

1.1. Milk Replacer Formulas Prepared with Animal Origin Products

In ruminant breeding, especially in the early developmental stages of young animals, nutritional management plays a decisive role in determining later performance parameters. Due to their rapidly developing physiological systems, kids require a high quality and balanced diet from the first weeks of life immediately after birth. At this critical period, the use of feeds with high protein quality, energy density, and digestibility is crucial for the development of the immune system, body weight gain, and proper development of rumen functions. Animal replacers such as fishmeal, blood meal, meat and bone meal, plasma proteins, and milk by-products are of importance, as they provide proteins of high biological value, an appropriate balance of essential amino acids, and a rich supply of micronutrients. Especially in the pre-weaning period, the controlled and balanced incorporation of these resources into rations supports immunity and maximizes growth performance. Among animal-based milk replacers, cow's milk, milk products, and milk by-products are the most commonly used due to their relatively low cost. Research has shown that diets formulated with milk replacers of animal origin do not show significant differences in health and growth parameters compared to those fed with maternal milk (Galina et al., 1995; Ripoll et al., 2021). Nevertheless, the occurrence of diarrhea, bloating, or weakness in kids should be carefully monitored after switching to artificial milk replacers. Studies investigating the use of animal-based milk replacers in kid nutrition are presented below.

In a study conducted by Galina et al. (1995), a total of 90 female kids of the Saanen, Alpine, and Toggenburg breeds with similar initial body weights were divided into six treatment groups, of 15 animals each. The treatments included: maternal milk, cow's milk, milk replacer, milk replacer + 20% goat whey, milk replacer + 35% goat whey, and milk replacer + 50% goat whey. The trial lasted eight weeks until weaning. The results showed that kids reared on goat's milk, cow's milk, or milk replacer with 35% goat's whey showed no significant differences in growth performance. However, the kids in the group receiving milk replacer + 20% whey showed significantly lower growth rates, while in the group receiving milk replacer + 50% whey, 80% of the kids showed digestive disorders at least once, and one mortality was recorded.

In another experiment, Knupp et al. (2016) evaluated the economic feasibility of feeding programs based on liquid diets as an alternative to goat milk, using Monte Carlo techniques. Forty-eight male kids (24 Saanen and 24 Alpine) with similar age and initial body weights were divided into four groups of 12 animals each: Goat's milk, cow's milk, commercial milk replacer, and fermented bovine colostrum. The kids were slaughtered at either 60 or 90 days of age. Based on an economic analysis that took into account the costs of feeding and management up to slaughter, it was concluded that goat milk- fed kids resulted in economic losses at both slaughter ages, while cow milk feeding resulted in the highest profit. Commercial milk replacers, although not superior to natural milk in terms of growth outcomes, were highlighted as more cost-effective, supporting their use as an alternative to maternal milk in the pre-weaning period. These findings suggest that to increase marketable goat milk and improve farm profitability, replacer feeds should be preferred over giving goat milk directly to kids.

Ripoll et al. (2021) investigated the effect of rearing systems on carcass quality. Two groups As breeding system were compared: Kids reared with a commercial milk replacers and those suckled by their maternal. A total of 240 kids, representing eight breeds (Florida, Cabra del Guadarrama, Majorera, Palmera, Payoya, Retinta, Tinerfeña, and Verata), were included, with 30 animals per breed randomly assigned to each treatment (15 kids per group). After colostrum feeding for the first two days, the kids were either suckled freely or fed ad libitum via an automatic milk replacer

until they reached 8 kg body weight. The milk replacer used contained 60% skimmed milk and 40% whey powder. The post-slaughter findings showed that the kids fed with the milk replacer had a higher muscle percentage in the carcass, a higher head and internal organ weight, a higher carcass length, and limb measurements, but a lower fat deposition in the skin, intermuscular tissue, and kidney fat. The authors emphasized that both breed characteristics (dairy vs. meat type) and rearing systems significantly influenced carcass characteristics, suggesting that production systems should be tailored to market requirements.

In another study, Sepriadi et al. (2022) investigated the inclusion of black soldier fly (Hermetia illucens) larval meal as a sustainable protein source in milk replacer diets for Ettawa crossbred kids. Ten kids were allocated equally to two treatments groups: conventional commercial milk replacer and insect meal-enriched replacer. Parameters measured included feed intake, average daily body weight gain, weaning weight, and physiological indicators (rectal temperature, heart rate, respiratory rate). Kids in the insect meal-enriched replacer group had a higher dry matter, calcium, and fat intake, but a lower phosphorus and protein intake. Growth performance remained unchanged between the groups, although physiological parameters increased within acceptable limits in the insect meal group. The study concluded that black soldier fly larval meal is a sustainable and environmentally friendly alternative for milk replacer formulations, although further improvements in protein composition and palatability compared to commercial products are required.

In view of these findings, the more effective use of milk replacers in the feeding of kids on farms with high milk-producing breeds will help to increase the profitability of farms and the added value of dairy products. Future research should in particular investigate the bioavailability, digestibility, and effects on the immune system of different protein sources and test their applicability under field conditions. This will enable the development of a more sustainable and efficient production model, both in terms of animal welfare and production economics.

1.2. Milk replacer prepared with products of animal and plant origin

Profitability, animal welfare, and sustainability in ruminant breeding are closely linked to the optimization of feeding strategies in the early stages of development. Due to their rapid growth and development immediately after birth in kids, it is essential to meet their nutritional needs with high quality and balanced feeds. To supplement natural maternal milk, milk replacers have been developed as cost-effective and practical alternatives. In recent years, the inclusion of animal and plant-derived ingredients in milk replacer formulations has attracted considerable attention, as it provides a balanced nutritional profile while reducing production costs. Animal ingredients such as skimmed milk powder, whey, blood meal, fish meal, and egg powder provide high biological value proteins, essential amino acids, and a wide range of vitamins and minerals. Conversely, plant sources such as soy flour, wheat bran, starch derivatives, and oilseed pulp provide affordable and readily available alternatives that may also contain functional compounds such as antioxidants, fiber, and phytochemicals. An optimal combination of these two groups not only provides a highly digestible protein profile, but also promotes gut health, immunocompetence and feed intake. Previous studies have examined in detail the effects of milk replacers with different proportions of animal and plant components on growth performance, rumen development, nutrient digestibility, and meat quality in kids. For example, feed replacers combining milk powder with roasted soybeans or wheat-based formulations enriched with egg powder have shown successful results when used in well-adjusted proportions. Nevertheless, factors such as processing methods, feeding rate and the age at which the replacer is introduced remain critical to its effectiveness. This section

therefore highlights the influence of integrated animal and plant-based formulations in milk replacers on the nutrition and development of kids.

Ouedraogo et al. (1998) investigated the feasibility of incorporating roasted full-fat soybean meal as a component of milk replacer for kids. The experimental design consisted of a control diet (in which 95 of the crude protein was derived from skim milk powder and 5% from whey) and two treatments in which soybean meal was roasted at 100°C for either 10 minutes (HSF 10) or 30 minutes (HSF 30). A total of 20 kids, aged 13 days , were used: 6 in the control group, 8 in the HSF 10, group and 6 in the HSF 30 group. All replacement diets contained 24% crude protein and 22% fat. In the soy-based replacer diets, 45% of the total protein was supplied by HSF 10 or HSF 30, while the remainder came from 45% skim milk powder and 10% whey. The results showed that the control group had the highest digestibility values, while digestibility decreased in the HSF 10 group. The authors concluded that roasted full-fat soybean meal processed at 100°C for 30 minutes could be a viable protein source in milk replacers for kids.

Bañón et al. (2006) conducted another study to evaluate the effects of feeding kids with either natural goat milk or formulated milk replacers on meat quality and lipid composition. For this purpose, 36 male Murciano-Granadina kids were randomly assigned to two feeding groups. The substitutes consisted of skimmed milk powder, coconut oil, cereal products, and cereal by-products. The results showed that although the protein content of the meat was significantly higher in kids fed with milk replacers, their meat had a lower water binding capacity than kids raised on goat milk. In addition, different feeding regimeinfluenced the fat composition of the carcass: kids fed with maternal milk had meat with a higher saturated fat content. In addition, the sensory evaluation results showed that kids fed with milk replacement produced meat with better taste and odor values than the kids fed with maternal milk.

In a other study, Sampelayo et al. (2003) investigated the influence of different dry matter concentrations in milk replacers on the growth performance of kids. A total of 30 male Granadina kids were included in the trial. All animals received maternal milk for the first two days, after which six kids were immediately slaughtered. The remaining 24 kids were separated from their maternal on the second day and given milk replacers with either 120 g/kg or 200 g/kg dry matter as a milk substitute. Six kids from each treatment group (12 in total) were then slaughtered at 20 and 40 days of age. The formulated milk replacers consisted of 450 g/kg skimmed milk powder, 250 g/kg animal fat, 135 g/kg whey powder, 35 g/kg soy protein concentrate, 100 g/kg starch products and 30 g/kg of a vitamin, mineral and amino acid mixture. The results showed that kids fed milk replacer at 120 g/kg dry matter showed slower growth in the first 20 days than kids fed 200 g/kg replacer. However, this initial performance loss was compensated for in the following 20 days, as higher feed intake improved growth performance. The authors attributed the initial shortfall to the fact that the kids were unable to consume sufficient protein and energy when fed the lower dry matter feed. However, as rumen capacity subsequently increased, feed intake also increased accordingly, resulting in comparable growth rates between treatments. The study also highlights that metabolizable energy (ME) requirements are increased in the early growth phase, but gradually decrease as the animals adapt to the feeding regime. Overall, the results underline the need to adjust the composition of milk replacers and feeding programs to the age and stage of development of the kids in order to optimize growth and energy supply.

Astuti et al. (2019) investigated the inclusion of cricket meal as a protein source in milk replacers. Twelve Etawah crossbred kids were allocated to three dietary treatments with four kids per group: Goat milk, cow milk and a formulated milk replacer containing cricket meal. The milk replacer

consisted of skimmed milk powder, egg yolk powder, whole milk, wheat bran, fish oil, a vitamin-mineral premix and calcium carbonate ($CaCO_3$). The daily amount of milk replacer was set at 3.5% of the body weight of the kids on a dry matter basis. The average daily intake of cow milk, goat milk and the formulated milk replacer was given as 986 g, 875 g and 847 g, respectively. Accordingly, the dry matter intakes were 120 g, 98 g and 203 g, respectively. Kids who received the replacer consumed the most dry matter, which consequently led to a higher intake of protein, fat and calcium nutrients, which are considered crucial for early growth and development.

In another study, Islam et al. (2019) investigated the feasibility of adding rice gruel, an inexpensive and carbohydrate-rich ingredient, to milk replacers for black Bengal kids. The objective of this study was to evaluate the effects of rice gruel–based milk replacers in combination with soybean milk and cow milk on growth performance, blood parameters, carcass traits, visceral organ development and rumen morphology. For this purpose, 15 Black Bengal kids aged two to three weeks were randomly divided into three treatment groups with the same number of animals. Group A was fed whole milk only, group B was fed 75% milk + 25% rice gruel replacer, and group C was fed 50% milk + 50% rice gruel replacer. The results showed no significant differences in growth performance between the groups, indicating that the rice gruel replacement adequately supported normal growth. When examining the blood values, the hematological analysis revealed no significant differences in the erythrocyte, leukocyte, hemoglobin or immune cell profiles. However, packed cell volume (PCV) was higher in the rice porridge-fed goats, indicating improved nutrient and oxygen transport. Carcass and internal organ characteristics were similar in all treatments. Dry matter, fat and ash content of the meat showed that was slightly higher in the replacement groups, while crude protein content remained comparable. Histologic evaluation of rumen papillae showed longer and wider papillae in kids fed milk replacers diets, indicating improved rumen development and an earlier transition to functional rumination. Overall, the results suggest that milk replacers containing up to 50% rice gruel can be a safe, cost-effective and nutritionally sound alternative for kid rearing without compromising growth, health or carcass quality, while promoting accelerated rumen maturation.

Similarly, Sultana et al. (2014) aimed to formulate affordable milk replacers from locally available ingredients and evaluate their effects on growth performance, nutrient digestibility and economic profitability in black Bengal kids. In this experiment, three different milk replacer formulations were prepared and 20 kids were divided into four treatment groups (five animals each). The treatments included: control group (goat milk), a turmeric-based replacer, an egg and wheat flour-based replacer and a skim milk-based replacer. The study found that kids fed turmeric-enriched replacer diets had higher dry matter intake, resulting in higher nutrient intake and better growth performance compared to the other groups. Although feed conversion rate was similar across treatments, dry matter and organic matter digestibility was better in the turmeric group. The cost analysis also showed that the turmeric- enriched replacement diets had the most favorable cost-benefit ratio. In conclusion, the authors suggested that replacement diets containing turmeric or egg + wheat flour could serve as a viable alternative to milk feeding in kid rearing.

1.3. Economic Analysis

On dairy goat farms with high-yielding goat, feeding kids with milk replacer contributes directly to the profitability of the farm by increasing the amount of marketable milk. With natural suckling, kids consume almost all of their milk in the first two months of lactation, which significantly reduces the amount available for sale and leads to economic losses. The use of milk replacers allows farms to maintain the growth performance of kids while increasing the amount of milk that can be

marketed during the peak of lactation, a period characterized by maximum milk yield. Especially in the first two months of lactation, when milk yield is at its highest, rearing kids with milk replacers improves the availability of marketable milk and has a positive effect on the overall income of the farm. The economic benefits of this practice, which are supported by findings from the literature are summarized below.

Keskin and Biçer (2002) investigated the growth performance of kids and the economic impact on farms when comparing natural suckling with rearing on milk replacers. For this purpose, 30 kids from uniparous Shami does were divided equally into two treatment groups: one was reared on maternal milk and the other on milk replacer. The kids were observed for two months after birth and it was reported that neither the growth rate of the kids nor the yield of the maternal milk was negatively affected by the rearing system over a period of 60 days. However, in the milk replacer group, the amount of saleable milk increased, which improved the profitability of the farm based on both marketable milk yield and body weight of the kids. According to the results, the group of Damascus goats reared with milk replacers produced 79.5 liters of marketable milk per goat, while the value in the group with natural suckling was zero (Figure 1). This clearly shows that the use of milk replacer enables producers to bring the milk directly to market and thus increase income of the farms.

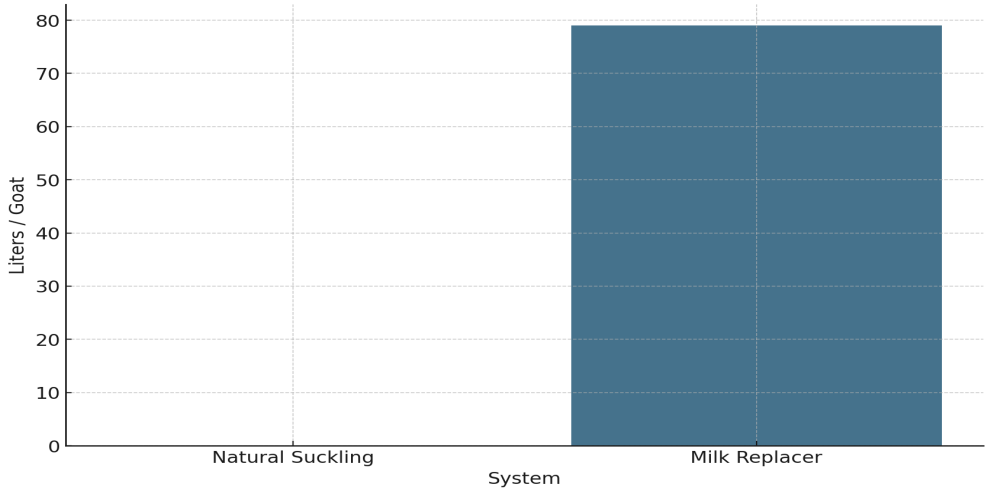

Figure 1. Comparison of marketable milk quantity according to feeding systems

In the same study, the net gain per kid reared with milk replacer was reported to be USD 8.09 compared with those naturally suckled (Figure 2). This result suggests that feeding kids with low-cost milk replacers until weaning age can significantly improve income due to the increase in marketable milk yield. Hassan et al (2018) also reported that kids reared on milk replacers achieved almost three times higher net profit over a 12-week period than naturally suckled counterparts, a result directly related to the greater amount of milk available for sale.

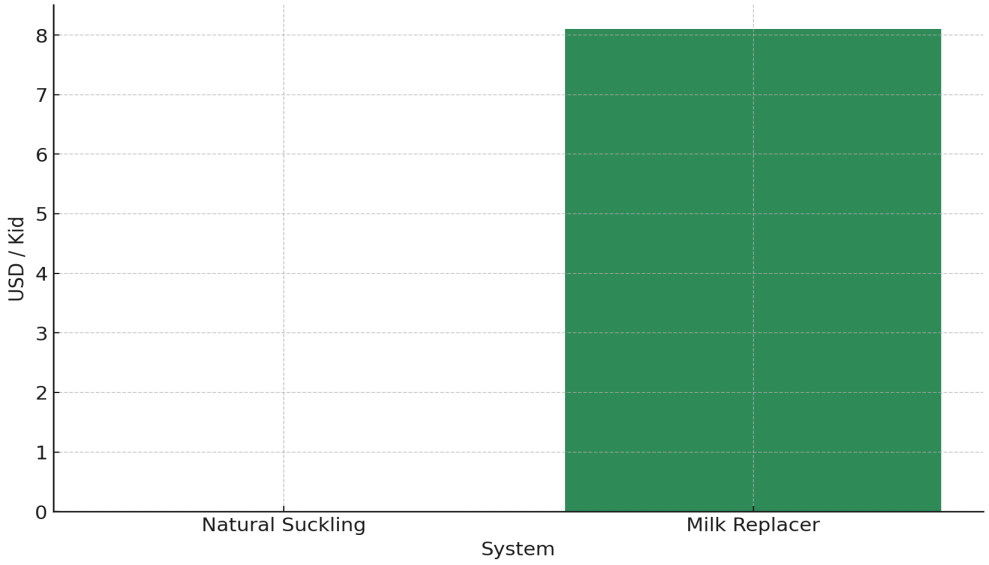

Figure 2. Comparison of net profit according to rearing systems

In addition, Keskin and Biçer (2002) reported that live weight gain in kids fed with milk replacer was similar or higher than in naturally suckled counterparts. Accordingly, kids fed with milk replacers gained on average 1 kg more live weight at day 60 (Figure 3).

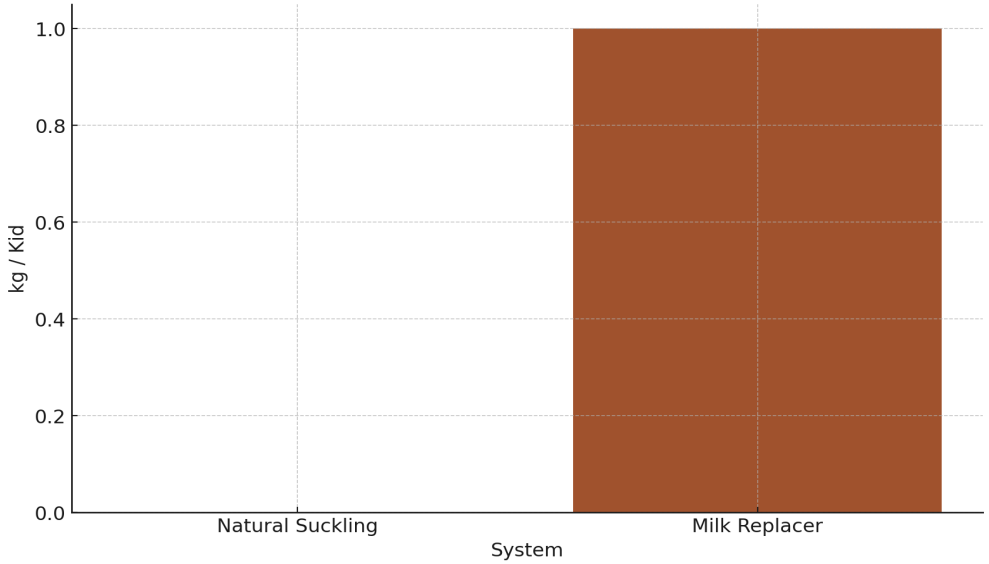

Figure 3. Comparison of live weight gain according to rearing systems

Similarly, Knupp et al. (2016) reported that replacing maternal milk with alternative liquid diets did not negatively affect the growth performance of kids, while the use of milk replacers increased the amount of marketable milk and thus improved farm profitability. Milk replacers serve as a strategic tool on dairy goat farms, especially in high-yielding herds, by simultaneously improving production efficiency and economic returns. When properly formulated and systematically applied, the use of milk replacers supports normal kid growth without adverse effects, ensures greater availability of saleable milk and consequently maximizes farm income. Therefore, promoting the use of milk replacers in kid rearing up to weaning age, especially in highly milk productive goats, is of considerable importance for strengthening the economic sustainability of the livestock.

2. CONCLUSION

In this review, the effects of the use of milk replacers in kid feeding on growth performance and farm profitability were investigated; in particular, their potential to increase the amount of marketable milk was evaluated. The findings show that milk replacer feeding offers significant advantages over traditional breastfeeding, both in terms of the nutritional profile, which is close to breast milk, and the fact that the producer has the opportunity to market the milk directly. On farms with goat breeds with a high milk yield, feeding milk until the kids are weaned (around two months) leads to a considerable reduction in the marketable milk yield and to economic losses. In this context, milk replacers not only support animal health and growth rate, but also increase profitability by making the milk of goats available for human consumption or the production of dairy products. Numerous studies in the literature report that kids who are fed with milk replacer achieve similar body weight gains as kids who are naturally suckled counterparts, and in some cases even faster growth rates. Economic analyzes also support the claim that this system significantly increases the amount of marketable milk and thus the income per animal. In this context, the following recommendations can be made:

- **In herds with high milk yields, switching kids to milk replacer shortly after birth is an effective strategy for increasing marketable milk production.**
- **The formulations of the milk replacer should be adapted to the age and developmental stage of the kids. The content of vitamins and minerals, especially protein and energy, should correspond to that of maternal milk.**
- **The balanced use of animal and vegetable ingredients in the production of kid formula increases the efficiency of nutrition and helps to reduce costs.**
- **Hygiene and biosecurity are important factors to consider in the production and use of kid formula. In particular, ensuring high quality ingredients to reduce the risk of digestive problems such as diarrhea, as well as appropriate dilution rates and temperature levels are critical to the use of formula.**
- **The economic analysis at farm level should include a comparison between the increased income from marketable milk achieved by using milk replacer and the cost of formulated milk replacer. This enables a more accurate cost-benefit calculation.**

In summary, milk replacers provide a holistic feeding approach to goat farming that both protects animal welfare and maximizes the producer's economic return by increasing the amount of marketable milk and dairy products. It is therefore recommended that this strategy be expanded, especially on farms with high-yielding goats.

ÖZET

Süt ineklerinde postpartum (doğum sonrası) dönem metabolik bozuklukların en sık gözlendiği kritik bir süreçtir. Doğuma girerken ineklerin bulunduğu vücut kondisyon skoru (VKS), olması gerekenden düşük ya da yüksek olması negatif enerji dengesi (NED), ketozis, yağlı karaciğer sendromu ve üreme sorunlarına yol açarak süt verimini ve hayvan refahını olumsuz etkilemektedir. Vücut kondisyon skoru, sığırların enerji rezervlerini ve genel sağlık durumunu değerlendirmek amacıyla kullanılan, pratik ve yaygın bir yöntemdir. Bu sistem, hayvanın belirli anatomik bölgelerindeki yağ ve kas dokusunun gözlemlenmesi ve elle kontrol edilmesi esasına dayanır. VKS genellikle 1 (aşırı zayıf) ile 5 (aşırı yağlı) arasında derecelendirilir. Ölçek üzerinde 1, yağ dokusu ve kas örtüsünden yoksun, kaşektik hayvanları; 5 ise aşırı yağlı ve metabolik sorunlara yatkın hayvanları temsil etmektedir. Böylece, VKS değerlendirmesi sığırların enerji depoları, metabolik dengesi ve üretim potansiyeli hakkında önemli bilgiler sunar. Propilen glikol (PG), glukoneojenik özelliği sayesinde enerji metabolizmasını destekleyen bir bileşiktir. Bu çalışmada postpartum dönemde oral PG uygulamasının VKS üzerine etkileri araştırılmıştır. Çalışmada, 40 adet Simental inek kullanılmıştır ve inekler rastgele yöntemle kontrol (n=20) ve deneme (n=20) gruplarına ayrılmıştır. Deneme grubuna doğum sonrası beş gün boyunca oral yolla günlük 500 ml PG uygulanırken, kontrol grubundaki ineklere herhangi bir uygulama yapılmamıştır. Doğum öncesi ve postpartum 21. günde VKS değerlendirmeleri yapılmıştır. Elde edilen sonuçlar istatistiksel olarak değerlendirildiğinde gruplar arasında önemli bir fark bulunmamıştır ($P>0.05$). Çalışmada PG uygulama süresinin sonuçlar üzerine etkili olabileceği ve ileride yapılacak yeni çalışmalarda literatüre katkı vermesi açısından önemli olduğu söylenebilir.

THE EFFECTS OF POSTPARTUM ORAL PROPYLENE GLYCOL ADMINISTRATION ON BODY CONDITION SCORE IN DAIRY COWS

ABSTRACT

The postpartum period in dairy cows is a critical phase in which metabolic disorders are most frequently observed. The body condition score (BCS) at calving, whether below or above the optimal range, can lead to negative energy balance (NEB), ketosis, fatty liver syndrome, and reproductive disorders, thereby adversely affecting milk yield and animal welfare. BCS is a practical and widely used method to evaluate the energy reserves and overall health status of cattle. This system is based on visual observation and manual assessment of fat and muscle tissues at specific anatomical sites. BCS is typically graded on a scale from 1 (emaciated) to 5 (obese). A score of 1 represents cachectic animals lacking fat and muscle coverage, while a score of 5 corresponds to excessively fat animals prone to metabolic problems. Thus, BCS assessment provides important insights into cattle's energy reserves, metabolic balance, and production potential. Propylene glycol (PG), owing to its gluconeogenic properties, is a compound that supports energy metabolism. This study investigated the effects of oral PG supplementation during the postpartum period on BCS. A total of 40 Simmental cows were used and randomly assigned to a control group (n=20) and a treatment group (n=20). The treatment group received 500 ml of PG orally once daily for five consecutive days postpartum, whereas no treatment was administered to the control group. BCS evaluations were performed prepartum and on day 21 postpartum. Statistical analysis of the results revealed no significant difference between the groups ($p>0.05$). It may be concluded that the duration of PG administration could influence outcomes, and that further research in this area would provide valuable contributions to the literature.

1. GİRİŞ

Gelişmekte olan ülkelerde, süt çiftliklerindeki giderlerin %70'inden fazlası hayvanların beslenmesi için kullanılan yemler oluşturmaktadır. Hayvancılık ile uğraşan yetiştiricilerin çoğu kaliteli beslemenin ve dengeli beslenmenin faydalarının farkında değildir. Hatta, bazıları, inek buzağı doğurduktan sonra besleme stratejisini düşünmektedir. Bunun yerine, geçiş dönemi (gebeliğin son 3 haftası ve laktasyonun ilk 3 haftası) için iyi planlanmış bir besleme ve yönetim programı olmalıdır. Bu aşamadaki uygunsuz besleme (az veya fazla), yeni doğan buzağının düşük doğum ağırlığına, doğum sonrası östrus göstermeme ve ineklerin düşük üretkenlik performansına yol açabilir (Sasser ve ark., 1988; Singh ve ark., 2003). Postpartum dönem, doğumdan sonraki ilk haftaları kapsar ve laktasyonun başlangıcını temsil eder. Bu dönemde hayvanın enerji gereksinimi süt üretimiyle birlikte hızla artar, ancak kuru madde alımı hemen yükselmez. Bu nedenle enerji açığı devam eder ve hayvanda canlı ağırlık kaybı gözlenir (Overton ve Waldron, 2004). Postpartum dönemde yetersiz beslenme veya yönetim hataları, döl verimi ve süt veriminde ciddi azalışlara yol açabilir. Ayrıca bu dönemde hipokalsemi, plasenta retensiyosu, metritis ve mastitis gibi rahim ve meme sağlığıyla ilişkili hastalıklar daha sık ortaya çıkar (LeBlanc, 2010).

Süt ineklerinde vücut kondisyon skoru (VKS), sahip olduğu vücut yağ oranının bir değerlendirmesidir ve süt sığırı yönetiminde önemli bir faktör olarak kabul edilmektedir. VKS' yi ölçmek için kullanılan ölçek ülkeler arasında farklılık gösterse de genellikle VKS 5'lik bir sistemde gösterilmekte ve bu sistemde 1 aşırı zayıf, 2 zayıf, 3 iyi, 4 yağlı, 5 aşırı yağlı hayvanı ifade etmektedir (Tablo 1) (Mishra ve ark., 2016; Çitil ve Uzlu, 2005; Koçyiğit, 2017). Bu değerlendirme, hayvanın vücudundaki kemik çıkıntılarını örten yağ tabakasının görsel olarak incelenmesine dayanır (Şekil 1) (Amaral Phillips, 2010; Kellogg, 2010). Uygulama sırasında özellikle kuyruk sokumu, bel ve kalça bölgelerindeki yağ örtüsü gözlemlenir (Amaral Phillips, 2010). Buzağılamalar arası VKS profili, süt laktasyon profilinin bir yansımasıdır. İnekler, somatotropik eksende meydana gelen homeostatik değişiklikler ve periferik dokuların insüline duyarlılığı ve yağ dokusundaki lipolitik yolların yukarı regülasyonu nedeniyle buzağılamadan sonra 50 ila 100 gün boyunca kondisyon kaybederler. Yönetim ve beslemenin, doğal insülin direnci dönemi geçene ve somatotropik eksen yeniden birleşene kadar, buzağılama sonrası erken VKS kaybı (buzağılamadan sonraki 1 ila 4. haftalar) üzerinde çok az etkisi vardır (Roche ve ark., 2009).

Tablo 1. Sığırın kondisyonuna göre vücut kondisyon skoru puanı, sırt yağ kalınlığı (mm) ve toplam yağ miktarı (kg) değişimi (Mishra ve ark., 2016; Çitil ve Uzlu, 2005; Koçyiğit, 2017).

Sığırın Kondisyonu	VKS	Sırt Yağ Kalınlığı (mm)	Toplam Yağ Miktarı (kg)
Aşırı zayıf	1	<5	<50
Zayıf	2	10	76
İyi	3	20	122
Yağlı	4	30	170
Aşırı yağlı	5	>35	>194

Şekil 1. Vücut kondisyon skorunun belirlenmesinde palpasyon yöntemi (Canatan, 2013; Koçyiğit, 2017).

Propilen glikol ($C_3H_8O_2$), renksiz, kokusuz ve tatlımsı tadı olan bir alkoldür. Sığırlara oral yol ile uygulandığında rumende propiyonik aside dönüşerek glukoneogeneze katkı sağlar (Nielsen ve Ingvartsen, 2004). PG'nin alınmasıyla yaklaşık 2 Mcal enerji sağlandığı, bu enerjinin karaciğerde glikoza çevrilerek kullanılabildiği bildirilmektedir (Butler ve ark., 2006). Overton ve Waldron (2004) PG'nin rumende 1–2 saat içinde %50 oranında sindirildiğini ve tamamının 3 saat içinde emildiğini bildirmişlerdir. PG, özellikle subklinik ketozisin önlenmesinde etkilidir. PG genellikle oral yolla, bireysel olarak enjeksiyon ile ya da yem katkısı şeklinde uygulanmaktadır. Etkili dozun 250–500 ml/gün olduğu bildirilmektedir (Nielsen ve Ingvartsen, 2004). Aşırı dozlarda ise iştah kaybı ve rumen bozuklukları gibi yan etkiler görülebilir (Grummer, 1995).

Bu çalışmada doğumdan sonraki ilk beş gün oral olarak günlük hayvan başına 500 ml PG uygulamasının süt sığırlarında VKS üzerine etkileri araştırılmıştır.

MATERYAL VE METOT

Deneme dizaynı, Hayvan ve Uygulama

Çalışma, Sivas Merkez'de faaliyet gösteren Lodos Tarım Hayvancılık A.Ş. işletmesinde gerçekleştirildi. Çalışmanın hayvan materyalini 40 adet Simental ırkı inekler oluşturmuştur. İnekler ortalama 650-700 kg ağırlığında, 2.5 yaşlı, 1. laktasyonda olan sağlıklı hayvanlar olup, bu hayvanların rasyonu kesif yem, silaj, saman ve yoncadan oluşmuştur. Çalışma da, hayvanlar her grupta 20 adet olmak üzere Kontrol grubu ve Deneme grubu olarak 2 gruba ayrıldı. Kontrol ve Deneme gruplarındaki hayvanlara günlük sırasıyla 0 ml ve 500 ml PG oral olarak uygulandı. Günlük 500 ml doz seçimi literatür önerileri dikkate alınarak belirlendi (Nielsen ve Ingvartsen, 2004). Tüm hayvanlar çalışma süresince eşit şartlarda ve optimum koşullarda barındırıldı.

Propilen Glikol

Propilen glikol (PG) içerik 1 kg için; Mono propilen glikol % 95.99, nikotinamid 20.000 mg, kobalt 40 mg, sorbitol 7000 mg.

Vücut Kondisyon Skorunun Tespiti

Çalışma da hayvanların VKS değerleri gebeliğin son haftasında ve doğumdan sonraki 21. günlerde belirlendi. İneklerin VKS değerlerinin tespit işleminde 5'lik sistem kullanıldı ve skorlama işlemi Ferguson ve ark. (1994) 'nın belirttiği yönteme göre yapıldı.

İstatistiksel Analizler

Elde edilen verilen normal dağılıp dağılmadığı SPSS (2011) paket programında one simple Kolmogorov-smirnov testi ile yapıldı. Testin sonucuna göre verilerin normal dağılım göstermediği tespit edildi. Bu nedenle verilerin istatistiksel analizi nonparametrik Two-Independent Samples Testlerinden Mann-Whitney U testi kullanılarak yapıldı ($P < 0.05$).

BULGULAR VE TARTIŞMA

Çalışmada grupların VKS değerlerine ait verilerin istatistiksel analizinde doğumdan önce ve postpartum 21. günde Kontrol ve Deneme grupları arasında istatistiksel olarak fark olmadığı tespit edildi (Tablo 2) ($P>0.05$).

Tablo 2. Propilen glikol uygulamasının vücut kondisyon skoru üzerine etkisi.

Vücut Kondisyon Skoru	Gruplar		*P* değeri
	Kontrol	Deneme	
Doğum öncesi	4.150±0.06	4.138±0.04	0.495
Postpartum 21. gün	3.750±0.06	3.800±0.05	0.799

Bütün değerler ortalama ± standart hata olarak verilmiştir. (n=20).

Süt inekleri doğumdan sonra ilk 100 gün boyunca kondisyon kaybederler. Bir ineğin doğum zamanı VKS' si, en düşük VKS' si ve doğum sonrası kaybettiği VKS miktarı, süt üretimi, üreme ve sağlık ile ilişkili olup hayvan refahının geçerli bir göstergesi olarak bilinmektedir (Roche ve ark., 2009). Bu nedenle doğum sonrası süt ineklerinde VKS kaybının yukarıda bahsedilen olumsuz durumlara yol açmasını engellemek için geçiş döneminde rasyona ilave olarak bazı enerji kaynaklarının verilmesi tavsiye edilmektedir (Grummer ve ark., 1995; Borş ve ark., 2014). Fonseca ve ark. (2004) yaptığı çalışmada buzağılama tarihine göre -10, -5, -4, -3, -2, -1, 0, 2, 4, 6, 8, 10, 12, 14 ve 16. günlerde 300 ml PG uyguladıkları hayvanların ortalama VKS değerleri arasında -10, 0, 15 ve 30. günlerde gruplar arasında istatistiksel olarak farkın olmadığını, 45 ve 60. günlerde ise kontrol grubunda önemli oranda düşük olduğunu tespit etmişler. Mevcut çalışmada da ölçülen VKS değerleri Fonseca ve ark. (2004) çalışmasındaki sonuçlarla uyumlu olup doğum öncesi ve postpartum 21. günde VKS değerleri açısından gruplar arasında önemli bir fark belirlenmedi. Smith ve ark. (1997)' na göre, daha yüksek VKS'ye sahip hayvanlar, doğumdan sonra daha düşük kuru madde tüketimi ve daha yüksek kilo kaybına daha yatkındır. Bu nedenle, PG takviyesinin doğumdan sonra 21. güne kadar VKS değişimi üzerinde hiçbir etkisi olmamıştır; bu da erken laktasyonda VKS' deki azalmayı hafifletemediğini göstermektedir; bu sonuçlarda literatürdeki çalışmalar ile uyumludur (Formigoni ve ark., 1996; Fonseca ve ark., 2004).

Sonuç

Buzağılamadan sonraki ilk 5 gün ineklere günlük 500 ml PG uygulamasının VKS değerleri üzerine önemli bir etkisinin olmadığı, bu sonuçlarda uygulama yapılan gün sayısının ve çalışmada hayvanların takibinin yapıldığı sürenin etkisinin olabileceği söylenebilir.

Açıklamalar

Bu bildiri, Orhan YALÇIN' ın "Süt ineklerinde doğum sonrası oral propilen glikol uygulamasının bazı kan parametreleri ve vücut kondisyon skoru üzerine etkileri" başlıklı yüksek lisans tez çalışmasının bir kısmından özetlenmiştir.

ÖZET

Dünya genelinde insanların protein ihtiyacını daha düşük fiyatlarla karşılaması ve endüstriyel üretime uygun olmaları nedeniyle kanatlı yetiştiriciliğinin önemi giderek artmaktadır. Ancak kanatlılarda meydana gelen *Mycoplasma gallisepticum* (*M. gallisepticum*), kaynaklı pnömoni olguları hem verim hem de üretimde önemli ekonomik kayıpların yaşanmasına neden olmaktadır. Hücre duvarından yoksun olan *M. gallisepticum*, *Mollicutes* sınıfı, *Mycoplasmatales* takımı ve *Mycoplasmataceae* familyası içerisinde sınıflandırılmaktadır. *Mycoplasmataceae* familyasında bulunan türler, üremeleri için zenginleştirilmiş besiyerine gereksinim duymaktadırlar. Bu amaçla besiyerlerine %10 oranında maya ekstraktı, %10-15 oranında da at serumu ilave edilmektedir. Hücre duvarından yoksun olan *Mycoplasma* türleri, katı besiyerlerinde ortası düğmeli görünüme sahip koloniler oluşturmaktadır. Kanatlılarda özellikle *M. gallisepticum*, *M. synoviae*, *M. meleagridis*, ve *M. iowae* görülen en yaygın *Mycoplasma* türleridir. Kronik solunum sistemi enfeksiyonuna (CRD, Chronic Respiratory Disease) neden olan *M. gallisepticum* ise en patojen tür olarak bilinmektedir. *M. gallisepticum*'da bulaşma enfekte hayvanlarla veya kontamine materyallerle direkt temas sonucunda meydana gelmektedir. Hayvanlarda konjuktivit, öksürük, aksırık, yumurta verimi ve yem alımında azalma gibi spesifik olmayan klinik semptomlar görülebilmektedir. Tedavi amacıyla özellikle tetrasiklin, florokinolon ve makrolid grubu antibiyotikler tercih edilmektedir. Koruma ve kontrol programları kapsamında ise hijyen, sanitasyon ve aşı büyük önem arz etmektedir.

CHRONİC RESPİRATORY SYSTEM INFECTİON (CRD) İN POULTRY

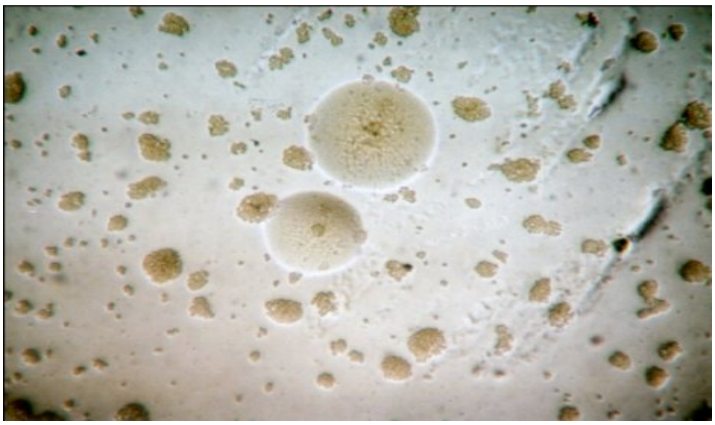
ABSTRACT

The importance of poultry farming is increasing because it meets the protein needs of people around the world at lower prices and is suitable for industrial production. However, *Mycoplasma gallisepticum* (*M. gallisepticum*)-induced pneumonia cases in poultry cause significant economic losses in both yield and production. *M. gallisepticum*, which lacks a cell wall, is classified within the *Mollicutes* class, *Mycoplasmatales* order, and *Mycoplasmataceae* family. Species in the *Mycoplasmataceae* family require enriched media for their reproduction. For this purpose, 10% yeast extract and 10-15% horse serum are added to the media. *Mycoplasma* species lacking a cell wall form colonies with a button-like appearance on solid media. The most common *Mycoplasma* species seen in poultry are *M. gallisepticum*, *M. synoviae*, *M. meleagridis*, and *M. iowae*. *M. gallisepticum*, which causes chronic respiratory system infection (CRD, Chronic Respiratory Disease), is known as the most pathogenic species. Transmission of *M. gallisepticum* occurs through direct contact with infected animals or contaminated materials. Nonspecific clinical symptoms such as conjunctivitis, cough, sneezing, decreased egg production, and decreased feed intake may be observed in animals. Tetracycline, fluoroquinolone, and macrolide antibiotics are preferred for treatment. Hygiene, sanitation, and vaccination are crucial within prevention and control programs.

Keywords: CRD, Poultry, *Mycoplasmataceae*, *Mycoplasma gallisepticum*, Pneumoniae

GİRİŞ

Kanatlılarda meydana gelen solunum sistemi hastalıkları bakteri, virüs ve mantar başta olmak üzere birçok patojen tarafından meydana gelebilmektedir. Ayrıca çevresel faktörler de klinik tablonun şiddetlenmesi ve meydana gelen lezyonlarda artışa neden olabilmektedir (Glisson, 1998). Özellikle *M. gallisepticum* kaynaklı meydana gelen kronik solunum yolu hastalığı kanatlı sektöründe büyük ekonomik kayıpların yaşanmasına neden olabilmektedir (Olesiuk ve Van Roekel, 1960).



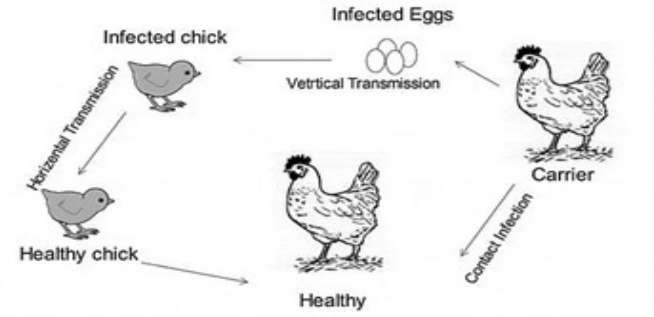
Konu ile ilgili yapılan çalışmalar incelendiğinde ulusal ve uluslararası alanda birtakım çalışmaların yapıldığı görülmektedir. Yapılan bu çalışmalar incelendiğinde *M. gallisepticum* bulunma oranının %26.4 ile %62 arasında değiştiği bildirilmiştir (Özgün ve Türkyılmaz, 2016; AbdelRahman vd., 2022; Marouf vd., 2022; Güllü Yücetepe, 2023).

1. KRONİK SOLUNUM SİSTEMİ ENFEKSİYONU (CRD)

Kümes hayvanlarının önemli bulaşıcı hastalıklarından biri olan kronik solunum sistemi enfeksiyonu, *M. gallisepticum* tarafından meydana gelmektedir. Kronik solunum sistemi enfeksiyonu, kanatlılarda karkas ağırlığı, yumurta verimi, kilo alımı ve yem verimliliğinde azalma nedeniyle ciddi ekonomik kayıplara yol açmaktadır (Rajkumar vd., 2017).

2. ETİYOLOJİ

Mycoplasma cinsi içerisinde yer alan *Mycoplasma gallisepticum*, *Mollicutes* sınıfı, *Mycoplasmatales* takımı ve *Mycoplasmataceae* familyasında yer almaktadır (Gautier-Bouchardon, 2018; Yadav vd., 2022). *Mycoplasmataceae* familyasında 22 *Mycoplasma* türü bulunmakla birlikte *M. gallisepticum*, *M. meleagridis*, *M. synoviae* ve *M. iowae* kanatlılarda görülen en yaygın türler arasında yer almaktadır (Shoaib, 2019). Hücre duvarından yoksun olan *Mycoplasma* türleri (Yadav vd., 2022), 0,3-0,5 µm çapında, pleomorfik, yuvarlak ya da filamentli mikroorganizmalardır (Lockaby ve Hoerr, 1999). *M. gallisepticum* zenginleştirilmiş besiyerlerinde iyi üreme özelliğine sahiptirler. Katı besiyerlerinde, kenarları yuvarlak, ortası düğmeli ve besiyerlerine gömülü koloni oluştururlar (Şekil 1). Meydana gelen bu koloniler bakterilerin L-formuna benzer yapıdadırlar. *M. gallisepticum* %10 maya ekstraktı ve %15-20 oranında at serumu ilave edilmiş sıvı besiyerlerinde de iyi üreme özelliğine sahip olmaktadır (Esendal, 2002).



Şekil 1: *M. gallisepticum* kolonilerinin stereomikroskobik görüntüsü (Uriarte vd., 2015).

3. BULAŞMA

Özellikle tavuk ve hindilerde enfeksiyona neden olan *M. gallisepticum* bıldırcın, güvercin, keklik ve sülün gibi birçok kanatlıda da enfeksiyona neden olmaktadır (Shoaib, 2019). Bu nedenle *M.*

gallisepticum yüksek yaygınlık oranı ve geniş konakçı yelpazesine sahip olması nedeniyle kanatlılarda en patojen tür olarak bilinmektedir. (Umar, 2017). *M. gallisepticum* horizontal ya da vertikal yolla bulaşmaktadır. Horizontal yolla meydana gelen bulaşmada sağlıklı hayvanların enfekte hayvanlarla teması oldukça önem arz etmektedir. Buna ilaveten hayvanlar etkeni damlacıklar yolu ile direkt olarak da alabilmektedirler. Bu nedenle çevresel kaynaklar sürekli enfeksiyon nedeni olabilmektedir (Esendal, 2002; Marouf vd., 2022). Yumurta yolu ile meydana gelen vertikal bulaşmada ise çoğunlukla damızlık değeri olan hayvanlar etkilenmektedir (Esendal, 2002; Shoaib, 2019) (Şekil 2).

Şekil 2: *Mycoplasma gallisepticum*'da vertical ve horizontal bulaşma (Umar vd., 2017).

4. KLİNİK BULGULAR

Hastalığın inkübasyon süresi yaklaşık 1 aydır. Ancak bu süre deneysel koşullarda 10 ile 20 gün arasında değişebilmektedir. Genellikle öksürük, hırıltılı soluma, aksırık, konjuktivit, artritis, göz ve burun deliklerinde akıntı, embriyonik ölümlerde artış, yumurta veriminde azalma ve tracheal sesler gibi spesifik olmayan klinik bulgular görülmektedir. Ayrıca yem tüketiminin azalmasına bağlı olarak kilo kaybı da meydana gelmektedir. Hindilerde meydana gelen klinik tablo tavuklara oranla daha şiddetli bir seyir göstermektedir. Hindilerde oluşan infraorbital şişkinlik ileri olgularda gözlerin tamamen kapanmasına neden olabilmektedir (Esendal, 2002; Marouf vd., 2022; AlRufaei ve Alwan, 2023).

5. TEŞHİS

5.1. KLİNİK VE NEKROPSİ BULGULARI

Kronik solunum sistemi enfeksiyonu, kolibasillozis, Newcastle, infeksiyöz koriza ve kronik kolera gibi hastalıklarla karışabileceğinden klinik ve nekropsi bulguları yeterli olmamaktadır. Bu nedenle kesin teşhis amacıyla laboratuvar muayenelerinin yapılması gerekmektedir (Esendal, 2002).

5.2. ALINABİLECEK ÖRNEKLER

Etken teşhisi amacıyla hava kesesi, akciğer, trakea gibi organlardan alınan dokular ile infraorbital sinüs, oküler ve sinovial eksüdatlardan alınan sürüntü örnekleri izolasyon ve identifikasyon amacıyla laboratuvara gönderilebilir. (Ferguson-Noel vd., 2012).

5.3. İZOLASYON VE İDENTİFİKASYON

Mycoplasma türlerinin izolasyonu amacıyla zenginleştirilmiş besiyerleri tercih edilmektedir. Bu amaçla besiyerlerine %10 maya ekstraktı ve %10-15 oranında at serumu ilave edilmektedir (Esendal, 2002). Ayrıca mantarların ve başka bakterilerin üremesini engellemek amacıyla bakteri inhibitörleri ve antibiyotikler de ilave edilmektedir. Bu amaçla özellikle besiyerlerine talyum-asetat ve ampisilin ilave edilmektedir. Ancak *Mycoplasma* türlerinin biyosentez kapasitesinin

düşük olmasından kaynaklı izolasyon aşaması uzun süre ve deneyim gerektirmektedir. Ayrıca amino asit, kolesterol ve vitamin gibi birçok besin maddesi için konak hücreye bağımlı olmaları da *Mycoplasma* türlerinin in vitro ortamda üremesini zorlaştırmaktadır (Shoaib, 2019). Bu nedenle *Mycoplasma* türlerinin teşhisi amacıyla çoğunlukla serolojik yöntemler ve moleküler tekniklerden faydalanılmaktadır. Serolojik teşhis amacıyla ELISA ve serum aglütinasyon testleri sıklıkla kullanılmaktadır. Serum aglütinasyon testlerinde 1/10 ve üzeri titreler pozitif olarak kabul edilirken, 1/5 şüpheli ve 1/5'ten küçük titreler negatif olarak değerlendirilmektedir (Umar vd., 2017).

6. TEDAVİ

M. gallisepticum hücre duvarından yoksun olduğu için hücre duvarı sentezini inhibe ederek etkisini gösteren ß-laktam (penisilin/sefalosporin vs.) grubu antibiyotiklere karşı doğal dirençlidirler (Umar vd., 2017; Ferguson-Noel vd., 2020). Bu nedenle tedavi amacıyla tilmikosin gibi makrolid grubu antibiyotikler, tetrasiklin, florokinolonlar ve linkomisin-spektinomisin sıklıkla kullanım alanı bulmaktadır (Umar vd., 2017; Ferguson-Neol, 2020; Yadav vd., 2022).

7. KORUMA-KONTROL

M. gallisepticum kaynaklı enfeksiyon olgularında koruma ve kontrol amacıyla ilk yapılması gereken enfeksiyondan ari ve döllenmiş yumurta elde etmektir. Böylece hem hastalıktan ari kanatlı yetiştiriciliği idame ettirilebilecek, hem de sürülerin ari statüsü korunmuş olacaktır. Sanitasyon ve hijyen kurallarına uymak da dikey bulaşma olasılığını azaltmak için öncelikli uygulanması gereken önlemler arasında yer almaktadır (Mugunthan, 2023). *M. gallisepticum*'un eradikasyonu amacıyla uygulanacak programda sürülerin düzenli bir şekilde kültürel ya da serolojik olarak taranması gerekmektedir (Esendal, 2002). Bunların haricinde *M. gallisepticum*'a karşı aşı da kontrol amacıyla sıklıkla kullanılmaktadır. Bu amaçla hem inaktif hem de zayıflatılmış aşılardan yararlanılmaktadır (Whithear, 1996).

8. SONUÇ

Sonuç olarak kanatlılarda önemli verim kayıplarına neden olan *M. gallisepticum*'da spesifik klinik belirtilerin gözlenmemesi ve türler arasında bulaşmanın kolay gerçekleşmesi ciddi risk teşkil etmektedir. Ayrıca yapılan çalışmalar kapsamında *M. gallisepticum* bulunma oranının yüksek olması kanatlı sektöründe problemlerin artmasına neden olabileceği düşünülmektedir. Bu nedenle *M. gallisepticum* kaynaklı enfeksiyonların önlenmesi amacıyla koruma-kontrol programlarına öncelik verilmesi, ari işletmelerin ön plana çıkarılması gerektiği kanısına varılmıştır.

IMMUNOLOGICAL RESPONSES AND ADAPTATION OF KANO BROWN BUCKLING GOATS FED DIETS CONTAINING *PLEUROTUS OSTREATUS* BIODEGRADED SUGARCANE SCRAPINGS

Dr. Emmanuel Ugochukwu ANASO (PhD)

Department of Animal Science, Faculty of Agriculture, Federal University of Agriculture

Mubi Adamawa, Nigeria.

E-mail: dranasoeub@gmail.com

ABSTRACT

Ruminant production in sub-Saharan African is principally constrained by dearth and unsteady quantity and quality of the year-round feed availability which affect both the growth (productive) and sexual (reproductive) performance of the animal. This problem of soaring cost of conventional feedstuffs used in ration formulation necessitates quest by animal nutritionists for alternative, non or less competitive, available and cheap feedstuffs, particularly lignocellulosic residues constituting environmental hazard due to improper disposal. This study evaluated the impact of replacing corn bran with biodegraded sugarcane scrapings (BSS) treated with *Pleurotus ostreatus* on the physiological and immunological responses of growing goats. Twenty-one healthy Kano Brown bucklings (aged 6–7 months; average body weight 9.40 ± 0.39 kg) were randomly assigned to three dietary treatments: 0% (T1), 15% (T2), and 30% (T3) BSS inclusion levels in a completely randomized design over a 16-week feeding trial. The primary focus was to assess the immune response—specifically levels of immunoglobulins A, M, and G; triiodothyronine (T3); total antioxidant capacity (TAC); and key antioxidant enzymes such as superoxide dismutase (SOD), catalase (CAT), glutathione peroxidase (GPx), and glutathione reductase (GR). Results indicated that the inclusion of BSS had no significant effect on these immunological or oxidative stress markers, all of which remained within physiologically normal ranges across the treatment groups. The biodegradation process significantly improved the nutritive profile of sugarcane scrapings, and dietary inclusion at 15% supported adequate nutrient intake and physiological stability without compromising immune function. Moreover, the 30% inclusion level was found to be safe and effective, promoting optimal health and performance in the goats. These findings highlight the potential of BSS as a sustainable, non-conventional feed resource in small ruminant nutrition.

Keywords: Solid state fermentation, *Pleurotus ostreatus*, sugarcane scrapings, immune status, small ruminant welfare

INTRODUCTION

The main factor limiting ruminant output in sub-Saharan Africa is the scarcity and unpredictability of year-round feed availability, which has an impact on the animal's growth (productive) and sexual (reproductive) performance (Anaso and Olafadehan, 2025). Animal nutritionists must search for alternative, non-competitive, readily available, and inexpensive feedstuffs due to the problem of the skyrocketing cost of conventional feedstuffs used in ration formulation. This is especially true of lignocellulosic residues, which pose a risk to the environment due to improper disposal (Olafadehan et al., 2023b).

A number of coproducts are produced concurrently with the cultivation of sugarcane, a plant that is widely grown in northern Nigeria. One significant and widely accessible coproduct is sugarcane scraping or peel (Anaso et al., 2024b; Olafadehan et al., 2023a). Despite its availability, its low crude protein (CP) and lignified nature limit its use in livestock (Anaso & Anaso, 2025). Solid state fermentation (SSF) using lignocellulose fungus has been used to improve the CP and dissolve the lignin barrier, increasing the nutritional value. As a result, the lignocellulosic structure has been altered, allowing the carbohydrates to be converted more efficiently (Anaso, 2025a).

According to reports, white rot fungus can successfully mineralize lignin into carbon dioxide and water by creating ligninolytic enzymes such laccase, manganese peroxidase, and lignin peroxidase (Sanchez, 2010; Isroi et al., 2011; Anaso et al., 2021a,b). Additionally, employing the white rot fungus in solid state fermentation of lignified roughages provides a safe alternative to physical or chemical treatment. While the majority of earlier research on the use of solid-state fermented lignocelluloses in ruminant diets concentrated on productivity, there is little data on fertility or reproductive potential, especially in male animals (Anaso et al., 2023).

A detailed evaluation of the animals' testicular measurements, particularly scrotal circumference and length, as well as the characteristics of their semen, may shed some light on how well the animals' diet meets their requirements for sufficient reproduction. The current study's goal was to evaluate the oxidative blood profile and immune system of bucks fed diets containing sugarcane scrapings that Pleurotus ostreatus had biodegraded.

Materials and methods

Experimental location

The experiment was conducted at the University of Abuja Teaching and Research Farm in Abuja, Nigeria. Located between latitudes 8º 55'N and 9º 00'E and longitudes 7º 00'N and 7º 05'E, the position is 456 meters above sea level. The area has an annual temperature of 25.8–42°C and 1100–1650 mm of precipitation (Anaso and Alagbe, 2025; Anaso and Alhassan, 2025).

Preparation and biodegradation of sugarcane scrapings

Pleurotus ostreatus was bought from a reputable commercial producer in Nigeria, while fresh SS was collected from local sugarcane processors, chopped into 1-2 cm lengths, and air-dried at room temperature (25–30°C). Before the Pleurotus inoculation for solid state fermentation, the SS was combined with distilled water in a 1:1 ratio in each previously cleaned, dried, and sanitized container to reduce the moisture content to 67%. To get rid of any living microorganisms, the SS were autoclaved twice, once at 121°C for 15 minutes each time, with cooling intervals in between. Before being infected with P. ostreatus spores in a 25:1 ratio, the prepared SS were cooled in an aseptic atmosphere. After that, the inoculation room was kept at 30°C and 100% relative humidity until mycelia developed. Autoclaving the material prevented mycelia growth and biodegradation

of the biodegraded SS (BSS) after a 21-day period of inoculation and SSF. The BSS were packaged and stored until they were needed for feeding after being dried to a constant weight. 2.3. Diets, management, and experimental animals Kano For the experiment, 21 brown male goats weighing 9.44 ± 0.39 kg and aged between 6 and 7 months were bought from an open market.

Within a 6 m × 8 m x 4 m corral, the goats were kept in individual 1.2 m2 cages. Two weeks prior to their arrival, the pen and its immediate surroundings were thoroughly cleaned using Hypo® (sodium hypochlorite, caustic soda, and de-mineralized water) and antiseptic (Morigad). During their two-week quarantine, the animals received preventative treatments. These included an intramuscular injection of a long-acting oxytetracycline HCl at 1 mL/10 kg BW, an oral anti-stress drug called Vitalyte®, a subcutaneous injection of the live PPR vaccine (1 mL at 102.5 of the TCID50 PPR virus) at the neck region, and a subcutaneous injection of an anti-parasitic drug called Avomec® at 0.5 mL/25 kg BW. Three complete meals were created using varying SS 0 (control), 15, and 30% inclusion ratios. The meals that catered to the requirements of growing goats were designed in accordance with the NRC's (2007) recommendations. Buck juveniles were fed at 5% of their body weight (based on dry matter; DM) and were balanced for body weight throughout a 12-week period (January to March). After then, one of the experimental diets was given to the goats at random. The amount of feed given to the goats was changed during the trial to ensure that some was left behind. Feeding was done twice a day between 8:00 and 16:00. Every day, they had unrestricted access to clean water.

Immune function was assessed by quantifying immunoglobulin classes (IgA, IgG, and IgM), also using Stanbio-specific kits per Elghalid et al. (2020) and Anaso (2025b,c).

Oxidative stress markers evaluated included triiodothyronine (T3), total antioxidant capacity (TAC), and the enzymatic activities of malondialdehyde (MDA), superoxide dismutase (SOD), catalase (CAT), glutathione peroxidase (GPx), glutathione reductase (GR), and cortisol. These were likewise analyzed using the aforementioned commercial kits and standardized methodologies (Anaso et al., 2025a,b,c,d).

Data analysis

The obtained data was subjected to and met normal distribution conditions. Subsequent results for body weight, scrotal parameters and semen characteristic were subjected to analysis of variance (ANOVA) in a completely randomized design using the SPSS BASE 23 (SPSS software products, USA). Duncan multiple range test (DMRT) of same software was used to test the significant difference between the means at ($p \leq 0.05$ level of significance.

Results and Discussion

Immune and oxidative stress responses of goats

Table 1 presents the immunological and oxidative stress responses of growing Kano Brown goats fed diets containing varying inclusion levels of biodegraded sugarcane scrapings (BSS) treated with *Pleurotus ostreatus*. The dietary treatments consisted of 0% (T1), 15% (T2), and 30% (T3) BSS in a completely randomized design. Results revealed that the inclusion of BSS had no significant ($P > 0.05$) effect on the concentrations of immunoglobulins (IgA, IgM, and IgG), triiodothyronine (T3), and antioxidant enzymes including superoxide dismutase (SOD), catalase (CAT), glutathione peroxidase (GPx), and glutathione reductase (GR). Similarly, total antioxidant capacity (TAC), malondialdehyde (MDA), and cortisol levels were not significantly altered by the

dietary treatments, indicating that the goats maintained normal immunological and oxidative status across all groups.

Important humoral immune components that neutralize pathogens, suppress toxins, and protect mucosa are immunoglobulins (IgG, IgM, and IgA) (Anaso et al., 2025a,d; Woof & Kerr, 2005; Alagawany et al., 2021). The treatment groups' similar amounts of these immunoglobulins indicate that substituting biodegraded sugarcane scrapings for maize bran did not compromise immune function. Similarly, sustained metabolic and thermoregulatory balance is reflected in the constant T3 concentration across treatments (Bowen, 2010; Anaso et al., 2025g).

Indicators of oxidative stress, such as SOD, CAT, GPx, GR, and TAC, were statistically equivalent ($P > 0.05$) between groups, suggesting that the antioxidant defense system was unaffected by the dietary addition of BSS. These enzymes are essential for maintaining cellular homeostasis and neutralizing reactive oxygen species (ROS) (Chelikani et al., 2004; Deponte, 2013; Anaso et al 2024 a,c,d). The result that BSS inclusion up to 30% does not cause oxidative stress in goats is further supported by the non-significant fluctuation in MDA concentration, an indication of lipid peroxidation and membrane integrity.

By breaking down lignin and partially solubilizing cellulose and hemicellulose, P. ostreatus's biodegradation of sugarcane scrapings probably increased the substrate's nutritional profile and fiber digestibility, leading to better feed utilization (Anaso et al., 2025a). Goats fed diets containing 15% and 30% BSS therefore showed normal physiological reactions and stable redox balance, indicating that BSS inclusion did not cause inflammatory or metabolic distress.

All things considered, these results show that biodegraded sugarcane scrapings can safely substitute traditional feed components like maize bran in goat diets without having a negative impact on oxidative balance or immune competence. The promise of BSS as a sustainable, non-conventional feed source for small ruminant production in tropical regions where feed scarcity and high input costs remain important restraints is highlighted by the stability of immunological and antioxidant indicators across treatments.

Table 1. Immune and oxidative stress responses of goats

Parameter	T1	T2	T3	SEM
Immunoglobulin G (mg/100ml)	3.998.22	3.973.00	3.965.23	103.50
Immunoglobulin A (mg/ml)	0.30	0.27	0.23	0.08
Immunoglobulin M (mg/ml)	3.72	3.54	3.49	0.59
Triiodothyroxine (nmol/L)	1.99	1.81	1.79	0.59
Melanodialdehyde (nmol/L)	0.92	0.97	0.98	0.03

Superoxide dismutase (nmol/mL)	887.55	873.25	841.47	12.07
Catalase (U/gHb)	1660.47	1670.77	1680.00	17.85
Glutathione peroxidase (U/gHb)	183.60	173.50	169.90	2.59
Cortisol (ng/ml)	14.71	15.01	15.51	0.30
Total antioxidant capacity (nmol)	1.08	1.33	1.67	0.03
Glutathione reductase (IU/10^{11}RBC)	1.38	1.48	1.56	0.30

Means with the different superscripts along the row are significantly ($P < 0.05$) different

T1, T2 and T3 connoting treatments one, two and three.

Conclusion

The present study demonstrated that the dietary inclusion of *Pleurotus ostreatus*-biodegraded sugarcane scrapings (BSS) as a partial replacement for corn bran had no adverse or significant effect on the immunological and oxidative stress responses of growing Kano Brown goats. Immunoglobulin concentrations, thyroid hormone levels, and antioxidant enzyme activities remained within normal physiological ranges, indicating that the inclusion of BSS up to 30% supports immune competence and oxidative balance comparable to conventional diets. The biodegradation process enhanced the nutritive quality of sugarcane scrapings, providing a safe, nutrient-dense, and environmentally friendly alternative feed resource. Therefore, BSS can be effectively utilized as a sustainable non-conventional feed ingredient in small ruminant production systems, particularly in regions challenged by high feed costs and limited availability of conventional feedstuffs. Further studies on nutrient digestibility, growth performance, and long-term reproductive outcomes are recommended to optimize inclusion levels for commercial application.

ABSTRACT

The rapid advancement of frontier technologies presents a pivotal opportunity for accelerated development in Africa. However, the continent's readiness to harness these technologies remains uneven and poorly understood at a comparative national level. This study conducts a comprehensive comparative assessment of frontier technology readiness across eleven African countries—Nigeria, Ghana, South Africa, Egypt, Morocco, Mauritius, Algeria, Botswana, Tunisia, Libya, and Gabon—from 2010 to 2023. Utilizing longitudinal data from the United Nations Conference on Trade and Development (UNCTAD, 2025), the analysis deconstructs the Overall ICT Index into its five constituent components: ICT Infrastructure, ICT Skills, Research & Development (R&D), Industry Activity, and Access to Finance.

The findings reveal a landscape of pronounced stratification and general stagnation, challenging optimistic narratives of universal digital leapfrogging. South Africa emerges as the consistent leader, demonstrating a relatively balanced innovation system. In contrast, major economies like Nigeria and Ghana exhibit a "stagnation paradox," with their vibrant tech ecosystems failing to translate into broad-based readiness due to critically low and stagnant scores in R&D and skills. The study identifies critical asymmetries, such as in Morocco, where advanced infrastructure is undermined by a chronic human capital deficit. The data further exposes a pervasive "innovation chasm," with R&D capacity being exceptionally weak across most sampled countries.

The discussion, framed within the National Systems of Innovation and Capabilities Approach theories, concludes that the primary constraint to frontier technology readiness in Africa has shifted from a connectivity gap to a profound human capital and innovation gap. The study recommends a fundamental reorientation of policy towards integrated national strategies that simultaneously address skills development, R&D investment, and industrial policy. The implications call for systemic policy orchestration and long-term commitment to building holistic innovation ecosystems, positioning this study as a critical evidence base for guiding Africa's effective participation in the Fourth Industrial Revolution.

1.0 INTRODUCTION

1.1 Background of the Study

The 21st century is being fundamentally reshaped by a new wave of technological advancement, often termed the Fourth Industrial Revolution (4IR) or frontier technologies. These technologies—which include Artificial Intelligence (AI), Big Data analytics, the Internet of Things (IoT), blockchain, robotics, and biotechnology—are characterized by their rapid pace of development, pervasive scale, and transformative potential across all sectors of the economy and society (Schwab, 2016). For developing regions, particularly Africa, these technologies present a historic opportunity to accelerate development, overcome traditional infrastructural bottlenecks, and "leapfrog" several stages of growth through innovative applications in agriculture, health, finance, governance, and education (World Bank, 2019).

The potential for digital transformation in Africa is significant. The continent has witnessed the world's most rapid growth in mobile connectivity, which has already spurred innovation in mobile money, with services like M-Pesa in Kenya becoming a global benchmark (Suri & Jack, 2016). This mobile-led digital revolution has fueled a vibrant and growing tech startup ecosystem, with hubs in Lagos, Nairobi, Cape Town, and Kigali attracting significant venture capital and international attention (Soliman *et al*., 2025; Guzikova & Somga Bitchoga, 2022). This narrative of a dynamic, digitally rising Africa has become a powerful and optimistic counterpoint to older, more pessimistic depictions of the continent.

However, the ability to merely *use* mobile phones is fundamentally different from the capacity to *adopt, adapt, and develop* sophisticated frontier technologies. The latter requires a robust and holistic national innovation system. Recognizing this, international bodies like the United Nations Conference on Trade and Development (UNCTAD) have developed sophisticated frameworks to measure a country's readiness for these technologies. This "Frontier Technology Readiness Index" moves beyond simple connectivity metrics to assess a country's foundational preparedness across multiple dimensions: the quality of its ICT infrastructure, the level of its population's relevant skills, the strength of its Research & Development (R&D) ecosystem, the technological absorption capacity of its industry, and the availability of financing for innovation (Das, 2025; Saha & Ali, 2025; Masamha *et al*., 2024).

While aggregate reports often highlight continental potential, the reality on the ground is one of profound disparity. The performance of African nations in building these foundational pillars is not uniform, and a detailed, comparative analysis at the country level is crucial to move beyond generalizations. This study, therefore, grounds itself in the empirical data provided by UNCTAD (2025) for the period 2010-2023, focusing on a select group of eleven African countries: Nigeria, Ghana, South Africa, Egypt, Morocco, Mauritius, Algeria, Botswana, Tunisia, Libya, and Gabon. By examining the trajectories of their Overall ICT Index and its constituent components, this research provides a nuanced and evidence-based background against which the continent's true readiness for the 4IR can be assessed.

1.2 Problem Statement

Despite the optimistic rhetoric surrounding Africa's digital potential and the palpable energy within its tech startup scenes, there is a growing concern that a significant "readiness gap" threatens to derail this promise. Preliminary analysis of the provided UNCTAD data suggests that progress towards genuine frontier technology readiness is highly uneven and, for a majority of the selected countries, has stagnated over the past decade. The celebrated success stories of a few startups and

innovation hubs appear to exist within isolated bubbles, failing to translate into broad-based, national technological capability.

The core problem this study addresses is the persistent and multi-dimensional stagnation in frontier technology readiness across many key African economies, which risks locking them into a cycle of technological consumption rather than innovation, thereby exacerbating global and intra-continental inequalities. This problem manifests in several critical ways:

1. **The Stagnation Paradox:** Major economies like Nigeria and Ghana show minimal improvement in their Overall ICT Index over 14 years, remaining in the lower tier (0.3-0.4) despite their demographic and economic weight. This indicates a systemic failure to convert potential into sustained readiness.

2. **The Asymmetry of Development:** Some countries, like Morocco, demonstrate strong advancement in infrastructure but are held back by chronically low scores in human capital (ICT skills). This "infrastructure-skills" asymmetry suggests that investments are unbalanced and not yielding full returns.

3. **The Innovation Chasm:** The data points to a critical deficiency in R&D capacity across nearly all sampled countries, with South Africa being a notable exception. This indicates a weak foundation for domestic technology creation and adaptation, leaving economies perpetually dependent on foreign technologies.

4. **The Policy Disconnect:** The volatile and often declining Industry Activity Index in resource-rich nations like Nigeria and Algeria suggests that the productive sectors of these economies are not driving or demanding technological innovation, pointing to a failure of industrial policy to integrate with digital strategy.

Therefore, the problem is not a lack of activity, but a lack of synergistic and systemic progress across all the pillars that constitute true technological readiness. Without a clear, comparative understanding of where and why these disparities and stagnations exist, policymakers and stakeholders risk misallocating resources and pursuing strategies that fail to address the root causes of the readiness gap.

1.3 Justification for the Study

This research is critically important for both academic and practical reasons. It moves the discourse beyond anecdotal evidence and high-level continental summaries to provide a rigorous, data-driven, longitudinal comparison of specific African nations.

- **For Policymakers and Governments:** The findings of this study will serve as a critical diagnostic tool. By deconstructing the Overall ICT Index into its components, the research will pinpoint specific areas of weakness (e.g., R&D in Ghana, skills in Morocco) for targeted policy intervention. It will help governments understand that a singular focus on infrastructure, for instance, is insufficient without parallel investments in education and research. The comparative element allows for cross-country learning, where lagging nations can identify and emulate the successful strategies of performers like Mauritius or South Africa in specific domains.

- **For International Development Partners and Investors:** Donor agencies and private investors can use the insights from this study to make more informed decisions. It helps identify not just markets with current potential, but also those with the foundational readiness for sustainable, long-term technological growth. The analysis of the R&D and Industry Activity

indices, for example, can guide venture capital towards ecosystems with a stronger potential for deep tech innovation, while the analysis of skills can inform where investments in capacity building are most urgently needed.

- **For Academic Contribution:** This study fills a gap in the literature by providing a multi-dimensional, time-series analysis of technology readiness focused exclusively on a diverse set of African nations. It empirically tests and challenges popular narratives like "leapfrogging" by showing the hard constraints of skills and R&D. It contributes to scholarly debates in development economics, innovation studies, and African studies by providing quantitative evidence on the structural bottlenecks to technological upgrading in the region.

- **For Strategic National Planning:** The study sounds an urgent alarm on the human capital and innovation crisis. By highlighting the pervasive stagnation in the ICT Skills and R&D indices, it provides a powerful justification for radically rethinking national education systems and science, technology, and innovation (STI) policies. It argues that the future of Africa's digital economy depends less on the next undersea cable and more on the quality of its universities and research labs.

In essence, this research is justified by its potential to translate raw data into actionable intelligence, guiding the strategic investments and policies required to ensure that Africa does not merely witness the Fourth Industrial Revolution but actively participates in shaping it.

1.4 Research Objectives

The primary aim of this study is to conduct a detailed comparative assessment of the frontier technology readiness of selected African countries from 2010 to 2023, using the UNCTAD index data to identify patterns, disparities, and key determinants of performance.

To achieve this aim, the following specific objectives are formulated:

1. To assess and rank the overall frontier technology readiness of the selected countries over the period 2010-2023, identifying leaders, laggards, and trajectories of change.

2. To deconstruct the overall readiness by comparatively analyzing the performance of each country across the five sub-indices: ICT Infrastructure, ICT Skills, Research & Development, Industry Activity, and Access to Finance.

3. To identify the key strengths and critical weaknesses within each country's national innovation system, explaining how the interplay between different sub-indices (e.g., high infrastructure with low skills) impacts their overall score.

4. To situate the empirical findings within the existing academic and policy literature, explaining the observed performances with reference to previous studies on digital development, innovation systems, and industrial policy in the African context.

5. To derive evidence-based conclusions and implications that can inform national policies and regional strategies aimed at bolstering holistic frontier technology readiness across the continent.

By systematically addressing these objectives, this study will provide a comprehensive and nuanced understanding of the complex landscape of technological readiness in Africa, offering a vital resource for shaping its digital future.

2.0 Literature Review

2.1 Theoretical Framework

To systematically analyze and interpret the disparities in frontier technology readiness across the selected African nations, this study is anchored in a multi-theoretical framework. No single theory can fully capture the complex, multi-dimensional nature of technological readiness; therefore, this research draws upon and integrates several complementary theoretical perspectives from development economics, innovation studies, and information systems. These theories collectively provide the conceptual lenses through which the UNCTAD index data can be meaningfully understood and explained.

2.1.1 The Capabilities Approach and Human Capital Theory

At its core, the readiness to leverage technology is fundamentally about human agency. Sen's Capabilities Approach (1996) shifts the focus from mere access to resources (e.g., telecom infrastructure) to what people are actually able to do and be with those resources. In this context, technological readiness is not just about having internet connectivity but about the *capability* to use that connectivity for learning, innovation, and economic advancement. This perspective directly informs the ICT Skills Index, which measures the population's ability to effectively engage with technology. The persistently low scores in this index for countries like Nigeria and Ghana, as highlighted in the data, can be interpreted as a critical failure in expanding these essential human capabilities, a point reinforced by contemporary studies on digital literacy in Africa (Asongu & Nwachukwu, 2016).

Closely linked to this is Human Capital Theory (Becker, 1918), which posits that investments in education and skills training are crucial for economic productivity. The stagnant skills indices across the sample suggest a severe under-investment in the specific human capital required for a digital economy. When viewed through this lens, the "leapfrogging" narrative is contingent upon a population possessing the skills to adopt and adapt complex technologies, a condition that, as the data reveals, is largely unmet in many of the studied countries (Friederici *et al*., 2017).

2.1.2 National Innovation Systems (NIS) Framework

To understand the broader ecosystem within which technological readiness is built, this study employs the National Innovation Systems (NIS) framework. Pioneered by scholars like Freeman (1987) and Lundvall (1992), the NIS approach argues that technological progress and economic growth are driven by the complex interactions and flows of knowledge and technology among a network of actors in a country, including firms, universities, research institutes, and government agencies. The structure of the UNCTAD index aligns perfectly with this framework. The sub-indices represent core components of an innovation system:

- **ICT Infrastructure** represents the physical backbone for knowledge diffusion.
- **R&D Capacity** reflects the knowledge creation function, primarily within universities and public research labs.
- **Industry Activity** indicates the private sector's capacity to absorb and apply new knowledge.
- **ICT Skills** represents the stock of human capital flowing through the system.
- **Access to Finance** is a key institutional factor enabling innovation.

The poor performance of a country like Algeria across multiple indices signals a weak and poorly coordinated NIS. Conversely, South Africa's relative leadership, particularly in R&D, points to a more mature, though not flawless, innovation system, a finding consistent with analyses of the South African NIS (Daniels & Gebhardt, 2021); Khomyakov *et al*., 2020). The framework explains why isolated improvements in one area (e.g., infrastructure in Morocco) may not yield proportional gains in overall readiness if other system elements remain underdeveloped.

2.1.3 Technology Acceptance Model (TAM) and its Extensions

While macro-level theories like NIS explain the national ecosystem, the Technology Acceptance Model (TAM) (Davis, 1989) and its subsequent extensions provide a micro-level perspective on how and why individuals and organizations adopt new technologies. The original TAM posits that perceived usefulness and perceived ease of use are the primary determinants of technology adoption. This can be linked to the ICT Skills Index (ease of use) and the Industry Activity Index (usefulness for productivity gains).

However, the basic TAM is limited in developing contexts. The data from this study supports the need for an expanded view, as proposed by Venkatesh *et al*. (2016) in the Unified Theory of Acceptance and Use of Technology (UTAUT2). This model incorporates facilitating conditions—which include the objective state of ICT Infrastructure and Access to Finance—as critical moderating variables. The volatile industry activity in Nigeria, for instance, can be interpreted as a context where perceived usefulness of frontier technologies is low due to unfavorable facilitating conditions, such as political instability and inadequate infrastructure, inhibiting investment in technological upgrading by firms (Nnawulezi *et al*., 2023).

2.1.4 Diffusion of Innovations Theory and the "Leapfrogging" Debate

Rogers' Diffusion of Innovations Theory (2003) provides a classic model for how new technologies spread through a social system over time. The theory categorizes adopters into innovators, early adopters, early majority, late majority, and laggards. The UNCTAD data effectively maps the relative position of these African countries on the diffusion curve for frontier technologies as a whole. South Africa and Mauritius can be seen as the "early adopters," while the stagnating nations represent a "late majority" or "laggard" status at a systemic level.

This theory critically engages with the popular discourse of "Technological Leapfrogging" in Africa. The leapfrogging hypothesis suggests that latecomer economies can bypass certain stages of technological development by directly adopting advanced technologies (World Bank, 2019). However, the empirical evidence from this study challenges a simplistic application of this theory. The data reveals that leapfrogging is not automatic; it requires a foundational level of readiness across multiple dimensions. The inability of most countries to improve their R&D and skills indices suggests they are struggling to build the absorptive capacity necessary to *adapt* and *manage* advanced technologies, leaving them as passive consumers rather than active shapers—a limitation clearly identified in critical scholarship on the topic (Heeks, 2022; Foster, 2021; Andreoni & Tregenna, 2020). Thus, this research uses diffusion theory to temper the over-optimism of the leapfrogging narrative with empirical reality.

By integrating these four theoretical perspectives, this study constructs a robust analytical framework. The Capabilities Approach and Human Capital Theory focus on the human element; the NIS framework provides the macro-structural context; TAM/UTAUT2 explains the micro-level adoption drivers; and Diffusion of Innovations theory places the entire process within a temporal and comparative context. Together, they offer a comprehensive toolkit for dissecting the results of

the comparative assessment and for deriving meaningful, theoretically grounded conclusions about the future of frontier technologies in Africa.

2.2 Conceptual Framework

A conceptual framework is an analytical tool that outlines the key concepts, variables, and their presumed relationships in a study. It provides a visual and narrative structure for organizing the research. For this study, the conceptual framework is built upon the integrated theoretical foundations and operationalizes them using the UNCTAD indices. It illustrates how the five sub-indices collectively determine the overall frontier technology readiness and the consequent outcomes.

The framework below (Figure 1) depicts the relationships between the variables under investigation.

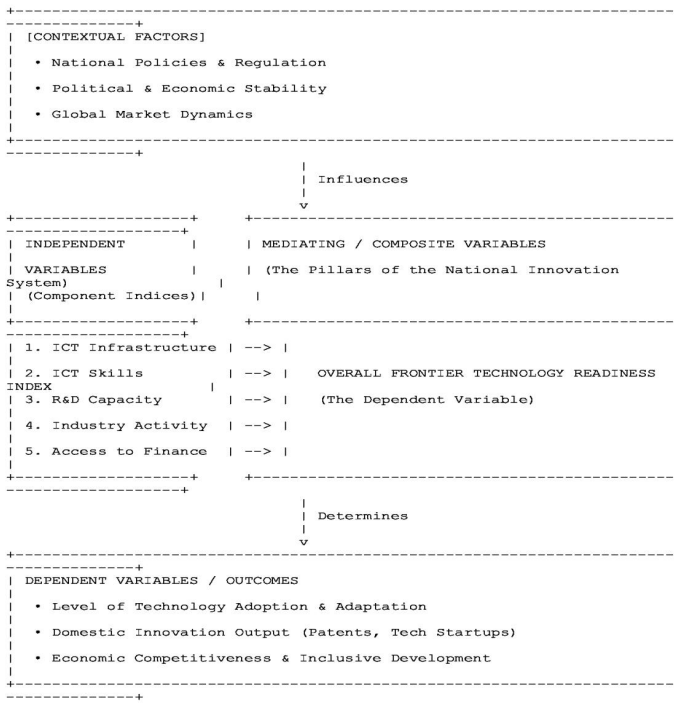

Figure 1: Conceptual Framework for Assessing Frontier Technology Readiness

Explanation of the Framework Components:

1. Independent Variables (The Component Indices)

The five sub-indices from the UNCTAD database form the independent variables or the foundational inputs of the framework. These are the measurable pillars that constitute the core of a country's National Innovation System (NIS), as discussed in the theoretical framework.

- **ICT Infrastructure Index:** Represents the tangible, physical foundation for digital connectivity (e.g., broadband penetration, network quality).

- **ICT Skills Index:** Represents the human capital and capabilities required to effectively use and develop technology.
- **R&D Capacity Index:** Represents the national potential for knowledge creation, technological experimentation, and innovation.
- **Industry Activity Index:** Represents the demand-pull and absorption capacity from the productive sector of the economy.
- **Access to Finance Index:** Represents the availability of capital to de-risk and fuel technological ventures and innovation.

2. The Mediating/Composite Variable (Overall Frontier Technology Readiness Index)

The Overall ICT (Frontier Technology Readiness) Index is positioned as the central, mediating variable. It is not an independent outcome but a composite measure that *results from* the interplay of the five independent variables. The framework posits that the overall readiness is a function of the synergistic performance of all five pillars. A weakness in one pillar (e.g., low R&D Capacity) can mediate and depress the overall score, even if other pillars are strong (e.g., good Infrastructure). This aligns with the systemic view of the NIS framework, where the interaction between components is critical.

3. Dependent Variables / Outcomes

The ultimate goal of building technological readiness is to achieve positive socio-economic outcomes. These are the dependent variables that are influenced by the level of a country's Overall Readiness. While this study primarily focuses on empirically analyzing the relationship between the independent variables and the overall index, the framework logically connects this readiness to broader consequences:

- **Level of Technology Adoption & Adaptation:** Countries with higher overall readiness will more effectively integrate frontier technologies into business processes, government services, and daily life.
- **Domestic Innovation Output:** A strong readiness foundation fosters a environment conducive to homegrown innovation, measured by patents, high-growth tech startups, and novel technological solutions to local problems.
- **Economic Competitiveness & Inclusive Development:** Ultimately, successful adoption and innovation should translate into broader economic benefits, such as increased productivity, job creation in high-value sectors, and more inclusive growth, as envisioned by the Capabilities Approach.

4. Contextual Factors

The entire process is enveloped by contextual factors that influence the strength of the pillars and their translation into outcomes. These are not directly measured by the indices but are crucial for interpreting the results. They include:

- **National Policies & Regulation:** The quality of a country's digital strategy, education policy, R&D funding, and business climate.
- **Political & Economic Stability:** Conflict (as seen in Libya's data volatility) or macroeconomic instability can cripple technological development.

- **Global Market Dynamics:** Factors like global tech trends, foreign direct investment flows, and international collaboration opportunities.

Relationship Propositions:

The conceptual framework implies several key propositions that this study investigates:

1. **Synergy Proposition:** The Overall Readiness Index is not a simple average but emerges from the synergistic interaction of the five component indices. A significant imbalance will constrain the overall score.

2. **Bottleneck Proposition:** The component index with the lowest score in a country's profile acts as a critical bottleneck, limiting the effectiveness of investments in other areas (e.g., excellent infrastructure yields low returns without corresponding skills).

3. **Causality Flow Proposition:** The framework suggests a primary flow of influence from the foundational pillars (independent variables) to the composite readiness (mediating variable), and subsequently to developmental outcomes (dependent variables). The data analysis will test the first part of this causal chain.

In summary, this conceptual framework provides a structured model for analyzing the UNCTAD data. It posits that the Overall Frontier Technology Readiness of the selected African countries is a direct result of the combined and interrelated performance of their ICT Infrastructure, Skills, R&D, Industry Activity, and Access to Finance, all of which are situated within a unique national context that shapes their development.

2.3 Empirical Review

This section synthesizes findings from previous empirical studies related to the components of frontier technology readiness in Africa. It examines what existing research has already uncovered about ICT infrastructure, skills, R&D, industry, and finance across the continent, providing a foundation against which the new data from this study can be compared and contextualized.

2.3.1 ICT Infrastructure: The Connectivity Divide and Its Limits

Empirical studies consistently highlight a significant digital infrastructure divide within Africa. Researches by the GSMA (2018); Guzikova & Somga Bitchoga, (2022) confirm that while mobile broadband coverage continues to expand, a usage gap persists, meaning many covered by networks do not use the internet due to factors like affordability and lack of digital literacy. This aligns with the volatile and middling infrastructure scores for countries like Nigeria and Ghana in our data. Nnawulezi *et al*. (2023), in a study on Nigeria, empirically linked this volatility to regulatory challenges, multiple taxation, and frequent vandalism of telecom infrastructure, directly explaining the inconsistent performance observed in the index.

Conversely, the steady improvement in Morocco's infrastructure score is empirically supported. Elharissi *et al*. (2025) evaluated the *Maroc Digital 2020* strategy and found that concerted public investment in national broadband and fibre optic networks led to measurable improvements in connectivity metrics, corroborating the positive trend seen in the data. Similarly, South Africa's high score is consistently documented in the Research ICT Africa (RIA) surveys (Gillwald *et al*., 2018), which, while pointing out urban-rural disparities, affirm the country's relatively advanced network status. However, a critical empirical finding from the broader literature, which our data reinforces, is that infrastructure alone is insufficient. Asongu and Nwachukwu (2016) used panel data to demonstrate that the impact of ICT infrastructure on

inclusive development is significantly moderated by the level of human capital, a theme that becomes starkly evident when comparing infrastructure and skills indices.

2.3.2 ICT Skills: The Persistent Human Capital Bottleneck

The chronic stagnation in the ICT Skills index found in our data is one of the most strongly validated findings by previous empirical work. A comprehensive reports by Voufo *et al*.(2025); Disse & Sommer, (2020) quantified a massive digital skills gap across Sub-Saharan Africa, identifying it as the single biggest constraint to digital transformation. This is not just about advanced programming skills but also foundational digital literacy. Empirical works by Bello & Ajao (2024); Ejilah (2023) in Nigeria specifically identified a misalignment between university curricula and the practical skills demanded by the digital economy, creating a pool of graduates unfit for the tech workforce and explaining Nigeria's persistently low score.

The case of Morocco, with its high infrastructure but low skills score, is a textbook example of an imbalance that scholars have begun to flag. Friederici *et al*. (2017) argued, based on case studies of tech hubs, that the "leapfrogging" narrative often overlooks the deep, foundational investments in education required to build a sustainable digital economy. Our data provides large-N, longitudinal evidence for their qualitative claim. The slight improvement in Mauritius' skills score aligns with its national focus on high-value services and its investments in specialized training programs, as documented in Draft (2021) reports, suggesting that targeted policy intervention can yield measurable, if gradual, improvements.

2.3.3 Research & Development (R&D): The African Innovation Paradox

The empirical literature on R&D in Africa overwhelmingly confirms the "innovation chasm" revealed by our data. Khomyakov *et al*. (2020) provide empirical evidence from South Africa, showing that its relatively strong performance is attributable to a consolidated system of universities, science councils, and a higher (though still below target) percentage of GDP expenditure on R&D. This directly explains South Africa's outlier status with a consistent score of 0.5.

For other nations, the picture is bleak. Juma (2016) compiled extensive case studies showing that most African economies have historically been structured as extractive enclaves with little incentive for industrial R&D. The consistently near-zero scores for Libya and Botswana in our data are empirical proof of this legacy. A more recent study by Andreoni and Tregenna (2020) on industrial policy found that the lack of R&D capacity is a key factor trapping middle-income African countries in low-value-added activities, unable to climb the technological ladder. The minimal improvements in Nigeria and Ghana's R&D scores towards the end of the period (to 0.4 and 0.3) may reflect the nascent growth of their startup ecosystems, but as Liedong and Rajwani (2022) empirically note, these ecosystems are still largely focused on business model innovation rather than deep-tech R&D, limiting their impact on this particular index.

2.3.4 Industry Activity: Volatility and De-industrialization

The high volatility in the Industry Activity index, particularly for commodity-dependent nations like Nigeria and Algeria, is strongly supported by empirical studies on de-industrialization. Andreoni and Tregenna (2020) empirically demonstrate that premature de-industrialization in many African countries has stripped them of the "learning-by-doing" capacity that is crucial for technological absorption. When the manufacturing base shrinks or remains

underdeveloped, as the data suggests for Algeria (scores of 0), the demand for frontier technologies from the productive sector plummets.

The stable, high scores for Mauritius and Tunisia are also empirically grounded. Studies on export processing zones and manufacturing in Mauritius have shown a more diversified and technologically integrated industrial base. The collapse and failure to recover in Nigeria's score, as seen in the data, can be linked to empirical analyses of the "Dutch Disease" and its effect on crowding out non-oil sectors, making investment in technological upgrading for industry unattractive. This creates a vicious cycle, as identified by Heeks (2022); Foster (2021), where a weak industrial sector cannot demand technology, and a lack of technology keeps the sector weak and uncompetitive.

2.3.5 Access to Finance: Bridging the Qualitative Gap

The empirical literature makes a critical distinction that explains the paradox of high "Access to Finance" scores coupled with low overall readiness. Studies by the Citaristi (2022); Canton (2021) show that while financial inclusion—access to a bank account—is improving, this is a different metric from access to *risk capital*. Liedong and Rajwani (2022) conducted an empirical survey of African entrepreneurs and found that access to venture capital, angel investment, and patient growth capital remains the most significant barrier to scaling technology businesses, particularly those focused on innovation rather than trade.

Therefore, the high and stable scores in the data likely reflect improvements in traditional banking penetration, as documented by the World Bank's Global Findex database. However, this does not contradict the empirical findings of a severe equity gap. The data, in this case, may be measuring a necessary but insufficient condition for frontier technology readiness. The real constraint, as empirically established, is not the availability of debt, but the availability of finance that is willing to bear the high risks associated with pioneering new technologies in uncertain markets.

Synthesis and Identification of the Research Gap

This empirical review confirms that many of the trends observed in the UNCTAD data—infrastructure asymmetry, skills stagnation, the R&D chasm, and industrial volatility—are not novel in isolation. However, previous studies have often focused on single countries, single components, or shorter time frames. The gap in the literature that this study fills is the systemic, comparative, and longitudinal analysis of how these five critical components interact *together* over a 14-year period across a diverse set of eleven African nations. By providing this integrated, data-driven portrait, this research can move beyond diagnosing isolated problems to revealing the systemic interdependencies that have led to the widespread stagnation in frontier technology readiness, thereby offering a more holistic evidence base for policy and investment.

3.0 Research Methodology

This section outlines the systematic approach employed to conduct the comparative assessment of frontier technology readiness across the selected African countries. It details the research design, data source and collection methods, the variables under study, the techniques for data analysis, and the ethical considerations that underpin the study.

3.1 Research Design

This study adopted a quantitative, non-experimental research design focused on descriptive and comparative analysis. The objective was not to manipulate variables but to describe, compare, and interpret existing patterns within the dataset. Specifically, the design can be characterized as:

- **Longitudinal:** The study analyzed data over a 14-year period (2010-2023), allowing for the examination of trends, progress, stagnation, and volatility in the indices over time.
- **Comparative:** The core of the research involved systematically comparing the performance of the eleven selected African countries (Nigeria, Ghana, South Africa, Egypt, Morocco, Mauritius, Algeria, Botswana, Tunisia, Libya, and Gabon) against each other and across the different indices.

This design was deemed most appropriate as it facilitates a robust, data-driven comparison of national innovation systems, enabling the identification of relative strengths, weaknesses, and long-term trajectories that are not apparent in single-year or single-country analyses.

3.2 Data Source and Collection Method

The study relied exclusively on secondary data of the highest international standard.

- **Source:** The data was extracted from the United Nations Conference on Trade and Development (UNCTAD) database, 2025. UNCTAD is a reputable, authoritative body within the United Nations system, and its data on technology and innovation is widely cited in academic and policy circles, ensuring the reliability and validity of the data used.
- **Collection Method:** Data was collected in a structured manner from the provided document, "Overall ICT index of in Africa." The data points for all six indices (Overall ICT Index, ICT Infrastructure, ICT Skills, R&D, Industry Activity, and Access to Finance) for all eleven countries across all fourteen years were systematically compiled into a master dataset for analysis.

3.3 Variables and Measurement

The variables in this study are explicitly defined by the UNCTAD indices. Each index is a composite measure constructed by UNCTAD from various underlying indicators to provide a standardized score between 0 and 1, where a higher score indicates better performance.

- **Dependent Variable:**
  - **Overall Frontier Technology Readiness Index:** A composite index that assesses a country's overall preparedness to use, adopt, and adapt frontier technologies.
- **Independent Variables (Component Indices):**
  - **ICT Infrastructure Index:** Measures the level of ICT infrastructure (e.g., fixed broadband subscriptions, internet bandwidth, mobile network coverage).
  - **ICT Skills Index:** Assesses the level of relevant skills in the population (e.g., tertiary enrolment in STEM fields, digital literacy rates).
  - **Research & Development (R&D) Index:** Evaluates the national capacity for research and development (e.g., R&D expenditure as % of GDP, number of researchers per million people).

- **Industry Activity Index:** Assesses the level of relevant industrial capacity for technology absorption (e.g., high-tech exports, manufacturing value added).
- **Access to Finance Index:** Measures the availability of finance to the private sector (e.g., domestic credit to private sector, venture capital availability).

3.4 Data Analysis Techniques

The compiled data was analyzed using a combination of descriptive and analytical techniques to address the research objectives.

1. **Descriptive Statistical Analysis:** This was the primary mode of analysis. For each country and each index, we calculated:
   - **Means/Averages:** To determine the central tendency of a country's performance over the entire period or specific sub-periods.
   - **Trend Analysis:** To identify the direction and magnitude of change over the 14 years. This involved visual inspection of line graphs and noting periods of improvement, decline, or stagnation.
   - **Ranking:** Countries were ranked for each index based on their most recent (2023) scores and their average scores over the period to identify leaders and laggards.
2. **Comparative Analysis:** This involved side-by-side comparison of:
   - **Cross-country performance** on a single index (e.g., comparing all countries' R&D scores in 2023).
   - **Intra-country performance** across different indices (e.g., comparing Morocco's Infrastructure score with its Skills score to identify asymmetries).
   - **Performance over time** to compare trajectories (e.g., comparing Nigeria's volatile Industry Activity trend with Mauritius's stable one).
3. **Qualitative Interpretation:** The quantitative trends and comparisons were interpreted qualitatively by situating them within the context of the existing theoretical and empirical literature reviewed in theoretical and conceptual frameworks. For instance, a country's stagnant skills index was not just reported but explained by linking it to previous studies on educational deficits in that region.

3.5 Ethical Considerations

As this study utilizes exclusively publicly available, aggregated secondary data from a reputable international organization (UNCTAD), several ethical risks are minimized.

- **Anonymity and Confidentiality:** The data is at the national level and does not contain any personal, identifiable information about individuals. Therefore, concerns about participant anonymity and confidentiality are not applicable.
- **Integrity and Objectivity:** The primary ethical consideration was to maintain intellectual honesty and objectivity in the analysis and interpretation of the data. The researcher committed to:
  - Accurately representing the data without manipulation or misrepresentation.
  - Acknowledging the limitations of the data and the study.

- Providing a balanced interpretation, even when findings contradict popular narratives or initial assumptions.
- Properly citing all sources of literature and the primary data source to avoid plagiarism.

3.6 Limitations of the Methodology

While robust, this methodology has certain limitations:

1. **Aggregation Bias:** The indices are composite measures. A single score may mask significant internal disparities, such as urban-rural divides or inequalities between demographic groups, within a country.
2. **Methodology of Index Construction:** The specific weighting and selection of sub-indicators used by UNCTAD to construct each index are not detailed in the provided dataset. Changes in their methodology over time could theoretically affect comparability, though UNCTAD strives for consistency.
3. **Causality:** The descriptive and correlational nature of this analysis can identify strong associations and bottlenecks but cannot definitively establish causality between the component indices and the overall readiness score.
4. **Scope of Countries:** The study is limited to eleven countries. While they are diverse and significant, the findings cannot be generalized to all 54 African nations.

Despite these limitations, the methodology provides a systematic, transparent, and rigorous framework for achieving the research objectives of describing, comparing, and interpreting the landscape of frontier technology readiness in the selected African countries.

4.0 Results and Discussion

This section presents a detailed analysis of the Frontier Technology Readiness Index, decomposed into its core components, across eleven African countries from 2010 to 2023. The discussion integrates the findings from the data with existing scholarly work to contextualize the performance, trajectories, and underlying challenges of each nation. The composite "Overall ICT Index" serves as our primary indicator of readiness, while the sub-indices—ICT Infrastructure, ICT Skills, Research & Development (R&D), Industry Activity, and Access to Finance—provide the granularity needed to diagnose the strengths and weaknesses within each national ecosystem.

4.1 Overall ICT Index: A Tale of Stagnation and Modest Progress

The Overall ICT Index reveals a landscape of pronounced stratification and general stagnation rather than widespread, dynamic growth (Figure 2). The selected countries can be broadly categorized into three tiers: leaders, middling performers, and laggards.

4.1.1 The Leading Cohort: South Africa, Mauritius, Morocco, and Egypt

South Africa consistently emerges as the regional leader, maintaining a score between 0.6 and 0.7 for most of the period, peaking at 0.7 from 2013 onwards. This leadership is not accidental and is supported by literature emphasizing its relatively advanced digital economy. As noted by Gillwald et al. (2018) in their "After Access" surveys, South Africa, while facing significant inequality, possesses a more mature telecommunications market, higher internet penetration rates, and a more robust regulatory environment compared to most of its peers. This foundational advantage is clearly reflected in the data.

Mauritius and Morocco form a strong second tier within the leaders' group, both maintaining scores around 0.5-0.6. Mauritius's performance aligns with its status as a high-income island economy with a strategic focus on becoming a cyber-island and technology hub. Its consistent scores suggest a stable, if not rapidly accelerating, digital development path. Morocco's progress, particularly its climb to 0.6 from 2012, can be linked to sustained public investment in digital infrastructure, such as the National Strategy for Information Society and Digital Economy (Maroc Digital 2020/2025). A study by Elharissi *et al*. (2025) highlighted that these government-led initiatives have significantly improved broadband connectivity and e-government services, which is corroborated by its steady performance in the overall index.

Egypt maintains a stable but unspectacular score of 0.5 throughout the period. This stagnation, despite its large market and human capital potential, points to systemic inefficiencies. Previous research, such as that by the Barasa & Kiiru (2023); Kamel (2021), has often cited regulatory hurdles, a dominant state-owned telecom operator, and bureaucratic obstacles to digital entrepreneurship as factors holding back Egypt's full digital potential, which is evident in its flatlining overall index.

4.1.2 The Middling and Laggard Cohort: Tunisia, Nigeria, Ghana, Botswana, Algeria, Libya, and Gabon

The most striking feature of this group is the pervasive stagnation. Nigeria, the continent's largest economy, oscillates between 0.3 and 0.4, never surpassing the 0.4 mark for more than a year at a time. This is a critical finding. Despite a vibrant tech startup scene in Lagos, often dubbed "Yabacon Valley," this dynamism is not translating into broad-based frontier technology readiness. This paradox can be explained by the works of Odera (2024); O'Reilly *et al*.(2018), who argued that while Nigerian innovation is bottom-up and entrepreneurial, it operates in spite of, not because of, government policy and national infrastructure. The data suggests that the celebrated startup ecosystem exists within a bubble, unable to lift the national average due to crippling deficits in power, broadband penetration, and digital literacy for the majority of the population.

Ghana mirrors Nigeria's trajectory closely, hovering around 0.3-0.4. Botswana, Algeria, and Libya also fall into this range, with Libya showing particular volatility, dropping to 0.3 in several years, likely reflecting the severe impact of political instability and conflict on its technological foundations. Tunisia, often praised for its educated populace, shows a surprising decline from 0.6 to 0.5 in the final years, a worrying signal that requires further investigation into its recent economic and political challenges.

Gabon's consistent position at the bottom of the table (0.3-0.4) underscores the challenges faced by smaller, resource-dependent economies in diversifying into the digital space. The data paints a clear picture: for most of these countries, the last decade has been marked by a "digital stall," where initial gains from mobile voice penetration have not been successfully parlayed into a deeper, frontier-technology-ready digital transformation (Asongu & Nwachukwu, 2016).

4.2 Deconstructing Readiness: An Analysis of the Component Indices

To understand the drivers behind the overall index performance, a deep dive into the sub-indices is essential.

4.2.1 ICT Infrastructure Index: The Foundational Divide

The ICT Infrastructure Index reveals the most dynamic changes and the clearest divide between nations (Figure 3). South Africa, Morocco, and Mauritius demonstrate significant improvement

and high performance. Morocco, in particular, shows a remarkable journey from 0.6 in 2010 to a stable 0.7 from 2012 onwards. This aligns with its national broadband strategy and investments in fibre optic networks. South Africa's climb to 0.7 by 2019 reflects its relatively advanced 4G and fibre-to-the-business infrastructure, though rural-urban disparities remain a concern, a point consistently raised in South African ICT policy reviews (Venter & Daniels, 2020).

In stark contrast, Nigeria's infrastructure score is highly volatile, oscillating between 0.4 and 0.6 before settling at 0.5 in 2023. This volatility is symptomatic of an unstable policy environment and inconsistent investment. The findings of Nnawulezi *et al*. (2023) on the quality of service in Nigeria's telecom sector support this, citing issues like multiple taxation, vandalism of infrastructure, and inadequate energy supply as perennial constraints. Ghana shows a more positive, though slower, trajectory, gradually improving from 0.3 to 0.6 by 2023, reflecting steady, incremental progress in network expansion.

A critical observation is that for countries like Nigeria and Ghana, their infrastructure scores in later years (0.5 and 0.6 respectively) are often higher than their overall ICT index (0.4). This indicates that while tangible network infrastructure may be improving, other soft components—skills, R&D, and industrial absorption—are dragging the overall readiness down.

4.2.2 ICT Skills Index: The Pervasive Human Capital Bottleneck

The ICT Skills Index presents perhaps the most alarming and stagnant dataset (Figure 4). With the exception of Mauritius, which shows a slight improvement to 0.6, and South Africa which holds steady at 0.5, nearly all countries are trapped at low scores between 0.3 and 0.5. Nigeria oscillates around 0.3-0.4, Ghana is stuck at 0.3, and Morocco, despite its infrastructure gains, remains at a low 0.4.

This chronic skills deficit is a central theme in African digital development literature. A report by Voufo *et al*.(2025) estimated a massive shortage of digital skills across the continent, constraining productivity and innovation. The data powerfully confirms this. Morocco's high infrastructure score coupled with a low skills score (0.7 vs. 0.4 in 2023) exemplifies a "hardware without software" paradox. Building networks is futile if the population lacks the skills to utilize them for advanced applications. This finding is supported by Asongu and Nwachukwu (2016), who argue that without complementary investments in education and digital literacy, infrastructure investments yield diminishing returns for inclusive development and technological upgrading.

The consistently low scores for Ghana and Nigeria, despite their numerous universities, point to a critical misalignment between educational curricula and the demands of a digital economy. Studies have shown that graduates often lack practical, job-ready digital skills, creating a vacuum that the private sector struggles to fill (Bello, & Ajao, 2024).

4.2.3 Research & Development (R&D) Index: The Innovation Chasm

The R&D Index exposes the deepest chasm in the frontier technology readiness landscape (Figure 5). South Africa is the undisputed leader, maintaining a perfect 0.5 from 2010 to 2023. This is consistent with its well-documented research ecosystem, featuring world-class universities, science councils, and a relatively high proportion of GDP spent on R&D compared to other African nations (Khomyakov *et al*., 2020). Egypt is a distant second, improving from 0.4 to 0.5, reflecting its historical strength in engineering and a large public research sector.

For the rest, the scores are abysmally low. Nigeria and Ghana barely reach 0.4 and 0.3 respectively by 2023, having started at 0.2. Morocco shows some improvement to 0.5, aligning with its national

innovation strategy. However, the scores for Algeria (0.3), Botswana (0.2), and Libya (0.2) indicate a near-total absence of a meaningful R&D culture geared towards frontier technologies.

This data provides empirical evidence for the "innovation periphery" status of most African economies. The work of Juma (2016) emphasized that sustained economic advancement is impossible without domestic technological learning and adaptation, which is fueled by R&D. The near-flat lines for most countries in this index suggest a critical missing link. Without a strong R&D base, these countries are condemned to be mere consumers and importers of technology, unable to adapt, create, or own the next generation of technological solutions relevant to their local contexts. This finding starkly contrasts with the narrative of "leapfrogging," suggesting that without building foundational innovation capacity, leapfrogging remains a mirage (Friederici *et al*., 2017).

4.2.4 Industry Activity Index: Volatility and De-industrialization Concerns

The Industry Activity Index is the most volatile of all (Figure 6), with dramatic peaks and troughs, particularly for Nigeria and Algeria. Nigeria's score plummets from 0.4 in 2010 to 0.1 in 2016 before recovering slightly to 0.2. Algeria's score hits 0 in 2013-2014 before a minimal recovery. This extreme volatility is indicative of economies heavily reliant on commodities (oil and gas), where industrial activity is susceptible to global price shocks and domestic policy instability.

Mauritius and Tunisia show the most resilience and highest scores in this category, reflecting their more diversified industrial bases and stronger integration into global manufacturing and services value chains. South Africa maintains a respectable 0.6, consistent with its more complex industrial structure.

The poor performance of Nigeria and others in this index is critical. It suggests that the productive sectors of these economies are not actively integrating or demanding frontier technologies. This lack of "demand-pull" from industry creates a weak incentive for innovation and technology development. As argued by Andreoni and Tregenna (2020), the loss of industrial capacity (de-industrialization) in many African countries has severely weakened their ability to master and adapt technologies, creating a vicious cycle of low productivity and low technological absorption. The data here provides a strong, quantitative confirmation of this thesis.

4.2.5 Access to Finance Index: A Misleading Picture of Stability

The Access to Finance Index shows remarkably high and stable scores for most countries (Figure 7), with South Africa, Morocco, Mauritius, and Tunisia consistently at 0.9. This seems to contradict the widespread narrative of a financing gap for SMEs and tech startups in Africa. However, this index likely measures the breadth of traditional financial services (e.g., bank accounts) rather than the availability of *risk capital* suitable for technology ventures.

The high scores, therefore, present a misleading picture. While basic financial inclusion may be improving, the specific type of finance needed for high-risk, high-growth frontier technology businesses—venture capital, angel investing, growth equity—remains scarce outside of a few hubs like South Africa, Kenya, and Nigeria. The work of Liedong and Rajwani (2022) on financing constraints for African startups confirms that access to patient, risk-tolerant capital is a primary bottleneck. Thus, the stability of this index masks a critical qualitative deficiency in the financial ecosystem for frontier technology, explaining why high "access to finance" scores do not automatically translate to high overall readiness in countries like Nigeria and Ghana.

4.3 Synthesis and Cross-Country Comparative Analysis

Synthesizing these indices allows for a nuanced diagnosis:

- **South Africa:** A balanced leader. Its strength is built on a solid foundation of good infrastructure (0.7), the continent's best R&D (0.5), and a strong industrial base (0.6). Its relative weakness is in skills (0.5), which could cap its future potential.
- **Morocco:** The "Infrastructure Powerhouse." Its high infrastructure score (0.7) drives its overall readiness, but this is undermined by significant weaknesses in skills (0.4) and, until recently, R&D (0.5). Its challenge is to translate infrastructure into human capital and innovation.
- **Mauritius & Tunisia:** The "Stable Performers." They show balanced profiles with relatively strong industry and finance scores. Tunisia's recent decline in the overall and skills index is a red flag that warrants further study.
- **Nigeria & Ghana:** The "Stalled Giants." Their story is one of paradox. They possess vibrant tech ecosystems and improving infrastructure, but these are nullified by a catastrophic combination of low skills (0.3-0.4), negligible R&D (0.3-0.4), and a weak, volatile industrial sector. Their digital futures are held hostage by these systemic failures.
- **Botswana, Algeria, Libya, Gabon:** The "Resource-Constrained." Their low scores across most indices, particularly R&D and industry, reflect economies struggling to diversify beyond natural resources and build a holistic digital innovation system, further hampered in Libya's case by conflict.

5.0 Conclusion, Recommendations, and Policy Implications

5.1 Conclusion

This study set out to conduct a comparative assessment of frontier technology readiness across eleven African nations from 2010 to 2023. The analysis of the UNCTAD index data reveals a landscape characterized not by widespread, dynamic growth, but by pronounced stratification, pervasive stagnation, and critical systemic imbalances. In other words, the comparative assessment reveals that frontier technology readiness in Africa is not a monolithic story but a complex mosaic of divergent paths. The data robustly demonstrates that progress is not guaranteed by isolated improvements in infrastructure or a buzzing startup scene in a single city. The overarching conclusion is that the promise of a digitally transformed Africa is being held hostage by foundational weaknesses in its national innovation systems, with human capital and research capacity emerging as the most binding constraints. Succinctly, true readiness is a multivariate function, and the continent's primary constraint has shifted from a pure infrastructure gap to a more profound human capital and innovation gap, as evidenced by the stagnant ICT Skills and R&D indices.

The findings robustly demonstrate that South Africa remains the continent's relative leader, boasting a balanced profile with strengths in infrastructure, R&D, and industry. Mauritius, Morocco, and Egypt form a second tier, yet each exhibits a critical asymmetry; Morocco's advanced infrastructure is undermined by a chronic skills deficit, a clear case of "hardware without software." The most concerning narrative belongs to the "stalled giants," Nigeria and Ghana, whose vibrant tech ecosystems fail to elevate their national readiness due to catastrophically low and stagnant scores in R&D and skills, coupled with a volatile industrial sector. The performance of other nations like Botswana, Algeria, Libya, and Gabon underscores the difficulty resource-dependent economies face in diversifying into a knowledge-based digital economy.

Theoretically, the study challenges the simplistic "leapfrogging" narrative. The empirical evidence aligns more closely with the National Systems of Innovation framework, confirming that technological progress is a multivariate function requiring synergistic interaction between all components. The data validates the Capabilities Approach, showing that without expanding the population's capabilities (skills), investments in resources (infrastructure) yield diminishing returns. Ultimately, the study concludes that Africa's readiness gap is fundamentally a human capital and innovation gap. Without a strategic, coordinated, and long-term focus on fixing these fundamentals, the continent risks being confined to the periphery of the Fourth Industrial Revolution, consuming technologies it does not create or truly own.

5.2 Recommendations

Based on the specific weaknesses and imbalances identified, the following targeted recommendations are proposed:

A. For Governments and National Policymakers:

1. **Prioritize Education and Skills Revolution:** Move beyond curricular reforms to a fundamental overhaul of education systems.

   - **For Nigeria, Ghana, and Morocco:** Integrate computational thinking, digital literacy, and STEM education from primary levels. Forge industry-academia partnerships to ensure university curricula are aligned with market needs, addressing the specific skills gap identified in their indices.

   - **For all countries:** Launch massive, publicly-funded digital upskilling and reskilling programs targeted at the current workforce.

2. **Catalyze Investment in R&D:**

   - **For Nigeria, Ghana, Algeria, and Botswana:** Fulfill the African Union's target of allocating at least 1% of GDP to R&D. Create competitive public research funds and introduce tax incentives for private sector R&D, especially in areas of local relevance like agritech, cleantech, and healthtech.

   - **For South Africa and Egypt:** Build on their existing strengths by increasing funding for translational research and commercializing university-held patents.

3. **Develop Integrated National Digital Strategies:** Create or update national digital economy strategies that explicitly address the interlinkages between the five pillars. An infrastructure plan must be coupled with a parallel skills development plan and a strategy to stimulate industrial demand.

4. **Strengthen the Enabling Environment:** For countries with volatile industry indices like Nigeria and Algeria, focus on macroeconomic stability, reliable power supply, and policies that incentivize investment in non-oil sectors to create a stable demand-pull for technology.

B. For International Development Partners and Regional Bodies (AU, AfDB):

1. **Facilitate Cross-Border Learning:** Establish peer-learning platforms where countries like Morocco can share infrastructure deployment models, while Mauritius and South Africa can share insights on skills and R&D policy.

2. **Finance Public Goods:** Direct development funding towards regional public goods that are too costly for single nations, such as regional data clouds, high-performance computing centers, and Pan-African digital literacy initiatives.

3. **Support Policy Harmonization:** Assist in harmonizing digital policies and regulations across regions to create larger markets that can attract more significant R&D and infrastructure investments.

C. For the Private Sector and Academia:

1. **Deepen Collaboration:** Industry should actively partner with universities to co-create curricula, fund chairs, and offer internship programs to bridge the skills gap directly.

2. **Focus on "Demand-Pull" Innovation:** Large corporations should explicitly signal their demand for locally developed tech solutions, creating a market that pulls innovation from startups and research labs.

3. **Develop Innovative Financing Models:** The financial sector must move beyond traditional debt and develop venture capital, private equity, and impact investment vehicles tailored to the high-risk, long-term nature of deep-tech startups.

5.3 Policy Implications

The findings of this study carry profound implications for policymaking, shifting the focus from isolated interventions to systemic transformation.

1. **From Connectivity to Capabilities:** The primary policy implication is that the era of prioritizing infrastructure above all else is over. The new imperative is a **dual-track policy** that continues to close the infrastructure gap while launching a parallel, aggressive national mission to close the skills and R&D gap. Investment in a fibre optic cable must be matched by a proportional investment in the teachers and researchers who will maximize its value.

2. **The Need for "Systemic Policy Orchestration":** Policymakers must act as system orchestrators rather than siloed managers. This requires breaking down ministerial silos. The Ministry of ICT must work inseparably with the Ministries of Education, Science & Technology, and Industry. A "Whole-of-Government" approach is non-negotiable for fostering the synergistic interactions required by a National Innovation System.

3. **Strategic Patience and Long-Term Commitment:** Building technological readiness is not a short-term electoral project. The stagnation evident in the 14-year data is a result of policy inconsistency and a lack of long-term vision. Policies must be insulated from political cycles, with 20-30 year horizons for education and R&D strategies, acknowledging that the payoffs are generational but foundational.

4. **Targeted, Context-Specific Interventions:** A one-size-fits-all policy is doomed to fail. The analysis provides a clear diagnostic for each country:

- **For Morocco:** Policy must pivot sharply towards skills and education.
- **For Nigeria and Ghana:** The urgent focus must be on stabilizing the industrial environment and making foundational investments in R&D.
- **For South Africa:** The challenge is to address its skills bottleneck and spatial inequalities to leverage its strong base for more inclusive growth.
- **For Libya and conflict-affected states:** The foundational policy is the restoration of security and governance, without which no digital development is possible.

In conclusion, this study provides a clear and urgent message: Africa's digital future hinges on its ability to confront its human capital and innovation crisis. The data has spoken, revealing a decade of lost potential for many. The path forward requires not just more investment, but smarter, more integrated, and more patient policymaking that builds the entire innovation system in concert. By heeding this evidence, African nations can transition from being passive consumers of technological change to becoming active architects of their own destinies in the global digital economy.

ÖZET

Fitoremediasyon, çevresel kirliliği azaltmak için bitkilerin biyolojik mekanizmalarını kullanan sürdürülebilir bir teknolojidir. Bu yöntem, kirleticilerin topraktan uzaklaştırılmasında ekonomik ve çevre dostu bir çözüm sunar. *Cymbopogon citratus* (limon otu), *Thymus vulgaris* (kekik), *Salvia officinalis* (adaçayı) ve *Taraxacum officinale* (karahindiba) gibi tıbbi ve aromatik bitkiler, fitoremediasyon uygulamalarında önemli bir yere sahiptir. Limon otu, geniş kök sistemi sayesinde ağır metallerin ve petrol türevli kirleticilerin temizlenmesinde etkili bir bitkidir. Ayrıca kök salgıları, toprak mikrobiyal aktivitelerini destekleyerek arıtım sürecine katkıda bulunur. Kekik, kurşun (Pb) ve kadmiyum (Cd) gibi ağır metallerin fitostabilizasyonunda başarılıdır; aynı zamanda antimikrobiyal ve antioksidan özellikleriyle çevreye ek katkılar sağlar. Adaçayı, kadmiyum (Cd) ve çinko (Zn) gibi kirleticilerin biyolojik parçalanmasını hızlandırarak toprak enzim aktivitelerini artırır. Karahindiba ise hiperakümülatör özelliği sayesinde kadmiyum (Cd) ve nikel (Ni) gibi ağır metallerin topraktan uzaklaştırılmasında yüksek etkinlik gösterir. Bu bitkiler, tıbbi ve aromatik özelliklerinin yanı sıra çevresel sürdürülebilirliğe de katkı sağlamaktadır. Güncel araştırmalar, genetik mühendisliği ve mikrobiyal destekli yaklaşımların bu bitkilerin fitoremediasyon etkinliğini artırabileceğini göstermektedir. Küresel ölçekte fitoremediasyonun yaygınlaştırılması, eğitim ve bilinçlendirme programlarıyla mümkün olup, bu yöntem uzun vadede çevre koruma çabalarına büyük katkılar sağlayabilir.

Anahtar kelime: Fitoremediasyon, ağır metal, tıbbi ve aromatik bitkiler, çevresel sürdürülebilirlik,

PHYTOREMEDIATION: THE ROLE OF LEMONGRASS, THYME, SAGE, AND DANDELION IN COMBATING ENVIRONMENTAL POLLUTION

ABSTRACT

Phytoremediation is a sustainable technology that utilizes the biological mechanisms of plants to reduce environmental pollution. This method offers an economical and eco-friendly solution for the removal of contaminants from soil. Medicinal and aromatic plants such as *Cymbopogon citratus* (lemongrass), *Thymus vulgaris* (thyme), *Salvia officinalis* (sage), and *Taraxacum officinale* (dandelion) play a significant role in phytoremediation applications. Lemongrass is an effective plant for the remediation of heavy metals and petroleum-derived pollutants due to its extensive root system. In addition, its root exudates enhance microbial activity in the soil, thereby contributing to the overall remediation process. Thyme is effective in the phytostabilization of heavy metals such as lead (Pb) and cadmium (Cd), and its antimicrobial and antioxidant properties provide additional environmental benefits. Sage accelerates the biodegradation of pollutants such as cadmium (Cd) and zinc (Zn) while enhancing soil enzyme activities. Dandelion, with its hyperaccumulator characteristics, exhibits high efficiency in removing heavy metals such as cadmium (Cd) and nickel (Ni) from the soil. Beyond their phytoremediation potential, these plants also contribute to environmental sustainability through their medicinal and aromatic properties. Recent studies indicate that genetic engineering and microbial-assisted techniques can enhance the phytoremediation efficiency of these species. On a global scale, the widespread adoption of phytoremediation can be achieved through education and awareness programs. In the long term, this approach holds great potential to support environmental protection and ecosystem restoration efforts.

1.GİRİŞ

Günümüz sanayileşme, madencilik ve yoğun tarımsal faaliyetler, ağır metaller, petrol türevli kirleticiler ve çeşitli organik bileşikler gibi zararlı maddelerin çevresel ortamlarda hızla birikmesine neden olmaktadır. Bu durum, sadece çevresel kirliliği artırmakla kalmayıp, ekosistemlerin hassas dengesini de ciddi şekilde tehdit etmektedir (Khan ve ark., 2013; Sarma ve Sarma, 2019). Ağır metallerin ve organik kirleticilerin toprakta birikimi, bitkilerde toksisiteye, mikrobiyal aktivitenin azalmasına ve besin döngüsünün bozulmasına yol açmaktadır (Alloway, 2013; Kabata-Pendias, 2011). Ayrıca bu kirleticiler, gıda zinciri yoluyla insan sağlığını da tehdit ederek ciddi halk sağlığı sorunlarına neden olmaktadır (Nagajyoti ve ark., 2010). Küresel çevre sorunlarının giderek arttığı bu dönemde, kirlilikle mücadelede yenilikçi ve sürdürülebilir çözümler bulmak büyük önem taşımaktadır (Bradl, 2005; Gherghel ve ark., 2017).

Bu nedenle fitoremediasyon, çevreye yayılan bu kirleticileri temizlemek için bitkilerin doğal biyolojik süreçlerini kullanan etkili ve çevre dostu bir yöntem olarak öne çıkmaktadır (Pilon-Smits, 2005; Ali ve ark., 2013). Bu teknoloji, ağır metaller ve organik kirleticiler gibi zararlı maddelerin toprak ve su ekosistemlerinden uzaklaştırılmasında sürdürülebilir bir çözüm sunmaktadır (Sarma, 2011; Shah ve Daverey, 2020; Sharma ve ark., 2021). Fitoremediasyon, diğer geleneksel arıtma yöntemlerine kıyasla daha düşük maliyetli, estetik açıdan daha hoş ve ekosisteme zarar vermeyen bir alternatif sunmaktadır (Salt ve ark., 1998; Alkorta ve Garbisu, 2001).

Fitoremediasyonun başarısı, seçilen bitki türünün morfolojik, fizyolojik ve biyokimyasal özelliklerinin yanı sıra toprak tipi, kirletici konsantrasyonu ve rizosferdeki mikrobiyal etkileşimlerle yakından ilişkilidir (Prasad ve Freitas, 2003; Sessitsch ve ark., 2013; Glick, 2010). Bu kapsamda, bitki–mikroorganizma işbirliği, özellikle ağır metallerin biyoyararlılığını artırarak kirletici alımını ve tolerans mekanizmalarını güçlendirmektedir (Mourato ve ark., 2015; Singh ve Prasad, 2015). Ayrıca, bazı bitkiler stres koşullarında sekonder metabolit üretimini artırarak hem kendi savunma sistemlerini güçlendirmekte hem de çevredeki toksik elementlerin kimyasal formlarını dönüştürebilmektedir (Rao ve ark., 2020; Chen ve ark., 2022). Bu nedenle, fitoremediasyon uygulamalarında çevresel koşullara uyum sağlayabilen, yüksek biyokütle üretebilen ve mikrobiyal etkileşimi destekleyen bitki türlerinin seçimi büyük önem taşımaktadır. Bu bağlamda, özellikle tıbbi ve aromatik bitkiler, fitoremediasyon alanında hem çevresel temizliğe hem de ekonomik faydalara katkı sağlayan özel bir kategoriye sahiptir. Limon otu (*Cymbopogon citratus*), kekik (*Thymus vulgaris*), adaçayı (*Salvia officinalis*) ve karahindiba (*Taraxacum officinale*), bu nedenle oldukça önemli bitkilerdir (Doty, 2008; Pilon-Smits ve Pilon, 2000). Bu bitkiler, uçucu yağ içeriği ve sekonder metabolit üretim kapasitesi sayesinde hem kirletici stresi azaltabilir hem de toprak mikrobiyal çeşitliliğini artırabilir (Mourato ve ark., 2015; Rai ve ark., 2021). Ayrıca bu türlerin sahip olduğu fitokimyasal bileşikler, metal iyonlarının şelatlaşmasında ve toksik etkilerin hafifletilmesinde rol oynayabilir (Nandakumar ve ark., 2019; Singh ve Prasad, 2015). Örneğin limon otu, kadmiyum ve kurşun gibi ağır metallere karşı yüksek tolerans sergilerken; kekik ve adaçayı, antioksidan enzim aktivitelerini artırarak metal kaynaklı oksidatif stresi azaltmaktadır (Chen ve ark., 2022; Rao ve ark., 2020). Karahindiba ise hiperakümülatör özelliği sayesinde metal taşınımında genetik olarak avantajlı bir tür olarak tanımlanmaktadır (Banik ve ark., 2021). Dolayısıyla, bu bitkilerin fitoremediasyon süreçlerinde kullanılması, çevresel sorunların çözümüne çift yönlü ve entegre bir katkı sağlama potansiyeli taşımaktadır. Son yıllarda yapılan çalışmalar, bu bitkilerin genetik olarak iyileştirilmesi ve mikrobiyal konsorsiyumlarla desteklenmesi halinde, fitoremediasyon etkinliklerinin önemli ölçüde artabileceğini göstermektedir (Cao ve ark., 2020; Kumar ve ark., 2022). Bu yaklaşımlar, hem toprak sağlığının yeniden kazanılmasını hem de sürdürülebilir ekosistem yönetimini mümkün kılmaktadır (Zhao ve ark., 2021).

2.LİMON OTUNUN (*Cymbopogon citratus*) FİTOREMEDİASYONDAKİ ROLÜ

Limon otu (*Cymbopogon citratus*), özellikle geniş ve yoğun kök sistemi sayesinde petrol türevli hidrokarbonların biyolojik parçalanmasında ve ağır metallerin fitostabilizasyonunda yüksek etkinlik göstererek ön plana çıkmaktadır (Cheng ve ark., 2023; Gautam, 2017). Bitkinin rizosferinde salgıladığı bileşikler aracılığıyla mikrobiyal aktiviteyi teşvik etme özelliği, poliaromatik hidrokarbonlar gibi karmaşık organik kirleticilerin giderilmesinde kritik bir rol oynamaktadır (Khan ve ark., 2013; Ahmad ve ark., 2021). Pilon-Smits (2005), limon otunun kurşun (Pb), kadmiyum (Cd) ve çinko (Zn) gibi metallerin fitostabilizasyonunda etkili olduğunu, aynı zamanda kök salgıları aracılığıyla toprak mikrobiyotasını desteklediğini bildirmiştir. Mikrobiyal destekli fitoremediasyon teknikleri, bu etkinliği artırarak limon otunun çevresel kirlilikle mücadeledeki rolünü artırmaktadır (Abou-Shanab ve ark., 2007; Zhang ve ark., 2020; Doke ve Sajadi, 2021). Ayrıca limon otunun yüksek buharlaşma kapasitesi ve biyokütle üretimi, kirleticilerin bitki bünyesinde seyreltilmesini sağlayarak fitostabilizasyon etkinliğini güçlendirmektedir (Shukla ve ark., 2022).

Son beş yılda yapılan çalışmalar da limon otunun bu potansiyelini pekiştirmektedir. Örneğin, Azam ve ark. (2021), limon otunun ağır metal stresi altındaki fizyolojik adaptasyon mekanizmalarını incelemiş ve bitkinin bu tür kirleticilere karşı yüksek toleransını ortaya koymuştur. Liang ve ark. (2022), limon otunun petrolle kirlenmiş topraklardaki biyoremediasyon kapasitesini artırmak için mikroorganizmalarla sinerjik etkilerini araştırmıştır. Ayrıca, Sharma ve ark. (2023), limon otunun pestisit kalıntılarının topraktan uzaklaştırılmasındaki rolünü değerlendirmiş, bitkinin organik kirleticilere karşı geniş spektrumlu bir arıtma yeteneğine sahip olduğunu belirtmiştir. Kumar ve ark. (2024) ise, limon otunun farklı ağır metal kombinasyonlarıyla kirlenmiş topraklardaki fitostabilizasyon performansını karşılaştırmalı olarak inceleyerek, çoklu kirletici koşullarında dahi etkinliğini sürdürdüğünü göstermiştir. Son olarak, Hussain ve ark. (2025) tarafından yapılan bir çalışma, limon otunun madencilik faaliyetlerinden kaynaklanan kirliliğin giderilmesinde umut vadeden bir bitki olduğunu ortaya koymuştur.

3.KEKİĞİN (*Thymus vulgaris*) FİTOREMEDİASYONDAKİ ROLÜ

Kekik (*Thymus vulgaris*), fitoremediasyon süreçlerinde, özellikle ağır metallerin fitostabilizasyonunda etkili bir bitki olarak öne çıkmaktadır. Nadjafi (2014), kekiğin kurşun (Pb) ve kadmiyum (Cd) gibi metallerin topraktan uzaklaştırılmasında önemli bir rol oynadığını belirtmiştir. Kekik, kök salgıları aracılığıyla toprak mikrobiyotasını zenginleştirerek kirleticilerin biyoyararlanımını artırmaktadır (Abou-Shanab vd., 2007). Ayrıca, kekik bitkisinin antimikrobiyal ve antioksidan özellikleri, çevresel stres faktörlerine karşı dayanıklılığını artırmaktadır (Hammoudi Halat vd., 2022). Bu özellikler, bitkinin kirli ortamlarda hayatta kalma ve arıtma kapasitesini doğrudan etkilemektedir. İftihar vd. (2023), kekik bitkisinin toprak iyileştirme süreçlerinde etkili olduğunu ve fitoremediasyon kapasitesini artırdığını bildirmiştir. Kekik, özellikle düşük ila orta düzeyde kirlenmiş alanlarda toprak sağlığını iyileştirme potansiyeline sahiptir (Pramanik ve Bera, 2022; Ghorbani ve ark., 2022). Ek olarak, kekik uçucu yağlarındaki timol ve karvakrol gibi bileşenlerin, ağır metal kaynaklı oksidatif stresi azaltmada antioksidan mekanizmaları güçlendirdiği bildirilmektedir (Al-Huqail ve ark., 2020).

Son yıllarda yapılan çalışmalar da bu potansiyeli desteklemektedir. Ali ve ark. (2020), kekik türlerinin farklı ağır metal kontaminasyon seviyelerindeki performansını değerlendirmiş ve yüksek bir fitoremediasyon kapasitesine sahip olduğunu ortaya koymuştur. Benzer şekilde, Khan ve ark. (2021b), kekiğin ağır metal birikimi ve stres toleransı mekanizmaları üzerine yaptığı araştırmada, bu bitkinin çevresel iyileştirme stratejileri için umut vadeden bir bitki olduğunu vurgulamıştır. Ek olarak, Rana ve ark. (2021), kekik esansiyel yağlarının fitoremediasyon sürecindeki sinerjistik etkilerini incelemiş, bu yağların bitkinin ağır metal

toleransını artırabileceğini belirtmiştir. Murtaza ve ark. (2023), kekiğin topraktaki petrol hidrokarbonları gibi organik kirleticilerin parçalanmasına yardımcı olan mikrobiyal aktiviteyi nasıl desteklediğini araştırmıştır. Son olarak, Hassan ve ark. (2024), kekik bitkisinin ağır metallerle kirlenmiş sulak alanlardaki adaptasyon yeteneğini ve arıtma performansını değerlendiren yeni bir çalışma sunmuştur.

4.ADAÇAYININ (*Salvia officinalis*) FİTOREMEDİASYONDAKİ ROLÜ

Adaçayı, ağır metallerin ve organik kirleticilerin temizlenmesinde etkili bir bitki olarak kabul edilmektedir. Mokhtari ve ark. (2023), adaçayının kadmiyum (Cd) ve çinko (Zn) gibi metallerin fitostabilizasyonunda başarılı olduğunu ve toprak enzim aktivitelerini artırarak kirleticilerin biyolojik parçalanmasını desteklediğini belirtmiştir. Toprak enzim aktivitesindeki bu artış, özellikle organik kirleticilerin daha hızlı mineralizasyonuna yol açmaktadır (Bajpai ve Pandey, 2019). Adaçayının kök salgıları, mikrobiyal toplulukları zenginleştirerek kirleticilerin biyoyararlanımını artırmaktadır (Ismail, 2019). Ayrıca, adaçayının güçlü antimikrobiyal ve antioksidan bileşenleri, çevresel toksisiteye karşı bitkinin direncini artırırken, arıtma süreçlerine de katkı sağlamaktadır (Mokhtari ve ark., 2023). Son araştırmalar, adaçayının ağır metallerle kirlenmiş topraklarda rizosferik mikrobiyal toplulukları modüle etme yeteneğini de vurgulamaktadır (Khan ve ark., 2021a; Alaboudi ve ark., 2021). Ayrıca, adaçayının yüksek sekonder metabolit üretimi, özellikle flavonoidler ve fenolik bileşikler aracılığıyla metal iyonlarının şelatlaşmasını kolaylaştırarak toksisiteyi azaltmaktadır (Sytar ve ark., 2019).

Ma ve ark. (2022), adaçayının farklı ağır metal konsantrasyonlarındaki büyüme tepkilerini ve metal birikim kapasitesini incelemiş, bitkinin çevresel iyileştirmedeki rolünü pekiştirmiştir. Benzer şekilde, Li ve ark. (2020), adaçayının rizofitodegradasyon yeteneğini detaylı olarak araştırmış ve toprak organik kirleticilerinin giderilmesindeki etkinliğini göstermiştir. Ayrıca, Ahmed ve ark. (2021), adaçayının tuz stresi altındaki ağır metal fitoremediasyon etkinliğini değerlendirerek, zorlu çevresel koşullarda dahi adaptasyon yeteneğine dikkat çekmiştir. Son bulgular, adaçayının aynı zamanda karbon sekestrasyonu potansiyeli yüksek türlerden biri olduğunu, bu nedenle hem kirlilik kontrolü hem de iklim değişikliğiyle mücadelede çift yönlü fayda sunduğunu göstermektedir (Petrova ve ark., 2022).

5.KARAHİNDİBANIN (*Taraxacum officinale*) FİTOREMEDİASYONDAKİ ROLÜ

Karahindiba (*Taraxacum officinale*), hiperakümülatör bir bitki olarak kadmiyum (Cd) ve nikel (Ni) gibi ağır metallerin topraktan uzaklaştırılmasında etkili bir araçtır (Kopittke ve ark., 2010; Salt ve ark., 1995). Yu ve ark. (2023), karahindibanın kök salgılarının toprak mikrobiyotasını zenginleştirerek metallerin biyoyararlanımını artırdığını bildirmiştir. Lu ve ark. (2021), karahindibanın toprak enzim aktivitelerini artırarak kirleticilerin biyolojik parçalanmasını desteklediğini belirtmiştir. Park ve Oh (2023), karahindibanın çevresel kirlilikle mücadelede hiperakümülatör özellikleri sayesinde etkili bir fitoremediasyon aracı olduğunu göstermektedir. Karahindibanın metal toleransı ve biriktirme yeteneği, toprak pH'ı ve organik madde içeriği gibi faktörlerden etkilense de özellikle maden sahaları gibi ağır metal kirliliğinin yaygın olduğu alanlarda büyük potansiyel sunmaktadır (Raskin ve ark., 1997). Yeni çalışmalar, karahindibanın genetik modifikasyon yoluyla ağır metal toleransının ve biriktirme kapasitesinin artırılabileceğini de işaret etmektedir (Ma ve ark., 2022). Chen ve ark. (2020), karahindibanın kadmiyum alımını ve detoksifikasyon mekanizmalarını detaylı olarak incelemiş, bitkinin stres koşulları altında dahi etkinliğini koruduğunu göstermiştir. Wang ve ark. (2021) ise, karahindibanın nikel kirliliğine sahip topraklarda fitoremediasyon kapasitesini değerlendirmiş ve yüksek bir biriktirme yeteneği saptamıştır. Ayrıca, Zhang ve ark. (2022), karahindibanın ağır metal stresi altındaki fizyolojik ve moleküler tepkilerini analiz ederek, bitkinin adaptasyon mekanizmalarına dair önemli bilgiler sunmuştur. Ek olarak, karahindibanın derin kök sistemi

sayesinde yüzeysel ve derin toprak tabakalarındaki kirleticilere erişebilmesi, onu uzun vadeli toprak restorasyon stratejileri için ideal bir tür haline getirmektedir (Silva ve ark., 2023).

6.SONUÇ VE ÖNERİLER

Limon otu, kekik, adaçayı ve karahindiba gibi tıbbi ve aromatik bitkiler, fitoremediasyon sürecinde oldukça etkili ve çevresel açıdan önemli araçlardır. Bu bitkiler, kurşun (Pb), kadmiyum (Cd), çinko (Zn), nikel (Ni) ve petrol türevli kirleticiler gibi çevre için toksik olan maddelerin toprak ve sudan uzaklaştırılmasında başarıyla kullanılmaktadır. Bu süreçte kullanılan mekanizmalar arasında fitostabilizasyon, hiperakümülasyon ve biyolojik parçalanma gibi doğal adaptasyon yöntemleri öne çıkmaktadır. Mikrobiyal destekli fitoremediasyon ise, bu bitkilerin etkinliğini daha da artırarak hem metal hem de organik kirleticilerin temizlenme hızını önemli ölçüde iyileştirmektedir (Glick, 2003; Sarma ve ark., 2021).

Limon otu, geniş kök sistemiyle petrol türevli kirleticilerin ve ağır metallerin toprağa olan etkilerini azaltmada önemli bir rol oynamaktadır. Çevresel stres koşullarına karşı oldukça dayanıklı olup, aynı zamanda toprak mikrobiyotasını destekleyen kök salgıları üretmektedir. Kekik, kurşun ve kadmiyum gibi ağır metallerin toprakta stabilize edilmesine yardımcı olurken, antimikrobiyal ve antioksidan özellikleriyle çevresel dayanıklılığı artırmaktadır. Adaçayı, topraktaki enzim aktivitelerini artırarak kirleticilerin biyolojik parçalanmasını hızlandırmakta ve kadmiyum ile çinko gibi kirleticilere karşı direnç göstermektedir. Karahindiba ise kadmiyum ve nikel gibi toksik metalleri hiperakümülatör özelliği sayesinde topraktan alarak bünyesinde biriktirmekte ve aynı zamanda toksinlere karşı antioksidan savunma sağlamaktadır.

Bu bitkiler, yalnızca çevresel kirleticilerin temizlenmesine katkı sağlamakla kalmaz, aynı zamanda tıbbi özellikleriyle ekonomik ve sağlık açısından faydalar sunar. Antibakteriyel, antioksidan ve antienflamatuar özelliklere sahip olan bu bitkiler hem çevreyi koruma hem de sürdürülebilir sağlık çözümleri sunma potansiyeline sahiptir. Gelecekte, bu bitkilerin genetik mühendisliği ve biyoteknolojik yaklaşımlarla geliştirilmesi, çevre kirliliği sorunlarına daha etkili çözümler sunabilir (Pilon-Smits, 2005; Shah ve Daverey, 2020). Ayrıca, mikrobiyal destekli tekniklerin yaygınlaştırılması ve bu bitkilerin çeşitli iklim koşulları altında incelenmesi, küresel çapta daha geniş bir uygulanabilirlik sağlayacaktır. Eğitim ve farkındalık kampanyalarıyla bu yöntemlerin yaygınlaştırılması, çevresel sürdürülebilirliğin artırılmasında önemli bir adım olacaktır. Fitoremediasyon, bu tıbbi ve aromatik bitkilerin çok yönlü faydalarını göz önünde bulundurarak, çevresel sorunların çözümünde umut verici ve yenilikçi bir yaklaşım olarak kendini göstermektedir.

ABSTRACT

Fish meal is one of the most important animal protein sources used in compound feeds for aquaculture. Due to its high nutritional value and balanced amino acid composition, it is also widely used in poultry and swine feeds. However, the source, species, and quality of the fish meal used in feeds are of great importance in terms of both feed safety and legal regulations. According to the legislation of the European Union and Türkiye, the use of any animal protein in ruminant feeds is prohibited. In addition, the inclusion of fish meal derived from the same species into the feed of that same species is also restricted under the regulations. Therefore, accurate identification of the presence and species of fish meal in compound feeds is essential.

The microscopic analysis technique is a rapid and reliable analytical method used to identify the distinctive morphological characteristics of raw materials in compound feeds, to detect harmful or toxic plant seeds that may contaminate the feed, to verify label declarations, and to determine the presence of animal proteins. Through this method, distinctive structures such as fish bones, bone tissue, muscle tissue, scales, and otoliths in feeds can be examined to determine the presence and origin of fish meal. In this way, both the detection of prohibited animal proteins and the verification of feed label accuracy are ensured.

In this study, a microscopic comparison was carried out between commercially obtained fish meal and anchovy meal produced from the Black Sea anchovy (*Engraulis encrasicolus*). The morphological characteristics of bone, muscle, and scale tissues were evaluated using stereo and light microscopes at magnifications ranging from 10× to 200×. In addition, various staining techniques (alizarin red, phenol–glycerin, Fehling) were applied to enhance the visibility of the diagnostic tissue structures.

As a result of the study, it was determined that the bone tissue of anchovy meal exhibited distinctive morphological features such as parallelly arranged elliptical and star-shaped lacunae, as well as a spinal structure resembling an hourglass. These differences were evaluated as important criteria for distinguishing anchovy meal from mixed fish meals at the microscopic level.

BALIK UNLARININ KALİTE KONTROLÜNDE MİKROSKOPİK YÖNTEMİN KULLANIMI

ÖZET

Balık unu, su ürünleri yetiştiriciliğinde kullanılan karma yemlerin en önemli hayvansal protein kaynaklarından biridir. Yüksek besin değeri ve dengeli amino asit içeriği nedeniyle ayrıca kanatlı ve domuz yemlerinde de yaygın olarak kullanılmaktadır. Ancak yemlerde kullanılan balık ununun kaynağı, türü ve kalitesi hem yem güvenirliği hem de yasal düzenlemeler açısından büyük önem taşımaktadır. Avrupa Birliği ve Türkiye mevzuatlarına göre, geviş getiren hayvan yemlerinde her türlü hayvansal protein kullanımı yasaktır. Ayrıca aynı türden elde edilen balık unlarının yine aynı tür balıkların yemine katılması da mevzuat kapsamında sınırlandırılmıştır. Bu nedenle, karma yemlerde balık unu varlığının ve türünün doğru biçimde tespit edilmesi gereklidir.

Mikroskopik analiz tekniği, karma yemlerde kullanılan hammaddelerin ayırt edici morfolojik özelliklerinin tanımlanmasında, yemlere karışabilecek zararlı veya toksik bitki tohumlarının saptanmasında, karma yemlerde etiket beyanlarının doğrulanmasında ve hayvansal proteinlerin tespitinde kullanılan hızlı ve güvenilir bir analiz yöntemidir. Bu yöntemle yemlerde balık kılçığı, kemik dokusu, kas dokusu, pul ve otalit gibi tanımlayıcı yapılar incelenerek balık ununun varlığı ve kökeni belirlenebilir. Böylece hem yasaklı hayvansal proteinlerin tespiti sağlanır hem de yem etiket beyanlarının doğruluğu kontrol edilir.

Bu çalışmada, piyasadan temin edilen balık unu ile Karadeniz hamsisinden (*Engraulis encrasicolus*) üretilen hamsi ununun mikroskopik olarak karşılaştırılması amaçlanmıştır. Stereo ve ışık mikroskobu (10–200x büyütme aralığında) kullanılarak elde edilen mikrograflar üzerinden kemik, kas ve pul dokularının morfolojik özellikleri değerlendirilmiştir. Ayrıca farklı indikatörlerle boyama teknikleri (alizarin kırmızısı, fenol-gliserin, Fehling) uygulanarak dokuların tanımlayıcı yapıları belirginleştirilmiştir.

Çalışmanın sonucunda, hamsi ununun kemik dokusunun paralel dizilmiş eliptik ve yıldız biçimli lakunalar ile kum saatini andıran omurilik yapısı gibi özgün morfolojik özellikler sergilediği belirlenmiştir. Bu farklılıklar, hamsi ununun karma balık unlarından mikroskopik düzeyde ayırt edilmesini sağlayan önemli bir kriter olarak değerlendirilmiştir.

Anahtar Kelimeler: Hayvansal protein, Balık unu, Mikroskopik analiz, Yem güvenirliği

1. INTRODUCTION

Due to its high protein content and balanced amino acid composition, fish meal is widely used in aquaculture as well as in poultry and swine feeds. According to the Turkish Standard No. 12296 (TS 12296) published by the Turkish Standards Institute, fish meal is defined as a product obtained from the processing of white- and dark-fleshed fish and other marine organisms, which involves the use of residues such as heads, skins, fins, bones, and internal organs (Anonymous, 1997).

The source, species, and quality of fish meal are of great importance for feed safety. According to European Union and Turkish regulations, the use of animal proteins in ruminant feeds is prohibited. However, in poultry and fish feeds, the use of animal tissues originating from the same species is not allowed; therefore, the identification of animal species in such feed ingredients has become mandatory (Anonymous, 2013). In this context, the microscopic analysis method used to detect the presence of animal proteins in feeds has been recognized by the European Union as the official and valid method (Momilovic and Rasooly, 2000; Van Raamsdonk et al., 2007). This method is based on the microscopic examination of animal tissue residues present in feed samples. In practice, coarse particles are examined under a stereomicroscope, while smaller fragments are evaluated according to their histological structures under a light microscope (Anonymous, 1998). The microscopic method is a rapid, economical, and reliable analytical technique used for the morphological identification of components in compound feeds, the detection of prohibited proteins, and the verification of label declarations (Umur et al., 2022).

In Türkiye, the most commonly used raw material for fish meal production is the Black Sea anchovy (*Engraulis encrasicolus*). Anchovy is preferred for high-quality fish meal production due to its high protein content, balanced amino acid profile, and low ash content (Özden and Selçuk, 2022). During periods when anchovy fishing is closed, sprat (*Sprattus sprattus*) is mostly used; however, anchovy meal has been reported to be superior in quality because of its homogeneous composition and higher nutritional value (Bayraklı, 2021; Özden and Selçuk, 2022). In addition to anchovy and sprat, other fish species such as herring, sardine, mackerel, menhaden, capelin, cod, and whiting are also used in fish meal production. The fact that anchovy meal is produced from a single species gives it a more consistent morphological structure and facilitates the identification of species-specific structural characteristics in microscopic analyses. In contrast, commercial mixed fish meals obtained from the market are produced from mixtures of different species, thus exhibiting a more heterogeneous morphological structure. Therefore, using anchovy meal as a reference material in microscopic analysis is important for verifying the species composition of commercial fish meals and enhancing the reliability of species-based quality control in feeds (Van Raamsdonk et al., 2007; Umur et al., 2022).

The chemical composition of fish meal varies depending on the fish species used, processing conditions, and storage period. Studies have shown that anchovy meal contains, on average, 62–70% crude protein, 8–10% crude fat, 15–20% ash, and less than 5% moisture (Bayraklı, 2021; Özden and Selçuk, 2022). These ratios are generally more variable in mixed commercial fish meals, where protein content tends to fluctuate irregularly, while ash content is reported to be higher. Moreover, low-quality fish meals are typically prone to oxidative degradation, elevated ash levels, and darkening in color, which are associated with fish species composition and processing temperature (Umur et al., 2022). It has also been reported that drying at high temperatures reduces the bioavailability of amino acids in fish meal and causes denaturation of protein structures (Van Raamsdonk et al., 2007). These findings indicate that anchovy meal, being derived from a single species and produced under controlled conditions, has a more

homogeneous structure, resulting in greater morphological consistency in microscopic analyses.

Microscopic examination of fish meal is based on the morphological identification of components, particularly through the evaluation of distinguishing features of bone, muscle, scale, otolith, and cartilage tissues (Liu et al., 2011). The shape, orientation, and density of lacunae and canaliculi structures in bone tissue differ significantly among species and are considered some of the most reliable morphological criteria for identification (Van Raamsdonk et al., 2007; Van Raamsdonk et al., 2012). It has been reported that fish bone tissues have thinner walls and more elongated lacunae compared to those of mammals or poultry, and that these structures can be clearly observed under a polarized light microscope (Liu et al., 2011). Additionally, the thickness of muscle fibers, the arrangement of myofibrils, and the surface patterns of scales (cycloid/ctenoid structures) vary among species and are regarded as complementary identification criteria in microscopic analysis (Momilovic and Rasooly, 2000). Among staining techniques, particularly alizarin red and phenol–glycerin applications have been reported to enhance contrast in calcified tissues, allowing morphological structures to be identified more clearly (De la Roza-Delgado et al., 2007). However, morphological similarities among closely related species (such as anchovy and sprat, which are small pelagic fish) make differentiation difficult; therefore, it has been suggested that the microscopic method should be supported by Real-Time Polymerase Chain Reaction (PCR) analyses (Holst et al., 2006).

The low cost, rapid applicability, and compliance of the microscopic method with standardized analytical protocols in official control laboratories make it the primary screening technique for detecting animal proteins in feeds (Van Raamsdonk et al., 2007). In Türkiye, the limited number of studies conducted in the field of feed microscopy and the shortage of trained personnel highlight the need for a detailed description of the microscopic characteristics of fish meals (Umur et al., 2022). Therefore, in this study, the microscopic properties of commercially obtained fish meal and anchovy meal produced from Black Sea anchovy (*Engraulis encrasicolus*) were compared. Morphological differences in bone and muscle tissues were evaluated using stereomicroscopy and light microscopy, with the aim of identifying the distinctive microscopic structural characteristics of anchovy meal and contributing to the accurate identification of fish meal species.

2. MATERIAL AND METHOD

Feed Material

In this study, a total of five samples of each type of fish meal and anchovy meal, approximately 2 kg per sample, were obtained in 2024 from compound feed factories operating in the Bursa region. The feed materials were ground using a laboratory-type mill (Fritsch Pulverisette 14, Idar-Oberstein, Germany) equipped with a 1 mm sieve and stored in glass jars under laboratory conditions.

Microscopic Analysis Method

The stereo and polarized light microscopic examinations of the fish meals were carried out at the Feed Microscopy Laboratory of the Bursa Food and Feed Control Central Research Institute, in accordance with the methods described by Khajarern and Khajarern (2008) and Anonymous (2013), respectively. The procedure described by Anonymous (2007) was used as the basis for the preparation of fish meal samples for microscopic analysis. For the analyses, 100 g of material determined by sampling was taken, and depending on the physical characteristics of the samples, the material was fragmented either manually or using a grinder. After fragmentation, flotation and sedimentation processes were performed to obtain different fractions.

In macroscopic examinations, a Leica S9i stereomicroscope equipped with an LED illumination system, both transmitted and reflected white light sources, a magnification range of 0.61–5.5×, and a 10-megapixel digital imaging system was used. For histological examinations, a Leica DM 750 P polarized light microscope, which allows high-resolution imaging within a magnification range of 50–500×, was employed.

For each staining method, at least 2 slides were prepared from both the sediment and flotation fractions, and at least 20 fields of view were examined per slide. As a result of the microscopic examinations, at least 10 micrographs were obtained, and 5 micrographs that best represented the morphological characteristics of the tissues were selected for evaluation. The images obtained from the stereo and polarized light microscopes were digitally processed using the LAS X 5.03 software.

For determining the histological characteristics of the fish meal samples, bone tissue in the sediment fraction was stained using the alizarin red method described by Frick et al. (2013a) and the phenol–glycerin method defined by Frick et al. (2013b), which enhanced the visualization of lacunae and canaliculi structures. In the flotation fractions, Fehling's indicator was applied according to the method reported by Anonymous (2013), and the resulting micrographs were recorded.

Morphological Evaluation and Comparative Examination

During the examinations, fish-specific morphological structures such as muscle tissue, bones, skin, vertebrae, and cartilage were evaluated in detail. After the staining procedures, differences in the color, shape, and density of the tissues were analyzed under polarized light, and the obtained micrographs were examined comparatively. The findings from both stereomicroscopic and polarized light microscopic analyses were evaluated together to determine the morphological characteristics of the tissues and the distinctive differences between species.

3. RESULTS

The micrographs of fish meal and anchovy meal obtained using a stereomicroscope are presented in Figure 1, while those obtained using a polarized light microscope are shown in Figure 2.

The colors of the fish meals examined in the study varied from light yellow to brown. This color variation is thought to result from the fish species used and the technological processes applied during production. In the anchovy meal, a skin structure ranging from bright white to light gray was observed, which makes the anchovy meal appear visually brighter compared to the other fish meals (Figure 1a, b).

In the fish meal, the muscle tissue exhibited irregular morphology under the microscope, with color tones ranging from yellow to brown. In the anchovy meal, however, the muscle tissue appeared more compact and distinct, displaying a yellowish-brown color (Figure 1c, d).

The bone tissues in the fish meal ranged in color from transparent to yellow and generally appeared ivory-colored. These bones, which exhibited a sharp-pointed, cylindrical, and brittle structure, were found to accumulate in the sediment fraction after separation (Figure 1e).

The bone tissues in the fish meal may exhibit different morphological forms depending on the fish species used. In the anchovy meal, the vertebral bone tissue was observed to have a distinctive hourglass-like structure. This characteristic morphology was considered a key feature for the microscopic identification of anchovy meal (Figure 1f).

b_1: Micrograph of anchovy meal	d_2: Skin, muscle tissue, and bone structures in anchovy meal (10×)	f_3 Vertebral bone tissue in anchovy meal (10×)

Figure 1. Images of fish meal and anchovy meal under a stereomicroscope

In the fish meal samples, the morphological characteristics of the bones were clearly identified through staining with the alizarin red indicator. This method enhanced the visibility of the bones, allowing the tissue boundaries to be clearly distinguished. As a result of this staining, elongated elliptical lacunae were observed in the bones of the fish meal samples (Figure 2a). In the anchovy meal samples, however, the same staining method revealed a distinct morphological structure in the bones, defined as a "star-shaped lacuna." This feature demonstrated that the anchovy bones were characteristically stained with alizarin red and could be structurally distinguished from those of other fish meals (Figure 2b).

In the fish meal samples, the phenol–glycerin indicator revealed the transparent structure of the bones but produced a lighter color contrast compared to alizarin red. In the anchovy meal samples, however, staining with the same indicator clearly displayed the star-shaped lacuna structure within the bone tissue. These findings demonstrate that the distinctive morphological characteristics of anchovy bones were clearly revealed by both staining methods (Figure 2c, d).

In the fish meal samples, staining with the Fehling indicator clearly distinguished the muscle tissue in the float fraction through its distinct color contrast. When the same indicator was applied to the anchovy meal, the muscle tissue was clearly visible under the microscope, and the structural details of the muscle fibers were observed at 100× magnification. In both meal types, the Fehling indicator proved to be an effective staining method for the identification of muscle tissue (Figure 2e, f).

4. DISCUSSION

The identification of animal protein sources is of great importance for feed safety and species-based traceability. In this context, microscopic analysis has long been recognized as a reliable method, particularly for the morphological characterization of fish meals. In the bone tissues of different fish species, variations in the structures of lacunae and canaliculi play a key role in distinguishing between species (Liu ve ark., 2011; Van Raamsdonk ve ark., 2017).

In this study, microscopic examination of anchovy meal revealed that its bone tissue exhibits a characteristic morphology. In particular, the hourglass-like structure of the vertebral bone tissue is regarded as an important microscopic marker for the identification of anchovy meal. The lacunae in anchovy meal are generally composed of elongated elliptical structures arranged in parallel, while in some regions, star-shaped lacunae are also observed. In contrast, in mixed fish meal derived from different fish species, the lacunae display a shorter, irregularly distributed morphology without a clear orientation. The distinct organization of the lacunae and canaliculi enables anchovy meal to be readily identified at the microscopic level.

Liu et al. (2011) reported that the patterns of lacunae and canaliculi vary among different fish species, noting that in herring, long, radiating, thread-like canaliculi and generally parallel-sided, tube-shaped lacunae are present. This description shows structural similarity to the parallel-arranged and elongated elliptical lacunae observed in anchovy meal. Umur et al. (2024) stated that star-shaped lacunae are less frequently observed in anchovy meal, that the canaliculi possess a filamentous structure similar to that found in ruminant bones, and that the shapes of the lacunae display distinctive morphological characteristics. Van Raamsdonk et al. (2007) also reported that elliptical lacunae are predominant in anchovy and herring. In our study, the coexistence of both parallel-oriented and elliptical or star-shaped lacuna forms in anchovy meal

indicates that this species exhibits a unique morphological diversity at the microscopic level. Furthermore, the descriptions by Van Raamsdonk et al. (2012, 2017) of fish bones as semi-transparent and glossy are consistent with the bright and smooth tissue structure identified in anchovy meal.

Comparative microscopic examinations of fish meal and anchovy meal revealed that anchovy meal exhibits a more homogeneous morphology. This is attributed to its single-species origin and the preservation of its structural integrity. In contrast, commercial fish meals are known to be produced from mixtures of different species, and therefore their morphologically heterogeneous structure is a natural outcome (Bayraklı, 2021; Özden & Selçuk, 2022). In the morphological evaluations, a regular arrangement and uniform tissue density were observed among the bone fragments in anchovy meal, whereas heterogeneous structures belonging to different fish species were identified in mixed fish meal. These findings are consistent with the results reported by Pinottia et al. (2016), who characterized fish meals using microscopic and digital image analysis. The researchers noted that fish bones have a more homogeneous structure compared to mammalian and avian bones, and that this feature serves as a reliable criterion for species identification. Therefore, the use of anchovy meal as a reference material is proposed as an approach that could improve the accuracy of species identification in feed analyses.

This study also revealed that the staining methods applied (particularly alizarin red and phenol–glycerin) did not cause any deformation in bone morphology; however, alizarin red enhanced the visibility of the lacuna and canaliculi structures. This finding is consistent with previous studies reporting that alizarin red increases contrast in calcified tissues, thereby facilitating morphological identification (De la Roza-Delgado et al., 2007; Frick et al., 2013a). Although the phenol–glycerin indicator produced smoother color transitions, it was not as effective as alizarin red in defining morphological boundaries. Similarly, Ottoboni et al. (2017) evaluated the effectiveness of different indicators on marine-derived materials and reported that alizarin red was particularly successful in staining fish tissues.

The hourglass-like vertebral bone structure and the parallel and star-shaped lacuna morphologies described in this study are considered distinguishing criteria at the species level for the microscopic identification of anchovy meal. Incorporating these morphological characteristics into future microscopic reference databases will make a significant contribution to the development of a standardized and reliable approach for species identification in fish meals.

5. CONCLUSION

This study demonstrated that microscopic analysis is a rapid and reliable method for the morphological identification of different types of fish meal. The bone structure of anchovy meal was characterized by parallel-arranged elongated elliptical lacunae, star-shaped lacuna formations, and, in particular, the hourglass-like structure of the vertebral bone tissue. These unique microstructures serve as distinct morphological criteria that enable anchovy meal to be clearly distinguished from mixed fish meals.

The alizarin red indicator was identified as the most suitable staining method for determining bone morphology, as it highlighted the boundaries of calcified tissues in anchovy meal, whereas the phenol–glycerin indicator provided complementary support.

In conclusion, microscopic characterization of anchovy meal contributes to the accurate identification of fish meal sources used in feed and the verification of species declared on product labels. In the future, integrating microscopic analyses with molecular methods will represent an important step toward enhancing feed safety and species-based traceability. This

study provides a reference dataset for future research in the field of feed microscopy in Türkiye and makes a scientific contribution to the standardization of species identification in feed quality control.

ABSTRACT

Rainbow trout (*Oncorhynchus mykiss*) farming hold an important place in aquaculture, with an annual production capacity of 773 thousand tonnes worldwide. Health management in aquaculture aims to ensure that fish are reared in fish farms under conditions that optimise growth rates and survival rates while minimising disease-related problems. Negative factors affecting health management can also lead to histological changes in the internal organs of fish. In this study, histopathological changes in the livers of rainbow trout (*Oncorhynchus mykiss*) farmed in and around Samsun province were evaluated in order to assess the health parameters, and a preliminary study was conducted to contribute to regional health management strategies. Between the years 2023 and 2025, post-harvest necropsies were performed on 55 rainbow trout (*Oncorhynchus mykiss*) that had been farmed, and tissue samples taken from the liver for general health screening were fixed in 10% neutral formaldehyde. After the routine tissue processing procedure, the samples were embedded in paraffin. Sections of 4–6 µm thickness taken from the blocks were stained with Hematoxylin-Eosin (H&E) and examined under a light microscope. Histopathological examination revealed varying degrees of hyperaemia in 39 fish, degenerations ranging from parenchymal alterations to vacuolisation in hepatocytes in 16 fish, focal or diffuse necrotic lesions in 28 fish, fatty degeneration in hepatocytes in 26 fish, haemorrhages -especially under the capsule- in 11 fish, increased melanomacrophage activity and necrosis in the centres in 6 fish, and mononuclear cell infiltration under the capsule and in the portal area in 21 fish, thickening of the capsule in 5 fish and oedema in 1 fish were detected. As a result of In addition, detachment of the capsule was observed in 6 fish the findings, hyperemia and fatty degeneration were prominently observed in the examined liver tissue samples. Based on the examinations and information received, it was concluded that hyperemia was not appropriate to be evaluated as a pathological finding, considering the possibility of

convulsions and compression due to intensive stocking during harvesting. The intense presence of lipid vacuoles in the cytoplasm of hepatocytes was associated with the feeding of cultured fish with high-calorie feeds, their lack of need to expend much energy to search for food, and the storage of this excess energy as lipids in the hepatocyte cytoplasm by the fish liver. The other findings identified were described as mild, nonspecific lesions.

Keywords: Aquaculture, fish health, liver histopathology, rainbow trout (*Oncorhynchus mykiss*)

INTRODUCTION

The rapid increase in the world population has led to a corresponding increase in demand for animal protein. Fish, in addition to being a high-quality source of protein, contains essential micronutrients such as various vitamins, minerals, and polyunsaturated omega-3 fatty acids. Therefore, in many countries, fish consumption is encouraged within the framework of government policies aimed at increasing the intake of omega-3 fatty acids. While the increasing population and such initiatives elevate the demand for fish, they have also led to global declines in wild fish populations. This situation raises concerns about the sustainability of the fishing industry and clearly highlights the importance of aquaculture. Nevertheless, food security emerges as a crucial issue in ensuring that all individuals have access to the essential food they need. Fisheries make a significant contribution to animal protein sources in both developed and developing countries. Particularly in Low-Income Food-Deficit Countries (LIFDC's), fisheries stand out not only in meeting the demand for animal protein but also as a vital source of micronutrients, minerals, and essential fatty acids. Therefore, fisheries and aquaculture can play an effective role in ensuring food and nutritional security, even in small quantities, especially in less developed or developing countries (Bovenkerk&Meijboom, 2012; Getu et al., 2015; Msangi et al., 2013). In this context, rainbow trout (*Oncorhynchus mykiss*), one of the most common fish species worldwide, has been transported to at least 99 countries after being moved outside its natural range and has established breeding populations in many different regions (Stanković et al., 2015). Today, rainbow trout (*Oncorhynchus mykiss*) farming, which has an annual production capacity of 773 thousand tons, has an important place in aquaculture (FAO, 2025).

It is impossible to successfully maintain an animal production programme without taking animal health into consideration. This also applies to aquaculture, where diseases are the most limiting factor in production, both economically and in terms of health (Blanco et al., 2000). Health management in fish farms aims to optimise fish growth rates and survival rates, ensuring they are raised under conditions that minimise disease-related problems. Factors affecting health management can cause histological changes in the internal organs of fish, and these changes are particularly evident in the liver due to its metabolic and detoxification functions. Tissue changes occurring in the liver are accepted as a parameter in assessing the general health status of fish (Rodrigues et al., 2017; Saraiva et al., 2015).

In fish, the liver is the largest internal organ of the body and performs functions similar to those of the liver in mammals, such as processing and storing nutrients absorbed by the digestive system, producing bile, and detoxification. Although the histology of the liver varies between species, there are general characteristics common to most species (Akiyoshi & Inoue, 2004; Genten et al., 2009). The teleost liver contains hepatocytes, endothelial cells, bile duct epithelial cells, fat-storing cells, macrophages, blood cells, and exocrine pancreatic cells (Hampton et al., 1985). Among these cellular components, melanomacrophage centers are particularly noteworthy structures in terms of immune function. Melanomacrophage centers play an important role in defence and inflammatory responses. Furthermore, their responsibility for the removal of foreign particles, dead cells and phagocytosis products ensures their use as important health biomarkers (Araujo et al., 2019).

In this study, a preliminary investigation was conducted in the Samsun region to assess the health management principles that could be supported by evaluating the health parameters of cultured rainbow trout (*Oncorhynchus mykiss*) through the examination of histopathological alterations in their livers.

MATERIALS and METHODS

In this study, 55 rainbow trout (*Oncorhynchus mykiss*) obtained through random sampling after harvest from aquaculture farms in the Samsun region between 2023 and 2025 were used as material.

Necropsies were performed on the fish, and tissue samples taken from the liver for general health screening were fixed in 10% buffered formaldehyde. The fixed tissues were embedded in paraffin after passing through the alcohol and xylene series in the standard tissue tracking procedure. Sections 4-6 µm thick were cut from the blocks, stained with Haematoxylin-Eosin (H&E) and examined under a light microscope.

RESULTS

The histopathological findings from the liver tissue of 55 rainbow trout (*Oncorhynchus mykiss*) examined as part of the health screening are presented in Table 1.

The histopathological examination revealed varying degrees of hyperaemia in 39 fish: mild in 25 fish, moderate in 7 fish, and severe in 7 fish. Degenerative changes in hepatocytes were observed in 16 fish in total: mild in 7 fish, moderate in 8 fish, and severe in 1 fish. Necrosis was also observed in hepatocytes in 28 fish in total: mild in 12 fish, moderate in 13 fish, and severe in 3 fish. Haemorrhages were observed in a total of 11 fish: mild in 9 fish, moderate in 1 fish, and severe in 1 fish, particularly under the capsule. An increase in melanomacrophage activity was observed in 6 fish, mild in 2 fish and moderate in 4 fish, along with mononuclear cell infiltration in 21 fish, mild in 13 fish, moderate in 8 fish, and more pronounced in the subcapsular and portal areas. Another prominent finding was fatty degeneration in hepatocytes, observed in a total of 26 fish: mild in 12 fish, moderate in 7 fish, and severe in 7 fish. In addition to these findings, capsule separation was detected in 6 fish, capsule thickening in 5 fish, and oedema in 1 fish. No histopathological changes were detected in 7 fish.

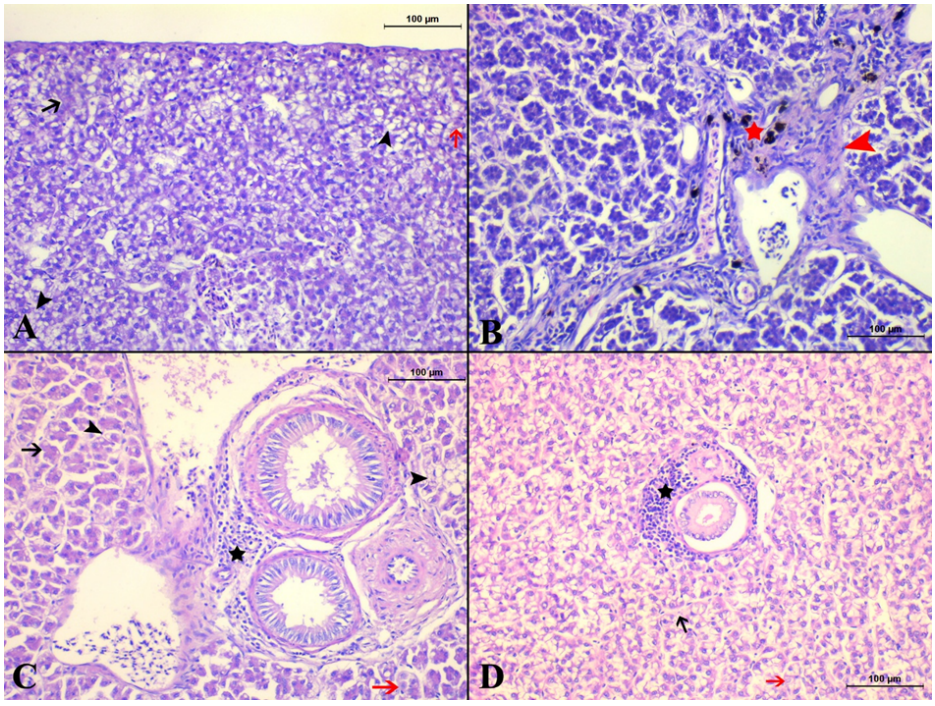

Figure 1. Rainbow trout *(Oncorhynchus mykiss)* liver tissue. A) Degeneration (red arrow), necrosis (black arrow) and fat vacuoles (black arrowhead) in hepatocytes x200; B) Increased melanomacrophage activity (red star), fibrosis (red arrowhead) x200; C) Degeneration in hepatocytes (red arrow), necrosis (black arrow), fat vacuoles (black arrowhead) and

mononuclear cell infiltration around the hepatic triad (black star) x200; D) Degeneration in hepatocytes (red arrow), necrosis (black arrow) and mononuclear cell infiltration around the bile duct (black star) x200, H&E.

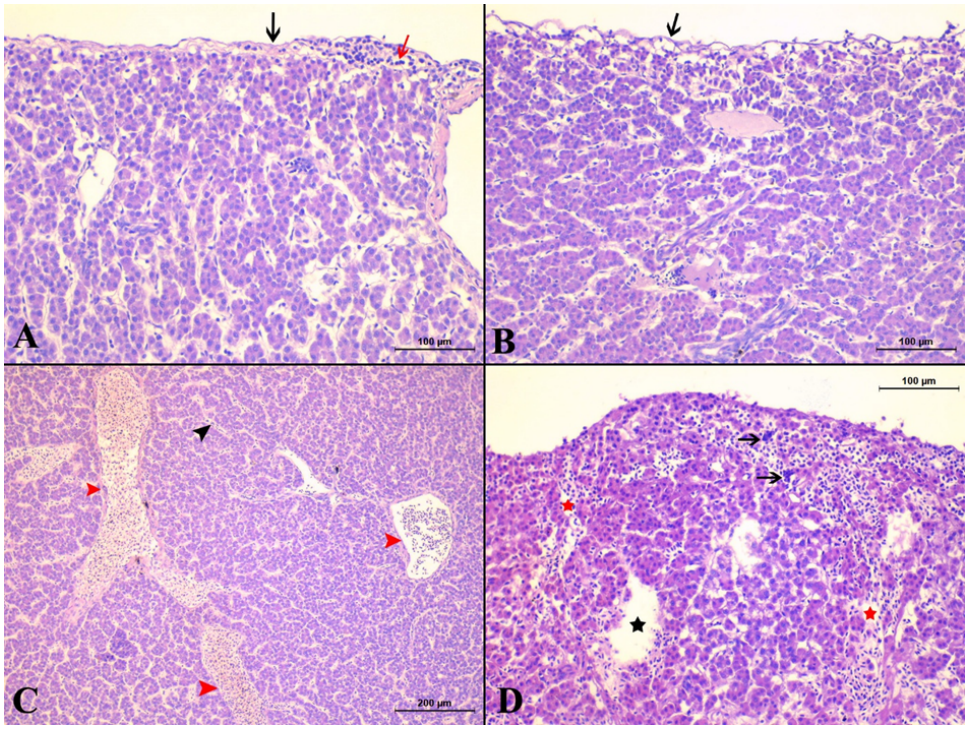

Figure 2. Rainbow trout *(Oncorhynchus mykiss)* liver tissue. A) Thickening of the capsule (black arrow), mononuclear cell infiltration beneath the capsule (red arrow) x200; B) Separation of the capsule (black arrow) x200; C) hyperaemia (red arrowhead), dilation of sinusoids (black arrowhead) ×100; D) mononuclear cell infiltration (black arrow), haemorrhage (red star) and dilation of sinusoids (black star) ×200, H&E.

DISCUSSION

Histopathological findings of hyperaemia, degeneration, necrotic changes and fatty degeneration in liver tissues from different fish species have been reported in numerous studies, and these findings have generally been associated with water pollution, the presence of heavy metals and exposure to toxic substances (Ayas et al., 2007; Feist et al., 2015; Fricke et al.,2012). Similar findings were also recorded in rainbow trout (*Oncorhynchus mykiss*) in this study. However, these findings were obtained only histopathologically as a preliminary study in terms of liver tissue health screening and were not associated with any specific cause as no analyses targeting any specific agent were performed.

In this study, fatty degeneration was observed in 26 of the 55 fish evaluated. However, Wolf et al. (2015) state that lipidosis in farmed fish, associated with a lipid-rich diet, can be considered normal as long as it does not cause adverse histopathological effects such as cell membrane rupture or saponification. As the rainbow trout used as material in the study were obtained from a cultured environment, the fatty degeneration findings were attributed to lipid-rich feeding.

The most common finding, hyperaemia, was recorded in 39 fish. Banihashemi et al. (2016) indicate that hyperaemia in liver tissue may be caused by the presence of metabolites resulting from ammonia effects. Furthermore, Wang et al. (2025) indicated that serious damage to liver tissue, including sinusoidal dilation and hepatocellular necrosis, may occur in fish depending on stocking density and stocking duration. Based on the examinations conducted and the information obtained, considering the possibility of convulsions and pressure formation during

intensive storage after harvesting, it was concluded that hyperaemia should be assessed as a traumatic lesion rather than a pathological finding. The other findings identified were defined as mild, non-specific lesions.

The liver becomes a target organ for pollutants due to its important role in detoxification and metabolism. Most histopathological changes occurring in the liver are shaped by exposure to toxic substances. Melanomacrophages play a role in disease processes and may change depending on factors such as chemical exposure (Lebepe et al., 2020). The findings of degeneration, necrosis, increased melanomacrophage activity, haemorrhage and mononuclear cell infiltration identified in this study have also been reported in studies conducted on different fish species. In these studies, these findings have been associated with various environmental stress factors such as organic pollutants, algal toxins, heavy metal poisoning, fluctuations in water temperature, and changes in oxygen concentration in the water (Abdel-Moneim, 2014; Feist et al., 2015; Fricke et al., 2012; Lebepe&Luus-Powell, 2020). In this context, it is thought that the findings obtained in the present study may also have been caused by similar environmental factors. However, the fact that the waters in which the fish used as material were raised have not been evaluated in terms of the parameters in question prevents these possibilities from being definitively confirmed. However, Mohamed (2009) states that hyperaemia can also cause cellular degeneration and necrosis. In this study, the general correlation between hyperaemia and findings of degeneration and necrosis suggested that, as Mohamed (2009) indicated, circulatory disorders may have triggered cellular damage, leading to these findings.

As a result, changes such as hyperaemia and fatty degeneration were observed in the liver tissues of rainbow trout raised in the Samsun region. These findings were not associated with any disease, considering the rearing and harvesting process and because they were based solely on histopathological findings in a preliminary study. Other histopathological findings were non-specific in nature. The findings indicate that the liver health of rainbow trout may be affected by environmental conditions and are expected to contribute to future studies on fish health screening in the region.

ÖZET

Filoksera zararlısının ülke topraklarımıza girişinden sonra asma fidanı üreticiliğinin büyük çoğunluğu, anaç üzerine yetiştirilmek istenen çeşidin aşılanması şeklinde gerçekleşmektedir. Bu nedenden dolayı çok sayıda ve çok çeşitli anaç kullanımı mevcuttur. Yetiştiricilik yapılırken anaçların hem filokseraya dayanımlarından hem de her bir anacın farklı özelliklerinden faydalanılmaktadır. Abiyotik stres faktörü de son zamanlarda değişen iklim koşullarını etkisi ile bitkisel üretimde negatif yönde etkisi ile kendisini göstermektedir. Tuzluluk en önemli abiyorik stres faktörlerinden birisi olmakla beraber verim ve kaliteyi oldukça önemli oranda olumsuz etkilemektedir.Yapılan çalışmada Ülkemizde en fazla üretimi yapılan Sultani Çekirdeksiz çeşidinin 5 BB ve 1613 anacı üzerine aşılı fidanları kullanılmıştır. Bu iki anacın tercih edilme sebebi tuza hassasiyetlerinin farklı olmasıdır. Tuz stresi bitkilere 0, 25 ve 75 mM NaCl şeklinde üç seviyede, seryum oksit (CeO_2-NP) nanopartikül uygulamaları ise dört farklı seviyede (0, 25, 50 ve 100 mg L^{-1}) uygulanmıştır. Uygulamalar sonucu aşılı fidanlarda incelenen fiziksel veriler; sürgün yaş- kuru ağırlığı, kök yaş-kuru ağırlığı, kuru madde oranı, fizyolojik veriler ise iyon akışı, hücre zarı zararlanma oranı (H.Z.Z.O) ve spad cinsinden klorofil miktarıdır. Elde edilen veriler incelendiğinde tuz stresi altındaki fidanlarda seryum oksit uygulamalarına göre anaç kombinasyonları arasındaki farklar istatitiksel açıdan fark oluşturmuştur.

Anahtar Kelime; 5 BB, yaş ağırlık, spad, iyon akışı

ABSTRACT

After the introduction of the phylloxera pest into our country, the majority of grapevine sapling production has been carried out by grafting the desired variety onto the rootstock. For this reason, there are many and diverse rootstocks in use. During cultivation, both the resistance of rootstocks to phylloxera and the different characteristics of each rootstock are utilized.Abiotic stress factor has also shown itself as a negative effect on plant production due to the effect of changing climate conditions in recent times. Salinity is one of the most important abionic stress factors and has a significant negative impact on yield and quality.In the study, saplings of Sultani Çekirdeksiz variety, which is the most produced variety in our country, grafted onto 5 BB and 1613 rootstocks were used. The reason why these two rootstocks are preferred is that they have different salt sensitivities. Salt stress was applied to plants at three levels of 0, 25 and 75 mM NaCl, and cerium oxide (CeO_2-NP) nanoparticle applications were applied at four different levels (0, 25, 50 and 100 mg L^{-1}).Physical data examined in grafted seedlings as a result of the applications are shoot fresh-dry weight, root fresh-dry weight, dry matter ratio, physiological data are ion flow, cell membrane damage rate (HZZO) and chlorophyll amount in spad. When the obtained data were examined, the differences between rootstock combinations according to cerium oxide applications in seedlings under salt stress created a statistical difference.

Key words; 5 BB, wet weight, spad, ion flow

1.INTRODUCTION

Viticulture activities take place on Earth between 20-40 degrees latitude in the Southern Hemisphere and 20-51 degrees latitude in the Northern Hemisphere. Due to its geographical location, Türkiye is located on latitudes that have favorable conditions for viticulture. Vitis vinifera L, commonly known as the European grapevine and comprising 90% of the grapes cultivated worldwide, is a grapevine species native to the Mediterranean region, Central Europe and Asia Minor (Winkler, 1974). Our country, which is at the center of the geography where the grapevine gene centers are located and where it was first cultivated, is among the world's major grape-producing countries due to its climate being suitable for viticulture. Türkiye ranks 5th among the world countries in terms of vineyard areas with 405,439 hectares and 6th in terms of fresh grape production with 4,100,000 tons (FAOSTAT, 2019).

Grapes, the fruit of the vine, are also distinguished from other fruits by their different ways of being evaluated. Grapes have different uses such as table grapes, dried grapes, wine grapes and must grapes, which makes them a sustainable food. Recently, adverse conditions such as changing climate conditions, increasing world population, and decreasing agricultural lands have limited the cultivation of grapes, as with all agricultural products. Like all living things, plants may encounter various negative effects while continuing their lives. Situations that change the course of ongoing metabolic events in plants and negatively affect growth and development by limiting them are called abiotic and biotic stress factors (Gürel and Avcıoğlu, 2001).

High salt levels in soil or water can inhibit plant growth, reduce crop yields, and even lead to plant death. Salt stress is a major problem for agriculture as many arable lands are affected by salt accumulation due to irrigation and climate change. Salt stress affects plants in various ways. High salt levels lead to an increase in the concentration of ions in the soil, including sodium (Na^+) and chloride (Cl^-), leading to an imbalance in the plant's water and ion uptake. This leads to inhibition of root growth and reduction of water uptake by the plant. Salt stress also causes osmotic stress as the plant has to work harder to maintain water and ion balance in its cells (Mahajan and Tuteja, 2005; Köşkeroğlu, 2006).

Many studies are being conducted on salt resistance in the field of viticulture under in vitro and in vivo conditions. These studies are conducted to determine the salt resistance of different rootstocks and varieties at different salt doses, and also by testing different chemical and plant nutritional elements. The results of studies combining different salt concentrations with chemicals thought to reduce the effect of salt damage (methyl-jasmonate, proline, salicylic acid, epibrassinolide, etc.) have an important place in salinity stress studies.

In this study, the effects of cerium oxide nanoparticles (CeO_2-NP) on salinity stress applied at different concentrations in grafted seedlings were investigated.

2. MATERIAL and METHODS

2.1. Plant Material

In this study, grafted grapevine saplings obtained by grafting Sultani Seedless Sultan 7 Clone on 1613 C and 5 BB rootstocks were used as plant material.

2.2. Chemical Material

The Cerium (IV) Oxcide nanoparticle used in the study had a particle size of <25 nm, a bottle weight of 25 g, and a molecular weight of 172.11. The product was purchased from the market as a commercial product of Merck.

2.3. Method

In the study, 5 BB 1613 C grapevine rootstocks and saplings of Sultani Seedless variety grafted onto these rootstocks were used. Saplings were grown in 5 L pots containing peat: perlite (1.1) growing medium. After planting, the seedlings were watered with Hoagland nutrient solution for one month until they had at least 8 leaves. One month later, salt stress (0, 25 and 75 mM NaCl) was applied daily (with 1/2 Hoagland solution) and continued for 2 months. One month after salinity stress applications, Nanoparticle CeO_2-NP applications were sprayed on the leaves at 4 different concentrations (0, 25, 50 and 100 mg L^{-1}) at 24-hour intervals (Gohari et al., 2021). Some physical data were collected at the beginning of the trial, some during the trial, and some at the end. Physiological data were collected at the end of the trial.

When looking at fresh and dry shoot weights, the differences in cerium oxide and salt treatments in seedlings of the 5 BB/Sultani Çekirdeksiz combination were not found to be statistically significant. In Sultani Çekirdeksiz sapling grafted on 1613, 75 mM NaCl application and 100 ppm cerium oxide application had a positive effect on fresh shoot weight. The highest values for dry shoot weight were obtained from 0 mM NaCl salt and 25 ppm cerium oxide applications (Tables 1; 2).

3.2. Fresh and dry root weight

When the effects of the applications on fresh and dry root weights were examined, the differences were found to be statistically significant. While the highest values in terms of fresh root weight were obtained from the application of 0 salt and 25 ppm cerium oxide in 5 BB/Sultani Çekirdeksiz and 1613/Sultani Çekirdeksiz combinations, in terms of dry root weight, the application of 0 salt and 25 ppm cerium oxide came to the fore in 5 BB/Sultani Seedless and the application of 0 salt and 25 ppm cerium oxide in 1613/Sultani Çekirdeksiz (Table 3; 4).

3.3. Dry matter ratio;

When the effects of the applications on the dry matter ratio were examined, the 75 salt 0 ppm application came to the fore in the seedlings of 5 BB/Sultani Çekirdeksiz, while the 0 salt 100 ppm application came to the fore in the seedlings of 1613/Sultani Çekirdeksiz (Table 5).

Table. 5. Effects of cerium oxide and salt applications on dry matter content in grapevine sapling

3.4. Ion flow;

When the effects of the applications on the ion flow are examined, the best effects for the 5BB/Sultani Çekirdeksiz combination were obtained in the application of 100 ppm cerium oxide at high salt concentration, while the best effects for the 1613/Sultani Seedless were obtained in the application of 0 ppm cerium oxide at 0 salt concentration (Table 6).

Table 6. Effects of cerium oxide and salt applications on ion flow in grapevine seedlings

	100	26,08 C b	25,07 CB c	45,60 A a

* Capital letters in the same column indicate change in cerium oxide at the same salt concentration, while lowercase letters in the same row indicate change in salt concentration at the same cerium oxide dose. According to Tukey's multiple comparison test, it is significant ($p<0.05$

3.5. Chlorophyll Measurements (Spad Values);

The effects of the applications on the spad value were taken once at the beginning and once at the end of the trial. The tables were formed as spad 1 and spad 2 values. While the differences in spad 2 values in 5 BB/ Sultani Çekirdeksiz seedlings were not found to be statistically significant, the application of 75 salt and 0 ppm cerium oxide gave the highest value for spad 1 value. In the 1613/Sultani Çekirdeksiz combination, the application of 25 salt and 100 ppm cerium oxide gave the highest values for spad 1 value, and the application of 25 salt and 50 ppm cerium oxide gave the highest values for spad 2 value (Tables 7; 8).

4. DISCUSSION and CONCLUSION

Researchers who examined the effect of salt concentration on shoot development in some grapevine rootstocks reported that shoot development decreased and shoot dry and fresh weights decreased depending on the salt concentration (Turhan et al., 2005; Çetin et al., 2011). Another study examining the effects of salicylic acid on salinity reported that salicylic acid had a positive effect on the dry weight of the slide (Kök, 2012). In the study, unlike these studies, increases in salt concentration and shoot fresh-dry weight data were observed in some plants (1613/Sultani) and parallel decreases (5 BB/Sultani) were observed in some plants. This can be explained by factors such as different salt concentrations, nanoparticle use, and variety differences. When examining the fresh and dry root weights of plants under salt stress, data show that these data varied depending on the plant and the cerium oxide dose. While there were no statistically significant differences in some plants, there were differences in others. Müftüoğlu et al. (2006) reported that root fresh weight decreased with increasing salt concentration. Kök (2012) reported that salicylic acid applications did not have a statistically

significant effect on dry root weight in grapevines under salinity stress, while Turhan et al. (2005) reported that dry root weight decreased with increasing salt stress. In the study conducted, it was reported that there was no statistical difference in fresh and dry root weights, but there were increases and decreases, depending on the effect of salt stress and cerium doses in parallel with these sources. In the study, dry matter ratio was calculated by dividing dry root weights by fresh root weights and reported as a percentage. The results show that while fresh and dry root weights vary depending on salt stress and the effects of cerium doses, no statistically significant difference is observed, but increases and decreases are observed.

Stress treatments in plants first negatively impact cell membrane structure. A decrease in membrane structure is one of the first symptoms observed. Researchers studying stress factors in plants are focusing on methods to maintain cell membrane integrity and tolerance. The extent of cell membrane damage caused by stress factors can be most easily determined by measuring ion leakage from cells (Bajji et al., 2001). When examining the ion flow data in the study, it is generally observed that ion flow increases with increasing salt concentration. However, 25 ppm cerium oxide application on 5BB rootstock and 25, 50 and 100 ppm cerium oxide applications on 5 BB/Sultani Seedless combination had a positive effect and reduced the ion flow. Under many stress factors, such as salinity, drought, and high temperature, cell membrane structures lose their integrity, leading to electron flow. A study in tomato plants reported that ion flow increased under short-term high temperatures (Camejo et al., 2005). An increase in ion leakage was also observed in kiwifruit under extreme temperature conditions (Xingyuan et al., 2004). In parallel with this study, studies on grapevines also reported that ion flow in plants increased with drought (Yağmur, 2008; Özden et al., 2009, 2011; Martim et al., 2009). The research aims to reduce the increase in ion flux under stress conditions by using different methods, chemicals, etc. In this study, cerium oxide application had positive effects on reducing ion flux in 5 BB/Sultani seedless plants.

Chlorophyll is a pigment essential for converting light energy into chemical energy. The amount of solar radiation absorbed depends on the amount of photosynthetic activity in the leaf. Therefore, the amount of chlorophyll content is related to photosynthetic activity and primary production (Curran et al., 1990). The chlorophyll content in the study was measured with a portable chlorophyllometer and determined as the spad value (Porro et al., 2002). Measurements were made as the first and last measurements in the study, and tables were created based on the spad values in two different periods. When data on spad values were examined in terms of varieties and cerium oxide applications under salinity stress, the differences were found to be statistically less significant than those for other parameters. In a study conducted with 13 different American grape 46 rootstocks, SPAD values were reported to vary between (30.19-20.62) (Gargın, 2011). The figures obtained in the study are parallel with these data. In a study where chlorophyll values were measured in different periods depending on ripening in the Alphonse Lavalle grape variety, spad values did not differ statistically according to the periods (Sucu and Altıner, 2021). In a study where different doses of IBA were applied to Michele Palieri and Black Seedless grape varieties, the differences between the spad values were not found to be statistically significant (Uysal, 2016, Sucu et al., 2017). The values are not similar to those in the study. This may be related to the difference in the applied stress factor.

Changing climate conditions negatively impact plants, as they do all living things. One of the most important abiotic stress factors is salinity stress. Since it is almost impossible to eliminate the negative conditions that occur as a result of climatic factors, researchers can only cope with the situation by taking precautions. Some of these methods include growing species with strong adaptability to harsh conditions and experimenting with different cultural and chemical methods. This study examined the effects of nanoparticle application, which has become

increasingly popular in recent years, on salinity stress. As a result of the study, the effect of cerium oxide application on physical, properties of grafted grapevine saplings under salt stress was investigated extensively and it was concluded that it had significant effects. Considering these data emerging in further studies and testing new types of rootstock stress factors, different nanoparticles and their doses are very important for plant stress studies.

ÖZET

Son yıllarda giderek artan sayıda tüketici, tıbbi gerekçelerle ya da yaşam tarzı tercihi olarak bitki bazlı süt alternatiflerini tercih etmektedir. Tıbbi nedenler arasında, dünya genelinde yaklaşık %75 oranında görülen laktoz intoleransı ile süt alerjisi öne çıkmaktadır. Ayrıca, memeli sütüne erişimin kısıtlı ve maliyetli olduğu ülkelerde bitki bazlı süt ikameleri daha ekonomik bir seçenek olarak değerlendirilmektedir. Teknolojik açıdan bitki bazlı süt ikameleri, bitkisel materyalin suda çözündürülmesi ve parçalanmasıyla elde edilen süspansiyonlar olup görünüş bakımından memeli sütüne benzemektedir. Üretim süreci, bitkisel materyalin suda ekstrakte edilmesi, sıvı fraksiyonun ayrılması ve son ürünün formülasyonu aşamalarını içermektedir. Homojenizasyon ve ısıl işlemler ise, bu ürünlerin süspansiyon stabilitesini ve mikrobiyolojik güvenliğini artırarak doğrudan tüketilebilir veya fermente süt ürünlerine dönüştürülebilir ticari ürünlerin elde edilmesini sağlamaktadır.

Ceviz; protein, yağ, diyet lif ve mineraller gibi değerli bileşenler açısından zengin olması nedeniyle insan beslenmesi açısından stratejik öneme sahip sert kabuklu bir meyvedir. Ceviz yağı; omega-3, 6 ve 9 yağ asitleri bakımından zengin besleyici özellikleriyle bilinmektedir. Aynı zamanda, çeşitli sağlık ve kişisel bakım ürünleri ile aromaterapi uygulamalarında kullanılmaktadır. Ceviz çekirdeğinin yaklaşık yarısı yağ olarak alınmakta kalanı ise küspe olarak düşük katma değerli hayvan yemi veya gübre gibi ürünlere işlenmektedir.

Bu çalışmada, ceviz küspesinden Alcalase 2.4 L enzimi kullanılarak ceviz içeceği üretilmiştir. Üretim sürecince sıcaklık, pH, enzim derişimi ve süre gibi farklı parametrelerin elde edilen protein konsantrasyonu üzerine etkisi incelenmiştir. Elde edilen sonuçlar, pH 9 düzeyinde, 60°C ekstraksiyon sıcaklığında, %2 enzim derişiminde ve 8 saatlik bir ekstraksiyon işlemi ile ceviz içeceğinin protein derişiminin 4.39 g/100 mL düzeyine kadar çıkabileceğini göstermiştir. Çalışılan parametreler arasında özellikle sıcaklık ve pH değerinin elde edilen protein konsantrasyonunu önemli derecede etkilediği görülmüştür.

Anahtar Kelimeler: Atık, Ceviz içeceği, Enzim, Protein

EFFECT OF ALCALASE 2.4 L ENZYME AND PROCESS CONDITIONS ON THE YIELD OF PROTEIN EXTRACTION FROM WALNUT POMACE

ABSTRACT

In recent years, an increasing number of consumers have preferred plant-based milk alternatives either for medical reasons or as a lifestyle choice. Among the medical factors, lactose intolerance—which affects approximately 75% of the global population—and milk allergy are particularly prominent. Additionally, in countries where access to mammalian milk is limited and its cost is high, plant-based milk substitutes are regarded as a more economical option. From a technological perspective, plant-based milk substitutes are suspensions obtained by dissolving and disintegrating plant material in water, and they resemble mammalian milk in appearance. The production process involves the extraction of plant material in water, separation of the liquid fraction, and formulation of the final product. Homogenization and thermal treatments enhance suspension stability and microbiological safety, enabling the production of commercial products that can be consumed directly or converted into fermented dairy analogues.

Walnut is regarded as a nut species of strategic importance for human nutrition due to its richness in various valuable components such as protein, fat, dietary fiber, and minerals. Walnut oil is known for its nutritive properties and is rich in omega-3, 6, and 9 fatty acids. It is also utilized in various health and personal care products as well as in aromatherapy applications. About half of the walnut kernel is obtained as oil and the other half is remained as walnut pomace that is underutilized as low commercial value products like animal feed and fertilizers.

In this study, a walnut beverage was produced from walnut pomace using Alcalase 2.4 L. During the process, the effects of various parameters such as temperature, pH, enzyme concentration, and extraction duration on protein concentration obtained were investigated. The results achieved indicated that protein concentration of the walnut beverage could reach up to 4.39 g/100 mL under the conditions of pH 9, an extraction temperature of 60°C, an enzyme concentration of 2% (g/100 mL), and an extraction duration of 8 hours. It is utmostly seen that especially temperature and pH has significantly affected the protein concentration obtained.

Keywords: Waste, Walnut beverage, Enzyme, Protein

1. GİRİŞ

Süt; proteinler, mineraller, yağlar ve şekerler gibi insan sağlığı açısından önemli bileşenleri içeren bir besin olarak kabul edilmektedir. Yüksek biyolojik değere sahip proteinler, lipitler, vitaminler ve kalsiyum gibi mineraller içermektedir. Besleyici özellikleri ve süt tüketiminin yaygın olarak önerilmesine rağmen, özellikle batı ülkelerinde süt tüketiminin giderek azaldığı gözlenmektedir (Silva vd., 2020). Son yıllarda giderek artan sayıda tüketici, tıbbi gerekçelerle ya da yaşam tarzı tercihi olarak bitki bazlı süt alternatiflerini tercih etmektedir. Tıbbi nedenler arasında, dünya genelinde yaklaşık %75 oranında görülen laktoz intoleransı ile süt alerjisi öne çıkmaktadır. Ayrıca, memeli sütüne erişimin kısıtlı ve maliyetli olduğu ülkelerde bitki bazlı süt ikameleri daha ekonomik bir seçenek olarak değerlendirilmektedir. Teknolojik açıdan bitki bazlı süt ikameleri, bitkisel materyalin suda çözündürülmesi ve parçalanmasıyla elde edilen süspansiyonlar olup görünüş bakımından memeli sütüne benzemektedir. Üretim süreci, bitkisel materyalin suda ekstrakte edilmesi, sıvı fraksiyonun ayrılması ve son ürünün formülasyonu aşamalarını içermektedir. Homojenizasyon ve ısıl işlemler ise, bu ürünlerin süspansiyon stabilitesini ve mikrobiyolojik güvenliğini arttıran diğer proses adımlarıdır (Mäkinen vd., 2016; Silva vd., 2020). Bitkisel süt ikameleri; genellikle baklagiller, yağlı tohumlar ve tahılların su özütleri olup, görünüm açısından inek sütüne benzemektedir (Mäkinen vd., 2016; Fructuoso vd., 2021). Süt ikamelerinin besin değerleri, bitki kaynağına, işleme ve zenginleştirmeye bağlıdır. Ancak bitkisel ikame ürünleri hayvan sütlerine göre son derece düşük protein ve kalsiyum içeriğine sahiptir. Bununla birlikte lezzetli ve besin açısından yeterli ürünler olarak formüle edildiklerinde, bitki bazlı ikameler süt ürünlerine sürdürülebilir bir alternatif sunabilir (Mäkinen vd., 2016; Silva vd., 2020).

Ceviz yağı yüksek miktarda çoklu doymamış yağ asidi (PUFA) (%61.8-75.3) içerir. Linoleik asit ceviz yağındaki başlıca yağ asididir (%52,5-60,2) ve ayrıca önemli miktarda linolenik asit (%8.8-15.2) içerir (Bakkalbaşı, 2019). Son yıllarda, içerdiği temel yağ asitleri nedeniyle ceviz yağına olan ilginin artmasıyla, ceviz yağının üretim ve tüketimi dünya genelinde giderek artmaktadır. Ceviz yağı soğuk presleme ile kolayca elde edilebilmektedir. Yağı alındıktan sonra kalan ceviz küspesi ise protein ve antioksidanlar açısından önemli bir doğal kaynaktır. Ancak ceviz çekirdeğinin yağı alındıktan sonra kalan küspe, düşük katma değerli hayvan yemi veya gübre gibi ürünlere işlenmektedir (Garcia-Mendoza vd., 2021; Rabrenović vd., 2022). Dolayısıyla zengin bir bileşime sahip olan düşük maliyetli ceviz küspesinin, tüketicilerin beslenme alışkanlıklarındaki değişimlere uygun olarak yeni bir ürüne işlenmesi , ekonomik katma değer yaratma, atık yönetimi ve çevre koruma gibi pek çok husus bakımından önemlidir (Rabrenović vd., 2022).

Biyoteknolojinin ilerlemesi ve enzim işlevlerinin anlaşılmasıyla birlikte günümüzde özellikle içecek endüstrisinde (alkollü ve alkolsüz içecekler), prosesin farklı aşamalarında daha kaliteli ürün elde etmek için ticari enzim preparatları kullanılmaktadır. Bu preparatlar askıda bulunan bileşenleri çökeltir, berraklaşmayı hızlandırır, renk maddelerinin geçişini ve meyve suyu verimini artırır. İçecek endüstrisinde enzim kullanımı, verimi artıran aynı zamanda karbon ayak izini, enerji tüketimini ve çevre kirliliğini azaltan bir yöntemdir (Cosme vd., 2023).

Bu çalışmada, ceviz küspesinden ceviz içeceği eldesinde Alcalase 2.4 L enziminin protein ekstraksiyonu üzerine etkisi incelenmiştir. Üretim sürecince sıcaklık, pH, enzim derişimi ve süre gibi farklı parametrelerin elde edilen protein konsantrasyonu üzerine etkisi belirlenmiştir.

2. MATERYAL ve METOT

2.1 MATERYAL

Bu çalışmada kullanılan ceviz örnekleri Hakkâri ilindeki yerel bir üreticiden temin edildi. Protein hidrolizi amacıyla Alcalase 2.4 L enzimi (Novo Holdings A/S, Bagsværd, Danimarka)

kullanıldı. Ceviz içeceğinin hazırlanmasında doğal mineralli su kullanıldı (Danone Hayat İçecek ve Gıda San. ve Tic. A.Ş., Türkiye). Protein tayininde analitik saflıkta kimyasallar kullanıldı.

2.2 METOT

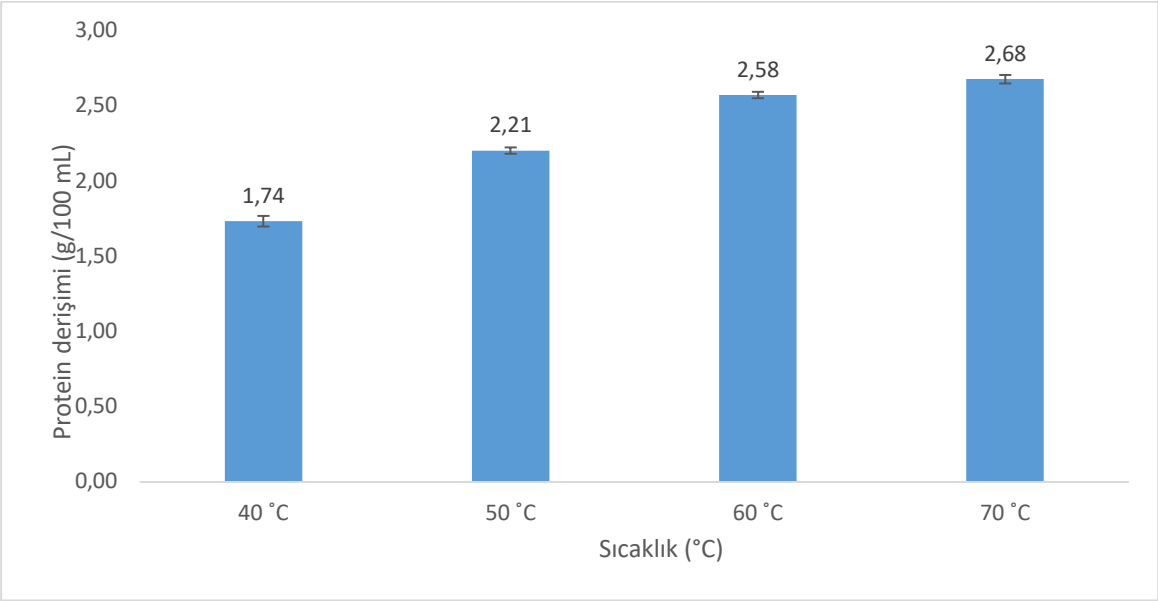
2.2.1 Ceviz İşleme ve Ön Hazırlık

Dış kabukların ayrılmasından sonra elde edilen ceviz içleri bir blenderda öğütüldü ve daha sonra soğuk pres makinesinden geçirilerek yağ ve posa ayrıldı. Elde edilen posadaki kalıntı yağı uzaklaştırmak için hekzan ile soğuk ekstraksiyon işlemi gerçekleştirildi. Elde edilen yağsız posa, hekzanın uzaklaştırılması için oda sıcaklığında bir gece havalandırılarak kurutuldu. Kurutulan posa tekrar öğütüldükten sonra gözenek boyu 0.85 mm olan elek kullanılarak elendi ve böylece yağsız ceviz unu elde edildi. Elde edilen yağsız ceviz unu ceviz içeceği üretiminde kullanıldı.

2.2.2 Ceviz İçeceği Üretimi ve Örnek Hazırlama

Yağsız ceviz unu ile doğal mineralli su ön denemeler ile belirlenen 1:9 (w:v) oranında karıştırıldı. Enzimin çalışma koşullarının (sıcaklık, pH, enzim konsantrasyonu ve süre) belirlenmesi için elde edilen karışıma %1 oranında enzim eklenerek 40, 50, 60 ve 70°C'de pH 6.25'te 6 saat süreyle inkübe (MCSİ 120, Mipro, Türkiye) edildi ve sıcaklığın enzim faaliyeti üzerine etkisi belirlendi. Enzim konsantrasyonun etkisini belirlemek için karışıma yağsız ceviz ununun %0.5, 1.0, 1.5 ve 2.0'si oranında enzim eklenerek 60°C'de, pH 6.25'te ve 6 saat süreyle inkübe edilerek enzim konsantrasyonunun etkisi belirlendi. Sürenin etkisini belirlemek için karışım 60°C'de, %2 enzim derişiminde, pH 6.25'te ve 100 rpm hızda 2, 4, 6, 8, 10 ve 12 saat çalkalanarak sürenin etkisi belirlendi. Son olarak pH'nın etksini belirlemek için karışımın pH değeri 0.1 N NaOH ile 6.25, 7.0, 8.0 ve 9.0'a ayarlandı. Bu karışım 60°C'de, %2 enzim derişiminde 8 saat süreyle inkübe edilerek pH'nın etkisi belirlendi. İnkübasyon sonunda elde edilen örnekler 5000 rpm hızda 15 dak santrifüj (NF 1200R, Nüve, Türkiye) edildi, üst faz kaba filtre kağıdından geçirildi ve protein tayini için kullanıldı.

2.2.3 Protein Tayini

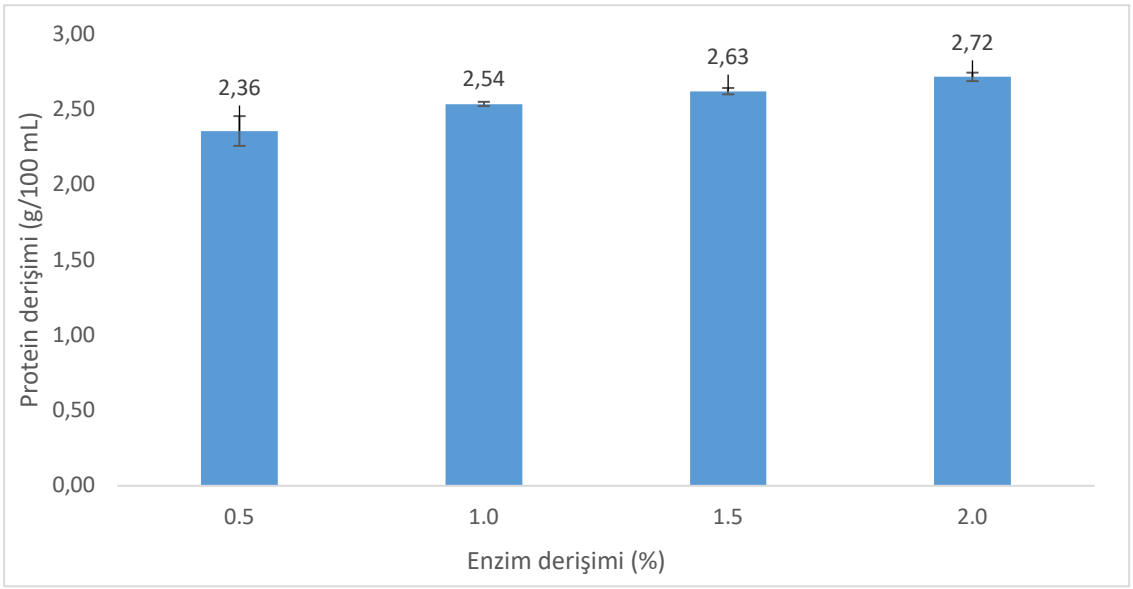


Farklı enzim konsantrasyonu, pH, sıcaklık ve sürelerde elde edilen ceviz içeceklerinin protein konsantrasyonu Biüret yöntemiyle belirlenmiştir. Örnekler belli oranlarda %0.85'lik NaCl çözeltisi ile 1 mL'ye tamamlanmış ve 4 mL biüret çözeltisi ilave edilerek vortexle karıştırılmıştır. Biüret çözeltisi ilave edildikten 30 dak sonra her örneğin absorbansı 540 nm'de (UV-Mini 1240 UV-VIS, Shimadzu, Kyoto, Japan) okunmuştur. Kalibrasyon eğrisi için sığır serum albümini standart olarak kullanılmıştır ($y=0.0585x+0.0053$, $R^2=0.9998$) (Gornall vd., 1949).

2.2.4 İstatistik Analizler

Bu çalışmada elde edilen sonuçların değerlendirmesinde SPSS (version 20.0 for Windows, SPSS Inc., Chicago, Illinois) paket programı kullanılmıştır. Grup ortalamaları arasında istatistiksel açıdan anlamlı bir farkın olup olmadığı tek yönlü varyans analizi (One-Way ANOVA) ile incelenmiştir. Farklılığın önem derecesi Duncan çoklu karşılaştırma testi kullanılarak tespit edilmiştir.

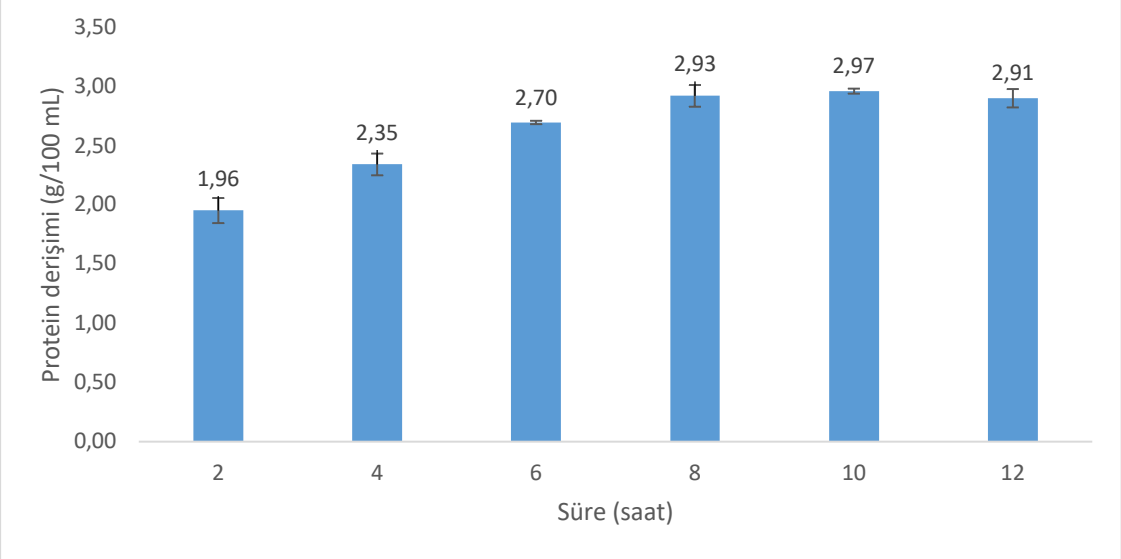
3. BULGULAR ve TARTIŞMA



Çalışmanın ilk aşamasında, enzimin çalışma sıcaklığının protein konsantrasyonuna etkisini belirlemek için %1 enzim eklenmiş örnekler 6 saat boyunca 40, 50, 60 ve 70°C'de bekletildi ve elde edilen örneklerde protein konsantrasyonu belirlendi. Farklı sıcaklıklarda elde edilen protein miktarı Şekil 3.1'de verilmiştir.

Şekil 3.1 Farklı sıcaklıklarda ekstraksiyonun (40, 50, 60 ve 70°C) ceviz içeceğinin protein derişimi üzerine etkisi (pH:6.25, %1 enzim derişimi, 6 saat ekstraksiyon)

Şekil 3.1 incelendiğinde, sıcaklığın artmasıyla beraber protein derişiminde de artış olduğu görülmektedir. Sıcaklıklar arasında görülen farklılık istatistiksel olarak ($P<0.05$) önemli bulundu. 40°C'de protein oranı %1.74 iken, sıcaklığın 70°C'ye yükselmesiyle protein oranı %2.68'e çıktı. En yüksek protein derişimi 70°C'de elde edilmesine rağmen bu sıcaklıkta içeceğin rengi olumsuz etkilendi ve koyulaştı. Tüketici albenisi dikkate alındığında ekstraksiyon için uygun sıcaklığının 60°C olduğu tespit edildi.

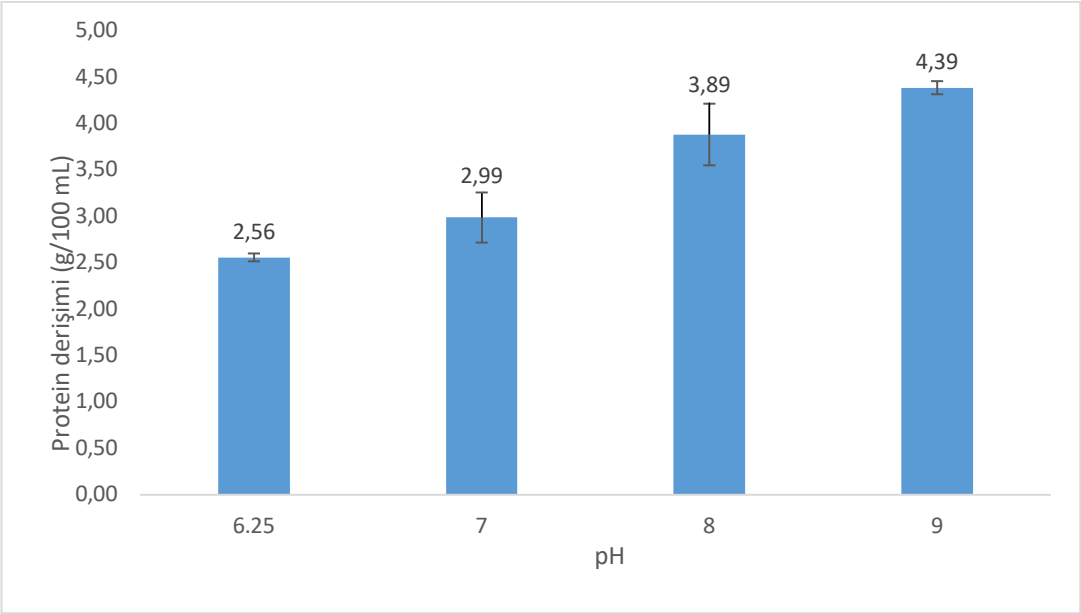


Enzim miktarının ceviz içeceklerinin protein derişimi üzerindeki etkisini belirlemek için karışıma ceviz ununun %0.5, 1.0, 1.5 ve 2.0'si kadar enzim ilave edildi ve protein ekstraksiyonu 60°C'de gerçekleştirildi. Enzim miktarının örneklerin protein derişimine etkisi Şekil 3.2'de gösterilmiştir.

Şekil 3.2 Enzim miktarının (%0.5, 1.0, 1.5 ve 2.0) ceviz içeceğinin protein derişimi üzerine etkisi (Sıcaklık: 60°C, pH: 6.25, 6 saat ekstraksiyon)

Şekil 3.2 incelendiğinde, %0.5 enzim oranında %2.36 protein derişimi elde edilirken enzim oranı %2'ye çıktığında protein derişimi de %2.72'ye yükseldi. Enzim derişimi arttıkça protein konsantrasyonu da istatistiksel olarak ($P<0.05$) önemli oranda arttı. Bu nedenle, içecekte yüksek protein oranı için ideal enzim derişimi %2 olarak belirlendi. See vd. (2011) Alcalase 2.4 L kullanarak somon derisinden enzimatik hidrolizle protein ekstraksiyonu gerçekleştirmiştir. Bu çalışmada enzim substrat oranı %0.5 ile 2.5 aralığında belirlenmiş ve bu değerin artmasıyla protein veriminde de artış gözlenmiştir. Bu durumun, yüksek miktarda enzimin protein hidrolizini artırmasından kaynaklandığı belirtilmiştir.

Ekstraksiyon süresinin protein derişimi üzerindeki etkisini gözlemek için 60°C sıcaklık ve %2 enzim konsantrasyonunda enzim eklenmiş karışım 2, 4, 6, 8, 10 ve 12 saat boyunca protein ekstraksiyonuna tabi tutuldu. Farklı ekstraksiyon sürelerinde elde edilen protein derişimi Şekil 3.3'te verilmiştir.



Şekil 3.3 Ekstraksiyon süresinin (2, 4, 6, 8, 10 ve 12 saat) ceviz içeceğinin protein derişimi üzerine etkisi (Sıcaklık: 60°C, enzim derişimi: %2, pH: 6.25)

Şekil 3.3 incelendiğinde protein derişiminde 8. saate kadar önemli oranda ($P<0.05$) bir artış gözlenirken 8. saatten sonra protein oranında görülen değişim önemli bulunmadı. Dolayısıyla 8 saatten uzun bir ekstraksiyon süresinin gereksiz olduğu tespit edildi.

Elde edilen sonuçlara göre, ideal ekstraksiyon koşulları 60°C ekstraksiyon sıcaklığı, %2 enzim derişimi ve 8 saat ekstraksiyon süresi olarak belirlendi. Anh vd. (2020) soyadan protein ekstraksiyonunda ekstraksiyon süresinin verime etkisini inceledikleri çalışmada, 2. saate kadar ekstraksiyon veriminde artış olduğunu tespit etmiştir. Ekstraksiyon süresini 3 saate çıkardıklarında ise ekstraksiyon veriminde herhangi bir artış olmamıştır. Bu çalışmada ise 8. saate kadar bir artış, 8. saatten sonra önemsiz değişimler görülmüştür.

Farklı pH değerlerinin ekstraksiyon etkinliği üzerindeki etkisini gözlemek için içeceklerin pH değeri 6.25 (doğal ortam pH değeri), 7.0, 8.0 ve 9.0'a ayarlandı. Bu pH değerlerinde, 60°C sıcaklıkta, %2 enzim varlığında ve 8 saat süreyle protein ekstraksiyonu gerçekleştirilmiş ve elde edilen protein derişimleri Şekil 3.4'te verilmiştir.

Şekil 3.4 Farklı pH değerlerinin (6.25, 7.0, 8.0 ve 9.0) ceviz içeceğinin protein derişimi üzerine etkisi (Sıcaklık: 60°C, enzim derişimi: % 2, Süre: 6 saat)

Bu çalışmada üretilen içeceğin doğal ortam pH değeri 6.25 olarak tespit edildi. Bu pH değerinde %2.56 protein derişimi elde edilirken, pH değerinin artmasıyla beraber protein derişiminde de çarpıcı biçimde bir artış gözlendi ve protein derişimi %4.39'a kadar çıktığı tespit edildi. Ancak pH 7'nin üzerindeki örneklerde ürün renginde önemli düzeyde koyulaşma gözlendi. Amiza vd. (2011), gümüş yayın balığı (Pangasius sp.) iskeletinden enzimatik protein hidrolizinin optimizasyonu ile ilgili yapmış oldukları çalışmada, Alcalase 2.4 L enzimini kullanmıştır. Bu çalışmada pH 7.5, 8.5 ve 9.5 olmak üzere üç faklı pH çalışılmış ve pH'nın artmasıyla protein veriminde önemli bir artış tespit edilmiştir. Montilha vd. (2017) Alcalase 2.4 L ile okaranın enzimatik protein hidroliz koşullarının optimizasyonu ile ilgili yapmış oldukları bir çalışmada, pH değerinin 7'den 9'a çıkmasıyla protein veriminin de artığını göstermiştir. Bu çalışmada elde edilen sonuçların literatürde belirtilen çalışmalarla uyumlu olduğu görülmektedir.

4. SONUÇ

Ceviz yağının alınmasından sonra geriye kalan ceviz küspesi, protein ve antioksidanlar açısından zengin, değerli bir doğal kaynaktır. Ancak bu küspe genellikle düşük katma değerli ürünler olan hayvan yemi veya gübre olarak değerlendirilmektedir. Oysa, böylesine besin değeri yüksek bir hammadde, son yıllarda giderek ilgi gören bitkisel bazlı içeceklerin üretiminde kullanılarak daha yüksek katma değerli bir ürüne dönüştürülebilir. Bu çalışmada, ceviz küspesinden Alcalase 2.4 L enzimi kullanılarak ceviz içeceği üretimi denenmiş ve farklı parametrelerin protein ekstraksiyonu üzerine etkisi incelenmiştir. Enzim ekstraksiyon 4 farklı sıcaklık, 4 farklı pH, 4 farklı enzim derişimi ve 6 farklı sürede gerçekleştirilmiştir. Yapılan çalışma sonucunda, ceviz içeceği üretiminde Alcalase 2.4 L enzimi kullanımının olumlu sonuçlar verdiği ve yüksek protein değerleri için ideal ekstraksiyon koşullarının 60°C ekstraksiyon sıcaklığı, %2 enzim oranı, 8 saat ekstraksiyon süresi ve 9 pH değeri olduğu sonucuna ulaşılmıştır. Çalışılan parametreler arasında özellikle sıcaklık ve pH değerinin elde edilen protein konsantrasyonunu önemli derecede etkilediği görülmüştür.

TEŞEKKÜR

Bu çalışma Van Yüzüncü Yıl Üniversitesi Bilimsel Araştırma Projeleri Koordinasyon Birimi tarafından desteklenmiştir (Proje No: FYL-2023-10541).

ÖZET

Son yıllarda farklı nedenlerle vegan/vejetaryen beslenmeye olan ilginin yükselmesi, bitkisel bazlı içeceklere yönelimi hızlandırmıştır. Soya, badem ve fındık sütü gibi alternatifler piyasada yaygın olarak yer almakta olup, ceviz meyvesi de yüksek besin değeri ve fonksiyonel özellikleri sayesinde bu alanda potansiyel bir hammadde olarak öne çıkmaktadır. Ceviz, yağ içeriği açısından zengin olup linoleik ve linolenik asit gibi değerli yağ asitleri barındırır. Yağ eldesi sonrası geriye kalan pres keki de özellikle yüksek protein ve doğal antioksidan içeriğine sahiptir ancak ekonomik olarak yeterince değerlendirilememektedir. Bu yağsız ceviz keki, ön işlemlerle ceviz ununa dönüştürülerek çeşitli gıda ürünlerine katılarak kullanılabilmektedir. Bitkisel içecekler genellikle tahıl, baklagil, tohum ve sert kabuklu meyvelerin su ile maserasyonu yoluyla üretilir. Maserasyon sürecinin hızlandırılması ve verimliliğin artırılması amacıyla son yıllarda ultrasonik ekstraksiyon yöntemleri tercih edilmektedir. Ultrasonik ekstraksiyon, geleneksel yöntemlere alternatif olarak öne çıkan yenilikçi bir teknolojidir. Bu çalışmada, ceviz pres atığından elde edilen yağsız ceviz ununun kullanımıyla, geleneksel ve ultrasonik ekstraksiyon yöntemlerinin ceviz içeceğine geçen protein miktarına etkileri incelenmiştir. Deneysel süreçte, ceviz içleri öğütülerek soğuk ekstraksiyon yöntemiyle yağdan arındırılmış ve yağsız ceviz unu elde edilmiştir. Ultrasonik ekstraksiyon işlemleri üç farklı güç seviyesinde (%50, %75 ve %100) gerçekleştirilirken, geleneksel ekstraksiyon oda sıcaklığında uygulanmıştır. Her iki yöntemde belirli zaman aralıklarında alınan örneklerde protein miktarı analiz edilmiştir. Elde edilen veriler doğrultusunda, ekstraksiyon yöntemlerinin hız ve verimlilik açısından karşılaştırmalı değerlendirmesi yapılmıştır. Protein verimliliği açısından değerlendirildiğinde, %100 genlikte gerçekleştirilen 3 dakikalık ultrasonik ekstraksiyon, geleneksel yöntemin yaklaşık 16 saatlik sürecine eşdeğer protein miktarı sağlamaktadır. Benzer şekilde, %75 genlikteki ultrasonik ekstraksiyon, klasik yöntemin bir saatlik verimine denk

gelmektedir. Bu bulgular doğrultusunda, ceviz pres atığından elde edilen ceviz içeceği üretiminde ultrasonik ekstraksiyonun, geleneksel yönteme kıyasla daha hızlı ve daha etkili bir protein ekstraksiyonu sağladığı sonucuna ulaşılmıştır.

Anahtar Kelimeler: Ceviz, Ceviz içeceği, Protein, Ultrases, Ekstraksiyon.

EFFECT OF DIFFERENT EXTRACTION METHODS ON PROTEIN CONTENT IN WALNUT BEVERAGE PRODUCTION

ABSTRACT

In recent years, the increasing interest in vegan/vegetarian nutrition for various reasons has accelerated the trend towards plant-based beverages. Alternatives such as soy, almond, and hazelnut milk are widely available on the market, and walnuts are also emerging as a potential raw material in this field due to their high nutritional value and functional properties. Walnuts are rich in oil and contain valuable fatty acids (linoleic and linolenic acid). The press cake left over after oil extraction is not sufficiently utilized economically, despite its high protein and natural antioxidant content. This oil-free walnut cake can be converted into walnut flour through pretreatment and used as a raw material in various food products. Plant-based beverages are generally produced through the maceration of grains, legumes, seeds, and hard-shelled fruits with water. In recent years, ultrasonic extraction methods have been favored to accelerate the maceration process and increase efficiency. Ultrasonic extraction is an innovative technology that stands out as an alternative to conventional methods. In this study, the effects of conventional and ultrasonic extraction methods on the amount of protein transferred to walnut drink using fat-free walnut flour obtained from walnut press waste were investigated. In the experimental process, walnut kernels were ground and defatted using the cold extraction method to obtain fat-free walnut flour. Ultrasonic extraction processes were carried out at three different power levels (50%, 75%, and 100%), while conventional extraction was applied at room temperature. The protein content was analyzed in samples taken at specific time intervals in both methods. Based on the data obtained, a comparative evaluation of the extraction methods in terms of speed and efficiency was performed. In terms of protein yield, a 3-minute ultrasonic extraction at 100% amplitude provided an equivalent protein amount to the conventional method's approximately 16-hour process. Similarly, ultrasonic extraction at 75% amplitude is equivalent to the yield of the classical method in one hour. Based on these findings, it was concluded that ultrasonic extraction provides faster and more effective protein extraction compared to the conventional method in the production of walnut drink from walnut press waste.

Keywords: Walnut, Walnut beverage, Protein, Ultrasound, Extraction

1. GİRİŞ

Ceviz, hem beslenme hem de ekonomik açıdan öne çıkan ve sevilerek tüketilen bir üründür (Oliveira ve ark., 2008). Yüksek yağ içeriğiyle birlikte zengin bir yağ asidi profiline, fenolik bileşiklere, fitosterollere, tokoferollere ve karotenoidlere sahip değerli bir besin kaynağıdır. Doymamış yağ asitleri ve tokoferol düzeyleri, yaygın olarak tüketilen diğer bazı yağlı tohumlara kıyasla belirgin şekilde daha yüksektir. Bu fitokimyasallar, cevizlere güçlü antioksidan ve antienflamatuar özellikler kazandırmakta; ayrıca kolesterol düşürücü etkiler göstermektedir. Diyete ceviz eklenmesi, nörodejeneratif hastalıkların başlangıcını geciktirebilir ve bazı kanser türlerine karşı koruyucu rol oynayabilir (Nguyen ve Vu, 2023).

Cevizin yalnızca doğrudan tüketimi değil, işlenmesi sırasında ortaya çıkan yan ürünleri de besin değeri ve fonksiyonel bileşen içeriği açısından dikkat çekmektedir. Ceviz yağı üretimi sırasında yeşil ceviz kabuğu, sert kabuk, septum ve ceviz unu gibi çeşitli yan ürünler ortaya çıkmaktadır. Bu yan ürünler, içerdiği çeşitli biyoaktif ürünler sayesinde gıda, kimya ve biyomedikal endüstrilerinde doğal katkı maddesi ve fonksiyonel bileşen olarak değerlendirilmektedir (Zhu ve ark., 2024). Özellikle ceviz yağı eldesinde, meyvelerin yağı alındıktan sonra kalan kısım ceviz unu olarak adlandırılmakta ve yüksek oranda ceviz proteini içermektedir (Sari ve ark., 2022).

Ceviz yan ürünleri, içerdiği zengin besin öğeleri ve biyoaktif bileşikler sayesinde, hem temel beslenme ihtiyaçlarını karşılamakta hem de ek sağlık faydaları sağlayan gıda formülasyonlarında kullanılmaktadır. Ceviz yan ürünlerinin çeşitliliği ve kendine özgü özellikleri göz önüne alındığında, ticari ölçekte değerlendirilmesini ve pazara entegrasyonunu sınırlayan en temel faktör, uygun ekstraksiyon teknolojisinin seçimi olarak öne çıkmaktadır. Geleneksel ekstraksiyon teknikleri, çevresel sürdürülebilirlik ve kaynak verimliliği açısından yetersiz kalmakta; ayrıca çözücü bağımlılığı nedeniyle düşük kaliteli ürünlerin elde edilmesine neden olmaktadır. Yenilikçi teknolojilerin yaygın olarak uygulanması, ekstraksiyon sürecinde organik çözücülerin kullanımını azaltır (Zhu ve ark., 2024). Son yıllarda, maserasyon sürecinin hızlandırılması ve verimliliğinin artırılması amacıyla ultrasonik ekstraksiyon yöntemi yaygın olarak kullanılmaktadır. Ultrasonik dalgaların ekstraksiyon ve gıda muhafazasında kullanımı, güvenli, verimli, ekonomik ve çevre dostu olarak uygulanabilen yeni ve etkili bir işleme teknolojisidir (Rodrigues ve Fernandes, 2009). Ultrason uygulamasıyla ekstraksiyon verimindeki artış, esas olarak, ultrasonik dalganın geçişiyle çözücüde oluşan akustik kavitasyonların etkilerine atfedilir (Wang ve ark., 2008).

Bu çalışmada, ekonomik değeri düşük ve genellikle değerlendirilmeden atılan ceviz pres atığının, ultrasonik teknik kullanılarak yüksek katma değerli ceviz içeceği üretiminde değerlendirilme potansiyeli araştırılmıştır.

2. MATERYAL VE YÖNTEM

2.1. Materyal

Araştırmada kullanılan Yavuz çeşidine ait ceviz örnekleri, Hakkâri ilindeki bir yerel üreticiden temin edilmiştir. Biüret analizinde analitik saflıkta Biüret reaktifi, sodyum klorür ve sığır serum albümini kullanılmıştır.

2.2. Yöntem

2.2.1. Ceviz İçeceği Üretiminde Farklı Ekstraksiyon Uygulamaları

Sert dış kabukları uzaklaştırılan cevizlere, mutfak tipi parçalayıcı (AR142 Soprano, Arzum, Türkiye) yardımıyla ön parçalama işlemi uygulandı. Daha sonra soğuk pres makinesinden (NF80, Karaerler, Türkiye) geçirilerek yağ ve posa ayrıldı. Elde edilen posadaki kalıntı yağ, çözücü olarak hekzan kullanılan soğuk ekstraksiyon işlemi ile uzaklaştırıldı. Soğuk

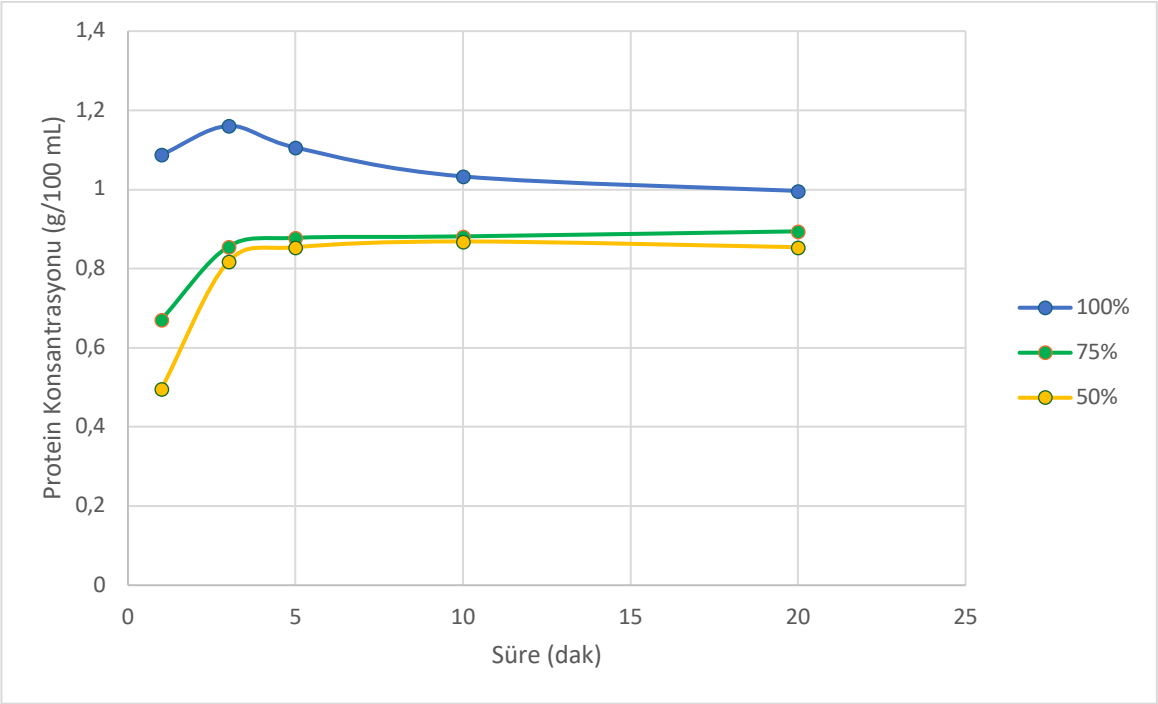
ekstraksiyon işleminde, posa ile hekzan 1:3 oranında, 180 rpm hızda ve 4 saat boyunca çalkalayıcıda (OS-3000, Jeio Tech, Güney Kore) karıştırıldı. Süre sonunda kaba filtre kâğıdı ile süzme işlemi yapıldı. Elde edilen posa, hekzanın uzaklaşması için oda sıcaklığında bir gece boyunca havalandırılarak kurutuldu. Kurutulan posa, öğütüldükten (K 3104, Arçelik, Türkiye) sonra gözenek boyutu 0.85 mm olan elek kullanılarak elendi ve böylece yağsız ceviz unu elde edildi.

Ultrasonik ekstraksiyon için hazır hale getirilen yağsız ceviz unu ile içme suyu 1:9 (w:v) oranında karıştırılarak elde edilen karışım farklı genliklerde (%50, 75 ve 100 amp gücünde) 1, 3, 5, 10 ve 20 dak boyunca ultrason destekli homojenizatörde (GM 3200, Bandelin, Almanya) homojenize edildi. Elde edilen homojenizat 3600 rpm hızda 5 dak santrifüj (NF 1200R, Nüve, Türkiye) edildikten sonra üst fazdaki sıvı kısım filtre edilerek ayrıldı.

Geleneksel ekstraksiyonda, yağsız ceviz unu 1:9 (w/v) oranında su ile karıştırıldı. Karışım ultrason işlemi uygulanmaksızın 16 saat boyunca 100 rpm hızda dairesel çalkalayıcıda (OS 3000, Jeio Tech, Güney Kore) karıştırıldı. Karışım santrifüj edildikten sonra üst fazdaki sıvı kısım filtre edilerek ayrıldı.

Her iki yöntemle de elde edilen ekstraktların protein miktarı Biüret yöntemi kullanılarak belirlendi.

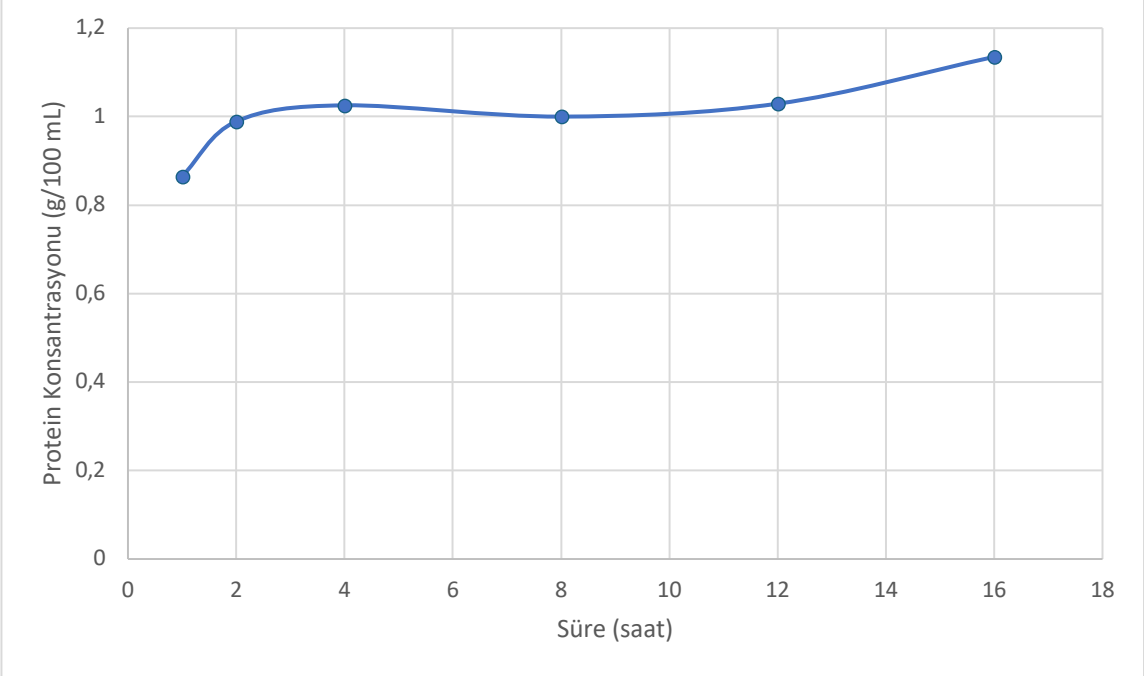
2.2.2. Biüret Yöntemi ile Protein Tayini



Biüret yöntemi ile protein tayininde örnekler belli oranlarda %0.85'lik NaCl çözeltisi ile 1 mL'ye tamamlanmış ve 4 mL biüret çözeltisi ilave edilerek vortexle karıştırılmıştır. Biüret çözeltisi ilave edildikten 30 dak sonra 540 nm'de (UV-Mini 1240 UV-VIS, Shimadzu, Kyoto, Japan) absorbans okunmuştur. Kalibrasyon eğrisi için sığır serum albümini standart olarak kullanılmıştır (Gornall ve ark., 1949).

2.2.3 İstatistiksel Analiz

Bu çalışmada elde edilen sonuçların değerlendirmesinde SPSS (version 20.0 for Windows, SPSS Inc., Chicago, Illinois) paket programı kullanılmıştır. Grup ortalamaları arasında istatistiksel açıdan anlamlı bir farkın olup olmadığı tek yönlü varyans analizi (One-Way ANOVA) ile incelenmiştir. Farklılığın önem derecesi Duncan çoklu karşılaştırma testi kullanılarak tespit edilmiştir.



3. BULGULAR VE TARTIŞMA

%50, %75 ve %100 ultrason genliklerinde 20 dakika boyunca uygulanan ultrason destekli ekstraksiyon işlemleri sonucunda elde edilen protein miktarları Şekil 1'de gösterilmiştir. En yüksek protein miktarı %100 ultrason genliğinde uygulanan ekstraksiyonun 3. dakikasında (1.16 g/100 mL) elde edilmiştir. Ancak bu genlikte 3. dakikadan sonra süre ilerledikçe ekstraktın protein içeriği azalmıştır. %50 ve %75 ultrason genliklerinde protein miktarında ilk 3 dakika süresince anlamlı bir artış gözlemlenmiştir, 3. dakikadan sonra ekstraksiyon süresi artmasına karşın protein içeriğinde önemli bir değişim görülmemiştir. Aynı ekstraksiyon süresinde örneklerde elde edilen protein miktarı incelendiğinde, ultrason genliğinin artmasıyla protein miktarının da yükseldiği belirlenmiştir. Benzer bir bulgu, yağsız soya gevreğinden protein ekstraksiyonu amacıyla ultrason teknolojisinin kullanıldığı çalışmada da rapor edilmiştir (Karki ve ark., 2010). Sonuçlar incelendiğinde, %50 ve %75 genlikte elde edilen sonuçların özellikle ekstraksiyonun 3. dakikasından sonra birbirine çok yakın seyrettiği, %100 genlikte elde edilen sonuçların ise %50 ve %75 genlikte elde edilen sonuçlardan tüm ekstraksiyon süresince önemli düzeyde yüksek olduğu gözlenmektedir. Protein içeriği açısından, aynı ultrason genliği altında ekstraksiyon süreleri arasındaki fark ve aynı sürede ultrason genlikleri arasındaki fark istatistiksel olarak anlamlı bulunmuştur ($P<0.05$).

Şekil 1. Ultrason destekli ekstraksiyonda protein konsantrasyonunun ultrason genliğine ve süreye (dak) bağlı değişimi

Geleneksel yöntemle elde edilmiş ceviz içeceği ekstraktlarının protein miktarındaki değişim ise Şekil 2'de sunulmuştur. Geleneksel ekstraksiyon süresi uzadıkça, ekstrakttaki protein miktarında genel olarak artış gözlemlenmiştir. Ekstraksiyon süresince ilk 4 saatte protein düzeyindeki artış yüksek iken, 4-12 saat arasında önemli bir değişim gözlenmemiştir. Ancak 12. saatten sonra tekrar bir artış eğilimi başlamıştır. Örneklerdeki en yüksek protein içeriği, 16 saatlik ekstraksiyon sonunda elde edilmiştir (1.13 g/100 mL). 16 saatlik geleneksel ekstraksiyon sonucunda elde edilen protein miktarı, %100 genlik kullanılan ultrason destekli ekstraksiyonun 3. dakikasında elde edilen protein miktarıyla (1.16 g/100 mL) benzerlik göstermektedir. Bu bulgular, ultrason destekli ekstraksiyonun daha kısa sürede daha yüksek protein verimi sağlayabildiğini ve ekstaksiyon süresini önemli ölçüde kısaltabildiğini göstermektedir. Bununla birlikte, uzun süreli uygulamalara rağmen geleneksel ekstraksiyon yöntemi ile elde edilen protein miktarı, ultrasonik yöntemle elde edilen değerlerin altında ya da ancak yakın seviyelerde kalmıştır. Susam tohumundan farklı yöntemler ile protein ekstraksiyonunda, ultrasonik ekstraksiyon ile benzer sonuçlar elde edilmiştir. Bu yüksek verimlilik, ultrasonun hücresel yapıyı bozarak proteinlerin daha etkin şekilde salınmasını sağlamasından kaynaklanmaktadır (Yang ve ark., 2021). Ultrason destekli ekstraksiyonun ceviz proteinlerinin ekstraksiyon verimini ve özelliklerini iyileştirmek için umut verici bir yaklaşım olduğu Lv ve ark. (2019) tarafından bildirilmiştir.

Şekil 2. Geleneksel ekstraksiyon yönteminde protein konsantrasyonunun süreye (saat) bağlı değişimi

SONUÇ

Bu çalışmada elde edilen veriler, ultrason destekli protein ekstraksiyonun ceviz içeceği ekstraktlarında protein konsantrasyonunu artırmada geleneksel yönteme göre daha etkili ve hızlı bir alternatif olduğunu göstermektedir. Aynı ekstraksiyon süresinde ultrason genliğinin yükselmesiyle protein miktarının arttığı görülmektedir. En yüksek protein ekstraksiyonu %100 ultrason genliğinde yalnızca 3 dakikalık uygulama ile elde edilmiştir. Bu miktar, geleneksel yöntemde 16 saatlik ekstraksiyon sonunda elde edilen maksimum değeri aşmaktadır. Buna karşın %100 genlikte 3. dakikadan itibaren azalma eğilimi ortaya çıkmıştır. Elde edilen sonuçlar, ultrasonik ekstraksiyonun hem verim hem de işlem süresi açısından geleneksel ekstraksiyona göre daha üstün bir yöntem olduğunu göstermektedir.

TEŞEKKÜR

Bu çalışma Van Yüzüncü Yıl Üniversitesi Bilimsel Araştırma Projeleri Koordinasyon Birimi tarafından desteklenmiştir (Proje No: FYL-2023-10541).

ÖZET

Turunçgil yetiştiriciliğinde meyve verim ve kalitesini etkileyen faktörlerden biri de iklim koşullarıdır. Yaz aylarında high temperature and direct solar radiatio nedeniyle meyvelerde oluşan güneş yanıklıkları ağaç gelişimine, meyve verim ve kalitesine ve ekonomik kayıplara neden olabilir. Bu araştırmada kaolin kilin farklı doz ve zamanlardaki uygulamalarının Okitsu wase mandarinlerinde bazı fizyolojik, morfolojik özelliklerine, meyve verim ve kalitesine etkileri incelenmiştir. Kaolin kil uygulaması (Surround WP) denemede yer alan ağaçların bir yarısına ilk kaolin (%5) uygulaması Mayıs sonu (Küçük meyve dökümünden sonra), diğer yarısına Haziran ortasında %2.5'luk ve/veya % 5 dozlarında farklı dönemlerde (1-7 kez) uygulanmıştır. Uygulama yapılmayan bitkiler kontrol olarak değerlendirilmiştir. Okitsu wase mandarinlerinde kaolin kil uygulamasının 6 ve 7 kez tekrarlandığı uygulamalarda, sıcaklık değerleri meyvede 1-2 ºC, yaprakta 4-5 ºC daha düşük ölçülmüştür. Bu etki Okitsu wase meyvelerinde güneş yanıklığı oranının azalmasına ve meyve ağırlığında artışa bağlı olarak ağaç başına verimde değişen oranlarda yükselmeye neden olmuştur. Kaolin uygulamaları kontrole göre SÇKM ve SÇKM /asit oranında artış göstermiştir. Ayrıca pazarlanabilir meyve oranını arttırmıştır.

EFFECTS OF THE APPLICATION OF KAOLIN ON OKITSUWASE SATSUMA AT VARIOUS DOSES AND TIMES ON SOME MORPHOLOGICAL, PHYSIOLOGICAL, EFFICIENCY AND QUALITY CHARACTERISTICS

ABSTRACT

One of the factors that affect fruit yield and quality in citrus growing is climate conditions. Sunburn on fruits due to high temperature and direct solar radiation in summer may affect tree growth, fruit yield and quality, and cause economic losses. This study analyzed the effects of kaolin treatment at different dosages and in different intervals on certain physiological and morphological characteristics, as well as fruit yield and quality of Okitsu wase mandarins. Kaolin treatment (Surround WP) was made (1 to 7 times) on half of the trees in the trial at the end of May (after small fruit drop) for the first time (5%), and on the other half at different intervals beginning from mid-June at 2.5% and/or 5% dosages. Plants, which were not subject to treatment, were considered as control. In treatments, where kaolin treatment was repeated 6 to 7 times on Okitsu wase mandarins, temperature values were measured 1 to 2 ºC lower in fruits and 4 to 5 ºC lower on leaves. This effect caused a reduction of sunburn ratio in Okitsu wase fruits and an increase in yield per tree at varying rates depending on the increase in fruit weight. Kaolin treatments exhibited an increase in TSS and TSS/acid ratios in comparison with the control. Furthermore, the ratio of marketable fruits increased as well.

Keywords: Citrus, mandarin, kaolin, quality, sunburn

INTRODUCTION

Turkey has a great potential for citrus production in consideration of its ecological and other characteristics. According to the statistics from 2025, Turkey's citrus production was 7,877,982 tons. Mandarin (37.48%) comprises 2,952,775 tons of such production (FAO, 2025). Among citrus fruits, the mandarin group is the first choice for table consumption, mainly due to its easy peelability. The most important factor that limits citrus growing is temperature. It was determined that heat stress caused by high temperatures in summer months caused morphological, physiological, and biochemical changes, as well as sunburns on leaves and fruits, particularly due to global warming in recent years. (Yücel, 2010; Şirin 2013; Ennab at al., 2017, Rodriguez et. al., 2019, Fischer et al.2022). Sunburn causes significant economic losses, particularly in many fruit varieties such as apple, mango, grapevine, pomegranate, citrus, and olive (Ennab et. al. 2017). In citrus plants, particularly young plants of early varieties, sunburns on fruits due to high temperatures cause loss of yield and quality. As a matter of fact, Chabbal et al. (2014) indicated that certain mandarin varieties belonging to satsuma group were quite sensitive to sunburn as they had scattered petal structures. In this regard, sprinkler irrigation, the use of coating materials, shading fruits with coatings such as netting and paper bags, and the use of light reflective materials such as kaolin may reduce sunburn in areas with high sunshine intensity (Parchomlochuk and Meheriuk, 1996; Wand et al., 2006, Alvarez et. al. 2015, Sarooghinia et al., 2020). Kaolin (a clay) is a natural mineral, main constituent of which is kaolinite ($Al_2Si_2O_5(OH)_4$), and which is used globally as "Particle Film Technology" against biotic and abiotic stress conditions (Yazıcı and Kaynak, 2007). Film cover treatment including Kaolin is effective in reducing heat stress (Glenn et al. 2001; Erez and Glenn 2002). Kaolin is sprayed on plants as a thin film coating: it reflects part of the extreme heat intensity received by the plant, creates a shading effect on the plant, reduces the temperature of plant organs, and increases photosynthesis (Glenn et al. 2002).

In citrus growing areas of Hatay province located at the southernmost part of Turkey, where summer months are hot and arid, sunburns, recently on the rise due to global warming, are frequently observed in young groves of Okitsu wase, an early, high-yielding, and high-quality variety. Reasons such as the expansion in area used for growing this variety in recent years and sensitivity to heat stress increase the importance of the matter.
This study was conducted with the purpose of determination of the effects of kaolin treatments, initiated at two different times and repeated at different dosages and intervals to prevent heat stress during fruit development period of Okitsu wase mandarins widely grown in Eastern Mediterranean Region, on heat stress, sunburn, fruit quality, yield, and certain physiological properties.

1. MATERIAL AND METHODS

The experimental grove was planted in Dörtyol (Hatay), located in the North West region of Turkey (36º09′E, 36º51′N; 9 m above the sea level) in a 6mX6m spacing (277 tree per ha). The trees were managed and selected for uniformity and crop load. Trees in the orchard were irrigated by means of drip irrigation at 7- to 10-day intervals throughout the experiment. Meteorological data was recorded for the duration of the experiment in the study area (Figure 1). Seven-year-old 'Okitsu wase' satsuma mandarin trees, grafted on sour orange (*Citrus aurantium* L.) rootstock, was used in the experiment. Commercial kaolin preparation (Surround WP) was used to prevent sunburn on Okitsu fruits. Besides control trees, ten cultural practices were experimented in the study. Kaolin treatment was made on half of the trees in the trial at the end of May (after small fruit drop) for the first time (5%), and on the other half at mid-June. Dosages, times, and numbers of all treatments in the study are given in Table 1.

Leaf And Fruit Surface Temperature (ºC):

In each repetition, measurements were performed at the end of June, July, and August using infrared thermometer (Spectrum IR thermometer) on 2 fruits and 2 fully developed leaves on selected branches at four sides (North, South, East, West) of the tree.

Leaf Chlorophyll Concentration:

In each repetition, measurements were performed on 2 fully developed leaves (4th±5th leaf from the shoot apex) on marked branches of fruitless shoots at four sides of the tree. Leaf chlorophyll concentration was estimated by SPAD readings (SPAD-502 meter, Minolta Inc., Osaka, Japan). In addition, the extract prepared according to Arnon (1949) by collecting measured leaf samples was read on three wavelengths in the spectrophotometer (645, 663, and 652 nm), and chlorophyll a, chlorophyll b, and total chlorophyll contents were determined according to Lichtenhaler and Welburn (1983).

In each repetition in June, July, and August, a total of 80 leaves were collected at four main sides of trees. Leaf area was determined with LI-3100 device. Specific leaf area (cm^2/g dry weight) and leaf thickness (g fresh weight /cm^2) were determined according to Koundouras et. al. (2008). Leaf relative water content (LRWC) (%) was determined according to Becalar et al. (2006). For this purpose, fresh weights (FW) of disks, received from leaf samples, were taken. Leaf disks, turgor weights of which were determined after being suspended in distilled water, were dried at 70°C for 24 hours and LRWC was calculated.

Yield And Fruit Quality :

The fruits were harvested in September at the optimum harvest time from each plot. The yield per tree (kg/tree) was obtained by weighing the harvested fruit.

A random sample of 15 fruits from each tree was collected to analyze for fruit quality. Fruit rind thickness and fruit rind color, fruit juice percentage (%), total soluble solid (TSS) (%), titratable acid (%) and soluble solid/acid ratio were determined. Fruit rind thickness was measured with a digital caliper (Mitutoyo CD-15CPX, Mitutoyo America Corporation, USA). Fruit rind color was measured at three different points around the equatorial region of each fruit, using a Minolta CR 300 reflectance Chroma Meter (Minolta, Osaka, Japan) which provided CIE L*, a* and b* values. Soluble solids were determined with a portable refractometer (FG-103/113) using a few drops of juice. The total acidity of the juice was determined by titrating 5 ml of the juice sample with 0.1 N sodium hydroxide (NaOH) using phenolphthalein as the indicator (Lado et al., 2014).

Fruit sunburn percentage: The scale [no burn (1), very mild (2), mild (3), average (4), considerable (5), excessive (6)] based on sunburn levels, used in OECD 2010 (Organization for Economic Co-operation and Development) standards for quality classification of mandarins, was used. 5≤ is considered as unmarketable according to OECD standards. (OECD, 2015) (Figure 2).

Marketable Fruit Ratio (%)

Sunburn values of fruits, included in repetitions for each treatment, were determined according to OECD 2010 scale. The total of fruits, which had a value of 4≥ according to the standards, were proportionally calculated.

The experiment utilized a ‘Randomized Complete Block’ design with five replicates for each treatment. Five trees of each treatment were selected for similarity in size, vigor and flowering intensity. Data was subjected to one-way analysis of variance (ANOVA) using SAS statistical software (SAS v9.0). Duncan’s multiple range test at % 5 level was used to compare the mean values.

3. RESULTS AND DISCUSSION

Fruit Surface Temperature (ºC)

Monthly average measurement values for the effects of treatment of Okitsu Wase variety with kaolin, at different intervals and dosages, on fruit surface temperatures are given in Figure 3. The highest fruit temperatures were observed in T11 (control) in June, July, and August (respectively 31.23 ºC, 31.78 ºC, and 33.55 ºC). The lowest fruit temperature was found in T1, T2, T5, T6, T8, T9, T10 treatments between 29.58 ºC - 29.95 ºC in June; and in T2, T7, T3, T4, T5, T8, T9, T10 treatments between 31.35 ºC - 32.27 ºC in August. The effect of kaolin treatment on fruit surface temperature led to 1 to 2ºC decline in comparison with the control plants. Based on these findings, it is understood that all kaolin treatments in the experiment were effective in reducing fruit temperature. This conclusion is similar to the findings of several researchers (Glenn et. al.,2001; Glenn et. al., 2003; Glenn et al., 2004; Clinton et. al.,2003; Pace et. al., 2007, Mohamed et al., 2019) reporting that methods such as film treatment and shading blocked lights at various levels and reduced fruit temperature or bud temperature at different degrees on fruits and vegetables. Clinton et. al. (2007) reported that single treatment of kaolin did not affect fruit temperature, but two treatments reduced fruit temperature by 1 to 2 ºC. Colavita et. al. (2010) determined that fruit surface temperature declined between 1.6 and 4.7 °C as kaolin dosage increased under the conditions in Argentina; however, such decline was not linear.

Leaf Surface Temperature (ºC)

In our study, leaf temperature values in kaolin treatments were found to be statistically lower than the control. It was seen that this effect was similar between kaolin treatments in June measurements, while it varied according to treatments in July and August, and the most effective treatments in these months were T3, T8, and T10 (Figure 4). Leaf temperatures were found up to 4 - 5 ºC lower in kaolin treatments in comparison with control plants. Glenn et al. (2003) reported that kaolin was a compound that reduced leaf temperature, heat stress, and solar damage. Denaxa et al. (2012) reported that kaolin reduced leaf temperature values in olives. Jifon and Syvertsen (2003) found that leaf temperature was 3ºC lower than the control as a result of kaolin treatment in Ruby Red grapefruit variety (treatment of trees with 60 g/L dosage twice a week at 3-week intervals). Ogiela (2020) reported that three kaolin treatments in June, July, and August reduced leaf and fruit surface temperatures in Persimmon. As a result of our study, temperature values measured on leaves of treated with kaolin are in parallel with the results of the studies mentioned above. Low leaf surface temperatures in the summer is important in terms of the potential to increase photosynthesis capacity of the plant.

Leaf Chlorophyll Content (SPAD)

According to average values of leaf chlorophyll content measurements performed to at four main sides of trees with SPAD-502 meter, statistically significant differences were found between treatments in June, July, and August. In June, leaf chlorophyll content was found to be the highest in T10 (79.19) and the lowest in control (T11) (67.70). In July, the highest value was found in T4 (86.56) and the lowest values were found in T11 and T2 treatments (respectively, 75.69 and 75.91). In August, chlorophyll level was found to be the highest in T3, T8, T7, T5, T4, T1, T6, T2, T10 treatments, which are statistically in the same group, and the lowest in the control (75.51 µmol m^{-2}). According to monthly measurements on treated and control trees, leaf chlorophyll contents increased upon kaolin treatment in the three periods. Leaf chlorophyll contents of control plants yielded the lowest value in all three periods (Figure 5). This finding is similar to the finding of Jifon and Syvertsen, (2003), reporting that chlorophyll contents of the leaves of Ruby Red grapefruit variety, treated with kaolin, were positively impacted in comparison with control leaves in summer and autumn. Şirin (2013)

reported that 2nd and 3rd 3% kaolin treatments had positive impacts on chlorophyll content in olives.

Chlorophyll a

Leaf chlorophyll content a was found to be the highest in T1 (1.13 mg/ g ta) according to the average of measurement periods. Other treatments, which were statistically in the same group, varied between 0.72-0.86 mg/ g ta (Table 2).

Chlorophyll b Content

Upon examination of Table 2, the effect of treatments according to the average of measurement months, is seen to be highest in T1 (0.090 mg/ g ta), and the lowest in T3 and T11 (0.073 mg/ g ta).

Total Chlorophyll Content

The effects of treatments on total chlorophyll content also displayed statistically significant variations. Among all treatments, total chlorophyll was observed to be the highest in T7 (2.05 mg/ g ta) and the lowest in T11 (1.43 mg/ g ta). Leaf chlorophyll contents of all trees subject to treatment were similar to the findings obtained from SPAD measurements, and kaolin treatment was determined to have positive impact. However, this impact increased in parallel with the frequency of treatment. It has generally been found to be higher in single applications (T7 and T1) (Table 2). Ogiela (2020) reported that chlorophyll a, b, and total contents of two and three 4% kaolin treatments exhibited an increase in comparison with the control in Costata variety of Persimmon. Glenn et al. (2001) found the effect of kaolin on leaf chlorophyll content in apple to be statistically insignificant. Lombardini et al. (2009) reported that chlorophyll a, chlorophyll b, and total chlorophyll contents of pecan leaves, which were in shade or exposed to sunlight, did not change.

Specific Leaf Area (cm^2 /g dry weight)

Upon comparison of treatments in terms of monthly averages, specific leaf area was found to be the highest in August (59.03 cm^2/ g dry weight) and the lowest in June (54.69 cm^2/ g dry weight). The effects of kaolin treatments on specific leaf area varied by month (Table 3).

Leaf Relative Water Content (%)

Leaf relative water content yielded higher values in July and August (respectively 62.41%; 59.88%) than June (44.68%). It was considered that this general increase could be due to the effect of accumulated kaolin in certain treatments. As reported by Şirin (2013), leaf relative water content is considered as an important indicator of drought stress. It is effective in ensuring balance between cell volume and transpiration ratio of leaf relative water content value and water provided to leaf, and it protects the plant from stress. (Dhanda and Sethi, 2002). Jifon and Syvertsen, (2003) administered kaolin to trees twice a week at a dosage of 60 g/L at 3-week intervals in Ruby Red grapefruit variety. The researchers determined that midday water use effectiveness was 25% higher in leaves treated with kaolin in comparison with the control. However, such effect could not be clearly observed in measurements conducted in the following months (Table 3).

Leaf Thickness (g fresh weight / cm^2)

No effect of treatments was observed on leaf thickness. However, leaf thicknesses by month were determined to be the highest in June (0.045 g fresh weight / cm^2) and the lowest in August (0.039 g fresh weight / cm^2) (Table 3).

Yield And Quality Characteristics

Fruit yield per tree was statistically different between treatments. The highest yield was obtained from T8 treatment (181.80 kg / tree), while the lowest yield was obtained from T11 treatment (Control) (153.60 kg / tree). Regular performance of kaolin treatments throughout summer months increased yield (Table 4). It is considered that the treatments affected yield as they increased the effectiveness of photosynthesis. It was seen that the findings on the increase in yield-per-tree values, in comparison with control trees, supported our study as reported by

Spiers et al. (2004) for blueberry, Ertan et al. (2009) for fig, İnce (2012) for pomegranate, and El – Tananay et al. (2019) for Balady mandarin variety.

The impact of treatments on fruit weight was similar to fruit yield per tree, and the highest fruit weight was obtained in T8, T9, and T5 treatments (99.33 g; 95.59 g; 96.46 g). The impact of T6, T11, and T1 treatments on fruit weight was found to be low (83.05 g; 82.90 g; 82.38 g). No or single treatment of kaolin was not sufficient for fruit size. The largest fruit size was obtained from T7 treatment with 46.84 mm. The impact of treatments on Okitsu wase mandarins was not found to be statistically significant in terms of fruit width (54.13 mm to 59.33 mm), rind thickness (1.81 mm to 2.08 mm), and juice content (58.20% to 46.43%). Chabbal et al. (2014) also reported for the same mandarin variety that kaolin treatment (a total of 7 treatments) at 2% and 4% dosages (in two, three, and four treatment frequencies) did not affect juice content. Tsai et. al. (2013) determined that shading did not affect juice amount in Murcott tangor (*Citrus sinensis* × *Citrus reticulata*) variety under the conditions in Taiwan. Furthermore, İnce (2012) indicated that the amount of juice amount in pomegranate was not affected by different dosages of kaolin.

The effects of treatments on titratable acid amounts were found to be statistically significant. While the highest acid amount was obtained from T7 treatment (1.33%), no significant difference was observed in other treatments other than T6 treatment. TSS content was found to be the highest in T8 treatment (8.32%), followed by T10 treatment (8.16%). It was seen that TSS content increased based on kaolin treatment and, as a matter of fact, kaolin was sprayed for 5 and 6 times on trees in T8 and T10 treatments (Table 4). It was determined that our findings were in line with other studies. As a matter of fact, Cantiro et. al. (2009) reported that TSS was increased by kaolin treatment (5.2%) in comparison with the control (4.6%); and Chabbal et. al. (2014) reported that 4% kaolin dosage increased TSS content in Okitsu mandarins. Forey et al.(2008) reported that kaolin treatments increased TSS content by 7% more than the control in Satsuma mandarins under the conditions in California. TSS/Acidity ratio was found to be the highest in T8 and T10 treatments (respectively 7.55; 7.44), and the lowest in T11, T6, and T7 treatments (respectively 6.57; 6.49; 6.16). Similar to yield and size, treatment frequency was also effective in TSS/Acidity ratio. Ennab et. al. (2017) reported that kaolin treatment increased TSS and TSS/A ratio in Balady mandarins, while Mohamed et al. (2019) reported that 4% kaolin treatment increased TSS/Acidity ratio in Murcott mandarins.

The effect of treatments on fruit color measurements was not found to be statistically significant. Hu values for fruits in all treatments varied between 117.03 and 118.55. The fruits displayed a yellow-green coloration(Table 5). Schupp et al. (2002) determined that sunburn was prevented in apples by triple kaolin treatments, but fruits were smaller and coloration was not sufficient as a result of the treatment made in July and August.

In our study, the ratio of fruits with sunburn was determined as 4.8% in the control. On the contrary, sunburn ratio was found to be lower in kaolin treatments. Marketable fruit amount was found to be the highest in T8 treatment (181.80 kg/tree) and the lowest in T11 treatment (control) (146.23 kg/tree). Kaolin treatment provided 10 to 25% increase in marketable fruit amount in comparison with the control(Table 6). Melgarejo et al. (2004) reported that Surround WP treatment on pomegranate (June – August; at 2- to 3-week intervals; 4 times) reduced sunburn damage on fruits to 9.4% in comparison with the control (21.9%). Forey et al. (2008) found out that kaolin treatment in Satsuma mandarins increased marketable fruit ratio by 20% and reduced sunburn by 50% in comparison with the control. Chabbal et al. (2014) reported that kaolin treatment in Okitsu mandarins protected against sunburn at the rate of 91.53% to 97.74%, while such ratio was 73.97% in control fruits. Ennab et al. (2017) reported that kaolin treatment on Balady mandarin reduced sunburn ratio from 21.9% to 9.4%. Protective effect of

kaolin in terms of controlling sunlight damage, indicated in the provided literature, was also identified in our study.

4. CONCLUSION

As a conclusion, it was found out that kaolin treatments on Okitsu wase mandarins were effective in prevention of fruit sunburn, reduced fruit and leaf temperature, and led to positive outcomes in terms of yield and certain quality parameters. T8 and T10 treatments, where kaolin treatment was repeated 6 and 7 times, led to the most effective outcomes in controlling high temperature. In these treatments, temperature values were measured 1-2 ºC lower in fruits and 4-5 ºC lower in leaves. This effect led to a decline in sunburn ratio in Okitsu wase fruits, as well as varying rates of increase in yield per tree based on the increase in fruit weight. The highest yield per tree (181.80 kg/ tree) was determined in T8 treatment, where 5% dosage was administrated in Mid-June and 2.5% dosage repetition was made at a 15-day interval. It is considered that practical use of kaolin treatment would be effective in hot periods during summer months as it yields positive results, particularly on young trees.

ACKNOWLEDGMENTS:

This study was based upon the research of a master's thesis f nancially supported by the Hatay Mustafa Kemal University Research Foundation (Project No: 10883).

ÖZET

Küreselleşme süreciyle birlikte yerel değerlere olan ilgi artmakta; bu değerlerin korunması ise giderek daha fazla önem kazanmaktadır. Yöresel gıda ürünleri, yerel kültürün temel bileşenlerinden biri olarak öne çıkmakta olup, bu ürünlerin taklit edilmesini önlemek ve haksız rekabeti engellemek amacıyla birçok ülkede çeşitli hukuki düzenlemelere gidilmektedir. Bu düzenlemeler arasında yer alan coğrafi işaret sistemi, etkili bir koruma aracı olarak dikkat çekmekte ve Türkiye açısından stratejik bir öneme sahiptir.

Türk Patent ve Marka Kurumu'na göre coğrafi işaret; bir ürünün kökenini, ayırt edici özelliklerini ve bu özelliklerle üretim bölgesi arasındaki ilişkiyi tanımlayan, aynı zamanda tüketiciye kalite güvencesi sunan bir işaret türüdür. Gıda ve tarım ürünleri, el sanatları ve sanayi ürünleri gibi çeşitli kategorilerde birçok ürün bu kapsamda tescil edilebilmektedir. Coğrafi işaret tescili, ürünün menşei ve üretim sürecinin doğru biçimde tanımlanmasını sağlayarak yerel ürünlerin haksız rekabete karşı korunmasına katkı sunmaktadır. Bu sistem aracılığıyla ürünlerin geleneksel yapısı ve yöresel özellikleri güvence altına alınmaktadır.

Anadolu'nun zengin biyoçeşitliliği ile tarihsel ve kültürel birikimi, Türkiye'nin tarımsal ürün çeşitliliğini ve mutfak kültürünü besleyen temel kaynaklardandır. Bu bağlamda, ülkemizin coğrafi işaret alma potansiyeli yüksek çok sayıda ürünü bulunmakta olup, bu ürünlerin tescillenerek korunması hem ekonomik hem de kültürel açıdan önem arz etmektedir. Tescil edilen ürünler, tüketici nezdinde güvenilirlik kazanmakta ve pazarda rekabet avantajı elde etmektedir.

Üzümün anavatanı konumunda bulunan Türkiye'de, bugüne kadar coğrafi işaret tescili almış 110 yerel üzüm çeşidi ve üzüm ürünü bulunmaktadır. Bu ürünler, 33 farklı il tarafından tescillenmiş olup, bölgesel çeşitliliğin korunmasına katkı sağlamaktadır. Bu çalışmada, Türkiye'de tescil edilmiş yerel üzüm çeşitleri ve üzüm ürünleri ile bunların temel nitelikleri incelenmiştir. Özellikle kaybolma riski taşıyan yerel üzüm çeşitlerinin bir an önce tescillenmesi ve koruma altına alınması gerekmektedir. Bu doğrultuda, ilgili çalışmaların hızlandırılması büyük önem taşımaktadır.

Anahtar Kelimeler: Mahalli üzüm, tescilli ürün, kültürel önem

GEOGRAPHICALLY INDICATED GRAPE VARIETIES AND GRAPE PRODUCTS IN TURKEY

ABSTRACT

With the globalization process, interest in local values is increasing, and the protection of these values is becoming increasingly important. Local food products stand out as a fundamental component of local culture, and various legal regulations are being implemented in many countries to prevent imitation of these products and curb unfair competition. The geographical indication system, one of these regulations, stands out as an effective protection tool and is of strategic importance for Turkey.

According to the Turkish Patent and Trademark Office, a geographical indication is a type of designation that identifies the origin of a product, its distinctive features, and the relationship between these features and the production region. It also provides quality assurance to consumers. Many products in various categories, such as food and agricultural products, handicrafts, and industrial products, can be registered under this system. Geographical indication registration contributes to the protection of local products against unfair competition by ensuring the accurate identification of the product's origin and production process. This system safeguards the traditional structure and regional characteristics of products.

The rich biodiversity and historical and cultural heritage of Anatolia are the fundamental resources that nourish Turkey's agricultural product diversity and culinary culture. In this context, our country has numerous products with high potential for geographical indication, and registering and protecting these products is of both economic and cultural importance. Registered products gain credibility with consumers and a competitive advantage in the market.

Turkey, the homeland of grapes, has 110 local grape varieties and grape products registered with geographical indications to date. These products are registered in 33 different provinces, contributing to the preservation of regional diversity. This study examines the local grape varieties and grape products registered in Turkey and their fundamental characteristics. Local grape varieties, particularly those at risk of extinction, need to be registered and protected as soon as possible. Therefore, accelerating relevant efforts is crucial.

Keywords: Local grape, registered product, cultural significance

GİRİŞ

Asmanın insanlar tarafından tanınması Yontma Taş Devri'ne (Paleolitik Dönem, yaklaşık 2 milyon yıl önce), kültüre alınması ve şarap üretiminin başlaması ise Cilalı Taş Devri'ne (Neolitik Dönem, M.Ö. 8500–4000) dayanmaktadır. Bağcılık ve şarap kültürünün gelişerek yayılması ise Bakır Çağı'nda (Kalkolitik Dönem, M.Ö. 5000–3000) gerçekleşmiştir. Tarihî kaynaklar ve arkeolojik bulgular, yabani asmanın (*Vitis vinifera sylvestris*) ilk kez Kuzeydoğu Anadolu ile Kafkas Dağları arasında yer alan Transkafkasya bölgesinde kültüre alındığını ve şarap üretiminde kullanılmaya başlandığını göstermektedir. Bu kültür daha sonra Anadolu üzerinden Aşağı Mezopotamya ve Mısır'a (M.Ö. 3500–3000), ardından da Girit Adası'na (M.Ö. 2200) ulaşmıştır. Roma İmparatorluğu Dönemi'nde ise bağcılık ve şarapçılık kültürü Avrupa'ya taşınmış, koloniler aracılığıyla nehir vadilerini izleyerek kıtanın iç kesimlerine doğru yayılmıştır (McGovern, 2007).

Üzüm, dünyada kültürü yapılan en eski meyve türlerinden biridir. Anavatanı, Anadolu'yu da içine alan Küçük Asya ile Kafkasya'yı kapsayan bölge olarak kabul edilmektedir. Üzüm, diğer meyve türleriyle karşılaştırıldığında en fazla çeşide sahip olanlardan biridir ve dünya genelinde 15.000'in üzerinde çeşidinin bulunduğu tahmin edilmektedir. Anavatanı Anadolu olan üzüm çeşitlerinin sayısı ise 1.200'ü aşmaktadır. Bu çeşitler, Tekirdağ Bağcılık Araştırma Enstitüsü bünyesinde kurulan Millî Koleksiyon Bağı'nda muhafaza edilmektedir. Ancak bu çeşitlerden yalnızca 50–60 kadarı ekonomik olarak üretime konu olmaktadır. Üzümler taze olarak sofralık tüketilebildiği gibi; şarap, reçel, üzüm suyu, jöle, üzüm çekirdeği özü, kuru üzüm, sirke ve üzüm çekirdeği yağı üretiminde de kullanılmaktadır (Anonim, 2024d).

Coğrafi işaretler, bir ürünün kaynağını, karakteristik özelliklerini ve bu özelliklerin ürünle coğrafi alan arasındaki ilişkisini gösteren ve garanti eden kalite işaretleridir. Coğrafi işaret tescili, kalitesi, gelenekselliği, yöreden elde edilen hammaddesi ve yerel niteliklere bağlı olarak belirli bir üne kavuşmuş ürünlerin korunmasını sağlar. Belirgin bir niteliği, ünü veya diğer özellikleri bakımından kökeninin bulunduğu yöre, alan, bölge ya da ülke ile özdeşleşmiş ürünleri gösteren bu işaretler, menşe adı veya mahreç işareti olarak tescil edilebilmektedir. Gıda, tarım, maden, el sanatları ve sanayi ürünleri coğrafi işaret tesciline konu olabilmektedir (Anonim, 2024f).

Bağ Bölgelerimiz

Şekil 1. Bağ bölgelerimiz

1.Ortakuzey Bölgesi

Bölgenin öne çıkan illeri arasında Çorum, Kırşehir, Bilecik, Yozgat, Uşak, Ankara ve Kırıkkale bulunmaktadır. Serin iklim özellikleri ve vejetasyon döneminin kısa olması, geç olgunlaşan üzüm türlerinin yetiştirilmesini kısıtlamaktadır. Son yıllarda, özellikle floksera zararlısının etkisi başta olmak üzere çeşitli etkenler nedeniyle bağcılık faaliyetlerinde belirgin bir gerileme yaşanmıştır. Ancak Ata Sarısı, Yalova İncisi ve Ergin Çekirdeksizi gibi yeni ıslah edilen üzüm çeşitleriyle yapılan adaptasyon çalışmaları, umut verici sonuçlar ortaya koymuştur (Şekil 1) (Çelik ve ark., 1998).

2.Ege Bölgesi

Türkiye'nin başlıca bağcılık merkezlerinden biri olan bu bölge, iklimsel özelliklerine göre üç alt bölgeye ayrılmaktadır (Şekil 1):

Orta Kesim: Manisa, Denizli ve İzmir illerini kapsayan bu bölüm, dünyaca ünlü çekirdeksiz üzüm çeşitlerinin yetiştirildiği bir alandır. Sofralık ve kuru üzüm üretiminde yüksek verim ve kalite potansiyeli ile dikkat çeker.

Kuzeybatı Kesim: Çanakkale ve Balıkesir illerini içine alan bu alan, Marmara Bölgesi'nin ılıman iklim koşullarını yansıtır. Bu nedenle bağcılık faaliyetleri daha elverişli sıcaklık ve nem koşulları altında sürdürülmektedir.

Güneydoğu Kesim (Göller Yöresi): Isparta ve Burdur illerini kapsayan bu kesim, İç Anadolu ve Akdeniz iklimleri arasında geçiş özelliği taşımaktadır. Bu durum, yöredeki üzüm çeşitliliğini artırmakta ve yetiştirme tekniklerini önemli ölçüde etkilemektedir (Çelik ve ark., 1998).

3.Marmara Bölgesi

Ege ve Akdeniz bölgeleriyle birlikte ele alındığında, Trakya'da da modern bağcılık uygulamalarının yaygınlaştığı görülmektedir. Bölge genelinde bağcılık açısından en dikkat çekici il Tekirdağ olup yüksek üretim kapasitesi ve ürün çeşitliliğiyle öne çıkmaktadır. Trakya'nın Anadolu yakasında ise Bursa ve Sakarya illeri bağcılık faaliyetlerinin yoğun biçimde sürdürüldüğü önemli üretim merkezleri arasında bulunmaktadır (Şekil 1) (Çelik ve ark., 1998).

4.Akdeniz Bölgesi

Bağ alanı genişliği ve üzüm üretim miktarı bakımından Türkiye'de Ege Bölgesi'nden sonra ikinci sırada yer alan bu bölge, bağcılık açısından önemli bir konuma sahiptir. Mersin, Adana, Hatay, Antalya, Gaziantep, Kilis ve Kahramanmaraş illerinde yoğunlaşan bağcılık faaliyetleri, bölgenin sofralık ve işlenmiş üzüm ürünleri üretiminde yüksek potansiyel taşıdığını göstermektedir (Şekil 1) (Çelik ve ark., 1998).

5.Kuzeydoğu Anadolu Bölgesi

Yüksek rakımlı arazilerin yaygın olduğu bu bölgede, Erzincan ve Artvin illerinde daha çok yerel ihtiyaçları karşılamaya yönelik sınırlı bağcılık faaliyetleri gerçekleştirilmektedir. Buna karşılık, Iğdır ile Erzurum'un bazı ilçeleri, iklim koşulları açısından bağcılığa elverişli potansiyel alanlar arasında değerlendirilmektedir (Şekil 1) (Çelik ve ark., 1998).

6.Güneydoğu Anadolu Bölgesi

Güneydoğu Anadolu Bölgesi'nde, bağcılık faaliyetleri açısından Şanlıurfa, Diyarbakır ve Mardin illeri öne çıkmaktadır. Buna karşın, Bingöl, Muş, Bitlis, Van, Şırnak ve Hakkari gibi iller, yüksek rakımlı ve engebeli topoğrafyaya sahip olmaları nedeniyle Türkiye'nin bağcılık potansiyeli en sınırlı bölgeleri arasında yer almaktadır. Özellikle düşük sıcaklık değerlerinin

yarattığı kısıtlayıcı etkiler, bu illerde bağcılık faaliyetlerinin dar alanlarda ve düşük yoğunlukta yürütülmesine neden olmaktadır (Şekil 1) (Çelik ve ark., 1998).

7.Karadeniz Bölgesi

Karabük ve Kastamonu illerinde, bağcılık faaliyetleri yerel tüketimi karşılamaya yönelik küçük ölçekli üretim şeklinde yürütülmektedir. Bu illerde gerçekleştirilen sofralık üzüm yetiştiriciliği, ticari üretimden ziyade mahalli ihtiyaçları karşılamaya yönelik olup, sınırlı alanlarda sürdürülen geleneksel bağcılık uygulamaları niteliği taşımaktadır (Şekil 1) (Çelik ve ark., 1998).

8.Ortadoğu Anadolu Bölgesi

Bölge, iklim ve bağcılık özellikleri açısından iki alt bölgeye ayrılmaktadır. Tokat ve Amasya illeri, geçit kuşağında yer almaları nedeniyle daha ılıman karasal iklim koşullarına sahiptir. Diğer alt bölgeyi ise Malatya, Elazığ ve Adıyaman illeri oluşturmaktadır. Bu ayrım, bölgedeki bağcılık faaliyetlerinin çeşitliliği ve üretim potansiyeli üzerinde belirleyici bir rol oynamaktadır (Şekil 1) (Çelik ve ark., 1998).

9.Orta Güney Bölgesi

Bağ alanı genişliği ve üzüm üretim miktarı bakımından Türkiye'de Ege ve Akdeniz bölgelerinden sonra üçüncü sırada yer alan bu bölge, özellikle Konya, Nevşehir ve Karaman illeriyle ön plana çıkmaktadır. Bunun yanı sıra, Aksaray ve Niğde illeri de önemli bağcılık merkezleri arasında bulunmaktadır. Ayrıca, Kayseri ve Afyon illerinin bazı yörelerinde de sınırlı ölçekte bağcılık faaliyetleri sürdürülmektedir (Şekil 1) (Çelik ve ark., 1998).

COĞRAFİ İŞARETLİ ÜZÜM ÇEŞİDİ VE ÜZÜM ÜRÜNLERİMİZ

1. Ortakuzey Bölgesi

1.a) Ankara Kalecik Karası Üzümü

Türkiye'nin önde gelen kırmızı şaraplık üzüm türlerinden biridir. Fidan dikiminden sonra ortalama üç yıl içinde ürün alınabilir. 06.07.2007 yılında Kalecik Belediyesi tarafından tescil edilmiştir (Şekil 2a) (Anonim, 2025g; Anonim, 2025h).

1.b) Ankara Beypazarı Yaprak Sarması

İnce, sıkı ve küçük şekilde sarılması ile genellikle sulu biçimde servis edilmesi, bu ürünün coğrafi bölgeye özgü özellikler taşıdığını göstermektedir. 20.05.2022 yılında Beypazarı Belediyesi tarafından tescil edilmiştir (Şekil 2b) (Anonim, 2025g; Anonim, 2025h).

1.c) Ankara Beypazarı Cevizli Tatlı Sucuk

İpe dizilen ceviz içleri, sıcak sucuk hamuruna iki defa batırılır ve ardından açık havada asılarak kurutulur. 07.04.2022 yılında Beypazarı Belediyesi tarafından tescil edilmiştir (Şekil 2c) (Anonim, 2025g; Anonim, 2025h).

Şekil 2. Ortakuzey bölgesi üzüm ve üzüm ürüleri

2. Ege Bölgesi

2.a) Balıkesir Avşa Ada Karası Üzümü

Genellikle şıra ve şarap üretiminde değerlendirilen bir üzüm çeşididir. 24.01.2023 yılında Erdek Ticaret Odası tarafından tescil edilmiştir (Şekil 3a) (Anonim, 2025g; Anonim, 2025h).

2.b) Balıkesir Avşa Ada Karası Şarabı

Avşa Adakarası Şarabı, Avşa Adakarası üzümünün işlenmesi sonucu elde edilen yerel bir şarap türüdür. Bu şarapta bulunan toplam tanen miktarı 3,47 ile 5,99 g/l arasında değişmektedir. 07.05.2025 yılında Erdek Ticaret Odası tarafından tescil edilmiştir (Şekil 3b) (Anonim, 2025g; Anonim, 2025h).

2.c) Çanakkale Bozcaada Çavuş Üzümü

Puslu sarımsı-yeşil renge sahip, iri ve yuvarlak ya da oval biçimli taneleri bulunan, seyrek salkımlı, ince kabuklu ve yarı saydam damarlı bir üzüm çeşididir. Hasat sonrasında genellikle taze olarak tüketilen Bozcaada Çavuş üzümü, son yıllarda kısmen şarap üretiminde de kullanılmaya başlanmıştır. 02.06.2020 yılında Bozcaada Tarımsal Kalkınma Kooperatifi tarafından tescil edilmiştir (Şekil 3c) (Anonim, 2025g; Anonim, 2025h).

2.d) Denizli Çalkarası Üzümü

Morumsu-siyah renge sahip, orta büyüklükte, dolgun, etli ve sulu taneleri bulunan bir üzüm çeşididir. Kabuğu orta kalınlıktadır. Düşük toplam asit içeriği ve dengeli duyusal özellikleri nedeniyle hem şarap üretiminde hem de kurutmalık olarak değerlendirilmektedir. 07.12.2020 yılında Çal Ziraat Odası tarafından tescil edilmiştir (Şekil 3d) (Anonim, 2025g; Anonim, 2025h).

2.e) Denizli İsabey Çekirdeksiz Üzümü

Beyaz renkte ve uzun elips biçimli tanelere sahip bir üzüm çeşididir. Avrupa'ya ihracatı gerçekleştirilmektedir. Genellikle sofralık olarak tüketilmekle birlikte, kurutmalık, şaraplık ve pekmez üretiminde de değerlendirilmektedir. 01.08.2006 yılında Çal Belediyesi tarafından tescil edilmiştir (Şekil 3e) (Anonim, 2025g; Anonim, 2025h).

2.f) Isparta Senirkent Dimrit Üzümü

Sofralık tüketimin yanı sıra şıra ve pekmez üretiminde de değerlendirilmektedir. Senirkent Dimrit üzümü, mor-siyah renkli ve oval biçimli, çekirdekli tanelere sahiptir. Salkımları orta büyüklükte olup konik formda ve sık yapıdadır. 10.02.2022 yılında Senirkent Belediyesi tarafından tescil edilmiştir (Şekil 3f) (Anonim, 2025g; Anonim, 2025h).

2.g) Isparta Senirkent Üzüm Pekmezi

Oval şekilli, mor-siyah renkli ve çekirdekli tanelere sahiptir. Bu pekmez, Dimrit üzümünden üretilmektedir. 17.03.2022 yılında Senirkent Belediyesi tarafından tescil edilmiştir (Şekil 3g) (Anonim, 2025g; Anonim, 2025h).

2.h) İzmir Bornova Misket Üzümü

Salkımları orta büyüklükte olup konik-silindirik bir yapıya sahiptir. Taneleri beyaz-sarı renkte, çekirdekli, yuvarlak ve orta büyüklüktedir; kalın kabuklu, sulu ve düşük asitlidir. En belirgin özelliği güçlü aroması ve tat açısından zengin yapısıdır. 07.04.2021 yılında Bornova Belediyesi tarafından tescil edilmiştir (Şekil 3h) (Anonim, 2025g; Anonim, 2025h).

2.ı) İzmir Ege Sultani (çekirdeksiz) Üzümü

Salkımları kanatlı yapıdadır ve taneleri uzun, yuvarlak biçimli olup sarıdan sarı-yeşil tonlarına sahiptir. Taneler sulu, etli ve gevrektir; ayrıca çekirdeksizdir. 27.07.2003 yılında İzmir Ticaret Borsası tarafından tescil edilmiştir (Şekil 3ı) (Anonim, 2025g; Anonim, 2025h).

2.i) İzmir Gökçealan Osmancık Üzümü

Salkımları orta büyüklükte, taneleri ise iri olup yeşilimsi açık sarı renkte, ince kabuklu ve yuvarlak biçimdedir. Bu üzüm çeşidi sofralık, kurutmalık, şıralık ve şaraplık olarak değerlendirilmeye uygundur. 25.08.2023 yılında Selçuk Belediyesi tarafından tescil edilmiştir (Şekil 3i) (Anonim, 2025g; Anonim, 2025h).

2.j) İzmir Kavacık Üzümü

Mor-siyah renge sahip, parlak görünümlü ve iri taneli bir üzüm çeşididir. Kalın kabuklu yapısı ve uygun saklama koşullarında yüksek dayanıklılığı ile sofralık kullanım için uygundur. 20.12.2019 yılında Karabağlar Belediyesi tarafından tescil edilmiştir (Şekil 3j) (Anonim, 2025g; Anonim, 2025h).

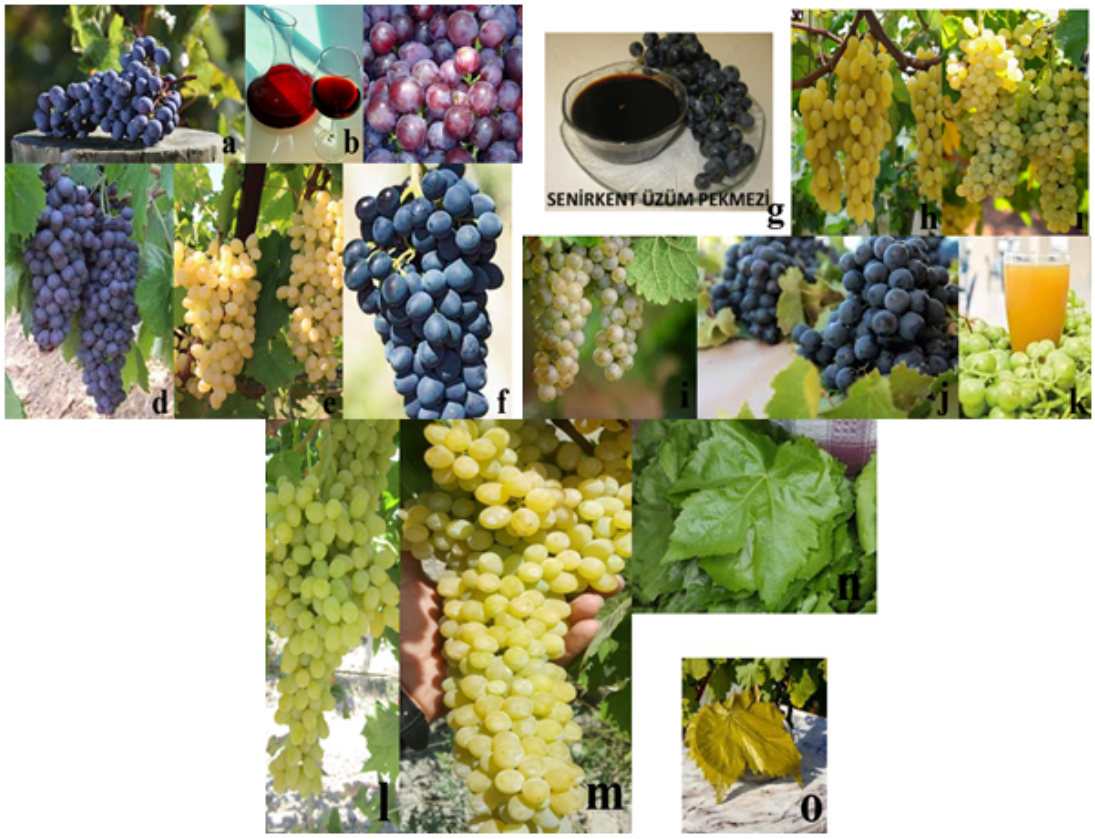
2.k) İzmir Bademli Koruk Şerbeti

Dikili'nin Bademli mahallesinde yapılan Bademli Koruk Şerbeti, siyah yediveren üzümünün koruğu, su, şeker ve ıtır otu ile hazırlanır. Tadı ekşi ve mayhoş bir içim sunar. 08.05.2023 yılında Dikili İlçe Tarım ve Orman Müdürlüğü tarafından tescil edilmiştir (Şekil 3k) (Anonim, 2025g; Anonim, 2025h).

2.l) Manisa Sultani Çekirdeksiz Üzümü

Salkımları orta büyüklükte ve normal yoğunlukta, taneleri eliptik-yuvarlak biçimli, yeşil-sarı renkte ve ince kabukludur. Sofralık, kurutmalık ve şıralık niteliklerin tamamını yüksek derecede sergileyen, verim ve yapısal gelişim açısından standart bir üzüm çeşididir. 18.02.2019 yılında Manisa Ticaret Borsası tarafından tescil edilmiştir (Şekil 3l) (Anonim, 2025g; Anonim, 2025h).

2.m) Manisa Saruhanlı Çekirdeksiz Beyaz Üzümü



Orta büyüklükte ve normal yoğunluktaki salkımlara sahip olan bu üzümün taneleri yuvarlak-eliptik biçimli, yeşil-sarı renkte, çekirdeksiz, sulu, etli ve ince kabukludur. 12.08.2021 yılında Saruhanlı Esnaf ve Sanatkârlar Odası tarafından tescil edilmiştir (Şekil 3m) (Anonim, 2025g; Anonim, 2025h).

2.n) Manisa Alaşehir Asma Yaprağı

Alaşehir Asma Yaprağı, coğrafi sınırda yetişen çekirdeksiz üzüm çeşitlerinin genç sürgünlerinden toplanır. Nisan sonundan haziran ortasına kadar 8–10 günlük aralıklarla toplanan yapraklar taze, kuru veya salamura edilerek dolma ve sarma yapımında kullanılır. Yapraklar yeşil ile koyu yeşil renkte, damarsız, ince, tüysüz ya da az tüylü ve damakta hafif ekşi bir tat bırakacak niteliktedir. 17.09.2021 yılında Alaşehir Ticaret ve Sanayi Odası tarafından tescil edilmiştir (Şekil 3n) (Anonim, 2025g; Anonim, 2025h).

2.o) Manisa Asma Yaprağı

Coğrafi sınırda üretilen Manisa Asma Yaprağı, 418 tescilli Manisa Sultani Çekirdeksiz üzümünün taze yapraklarından elde edilir. Yapraklar açık yeşil renkte, ince ve az tüylü olup genellikle dilimsizdir; damarsız veya az damarlıdır ve salamura edilerek kullanılır. 07.02.2023 yılında Manisa İl Tarım ve Orman Müdürlüğü tarafından tescil edilmiştir (Şekil 3o) (Anonim, 2025g; Anonim, 2025h).

Şekil 3. Ege bölgesi üzüm ve üzüm ürüleri

Manisa İlinde Tescil Edilen Üzüm Çeşitleri

107G116 nolu tübitak projesi kapsamında melezleme çalışmaları sonucunda ıslah edilip tescil edilmiştir. Tescil edilen üzüm çeşitleri;

Spil Karası üzümü (2016), Manisa Pembesi üzümü (2016), Lidya üzümü (2016), Ece üzümü (2016), Mesir üzümü (2016), Beyra üzümü (2017), Efem üzümü (2017)'dür (Anonim, 2024a).

3. Marmara Bölgesi

3.a) Bursa İznik Müşküle Üzümü

Taneleri oldukça iri ve hafif eliptik biçimli olan üzüm, kalın kabuklu, puslu ve şeffaf bir görünüme sahiptir; rengi sarı-yeşildir. Hasada yakın dönemlerde, tanelerin güneş gören kısımları kızarır. 20.08.2021 yılında İznik Belediyesi tarafından tescil edilmiştir (Şekil 4a) (Anonim, 2025g; Anonim, 2025h).

3.b) Bursa Üzüm Şırası

Çekirdekli siyah kuru üzüm, içme suyu ve isteğe bağlı olarak beyaz şeker kullanılarak üretilen alkolsüz bir içecektir. Renk dengesi sağlamak amacıyla siyah havuç suyu eklenir. 09.08.2021 yılında Bursa Ticaret ve Sanayi Odası tarafından tescil edilmiştir (Şekil 4b) (Anonim, 2025g; Anonim, 2025h).

3.c) Tekirdağ Yapıncak Salamura Asma Yaprağı

Yapıncak üzüm çeşidinden elde edilen asma yaprakları, üretimde kullanılır. 28.10.2020 yılında Süleymanpaşa Ziraat Odası tarafından tescil edilmiştir (Şekil 4c) (Anonim, 2025g; Anonim, 2025h).

Şekil 4. Marmara bölgesi üzüm ve üzüm ürüleri

Tekirdağ İlinde Tescil Edilen Üzüm Çeşitleri

Tübitak projesi kapsamında melezleme çalışmaları sonucunda ıslah edilip tescil edilmiştir.

Trakya İlkeren (1991), Barış (1991), Tekirdağ Çekirdeksizi (1991), Reçel Üzümü (1993), Güz Üzümü (1993), Güz Gülü (2011), Bozbey (2011), Tekirdağ Misketi (2011), Tekirdağ Sultani (2011), Özer Karası (2011), Gönülçelen (2016), Cengizbey (2016), Emirali (2016), Gürnil (2016), Kebeli (2016), Özer Beyazı (2016), Süleymanpaşa Beyazı (2016), Karamenüş (2018), Yayla (2018), Aksıdağan (2023), Alço (2023), Gümüş 59 (2023), Saklıkara (2023)'dır (Anonim, 2024b).

Yalova İlinde Tescil Edilen Üzüm Çeşitleri

Tübitak projesi kapsamında melezleme çalışmaları sonucunda ıslah edilip tescil edilmiş diğer üzüm çeşitleri ise; Ata Sarısı (1990), Yalova Çekirdeksizi (1990), Yalova İncisi (1990), Yalova Misketi (1990), Uslu (1990), Ergin Çekirdeksizi (1991), Atak 77 (2012), İsmetbey (2012), Pembe 77 (2012), Arifbey (2013), Samancı Çekirdeksizi (2013), Yalova Beyazı (2013)'dır (Anonim, 2024c).

4. Akdeniz Bölgesi

4.a) Margaz Üzümü

Kaş ilçesinde yetiştirilen bu üzüm, genellikle sofralık olarak tüketilir. Coğrafi sınır, killi-tınlı ve kumlu-killi-tınlı toprak yapısına sahip olup, organik madde içeriği yeterli seviyededir. Toprakların pH'ı hafif alkali, kireç oranı yüksek, tuzsuz ve drenaj sorunu bulunmamaktadır. 02.05.2025 yılında Kumluca Ticaret ve Sanayi Odası tarafından tescil edilmiştir (Şekil 5a) (Anonim, 2025g; Anonim, 2025h).

4.b) Gaziantep Karası Kuru Üzümü

Antep Karası kuru üzümü, Horoz Karası üzüm çeşidinden elde edilen yaş üzümlerin kurutulması ile üretilir. Yassı formda olan kuru üzümün kabuk rengi siyah, meyve eti koyu kahverengidir ve tanenli aroması ile vardır. 07.04.2022 yılında Gaziantep Ticaret Borsası tarafından tescil edilmiştir (Şekil 5b) (Anonim, 2025g; Anonim, 2025h).

4.c) Gaziantep Pekmezi

Gaziantep ilinde üretilen bu yöresel katı üzüm pekmezi, macun kıvamında ve amber renklidir. Tüketim sırasında ekmek üzerine sürülerek yenilebildiği gibi, eritilerek şurup şeklinde de kullanılabilir. 24.07.2020 yılında Gaziantep Ticaret Borsası tarafından tescil edilmiştir (Şekil 5c) (Anonim, 2025g; Anonim, 2025h).

4.d) Gaziantep Koruk Ekşisi

Gaziantep koruk ekşisi, koruk suyunun kaynatılması veya güneş altında bekletilerek koyulaştırılması ya da korukların kurutulup öğütülmesi yoluyla elde edilen lezzet verici bir üründür. Koruklar, üzümlerin henüz olgunlaşmadığı dönemde, üreticiler tarafından yapılan salkım seyreltme işlemi sırasında toplanır. Gaziantep mutfağında önemli bir yeri olan bu ekşi,

dolmalarda, salatalarda ve çeşitli yemeklerde yaygın olarak kullanılır. 11.04.2022 yılında Gaziantep Büyükşehir Belediyesi tarafından tescil edilmiştir (Şekil 5d) (Anonim, 2025g; Anonim, 2025h).

4.e) Gaziantep Şirin Tarhanası

Gaziantep Şirin Tarhanası, üzüm suyu veya üzüm pekmezinin, coğrafi sınır içinde "çiğ simit" olarak adlandırılan çok ince çekilmiş, pişmemiş sert buğday ile kaynatılmasıyla elde edilen yoğun kıvamlı karışımın kurutulmasıyla üretilen geleneksel bir tatlıdır. Ürün, genellikle atıştırmalık olarak tüketilir. 15.04.2022 yılında Gaziantep Büyükşehir Belediyesi tarafından tescil edilmiştir (Şekil 5e) (Anonim, 2025g; Anonim, 2025h).

4.f) Antakya Zılk Sarması

Antakya Zılk Sarması, Hatay mutfağına özgü bir lezzet olup; pazı yaprakları, pirinç, su, zeytinyağı, kuru soğan, sarımsak, salça, nar ekşisi, toz şeker, tuz ve çeşitli baharatların bir araya getirilmesiyle hazırlanır. Hatay yöresinde pazı bitkisine halk arasında "zılk" denildiği için, bu yemek "Antakya Zılk Sarması" adıyla anılmaktadır. 06.05.2024 yılında Hatay Valiliği tarafından tescil edilmiştir (Şekil 5f) (Anonim, 2025g; Anonim, 2025h).

4.g) Hatay Belen Kömürçukuru Pekmezi

Üretim teknolojisi gereği sıvı üzüm pekmezine katı üzüm pekmezi eklenerek yapılan bu pekmez, sürülebilir bir yapıya sahiptir. Renk tonları krem-kahverengiden açık kahverengiye kadar değişir. 28.07.2021 yılında İskenderun Ticaret ve Sanayi Odası tarafından tescil edilmiştir (Şekil 5g) (Anonim, 2025g; Anonim, 2025h).

4.h) Hatay Barburi Üzümü

Hatay'a özgü Barburi üzümü, yalnızca sofralık olarak değil; aynı zamanda pekmez, sirke ve şarap üretiminde de değerlendirilir. 28.04.2025 yılında Antakya Ticaret ve Sanayi Odası tarafından tescil edilmiştir (Şekil 5h) (Anonim, 2025g; Anonim, 2025h).

4.ı) Hatay Pirzolalı Yaprak Sarması

Hatay Pirzolalı Yaprak Sarması, taze asma yapraklarıyla hazırlanabildiği gibi salamura yapraklarla da yapılabilen yöresel bir yemektir. Bu yemeğin karakteristik özelliği, kuzu pirzolasıyla birlikte pişirilmesi ve iç harcında kıyma kullanılmasıdır. Kendine özgü pirzola ve asma yaprağı aroması sayesinde, Hatay mutfağındaki diğer sarma çeşitleri arasında özel bir yere sahiptir. 21.04.2025 yılında Hatay Valiliği tarafından tescil edilmiştir (Şekil 5ı) (Anonim, 2025g; Anonim, 2025h).

4.i) Hatay Yaprak Sarması

Hatay Yaprak Sarması, pilavlık pirinç, biber ve domates salçası, kuru soğan, sarımsak, nar ekşisi, karabiber ve zeytinyağıyla hazırlanan iç harcın asma yapraklarına sarılarak pişirilmesiyle elde edilen yöresel bir yemektir. Bu yemek, asma bitkisinin taze veya salamura yaprakları kullanılarak hazırlanabilir. İç harcında, 1361 tescil numarasına sahip coğrafi işaretli Hatay Nar Ekşisi kullanılması, yemeğe kendine özgü bir lezzet kazandırmaktadır. 23.12.2024 yılında Hatay Valiliği tarafından tescil edilmiştir (Şekil 5i) (Anonim, 2025g; Anonim, 2025h).

4.j) Kahramanmaraş Bertiz Kabarcık Üzümü

Üzüm, ağırlıklı olarak sofralık olarak değerlendirilse de şıralık ve pekmezlik kullanımının yanı sıra az miktarda kurutmalık olarak da kullanılmaktadır. Taneleri yeşil-sarı tonlarında olup ince kabukludur. 05.10.2023 yılında Kahramanmaraş Büyükşehir Belediyesi tarafından tescil edilmiştir (Şekil 5j) (Anonim, 2025g; Anonim, 2025h).

4.k) Maraş Samsası

Maraş Samsası, Kahramanmaraş iline özgü bir şekerleme türüdür. Üzüm suyu, buğday nişastası ve buğday ununun karıştırılarak odun ateşinde kaynatılmasıyla hazırlanır. Elde edilen karışım, ince bir tabaka hâlinde kurutulur, ardından şeritler şeklinde kesilerek öğütülmüş ceviz içiyle doldurulur ve üçgen biçiminde sarılır. Son aşamada, belirli bir süre baskı altında bekletilerek kendine has dokusu ve lezzeti elde edilir.07.02.2023 yılında Kahramanmaraş Büyükşehir Belediyesi tarafından tescil edilmiştir (Şekil 5k) (Anonim, 2025g; Anonim, 2025h).

4.l) Kilis Horoz Karası Üzümü

Taneleri mavi-siyah renkte olan bu üzüm, oldukça büyük ve uzun elips şeklindedir. Sulu ve etli meyve yapısına sahip olup sofralık olarak kullanılmasının yanı sıra kurutmalık olarak da değerlendirilmektedir. 21.08.2024 yılında Kilis İli Üzüm Üreticileri Birliği tarafından tescil edilmiştir (Şekil 5l) (Anonim, 2025g; Anonim, 2025h).

4.m) Mersin Gülnar Kuş Üzümü

Bu kuş üzümü siyah renkli, çekirdeksiz ve az şekerlidir. Etli ve ince kabuklu yapısıyla kurutmalık olarak değerlendirilir. Taze iken kırmızıdan siyaha döner; kurutulduğunda ise siyah ve küçük taneli hâle gelir. 22.01.2024 yılında Mersin Büyükşehir Belediyesi tarafından tescil edilmiştir (Şekil 5m) (Anonim, 2025g; Anonim, 2025h).

4.n) Mersin Tarsus Beyazı Üzümü (Topacık)

Bu üzümün yaprakları diğer çeşitlere göre biraz tüylüdür. Şeker oranı yüksek olduğundan pekmez ve pekmezli ürünler için idealdir. Çekirdekleri küçük ve yumuşaktır. 14.06.2005 yılında Tarsus Belediyesi tarafından tescil edilmiştir (Şekil 5n) (Anonim, 2025g; Anonim, 2025h).

Şekil 5. Akeniz bölgesi üzüm ve üzüm ürüleri

5. Kuzeydoğu Anadolu Bölgesi

5.a) Erzincan Cimin Üzümü

Erzincan Cimin üzümü, 2001 yılında Üzümlü Belediyesi tarafından Türk Patent Enstitüsü'ne yapılan başvuru sonucunda dünyanın ilk ve tek patentli üzümü olarak tescillenmiştir. Kendine özgü tadı ve düşük şeker içeriği ile sofralık olarak tercih edilen Cimin üzümü, hafif mayhoş bir lezzet profiline sahiptir. 13.06.2001 yılında Erzincan Üzümlü Belediyesi tarafından tescil edilmiştir (Şekil 6a) (Anonim, 2025g; Anonim, 2025h).

5.b) Erzincan Üzümlü Sarucu

Coğrafi işaret tescili 37 numara ile yapılmış olan Cimin üzümü, ortadan ikiye kesilerek kurutulan tanelerinin içine iç ceviz yerleştirildikten sonra pamuk ipliklere dizilerek sunulan geleneksel bir üründür. 05.09.2022 yılında Üzümlü Köylere Hizmet Götürme Birliği tarafından tescil edilmiştir (Şekil 6b) (Anonim, 2025g; Anonim, 2025h).

5.c) Iğdır Beyaz Üzümü

Beyaz üzümün en belirgin özelliği sofralık olarak iri meyvelere sahip olmasıdır. Iğdır ekolojisinde doğal olarak yetişen bu üzüm türü, yuvarlak taneli, yeşil-sarı renk tonlarında, hafif puslu, kalın kabuklu, çekirdekli ve sulu yapıya sahiptir. 09.08.2021 yılında Iğdır Ticaret ve Sanayi Odası tarafından tescil edilmiştir (Şekil 6c) (Anonim, 2025g; Anonim, 2025h).

Şekil 6. Kuzeydoğu Anadolu bölgesi üzüm ve üzüm ürüleri

6. Güneydoğu Anadolu Bölgesi

6.a) Batman Gercüş Mezrone Üzümü

Batman ili Gercüş ilçesinde yetişen bu üzüm, ağırlıklı olarak sofralık amaçla kullanılır ve şıra oranı %70-%80 arasında değişir. Üzüm aynı zamanda pekmez, sucuk, pestil ve şarap üretiminde de değerlendirilmektedir. Taneleri orta büyüklükte, yuvarlak şekilli olup yeşilimsi-sarı renkte ve ince kabukludur. 22.11.2023 yılında Batman Ticaret Borsası tarafından tescil edilmiştir (Şekil 7a) (Anonim, 2025g; Anonim, 2025h).

6.b) Diyarbakır Boğazkere Üzümü

Diyarbakır Boğazkere üzümü, başta şarap üretimi olmak üzere pekmez, pestil, şıra, sucuk ve kesme gibi geleneksel ürünlerin yapımında kullanılır. Mor-siyah renkteki bu üzüm çeşidi, damakta kendine has buruk bir tat bırakmasıyla dikkat çeker. 10.03.2021 yılında Diyarbakır Ticaret ve Sanayi Odası tarafından tescil edilmiştir (Şekil 7b) (Anonim, 2025g; Anonim, 2025h).

6.c) Mardin Midyat Zeynebi Üzümü

Zeynebi üzümü, sofralık olarak tüketilen bir üzüm çeşididir. İnce ve uzun silindirik yapısı nedeniyle, Midyat yöresinde Arapça kökenli "Zeynebi" adıyla anılmakta ve hem yerel hem de ülke genelinde tanınmaktadır. 08.02.2022 yılında Midyat Belediyesi tarafından tescil edilmiştir (Şekil 7c) (Anonim, 2025g; Anonim, 2025h).

6.d) Mardin Ömerli Karfoki Üzümü

"Karfoki" yerel üzüm çeşidinden elde edilen bu ürün hem yaş hem de kuru olarak sofralık amaçla tüketilmektedir. Yaş hali yeşil-sarı renkte olup, kurutulduğunda diğer kuru üzümlerden kolayca ayırt edilebilen kahverengiye yakın kehribar rengi alır. 08.02.2021 yılında Ömerli Kaymakamlığı tarafından tescil edilmiştir (Şekil 7d) (Anonim, 2025g; Anonim, 2025h).

6.e) Mardin Harire

Mardin Harire, üzüm pekmezi, beyaz şeker, buğday unu, su, tarçın ve yenibahar kullanılarak hazırlanan bir karışımın pişirilip soğutulmasının ardından üzerine ceviz içi eklenmesiyle Mardin ilinde üretilen geleneksel bir tatlıdır. 19.02.2024 yılında Mardin Artuklu Üniversitesi tarafından tescil edilmiştir (Şekil 7e) (Anonim, 2025g; Anonim, 2025h).

6.f) Siirt Gebole Tatlısı

Siirt Gebole Tatlısı, sadece Siirt yöresine has, buğday unu, su, şeker ve pekmezle özenle hazırlanan geleneksel bir lezzettir. Hem tatlı hem de yöresel kültürü yansıtan bu tat, bölgenin kendine özgü mutfak mirasının önemli bir parçasını oluşturur. 23.12.2024 yılında Siirt İl Tarım ve Orman Müdürlüğü tarafından tescil edilmiştir (Şekil 7f) (Anonim, 2025g; Anonim, 2025h).

6.g) Siirt Tillo Hariresi

Tillo ilçesinde üretilen Tillo Hariresi, üzüm şırası, buğday unu ve beyaz toprak kullanılarak hazırlanan ve coğrafi sınır içinde "herire" olarak adlandırılan bir üzüm pestilidir. Yumuşak dokusuyla dikkat çeken bu ürünün yapımında, Bineytati ve Sinceri adlı yerel üzüm çeşitlerinden elde edilen şıra kullanılır. Bu üzümler, yüksek şeker içeriği ve bol şıra miktarı nedeniyle tercih edilmekte olup, ürüne ayrıca şeker ilavesi yapılmamaktadır. 17.04.2023 yılında Siirt İl Tarım ve Orman Müdürlüğü tarafından tescil edilmiştir (Şekil 7g) (Anonim, 2025g; Anonim, 2025h).

6.h) Şanlıurfa Hasenik Pestili

Oval şekilli, sarı-yeşil renkte, ince kabuklu, sulu ve tatlı yerel üzüm kullanılarak geleneksel yöntemlerle üretilen bir pestil çeşididir. 29.04.2024 yılında Hilvan Yerel Eylem Grubu Derneği tarafından tescil edilmiştir (Şekil 7h) (Anonim, 2025g; Anonim, 2025h).

6.ı) Van Erciş Üzümü

Erciş üzümü, morumsu siyah renkte ve hafif basık, yuvarlak tanelere sahiptir. Olgunlaşması genellikle Eylül ayının ortasında gerçekleşir. 20.11.2020 yılında Van Ticaret Borsası tarafından tescil edilmiştir (Şekil 7ı) (Anonim, 2025g; Anonim, 2025h).

Şekil 7. Güneydoğu Anadolu bölgesi üzüm ve üzüm ürüleri

7. Karadeniz Bölgesi

7.a) Karabük Safranbolu Çavuş Üzümü

Safranbolu Çavuş üzümü, sarımsı yeşil renkte, hafif oval şekilli, ince kabuklu ve iri taneli bir üzüm çeşididir. 26.12.2022 yılında Safranbolu Kaymakamlığı tarafından tescil edilmiştir (Şekil 8a) (Anonim, 2025g; Anonim, 2025h).

7.b) Düzce Şırası

Düzce Şırası, Osmanlı kültürüne dayanan ve özellikle köftenin yanında tüketilen, alkol içermeyen bir içecektir. Tatlandırıcı ve kimyasal koruyucu maddeler içermeyen bu gazsız içecek, Türkiye'nin güney ve güneydoğu bölgelerinde yetişen kurutulmuş siyah üzümlerin çekirdekleriyle kıyma makinesinde işlenip, belirli oranlarda suda fermantasyon uygulanmasıyla üretilir. Üretimde genellikle küçük taneli ve ince kabuklu kuru üzümler tercih edilmektedir. 06.11.2020 yılında Düzce İl Tarım ve Orman Müdürlüğü tarafından tescil edilmiştir (Şekil 8b) (Anonim, 2025g; Anonim, 2025h).

Şekil 8. Karadeniz bölgesi üzüm ve üzüm ürüleri

8. Ortadoğu Anadolu Bölgesi

8.a) Adıyaman Besni Üzümü

Çekirdekli ve kurutmalık özellik taşıyan bu üzüm çeşidi, iri, homojen ve orta uzunlukta tanelere sahiptir. Taneler kısa oval şekillidir ve incedir, yeşil-sarı renkte kabuğa sahiptir. Meyve eti sertliği oldukça yüksek olup renksiz, susuz ve aromasızdır. Tane sapı kısadır ve her birinde 2–3 çekirdek bulunur. Olgunlaşınca rengi altın sarısına yakın kehribar tonlarındadır. 08.06.2018 yılında Besni Belediyesi tarafından tescil edilmiştir (Şekil 9a) (Anonim, 2025g; Anonim, 2025h).

8.b) Elazığ Boğazkere Üzümü

Elazığ yöresine özgü Boğazkere üzümü, otsu aromasıyla öne çıkar ve dengeli bir burukluğa sahiptir. Tüketildiğinde ağızda hafif yanık bir tat bırakır. Bu üzüm çeşidi genellikle şıralık ve şaraplık amaçlarla değerlendirilir. 11.02.2019 yılında Fırat Kalkınma Ajansı, Elazığ Üzüm Üreticileri Birliği, Fırat Üniversitesi, Elazığ Ticaret ve Sanayi Odası, Elazığ Tarım ve Orman İl Müdürlüğü tarafından tescil edilmiştir (Şekil 9b) (Anonim, 2025g; Anonim, 2025h).

8.c) Elazığ Öküzgözü Üzümü

Öküzgözü üzümü, büyük ve sulu taneleriyle öne çıkan bir çeşit olup şarap yapımında kullanılır. Taneleri oval şekilli, koyu renkli ve etlidir. Kabuk yapısı, Boğazkere üzümüne kıyasla daha incedir. 10.07.2008 yılında Tarım ve Köyişleri Bakanlığı Elazığ İl Müdürlüğü, Elazığ Merkez İlçe Üzüm Üreticileri Birliği tarafından tescil edilmiştir (Şekil 9c) (Anonim, 2025g; Anonim, 2025h).

8.d) Elazığ Tahannebi Üzümü

Elazığ yöresine ait Tahannebi üzümü, sofralık kullanımda erken olgunlaşan bir çeşittir. Yüksek şeker içeriği nedeniyle pestil ve orcik üretiminde de tercih edilir. Meyveleri uzun ve silindirik yapıda olup sarı ile açık yeşil tonları gösterir. 03.11.2023 yılında Elazığ İl Tarım ve Orman Müdürlüğü, Elazığ Ticaret ve Sanayi Odası tarafından tescil edilmiştir (Şekil 9d) (Anonim, 2025g; Anonim, 2025h).

8.e) Elazığ Orciği

Orcik, cevizli bir sucuk çeşididir ve genellikle bağ bozumu sırasında hazırlanır. Önceden ipe dizilen cevizler üzüm şırasına birkaç kez batırılıp kurutularak ürüne dönüştürülür. Elazığ Orciği, yöreye özgü üzümler ve taze cevizlerle yapılmasıyla farklılaşır. 30.11.2018 yılında Fırat Kalkınma Ajansı, Elazığ Tarım ve Orman İl Müdürlüğü, Fırat Üniversitesi, Elazığ Ticaret ve Sanayi Odası, Elazığ Üzüm Üreticileri Birliği tarafından tescil edilmiştir (Şekil 9e) (Anonim, 2025g; Anonim, 2025h).

8.f) Malatya Arapgir Köhnü Üzümü

Yüksek kaliteye sahip sofralık ve şaraplık üzüm çeşitlerinden biri olan bu üzüm, mora yakın siyah renkte tanelere sahiptir. Taneler, gri bir pusla kaplanmış, oval şekilli, iri çekirdekli ve bol şıralıdır. Tadının ise nötral olduğu belirtilmektedir. 24.06.2008 yılında Arapgir Belediyesi tarafından tescil edilmiştir (Şekil 9f) (Anonim, 2024e).

8.g) Malatya Banazı Karası Üzümü

Yüksek tanen içeriği nedeniyle bu üzüm, belirgin bir burukluk sergiler. Sofralık tüketim için taze olarak uygun olmayan bu çeşit, kurutulduğunda herhangi bir katkı maddesi kullanılmadan elde edilir ve renk homojenliği sağlanır. Orijinal rengi siyah ve puslu olup, puslu yapısı, diğer kurutmalık üzümlerden ayırt edilmesini kolaylaştırır. 26.03.2021 yılında Yeşilyurt Belediyesi tarafından tescil edilmiştir (Şekil 9g) (Anonim, 2025g; Anonim, 2025h).

8.h) Malatya Köpük Pestili

"Bastık" adı verilen bu pestil, üzüm suyu, beyaz şeker ve buğday unu ile yapılır. Tadı şekerli ve biraz ekşidir, rengi ise hafif koyu beyazdır. Doku olarak yumuşak bir yapıya sahiptir. 26.01.2022 yılında Malatya Ticaret Borsası tarafından tescil edilmiştir (Şekil 9h) (Anonim, 2025g; Anonim, 2025h).

8.ı) Malatya Tevek Yaprağı Sarması

Yapraklar ince ve az damarlıdır, haşlandığında sarı renge bürünür ve tadı hafif ekşimtıraktır. Mayıs ayında körpe olan yapraklar toplanarak taze ya da salamura halinde kullanılabilir. 23.05.2022 yılında Yeşilyurt Belediyesi tarafından tescil edilmiştir (Şekil 9ı) (Anonim, 2025g; Anonim, 2025h).

8.i) Tokat Erbaa Narince Bağ Yaprağı

Erbaa ilçesinde, uzun yıllardır Narince üzümü asmalarının salamuralık yaprakları ticari olarak toplanmakta ve pazarlanmaktadır. Yöre ekolojisinin sağladığı fiziksel ve kimyasal üstünlükler, bu yaprağın en önemli özelliği olup, aynı zamanda kısa sürede pişme kabiliyeti sunar. 05.12.2017 yılında Erbaa Ticaret ve Sanayi Odası tarafından tescil edilmiştir (Şekil 9i) (Anonim, 2025g; Anonim, 2025h).

8.j) Tokat Narince Salamura Asma Yaprağı

Bu asma çeşidinin yaprağının özellikleri arasında, ismine uygun olarak daha ince ve narin bir yapıya sahip olması, yumuşak dokusu ve yenildiğinde ağızda erimesi öne çıkar. Ayrıca, diğer asma yapraklarına göre daha sarı renkte olup, damar sayısı daha az ve ince yapıdadır. Kendine has tat ve aroması, bu yaprağı diğerlerinden ayıran bir diğer önemli özelliktir. 28.02.2019 yılında Tokat Ziraat Odası tarafından tescil edilmiştir (Şekil 9j) (Anonim, 2025g; Anonim, 2025h).

8.k) Tokat Zile Pekmezi

Normal pekmezlerden farklı olarak beyaz renkli olarak üretilmektedir. İçeriğinde yüksek miktarda üzüm şırası bulunur. Bu özellik, ona özgün bir nitelik kazandırır. 17.11.2009 yılında Zile Ticaret Borsası tarafından tescil edilmiştir (Şekil 9k) (Anonim, 2025g; Anonim, 2025h).

8.l) Tokat Zile Kömesi

Zile Kömesi, ipe dizilmiş ceviz içlerinin, Narince üzümü şırası, buğday nişastası ve un ile karıştırılarak hazırlanıp, hasuda ile kaplanmış bir tatlı ürünüdür. Hasuda, üzüm şırası, buğday nişastası ve unun pişirilmesiyle elde edilen, muhallebi kıvamında bir yöresel tatlıdır. 01.11.2017 yılında Zile Ticaret ve Sanayi Odası tarafından tescil edilmiştir (Şekil 9l) (Anonim, 2025g; Anonim, 2025h).

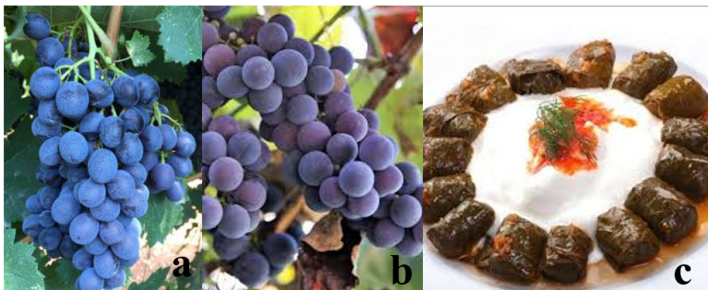
8.m) Tokat Üzüm Tarhanası

Narince beyaz üzüm şırasına ince buğday kırması eklenip kaynatılarak kurutulmasıyla yapılan bir tür tarhanadır. Ayrıca, Tokat üzüm tarhanasında ceviz içi de eklenerek çeşnili üzüm tarhanası yapılabilir. 09.07.2024 yılında Tokat Ticaret ve Sanayi Odası tarafından tescil edilmiştir (Şekil 9m) (Anonim, 2025g; Anonim, 2025h).

Şekil 9. Orta Anadolu bölgesi üzüm ve üzüm ürüleri

9. Orta Güney Bölgesi

9.a) Karaman Ekşikara Üzümü



Üzümler konik bir yapıya sahip olup, dolgundur. Taneleri küçük ile orta büyüklük arasında değişir ve koyu siyah renkte, puslu bir yüzeye sahiptir. 08.12.2022 yılında Karaman Ticaret ve Sanayi Odası tarafından tescil edilmiştir (Şekil 10a) (Anonim, 2025g; Anonim, 2025h).

9.b) Kayseri İncesu Karaevrek Üzümü

Salkımlar kısa uzunlukta olup, konik bir şekle sahiptir. Salkım sapı oldukça kısadır. Meyve eti renksizdir ve tatları tatlıdır. 26.08.2016 yılında İncesu Belediyesi tarafından tescil edilmiştir (Şekil 10b) (Anonim, 2025g; Anonim, 2025h).

9.c) Konya Etli Yaprak Sarması

Konya etli yaprak sarması, serçe parmağının baş boğumu kadar büyüklüğe sahiptir ve Konya mutfağının öne çıkan yemeklerinden biridir. 20.08.2021 yılında Konya Büyükşehir Belediyesi tarafından tescil edilmiştir (Şekil 10c) (Anonim, 2025g; Anonim, 2025h).

ÖZET

Quorum sensing (QS), bakterilerin hücre yoğunluğunu algılayarak kimyasal sinyaller aracılığıyla iletişim kurmasını sağlayan bir mekanizmadır ve biyofilm oluşumu, virülans faktörlerinin üretimi, antibiyotik direnci ve gen transferi gibi süreçlerin düzenlenmesinde kritik rol oynar. Özellikle patojen bakterilerde QS, konak bağışıklık yanıtına dirençli biyofilm yapılarının oluşumuna yol açarak klinik ve veteriner alanda ciddi enfeksiyon sorunlarına neden olur. Quorum quenching (QQ), QS sistemlerini doğal veya yapay yollarla bozarak bakterilerin koordineli davranışlarını engelleyen bir stratejidir. Bu yaklaşım; sinyal sentezinin inhibisyonu, sinyallerin enzimatik parçalanması veya reseptör blokajı yoluyla gerçekleştirilir. QS'i hedef alması nedeniyle QQ, bakterileri öldürmeden patojeniteyi azaltır ve antibiyotiklere alternatif veya tamamlayıcı bir yöntem olarak öne çıkar. QQ stratejileri arasında enzimatik yollar, bitkisel veya mikrobiyal doğal inhibitörler ve sentetik küçük moleküller bulunur. Bitkisel polifenoller, flavonoidler ve ajoene gibi doğal bileşiklerin yanı sıra probiyotiklerin ürettiği metabolitler QS'i baskılayabilir. Ayrıca CRISPR-Cas sistemleri, nanoteknolojiyle kontrollü taşıma yöntemleri ve yapay zekâ destekli bileşik taramaları gibi yeni teknolojiler QQ araştırmalarında önemli ilerlemeler sağlamaktadır. Veteriner alanda *Salmonella, Escherichia coli ve Staphylococcus aureus* gibi patojenlerin biyofilm oluşumunun engellenmesi; gıda endüstrisinde yüzey kontaminasyonunun önlenmesi; klinikte ise *Pseudomonas aeruginosa* gibi dirençli türlere karşı yeni tedavi seçenekleri QQ'nin potansiyel uygulama alanlarındandır. Ancak klinik kullanıma entegrasyon için standardizasyon, güvenlik, toksisite ve direnç gelişimi konularında daha fazla araştırma gerekmektedir. QQ, Tek Sağlık yaklaşımı çerçevesinde antimikrobiyal dirençle mücadelede umut verici, yenilikçi bir strateji olarak öne çıkmaktadır.

Anahtar Kelimeler: Quorum sensing, Quorum quenching, biyofilm

ABSTRACT

Quorum sensing (QS) is a mechanism through which bacteria communicate using chemical signal molecules in response to cell density, playing a crucial role in biofilm formation, virulence factor production, antibiotic resistance, and gene transfer. In pathogenic bacteria, QS facilitates biofilm development that resists host immune responses, posing serious challenges in clinical and veterinary contexts. Quorum quenching (QQ) refers to disrupting QS systems through natural or artificial means, thereby interfering with bacterial coordinated behavior. By inhibiting signal synthesis, enzymatically degrading signals, or blocking receptors, QQ reduces pathogenicity without killing bacteria, emerging as an alternative or complementary strategy to antibiotics. QQ strategies include enzymatic degradation, plant- or microbe-derived natural inhibitors, and synthetic small molecules. Natural compounds such as polyphenols, flavonoids, and ajoene, as well as metabolites produced by probiotics, have been shown to inhibit QS. Moreover, recent technologies such as CRISPR-Cas systems, nanotechnology-based delivery methods, and artificial intelligence driven compound screening have accelerated QQ research. Potential applications of QQ span multiple fields: inhibiting biofilm formation by pathogens like *Salmonella, Escherichia coli,* and *Staphylococcus aureus* in veterinary medicine; preventing surface contamination in the food industry; and providing novel therapeutic options against resistant species such as *Pseudomonas aeruginosa* in clinical settings. However, successful clinical integration requires further research on standardization, safety, toxicity, and resistance development. Within the One Health framework, QQ represents a promising and innovative approach for combating antimicrobial resistance by targeting bacterial communication rather than viability.

Keywords: Quorum sensing, Quorum quenching, biofilm

QUORUM QUENCHING: POTENTIAL APPLICATIONS IN VETERINARY AND CLINICAL MICROBIOLOGY

1. Quorum sensing vs. Quorum quenching

Quorum sensing (QS) is a mechanism that allows bacteria to sense cell density and communicate with each other through chemical signaling molecules (autoinducers). Thanks to QS, bacteria can coordinate their individual activities and act on a population scale. The Quorum sensing mechanism functions as a control system which regulates biofilm development and virulence factor production and antibiotic resistance acquisition and genetic material transfer (Papenfort & Bassler, 2016; Whiteley et al.,2017). The formation of biofilm structures by pathogenic bacteria leads to medical problems because these structures protect bacteria from host immune responses and make antimicrobial treatments useless (Brackman & Coenye, 2015; Rutherford & Bassler, 2012). Quorum quenching (QQ) is defined as the inhibition of QS mechanisms by natural or artificial means. QQ needs various strategies to succeed which include blocking signal molecule synthesis and using enzymes to break down existing signals and blocking receptor-signal binding (Grandclément et al.,2016; Fetzner, 2015). The treatment method breaks down bacterial coordination which leads to lower biofilm formation and decreased virulence factor production. Because quorum quenching employs a strategy aimed at reducing pathogenicity rather than directly killing bacteria, it is gaining importance as an alternative or complementary antimicrobial option to antibiotics (Defoirdt, 2018; O'Loughlin et al.,2013). In recent years, the effectiveness of natural products as QS inhibitors (QSIs) has been reported in various studies. The research by Lu et al. shows that plant-derived polyphenols and flavonoids and essential oils disrupt bacterial communication through their ability to block QS signals. 2022; Singh et al.,2022; Jakobsen et al.,2012). The research findings demonstrate strong potential for biofilm food contamination control and development of new medical treatments against antibiotic-resistant bacteria. Within the One Health perspective, QS and QQ research are critical. The uncontrolled use of antibiotics at high levels has developed into a rapidly expanding antimicrobial resistance (AMR) crisis which impacts human beings and animals and natural environments. QS enables the spread of resistance genes between bacteria and enables bacteria to develop resistance through biofilm formation (Rutherford & Bassler, 2012; Williams et al.,2022). The fight against antibiotic resistance should adopt QS targeting as its current strategic method. QS is expected to offer a wide range of applications in poultry production, including the suppression of *Escherichia coli* and *Salmonella* biofilms, the control of mastitis-causing *Staphylococcus aureus*, the prevention of surface contamination by pathogens in the food industry, and the treatment of *Pseudomonas aeruginosa* infections (Brackman & Coenye, 2015; Li et al.,2018). QS approaches to inhibit QS stand out as a promising research area that contributes to reducing antibiotic use, slowing the development of resistance, and maintaining the balance between human, animal, and environmental health within the framework of One Health.

2. Quorum Sensing Mechanisms

Quorum sensing operates through various signaling molecules in different bacterial groups, and the mechanisms are quite different between Gram-negative and Gram-positive bacteria. The main signaling function of quorum sensing molecules in Gram-negative bacteria relies on acyl-homoserine lactone (AHL)-derived compounds. The AHLs can freely cross bacterial cell membranes before they enter culture media to activate receptor proteins at specific concentrations which depend on bacterial numbers. The binding process triggers gene expression which results in multiple phenotypes that enable biofilm development and virulence factor production and antibiotic resistance. The LasI/LasR and RhlI/RhlR systems in *Pseudomonas aeruginosa* control biofilm organization while allowing the bacteria to create

elastase and rhamnolipid virulence factors (Lee & Zhang, 2015; Papenfort & Bassler, 2016). Gram-positive bacteria depend on oligopeptide signals to perform their QS operations. These peptide signals are released into the medium via carrier proteins and are detected by two-component system receptors located on the cell surface. The detected signal starts a phosphorylation chain reaction through histidine kinase which regulates gene expression. The agr system in *Staphylococcus aureus* plays a central role in the synthesis of virulence factors such as hemolysins and proteases (Novick & Geisinger, 2008; Tan et al.,2018). Autoinducer-2 (AI-2) functions as a vital signal which Gram-negative and Gram-positive bacteria produce to communicate with each other. The AI-2 signaling system enables bacteria to connect with each other in microbial communities which makes biofilm ecosystems more resistant to change (Xavier & Bassler, 2003; Pereira et al.,2013). QS has extensive clinical and veterinary importance. The QS system in *Escherichia coli* establishes conditions which enhance biofilm development thus making antibiotic therapy less effective for infections that originate from poultry zoonotic sources (Mokhtar et al.,2020). The dangerous medical complications occur because *Pseudomonas aeruginosa* forms dense biofilms and produces multiple virulence factors when it infects respiratory areas and wounds (Williams et al.,2022). *Salmonella* spp. The system creates threats to food safety and veterinary public health because it controls intestinal colonization and virulence gene expression through QS (Miller et al.,2001; Walters & Sperandio, 2006).

3. Quorum Quenching Strategies

Quorum quenching operates as a bacterial system which disrupts cellular communication by disrupting quorum sensing signal pathways. QQ functions by preventing bacterial virulence and biofilm development instead of directly killing bacteria to achieve pathogen control. QQ serves as an essential method to fight antimicrobial resistance according to Grandclément et al. (2016; Defoirdt, 2018).

3.1. Enzymatic QQ

The enzymatic QQ method works through direct interference with signaling molecules either by structural changes or by disrupting their function. AHL-lactonases inactivate QS signals by hydrolyzing the lactone ring in AHL (acyl-homoserine lactone) molecules. AHL-acylases prevent signal recognition by cleaving the acyl side chains of AHLs. Oxidoreductases perform chemical transformations on AHLs which prevents their receptor protein binding ability (Dong et al.,2000; Romero et al.,2020). Many bacteria and fungi species in nature produce these enzymes which help them gain competitive advantage in their microbial environments.

3.2. Natural Compounds

The main strategy to stop QS activity involves using plant extracts and natural products. Research shows Ajoene from garlic functions as an effective QS inhibitor which prevents *Pseudomonas aeruginosa* from forming biofilms (Jakobsen et al.,2012). The flavonoid compound quercetin functions as a QS signal blocker which affects both Gram-negative and Gram-positive bacterial species (Lu et al.,2022; Singh et al.,2022). Research shows that probiotic bacteria produce metabolites which decrease pathogen colonization through their ability to block QS (Castillo-Juárez et al.,2015).

3.3. Synthetic Inhibitors

Synthetic QS inhibitors were created (QSIs) through small molecule and peptide analog development during the last few years. The molecules bind to QS receptors through specific interactions which either replicate or block the typical function of natural signaling molecules. The process leads to virulence gene expression suppression. The LasR receptor in *Pseudomonas* becomes available to small molecules according to O'Loughlin et al. which allows them to

break down biofilm structure. 2013). The advantage of synthetic inhibitors is that they exhibit more specific effects and can be adapted to different bacterial species; however, the potential for toxicity and resistance development is still being investigated (Brackman & Coenye, 2015).

3.4. Microbial Competition Strategies

Natural ecosystems contain various microbial species which fight against each other in intense competitive battles. Some bacterial species increase their ecological advantage by disrupting the QS signals of other species. This phenomenon is defined as microbial QQ interactions. *Bacillus* species contain two types of bacteria which produce AHL-lactonase and release probiotic metabolites that interfere with pathogenic QS signals. The body uses these defense systems to protect its natural microbial balance and stop pathogenic organisms from growing (Chen et al.,2013; Romero et al.,2020).

4. New Approaches and Perspectives

Through quorum sensing and quorum quenching research, new approaches to combating bacterial infections that go beyond traditional antibiotic therapy have been discovered. The biofilm-forming capacity and virulence factors of pathogens can be suppressed through innovative QS system targeting methods which next-generation technologies provide. The development of CRISPR-Cas-based genetic interventions has become more popular because they enable direct targeting of QS genes for silencing purposes. The research of Zhang et al. (2020) demonstrates that CRISPR-Cas systems used to block QS regulators LasR and RhlR in Pseudomonas aeruginosa resulted in decreased biofilm development. 2020). The development of genetic engineering-based QQ applications shows promise to become a future clinical treatment for multidrug-resistant bacteria. Nanotechnology-supported QQ studies are also being conducted. Nanoparticles increase the efficacy and reduce toxicity of QS inhibitors (QSIs) by delivering them to target sites in a controlled manner. Research shows that silver and polymer-based nanoparticles when used with natural products can stop QS signals to reduce E. coli and Salmonella biofilm formation by significant amounts (Lu et al.,2022). The development of QQ research is experiencing rapid growth with the integration of artificial intelligence systems. Prediction studies of QS inhibitors in large molecular libraries are being conducted using artificial intelligence and machine learning algorithms (Tan et al., 2020). Research is progressing more rapidly to identify new QS inhibitors derived from natural and synthetic materials that exhibit potent antimicrobial activity. QQ holds promise as a drug that can be used in place of antibiotics by reducing antibiotic consumption and delaying the development of antibiotic resistance. Consequently, the worldwide spread of antimicrobial resistance creates a global health crisis that endangers humans and animals and pollutes the environment. Quorum quencing research is among the diverse and emerging techniques used within the One Health approach and is an alternative treatment method that helps prevent antibiotic resistance, improves treatment outcomes, and reduces environmental microbial contamination (Williams et al., 2022; Romero et al., 2020). However, further evidence-based studies, safety testing, and field applicability studies are needed to integrate QQ into clinical and veterinary practice.

ABSTRACT

The paper examines the impact of Artificial Intelligence (AI) in improving the delivery of public services of concern to policy issues and prospects within the developing world. Citizens are increasingly eager to see the digital transformation as one of the most significant keywords in the world until government efficiency, transparency, and citizen engagement. Nonetheless, they may not be experienced in the developing regions due to infrastructural disparities, limited economic power, and prepared policies. This research paper, with the help of a quantitative methodology, examines the indicators that are considered central, including AI Readiness Index, E-Government Development Score, Public Service Effectiveness, Internet Penetration and GDP per Capita, and the availability of national policies regarding AI. Data based on the ten developing countries had been collected through authoritative secondary sources and were analyzed using the Python based visualizations and correlation methods. The findings indicate a positive association between AI and readiness and effective provision of public services, which highlights the role and significance of digital maturity and value-based governance on the provision of high-quality services. Countries with a larger access to the internet and AI policies are more likely to achieve better results in service. The general absence of organized AI frameworks, digital infrastructure is an obstacle in most developing countries.

Keywords: Artificial Intelligent, Developing Nations, Digital Governance, Public Service Delivery.

1. INTRODUCTION

In most developing nations, the service delivery system is ineffective, unfair and faces a lot of systemic problems of bureaucratic deadlocks, corruption, poor infrastructure and human capacity shortage. In spite of the attempts to enhance service delivery, citizens often face delayed services, ineffective responsiveness, and the inferior quality of delivery in such essential segments of activity as healthcare (Rozenblit et al., 2025), education (Holmes & Tuomi, 2022), sanitation, and civil administration (Okhotnikova & Korpachova, 2021). Growing pressures put on traditional governance structures by people, inability to provide the right services and mismatches due to gaps in service supply validates the imperativeness presented by innovative and technologically controlled solutions (Eze et al., 2024). Artificial intelligence (AI) is, in this respect, a tool that can be transformational to the extent that it can make service delivery more efficient, leave administrative tasks, and make service delivery more responsive and data-informed. Nevertheless, implementation of AI technologies into the sphere of the government creates rather significant policy concerns, especially in regard to developing countries, where the institutional capacity and regulatory systems are not fully developed (Taeihagh, 2021).

AI is an abbreviation of cognitive systems that can be used to solve problems that usually involve intelligence although the system can be encompassed by human beings (Samoili et al., 2020). In the context of the field of public administration, the use of AI implies predictive analytics to plan resource distribution, automated customer service chatbots, intelligent transportation systems, and machine-learning fraud detection models and risk assessment. Such innovations are expected to make the process less hectic, increase accuracy, and expand access to public services. In the case of developmentally constrained countries with limited resources and exploding population, AI even promises the potential of an AI-enabled leapfrog of legacy systems and instead of creating a more adaptable governance model (Dafoe, 2018).

Although all these sound good, there are limitations to the incorporation of AI into the process of public services delivery. One of the major obstacles is the lack of a base of digital infrastructure within many developing states. There is sparse internet coverage, unreliable power, and insufficient data storage assistance, and this has limited the scale at which AI systems can be deployed. Also, the technical expertness in most of the institutions of the public sector in these contexts is very low and therefore not easy to design, or implement, or administer AI solutions. These deficiencies are even augmented by the absence of the multi-pronged policies that relate to data governance, algorithmic transparency, and ethical requirements.

Accountability, fairness, and inclusiveness are other issues with the development and roll out of AI. The reliability of AI systems lies in the input data and assumptions of the given systems. Algorithms can be used to produce biased or inaccurate results to various levels that result in unwanted discrimination or refusal of certain services in cases when the environment contains limited data or bad records (Williams et al., 2018). The lack of transparency between opaque AI-based decision-making mechanisms and the people may erode trust and transparency when the citizens cannot challenge or interpret algorithmic decision-making (Farinu, 2025). This has the potential of seriously derailing the acceptability and legitimate nature of AI-based systems in the developing countries where political and institutional trust is already at the low end.

The morality aspects of AI in the fields of governmental service are understudied in most developing countries (Aderibigbe et al., 2023). Most of the time when AI is used, there is widespread gathering and analysis of personal information, which is a source of concern since our privacy, consent, and possible surveillance are at stake. In the absence of legal protection and data security measures, there tends to be threats of misuse or exploitation of information by citizens (Yigitcanlar et al., 2022). This becomes especially problematic in highly controlled

or poor governance environments, which may distort the usage of AI technologies to control or discriminate against people instead of providing equal service.

However, the opportunities in AI provide countries that use it as a developing country to modernize the branch of government and overcome long-standing gaps in governance (Khan et al., 2024). This would be because, on the one hand, AI-learning early warning systems can improve response to disasters, and machine learning can improve healthcare resource allocation, and on the other hand, digital identity verification technologies can prevent some fraud involving welfare distribution (Waheeb, 2024). Already, there are some countries piloting AI applications with promising results. How technology can be used to scale access and enhance efficiency in service delivery can be seen in the case of Rwanda using AI in medical diagnostics and India using biometric identification to provide people with public subsidies (Sangwa & Mutabazi, 2025).

Tight policy frameworks are necessary to maximize benefits and minimize associated risks (Truby, 2020). Policymakers should come up with approaches that allow balancing AI use with national development initiatives as well as proper oversight and responsibility. This involves formulating legal and ethical protocols on the use of the data, infrastructure investments, and establishing and developing the technical capacity of government institutions (de Almeida et al., 2021). Notably, there seems to be a need to understand that policies must be place-specific, aligned to local situational opportunities and constraints, local institutional facts, cultural practices, and local development orientations. Multistakeholder participation that includes government agencies, the private sector, academia, and civil society is also important in promoting inclusive innovation and having AI systems that were built in the interest of the people (Moon, 2023).

This paper examines the two possibilities of AI, which are as follows: AI can revolutionize the provision of public services, and it also becomes a policy complexity in developing countries. It explores the way AI is already being used in the public sector, challenges to its successful execution, and institutional, legal, and ethical implications necessary to be knowledgeable about the responsible use. This research will give an in-depth idea of what opportunities AI can bring to the transformation of governance and look at the circumstances in which this process can be successful critically. The research has the potential to be applied in the discussion concerning technology-driven governance in the Global South by illustrating implementable or realistic situations and also in the formulation of some policy recommendations concerning assistance in the adoption of sustainable and inclusive AI.

2. METHOD USED

This paper will employ a quantitative research design based on secondary data to evaluate the contribution of Artificial Intelligence (AI) towards improving the service delivery of the developing countries. The research will focus on the descriptive and inferential statistical approach using the Python programming language and such data analysis packages as pandas, matplotlib, seaborn, and statsmodels. The research sample includes 10 developing economies, the choice of which rests on the availability of solid data on the state of AI readiness, government efficiency and e-government level of development, internet access, and GDP per capita as well as national policies dealing with AI.

2.1 Dataset Description

It had a structured collection of data based on open-source metrics of reputable sources such as the oxford Insights AI readiness Index (Marinaș et al., 2024), United Nations e-government Survey (United Nations, 2024), World Bank Development Indicators (Ott, 2023), and regional digital reports. These variables relate to AI Readiness Index, E-Government Development

Score, the level of Public Service Effectiveness, Internet Penetration Rate, the level of GDP per Capita, and a binary indicator of whether an AI policy framework is in presence. Table 1 shows the content of the collected dataset.

Table 1: Key Indicators for AI policy

Country	AI Readiness	E-Gov Score	Public Service	Internet Penetration	GDP/Capita	AI Policy
Nigeria	32	40	38	36	2200	No
Kenya	45	52	50	42	1800	Yes
Ghana	40	49	46	40	2100	No
Bangladesh	50	57	55	60	1900	Yes
Pakistan	46	54	51	50	2000	Yes
Ethiopia	35	42	39	30	850	No
Uganda	38	45	42	35	1200	No
Nepal	41	48	47	38	1300	Yes
Zambia	37	43	40	33	1150	No
Tanzania	36	44	41	34	1100	No

To understand the correlations of the variables, the study has used visual analytics by creating line graphs, histograms and summary tables to identify the patterns in the data and the performance of the countries. Other statistical tools like correlation analysis and linear regression were also explored to test the intensity and pattern of relationships between AI readiness and civic outcomes of public services. Figure 1 shows the block diagram of the study.

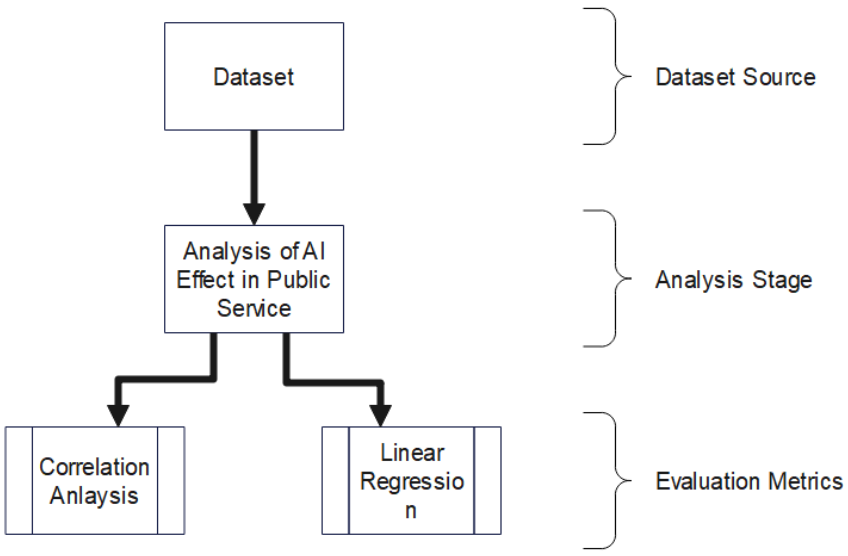

Figure 1: Flowchart of the Study (Source:Fieldwork, 2025)

The deployment of this methodological framework enables objective and replicable analysis of the effect of technological capacity and presence of policy on service delivery in resource-constrained environments. The empirical evidence and reproducible code helps gain a better credence to the results of the study and provide policy implications and developmental agencies with practical suggestions. One should admit limitations pertaining to data availability and consistency in time, but the method is a good foundation to future research and cross-country bench-marking in the domain of digital governance.

3. FINDINGS

The findings for the study were explained in this section. The comprehensive analysis of how AI has impacted the public health base on different criteria were analyzed using python environment on google colab. Figure 2 shows the heatmap of the correlation between six variables. There is a great positive correlation between AI Readiness, E-Government Score and Public Service Effectiveness, which means that the factors move in one direction. Interdependence is also very high between Internet Penetration and GDP. As demonstrated through the AI Policy Exists, there is less correlation, meaning that it may not have a direct impact on other indicators.

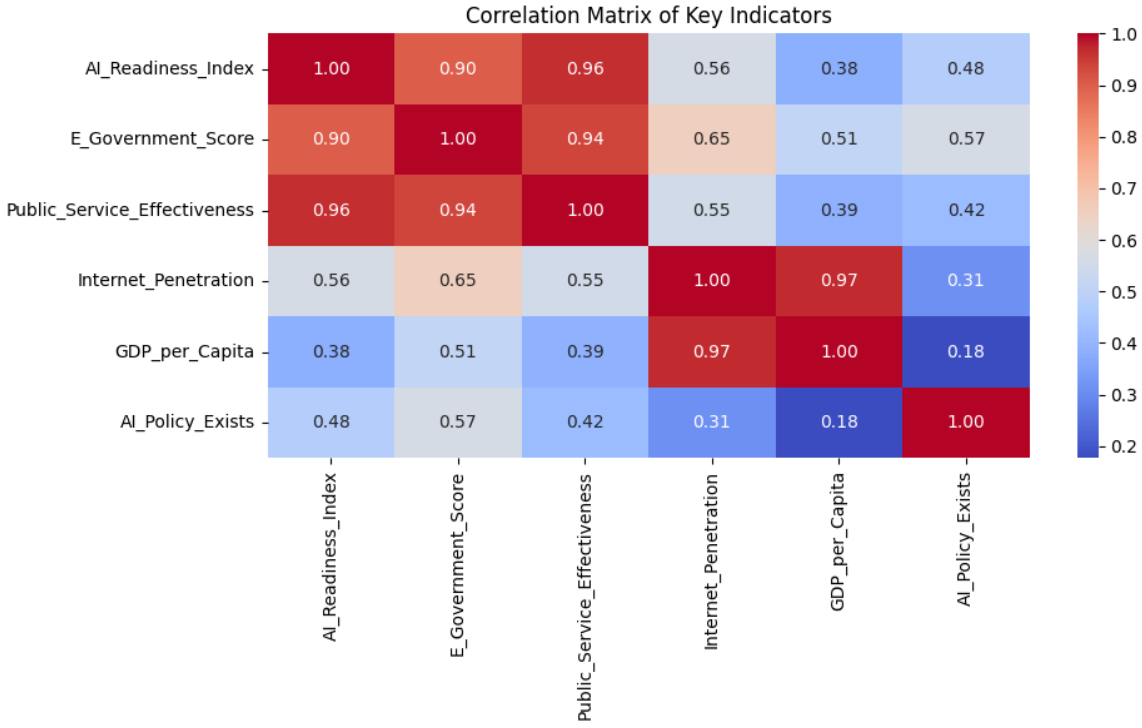

Figure 2: Correlation Matrix for the study

The graph in figure 3 is used to show the relationship between AI Readiness Index and the Public Service Effectiveness of different countries. The countries are one bubble, and the size of the bubble corresponds with GDP per Capita and the color of the bubble to E-Government Score. Since the upward trend is evident, increased AI preparedness can be linked to better functioning of the public services.

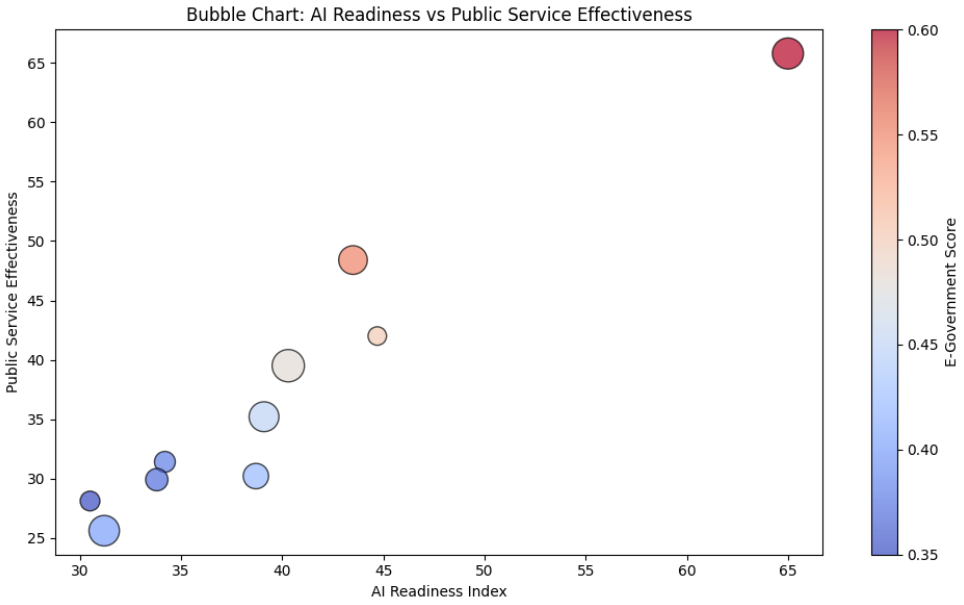

Figure 3: Bubble chart for the study

Figure 4 is a summary of a linear regression that would examine the relationship of five predictors on Public Service Effectiveness. Although coefficients of variables such as E-Government Score and AI Readiness are positive, none of them are strongly statistically significant ($p < 0.05$). This suggests the necessity to conduct additional research with, potentially, a bigger scale of data or a more tuned model.

	Variable	Coefficient	Std. Error	t-Statistic	P-Value	CI Lower (95%)	CI Upper (95%)
0	const	-21.5899	10.3350	-2.0890	0.1049	-50.2843	7.1046
1	AI_Readiness_Index	0.7206	0.3327	2.1660	0.0962	-0.2031	1.6443
2	E_Government_Score	80.4341	35.8140	2.2459	0.0880	-19.0016	179.8698
3	Internet_Penetration	-0.1003	0.9139	-0.1098	0.9179	-2.6377	2.4370
4	GDP_per_Capita	-0.0003	0.0124	-0.0250	0.9813	-0.0346	0.0340
5	AI_Policy_Exists	-3.3889	2.6991	-1.2556	0.2776	-10.8829	4.1050

Figure 4: Linear Regression

The histogram in figure 5 demonstrates the extent of the variation in the country scores of effectiveness of the public services. There is a concentration of most scores between 25 and 35 which shows low effectiveness in most of the countries. Such scores are outliers in a handful of countries. The subsequent KDE curve indicates a skewed distribution towards the left indicating that there are only a few countries which have high performance and most lie below the average mark of the entire effectiveness scale.

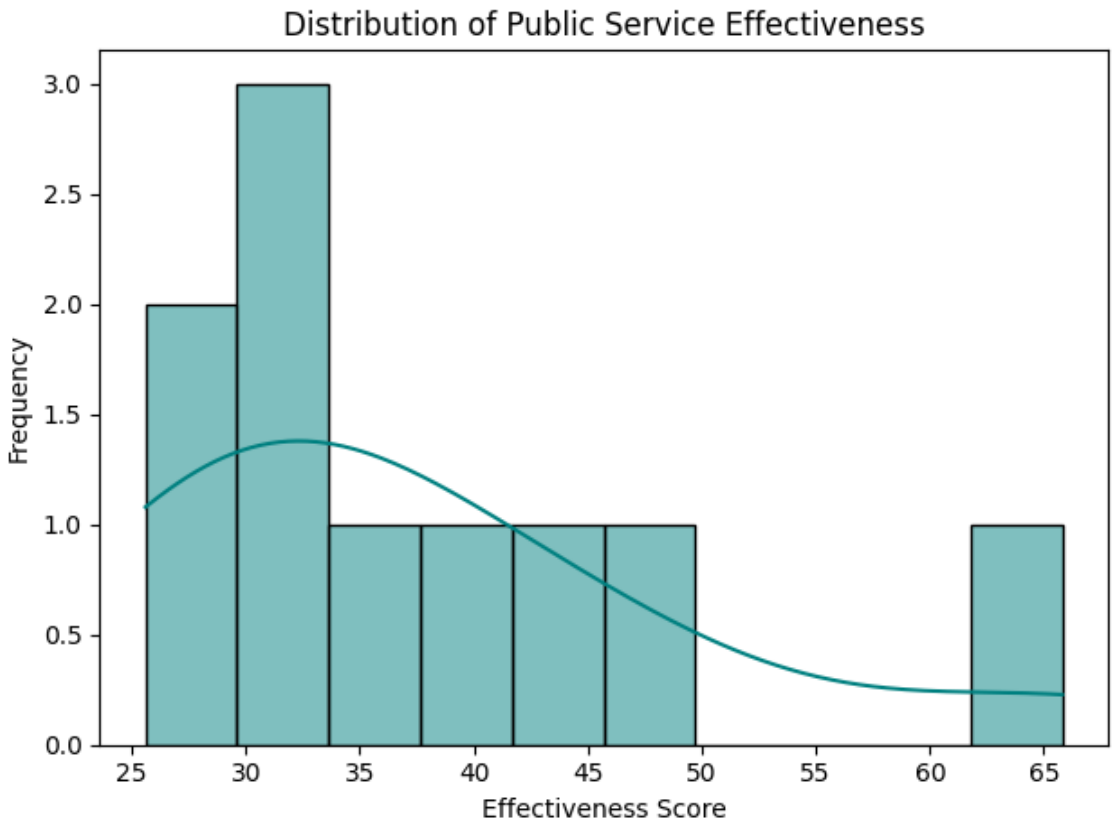

Figure 5: Histogram for the study

This line graph in figure 6 presents a comparison of the outcomes between AI Readiness Index and Public Service Effectiveness of different countries. India tops both scores with countries like Nigeria and Ethiopia being at the bottom of the ranking. Overall, there is a positive trend as the countries with a high level of AI readiness tend to have a better quality of service. Diversion like in Rwanda and Pakistan is, however, suggesting a conflict between the digital ability and the service delivery result.

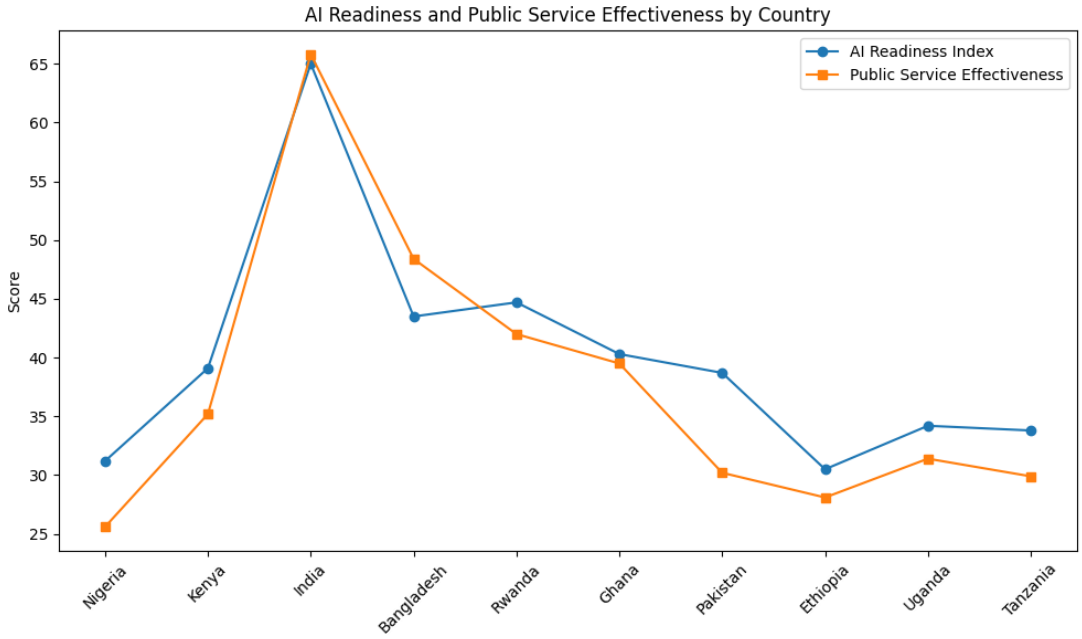

Figure 6: Line chart for the study

The pairplot shows in figure 7, explains how these major variables connect with each other, including AI Readiness, E-Government Score, Effectiveness of Public Services and Internet Penetration and GDP per capita. There is no overwhelming prevalence of some variable indicating substantial positive or negative correlations to others, instead, there are minor positive correlations among some variables, such as AI Readiness and GDP. This visualization is useful in exploratory analysis, and the possible patterns observed are a provision of deeper statistical verification.

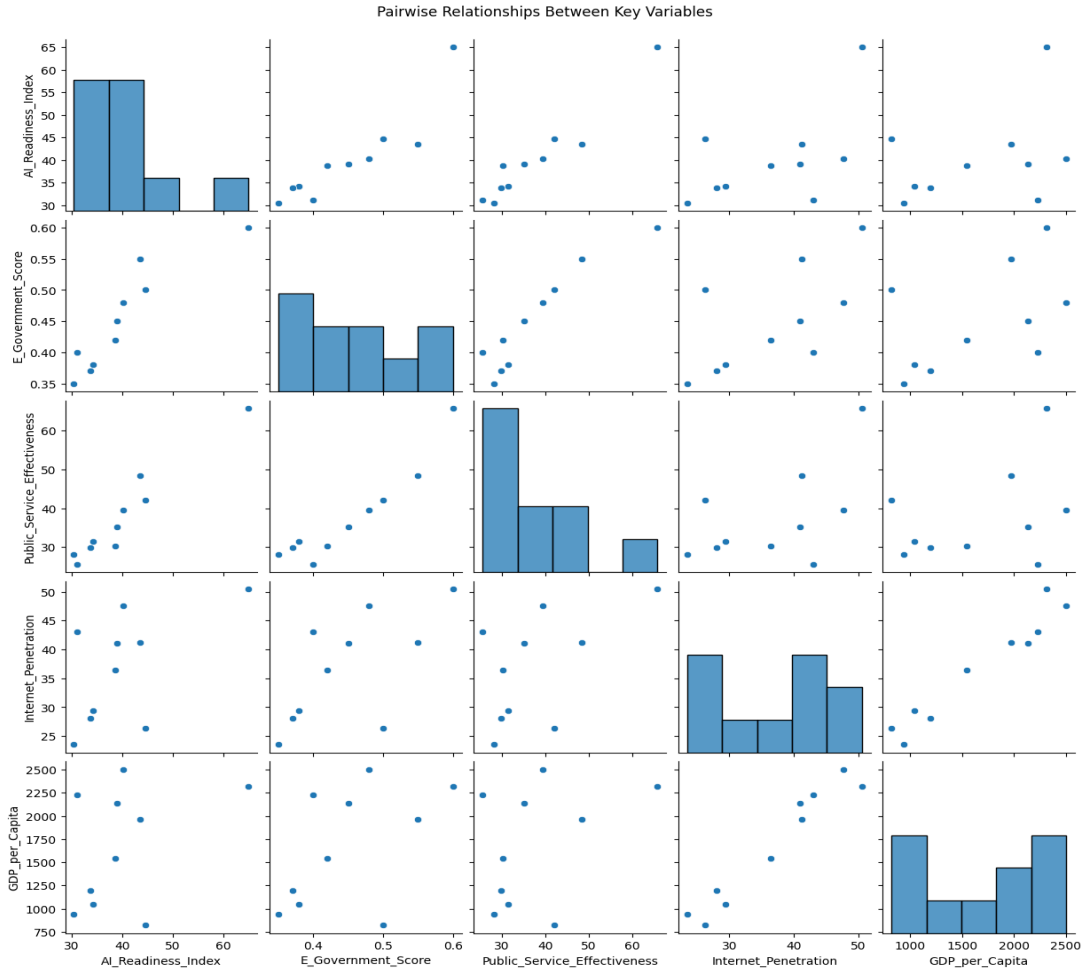

Figure 7: Pairplot chart for the study

4. CONCLUSION

The paper has explored the potential implementation of Artificial Intelligence (AI) in the sphere of improving public service provision in developing nations through the quantitative method that allows analyzing the information collected about the chosen countries. Major indicators including AI Readiness, E-Government Development Score, Internet Penetration and GDP per Capita were put into consideration as well as Public Service Effectiveness. The findings of the analysis indicated that there is a positive correlation between the state of being AI ready and better outcomes of the public service, and the importance of the digital infrastructure and strategic policy frameworks.

The countries that are more ready and have favorable policies to AI have shown superior results in terms of service provision. Nonetheless, formal AI policies are yet in place in various developing countries, which does not allow them to experience the benefits of the AI to the fullest. Also, internet equity and inequality of financial resources remain significant obstacles to digital change on the part of government.

The research has found out that hospitable factors, which include infrastructure, digital literacy, and policy orientation are required to realize the potential value of AI to enhance efficiency in governance and delivery of services. In order to gain maximally, developing countries should invest in inclusive digital policies, institutional capacity, and policy based on evidence and facts. In future, there should be studies that understand the qualitative views and the long-term assessment of the use of AI in public service to get a more balanced idea of its transformative power.

4.1 Recommendations

Developing countries must focus on establishing detailed AI policies that are aligned to national interests to help them take advantage of Artificial Intelligence in delivering public services. Digital infrastructure, access to the internet and capacity building require investment to enable AI usage. Data-driven decision-making should also be encouraged by governments to enhance data collection and automated analytics. Cooperation should be established with foreign agencies, business actors, and universities to transfer and innovate knowledge. Moreover, ethical principles and inclusive approaches are to be developed to make it clear that AI tools are transparent, fair, and customized to concrete needs of various groups of people.

YENİLENEBİLİR ENERJİ TEKNOLOJİLERİNİN VE SÜRDÜRÜLEBİLİR KALKINMANIN TARIMA ETKİSİ

Yegana AHMADOVA

Azerbaycan Devlet Pedagoji Üniversitesi, Tarih ve Coğrafya Fakültesi, Bakü

Tarlan AGAYEV

Azerbaycan Üniversitesi, Sosyal ve Beşeri Bilimler Fakültesi, Bakü

ÖZET

Günümüzde tarım, sadece gıda temin etmekle kalmayıp ekonomik kalkınmanın ve sosyal refahın temel taşlarından biri olarak öne çıkmaktadır. Tarım sektöründe sürdürülebilir uygulamaların benimsenmesi, toprak sağlığının korunması, biyoçeşitliliğin artırılması ve su kaynaklarının etkin kullanımı açısından kritik öneme sahiptir. Organik tarım, hassas tarım yöntemleri, agroforestry ve entegre zararlı yönetimi gibi yaklaşımlar, hem üretim verimliliğini artırmakta hem de çevresel etkileri azaltmaktadır. Bu yöntemler, tarımsal üretimde kimyasal pestisit ve gübre kullanımını azaltırken, sera gazı emisyonlarını düşürmeye ve yenilenebilir enerji kullanımı yoluyla enerji verimliliğini artırmaya katkı sağlamaktadır.

Küreselleşme ve değer katmış tarım faaliyetleri bir sıra ülkelerde çevresel baskıyı artırmakta ve ekolojik ayak izlerini genişletmektedir. Bu bağlamda, güneş, rüzgar, hidro ve biyokütle gibi yenilenebilir enerji kaynaklarının tarımsal üretimde kullanımı çevresel sürdürülebilirlik açısından kritik bir çözüm sunmaktadır. Güneş enerjisi ile sulama sistemlerinin ve enerji ihtiyacı yüksek tarımsal süreçlerin desteklenmesi, fosil yakıt bağımlılığını azaltırken sektörde karbon ayak izini düşürmektedir.

Sürdürülebilir tarımda enerji verimli teknolojiler, su tasarruflu sulama teknikleri ve hassas tarım uygulamaları hem verimliliği artırmakta hem de doğal kaynakların korunmasını sağlamaktadır. Ayrıca, çiftçilerin çevre bilincinin artırılması, eğitim programlarıyla sağlanabilir; bu programlar toprak sağlığı, su yönetimi ve sürdürülebilir kaynak kullanımı gibi konuları kapsayabilir. Organik gübre kullanımı ve hayvan gübresinin teşvik edilmesi gibi yöntemler, toprak kalitesini koruyarak çevre kirliliğini azaltır.

Değer katmış tarım ürünlerinin sürdürülebilir yöntemlerle üretilmesi, hem yerel hem de uluslararası pazarlarda rekabet avantajı sağlar. Yenilenebilir enerji kullanımı ve çevre dostu üretim süreçleri, ekonomik dayanıklılığı artırırken, iklim değişikliği ile mücadele ve sürdürülebilir kalkınma hedeflerine katkı sağlar. Tarımın enerji ve çevreyle entegrasyonu, hem çevresel hem de ekonomik açıdan uzun vadeli sürdürülebilirliğin anahtarıdır.

Anahtar Kelimeler: Sürdürülebilir Tarım, Yenilenebilir Enerji, Organik Tarım, Çevresel Sürdürülebilirlik.

THE IMPACT OF RENEWABLE ENERGY TECHNOLOGIES AND SUSTAINABLE DEVELOPMENT ON AGRICULTURE

ABSTRACT

In Agriculture remains a cornerstone of human survival, food security, and economic development. Beyond food production, it supports livelihoods, particularly in rural areas, and contributes to global trade and national prosperity. The adoption of sustainable agricultural practices is crucial for preserving soil health, promoting biodiversity, and conserving water resources. Methods such as organic farming, precision agriculture, agroforestry, and integrated pest management reduce the use of chemical fertilizers and pesticides, lower greenhouse gas emissions, and enhance energy efficiency through renewable energy utilization.

Globalization and value-added agricultural activities are increasing environmental pressure and expanding ecological footprints in a number of countries. Expanding the use of renewable energy sources, such as solar, wind, hydro, and biomass, in agriculture can mitigate these impacts. Solar-powered irrigation systems and bioenergy for agricultural processes reduce reliance on fossil fuels and help lower the carbon footprint of the sector. Renewable energy adoption also strengthens energy security and resilience against global market fluctuations.

Sustainable farming practices, including water-saving irrigation techniques, crop rotation, conservation tillage, and precision agriculture, enhance productivity while protecting natural resources. Educating farmers on environmental impacts and promoting eco-friendly inputs, such as organic fertilizers and animal manure, further supports soil quality and ecological preservation. These initiatives foster community engagement, knowledge sharing, and long-term social and economic viability for farming communities.

Value-added agriculture can also align with environmental objectives by integrating sustainable inputs and production methods. High-quality, eco-friendly agricultural products meet the growing global demand for green products, offering competitive advantages while conserving natural resources. By combining renewable energy use with sustainable agricultural practices, countries can simultaneously support economic growth and environmental sustainability.

Ultimately, the integration of renewable energy and sustainable agricultural practices is vital for reducing environmental footprints, enhancing climate resilience, and achieving long-term food security. Such strategies enable the creation of a more sustainable and robust agricultural sector that balances economic development with environmental stewardship, contributing to global climate goals and sustainable development objectives.

Keywords: Sustainable Agriculture, Renewable Energy, Organic Agriculture, Environmental Sustainability.

INTRODUCTION

Agriculture has been central to human development since the advent of sedentary societies; it not only provides food but also structures social organization, shapes land use, and underpins local and national economies. Over millennia, human societies have modified landscapes—clearing forests, domesticating plants and animals, and altering hydrological regimes—to meet expanding material needs. These anthropogenic transformations created the conditions for agricultural intensification and population growth, but also introduced a range of environmental pressures: soil degradation, biodiversity loss, water stress, and increased greenhouse gas (GHG) emissions. Understanding the historical trajectory of human–environment relations is essential for framing contemporary policy responses that reconcile productivity goals with ecological stewardship.

In the contemporary era the twin pressures of rising food demand and climate change make the sustainability of agricultural systems a central policy concern. Agricultural production and land use account for a substantial share of global anthropogenic GHG emissions and are both drivers and victims of climate change: unsustainable land-management practices degrade soils and reduce carbon sinks, while changing temperature and precipitation patterns alter crop suitability and water availability. The IPCC's Special Report on Climate Change and Land underscores these interconnections and calls for integrated solutions that address land degradation, food security, and climate mitigation concurrently.

Renewable energy technologies are increasingly presented as a complementary set of solutions that can reduce the agriculture sector's carbon intensity while improving energy access and resilience at farm and community scales. Solar, wind, small-scale hydro, and biomass-based systems can power irrigation pumps, cold chains, grain dryers, and processing units—functions that are energy-intensive and often dependent on fossil fuels in low- and middle-income settings. Notably, solar-powered irrigation systems (SPIS) and decentralized bioenergy applications have shown promise in reducing operational costs, enhancing productivity, and lowering emissions when designed alongside sustainable water and land-use practices. However, adoption at scale is not without challenges: SPIS can increase water extraction pressures if not paired with proper water governance; bioenergy feedstock production can compete with food production unless residues and waste streams are prioritized. These technological opportunities and trade-offs are examined in the joint FAO–IRENA synthesis and associated FAO technical guidance on SPIS.

From a development perspective, the World Bank and its Energy Sector Management Assistance Program (ESMAP) emphasize that renewable energy deployment must be integrated into broader rural electrification and agricultural modernization strategies. Investments that combine technical assistance, financing instruments, and regulatory reforms can increase the developmental impact of clean-energy technologies on agriculture—provided they address institutional capacity, market linkages, and gender-sensitive access to services.

Renewable Energy in Agri-Food Systems. The agri-food sector is one of the largest consumers of global energy and a significant contributor to greenhouse gas emissions. According to IRENA (2021), agriculture, forestry, and other land-use activities account for nearly one-quarter of global emissions, largely due to energy-intensive mechanization, fertilizer production, and post-harvest operations. Integrating renewable energy technologies (RETs) into this sector is increasingly viewed as a key strategy for decarbonization, energy efficiency, and sustainable rural development.

FAO and IRENA (2021) emphasize that renewable energy can support every stage of the agricultural value chain—from production and processing to distribution and waste management. Solar, wind, small hydro, and bioenergy systems can replace or supplement

diesel-based generators, providing stable and affordable energy for irrigation, livestock rearing, food storage, and value-added processing. The transition from fossil fuels to clean energy reduces vulnerability to fluctuating oil prices and strengthens energy security in rural economies (World Bank, 2020).

Furthermore, the adoption of RETs complements global sustainable development frameworks, particularly SDG 2 (Zero Hunger), SDG 7 (Affordable and Clean Energy), and SDG 13 (Climate Action). Countries that integrate renewable energy into agricultural planning demonstrate improved food security outcomes, as energy access enables mechanization, cold storage, and irrigation expansion (IRENA, 2022). However, the diffusion of these technologies remains uneven, constrained by financial barriers, lack of technical skills, and weak institutional support.

Solar-Powered Irrigation Systems (SPIS) and Water-Energy Nexus. Among renewable technologies, solar-powered irrigation systems have gained the most traction in developing countries. SPIS use photovoltaic panels to generate electricity for water pumping, providing farmers with an alternative to diesel-powered pumps. The FAO-IRENA report (2021) identifies SPIS as one of the most cost-effective and climate-resilient solutions for improving agricultural productivity and energy independence.

Empirical studies demonstrate that SPIS can increase cropping intensity, reduce energy costs, and lower carbon emissions (IRENA, 2021; FAO, 2021). For example, pilot projects in India, Morocco, and Kenya show reductions of up to 70% in irrigation energy costs compared with diesel pumps. However, the same studies caution that widespread adoption can lead to unsustainable groundwater extraction when water governance is weak (FAO, 2022).

The water-energy-food nexus thus emerges as a central policy concern. The IPCC (2019) underscores that technological efficiency alone cannot ensure sustainability; effective management of water rights, crop selection, and groundwater monitoring is critical to prevent resource depletion. Integrated governance models, combining energy subsidies with water-use regulation, have proven more successful than technology-only interventions.

Bioenergy and Waste-to-Energy in Agriculture. Bioenergy technologies—such as biogas digesters, biomass gasification, and biofuel production—represent another pathway to sustainable energy use in agriculture. The World Bank (2020) and IRENA (2022) highlight that biogas systems convert organic residues (animal manure, crop residues, and agro-industrial waste) into clean energy while producing nutrient-rich digestate for soil amendment. This dual benefit—energy generation and waste recycling—makes bioenergy highly compatible with circular-economy principles.

Studies by Abanades et al. (2021) and more recent reviews (2024–2025) show that small-scale anaerobic digesters can meet up to 30–50% of a farm's energy needs while reducing methane emissions from livestock waste. In countries like China, Vietnam, and Turkey, biogas programs have improved rural sanitation, reduced deforestation (by substituting firewood), and created employment in maintenance and equipment manufacturing.

However, large-scale biofuel production introduces sustainability challenges, such as land-use competition with food crops and potential biodiversity loss. The FAO (2020) and IPCC (2022) recommend prioritizing second-generation biofuels and waste-to-energy approaches that use non-food biomass and agricultural residues.

Agroecological Practices and Energy Efficiency. Sustainable agriculture extends beyond technological substitution; it also involves ecological management practices that improve energy efficiency and environmental resilience. Techniques such as conservation tillage, crop rotation, agroforestry, and integrated pest management reduce dependence on chemical inputs and enhance soil fertility. These methods lower indirect energy consumption—since producing fertilizers and pesticides is among the most energy-intensive agricultural processes (FAO, 2020).

Precision agriculture, supported by renewable-energy-powered sensors and data analytics, enables site-specific management of water and nutrients, minimizing waste and maximizing yield (IRENA, 2023). Moreover, agroforestry systems integrate trees and crops, increasing carbon sequestration and biodiversity while stabilizing microclimates. Together, these practices exemplify the synergy between renewable energy technologies and ecosystem-based approaches to sustainable land management.

The success of renewable energy adoption in agriculture depends heavily on governance frameworks and financing mechanisms. The World Bank's Energy Sector Management Assistance Program (ESMAP) highlights that decentralized energy systems require coordination among multiple sectors—agriculture, water, energy, and environment—to avoid policy fragmentation (World Bank, 2021).

Public-private partnerships (PPPs), concessional loans, and results-based financing have proven effective in scaling up renewable energy technologies in rural areas. For instance, India's "KUSUM" program provides capital subsidies for farmers installing solar pumps, while Morocco's "Green Generation Plan" links renewable energy deployment with agricultural modernization strategies.

Institutional capacity building, extension services, and farmer training remain critical. FAO (2022) stresses that awareness programs promoting environmental stewardship and technical training for maintenance can ensure long-term system performance and community ownership. Without these social components, technological adoption risks remaining superficial or inequitable.

METHODOLOGY

This study employs a **qualitative-integrative research design**, combining systematic literature synthesis, comparative case analysis, and conceptual modeling to explore the multidimensional relationship between renewable energy technologies (RETs) and sustainable agricultural development. The approach is rooted in a constructivist epistemology, emphasizing the co-evolution of technology, environment, and socio-economic systems (Yin, 2018; Creswell & Poth, 2019).

To operationalize the relationship between renewable energy technologies and sustainable agricultural development, a **thematic synthesis** approach was employed. The analysis was structured around five key dimensions:

1. **Energy Accessibility and Efficiency** – evaluating how RETs enhance energy availability for farm operations while reducing energy intensity.

2. **Environmental Sustainability** – assessing reductions in greenhouse gas (GHG) emissions, soil degradation, and water stress resulting from renewable energy adoption.

3. **Economic Viability** – measuring the impacts of RETs on production costs, farmer income, and local value chains.

4. **Social Inclusion and Equity** – analyzing how technology diffusion affects gender participation, rural employment, and community empowerment.

5. **Institutional and Policy Support** – identifying governance mechanisms, financing models, and regulatory instruments that facilitate or constrain RET integration in agriculture.

Each dimension was examined using **comparative cross-case synthesis** (Yin, 2018), allowing for triangulation between different geographic contexts—such as Asia's large-scale solar irrigation programs, Europe's circular bioeconomy models, and Africa's decentralized mini-grid initiatives.

Since ancient times, people have used land for agricultural purposes to provide daily food, but over-cultivation leads to a decrease in soil productivity.

According to the FAO analysis of land use indicators in the world, certain approaches are required to several issues. They include land fund, soil structure, and dimensions:

1. 37.1% of the total land fund is suitable for agriculture.

11% of it can provide the opportunity to obtain food products. Although pastures are twice as large as arable and perennial cropland, 10% of it can meet the demand for food products.

2. 31% of the total land fund is forest resources. Forests have many benefits for the environment and society. They include the formation of forestry, water circulation, climate formation processes. Fruits and berries from forests, mushrooms, are used for grazing, hunting, etc.

3. According to the indicators, other land areas are the same as forest areas, but different areas are used. In scientific sources, land areas are used for facilities, construction purposes, etc., which covers 2-3% of technological work. Other land areas include deserts, glaciers, rocks, swamps, water bodies, etc. (K.B.Bayramov, Z.R.Babayeva. 2024).

CONCLUSION

The integration of renewable energy technologies (RETs) into agricultural systems represents a **transformative pathway toward sustainable development**, addressing environmental, economic, and social challenges simultaneously. Agriculture, being inherently energy-intensive, benefits from decentralized, clean, and efficient energy sources, which enhance productivity, reduce greenhouse gas emissions, and support climate resilience.

Key findings indicate that:

1. **Energy Efficiency and Productivity Gains:** RETs such as solar PV, wind turbines, and biogas systems provide reliable and cost-effective energy solutions for irrigation, post-harvest processing, and farm mechanization. Enhanced energy access improves agricultural yields, reduces operational costs, and stabilizes rural livelihoods.

2. **Environmental Sustainability:** The adoption of renewable energy reduces dependency on fossil fuels, mitigates GHG emissions, and improves soil, water, and ecosystem health. RETs complement sustainable agricultural practices—such as organic farming, precision agriculture, and agroforestry—by supporting efficient water use, nutrient recycling, and biodiversity conservation.

3. **Economic and Rural Development:** RETs foster job creation, skill development, and local enterprise opportunities. They contribute to rural income diversification, enhance value-added agricultural production, and strengthen resilience to energy price volatility. Countries with effective policies linking renewable energy and agriculture demonstrate higher economic returns and improved market competitiveness.

4. **Social and Institutional Impacts:** Renewable energy adoption empowers communities by improving access to energy, enabling technological literacy, and supporting inclusive participation in sustainable agricultural initiatives. Institutional coherence, clear regulatory frameworks, and public–private partnerships are crucial for equitable and large-scale deployment.

5. **Systems Perspective:** Renewable energy and sustainable agriculture are interdependent. Circular bioeconomy models and precision agriculture powered by RETs illustrate how energy, water, and nutrient cycles can be optimized simultaneously, aligning agricultural production with climate mitigation and sustainable development goals.

Overall, renewable energy serves as both a **driver and enabler** of sustainable agriculture, providing a foundation for climate-smart practices, ecological stewardship, and economic resilience. However, achieving full potential requires addressing financial, technical, and policy barriers through coordinated multi-level interventions.

ABSTRACT

Urbanization has led to a significant reduction in green spaces, prompting the need for innovative approaches to restore ecological balance within cities. Vertical gardens, or living green walls, serve as sustainable solutions for enhancing urban biodiversity, improving air quality, and reducing the heat island effect. The integration of Artificial Intelligence (AI) into vertical gardening systems has revolutionized their design, operation, and maintenance. AI-driven sensors and Internet of Things (IoT) technologies enable real-time monitoring of environmental parameters such as humidity, temperature, light intensity, and soil moisture enabling precise irrigation and nutrient management. Machine learning algorithms assist in plant species selection based on site-specific microclimatic conditions and predict plant health issues before they occur. Furthermore, AI-based predictive models optimize resource utilization, reducing water and energy consumption while enhancing plant growth and aesthetic appeal. The convergence of AI and vertical gardening thus represents a step toward smart, sustainable, and resilient urban ecosystems that harmonize technology with nature.

Keywords: Artificial Intelligence; Vertical Gardens; Urban Sustainability; Smart Irrigation; IoT Sensors; Plant Health Monitoring; Resource Optimization; Green Architecture

INTRODUCTION

Vertical gardens are soil-based, hydroponic, or aeroponic plant systems arranged vertically on walls or structures—represent a cornerstone of sustainable urban design. They are increasingly adopted in urban centers like Singapore, Tokyo, and Bengaluru, where space constraints limit traditional green landscapes (Gupta & Ramesh, 2024). Integrating artificial intelligence (AI) into vertical gardens presents a progressive solution for sustainable urban greening, combining advanced technology with ecological design to address pressing urban challenges (Sun and Li, 2025). AI-powered systems can optimize water and nutrient delivery, ensuring consistent plant health while reducing waste and resource use. Machine learning and IoT devices enable real-time monitoring of vertical garden conditions, such as light, temperature, soil moisture, and air quality, automating adjustments for the best growth outcomes. Vertical gardening is a sustainable method and includes reducing urban heat, enhancing air quality, conserving water, and supporting pollinator species. Urbanization is rapidly transforming landscapes, leading to a loss of green spaces and escalating environmental pressures in metropolitan areas. Vertical gardens, also known as living walls, represent an innovative response to these challenges by introducing dense, multifunctional greenery into high-density settings where traditional gardens are impractical. Recently, the emergence of artificial intelligence (AI)—encompassing machine learning, sensors, robotics, and the Internet of Things (IoT)—has created opportunities to further enhance the sustainability and effectiveness of vertical gardening systems. The objective of this article is to assess how AI technologies are integrated into vertical gardens, evaluate their impact on urban sustainability, and identify challenges and trajectories for future development.

Since the 1990s, cities worldwide have experimented with vertical gardens to reclaim lost green space, mitigate the urban heat island effect, and improve air quality. Early systems often required manual maintenance and faced challenges in adapting to variable urban conditions (Lotfi, Refaat, El Attar, & Abdel Salam, 2020). However, modern advancements have shifted towards automation and digital integration (Rathor et al., 2024).

Studies show that green facades can lower surface temperatures by up to 15°C and reduce ambient heat islands by 20–30% (Chen et al., 2023). Additionally, they sequester CO_2 and particulate matter while promoting mental well-being among urban dwellers. Vertical farming can produce plants in vertically stacked layers in high-rise or indoor buildings. Examples of successful VGs and/or VFs are already present in advanced urban structures, where they provide ecological and food-production benefits. In New York City, for example, it has been estimated that a tall building 30 stories high can supply food for up to 50,000 residents (Despommier, 2010). As indicated by this estimation, a VG that requires one square of the city and has 30 stories (around three million square feet) can offer 2000 calories every day to 10,000 individuals. This evaluation clearly demonstrates that the implementation of VGs can be readily established in vertically sloped surfaces, such as in high-rise buildings in urban areas, where available land and space are limited.

Prior research has focused on smart agriculture systems using IoT and machine learning. IoT-driven irrigation solutions monitor soil moisture and automate water distribution, while computer vision models detect plant diseases through leaf imagery. However, few studies combine these technologies in the context of vertical gardening. Gaps still exist in adaptive irrigation prediction, automated nutrient management, and real-time feedback control. This study bridges that gap by developing a modular AI system that controls multiple vertical garden parameters simultaneously.

SYSTEM DESIGN AND METHODOLOGY

The proposed system architecture comprises four main layers—Sensor, Control, AI Processing, and User Interface as seen in **Figure 1**. Together, they create a closed-loop system capable of real-time monitoring and intelligent control. The design enhances plant growth efficiency, minimizes resource wastage, and supports remote supervision via a dashboard.

SYSTEM ARCHITECTURE

• Sensor Layer: Collects data using temperature, humidity, light, and soil moisture sensors.

• Control Layer: Managed by a microcontroller such as Raspberry Pi or ESP32 that transmits sensor data.

• AI Processing Layer: Analyzes incoming data using trained models in TensorFlow or PyTorch.

• User Interface Layer: Displays analytics and allows control actions via a mobile or web dashboard.

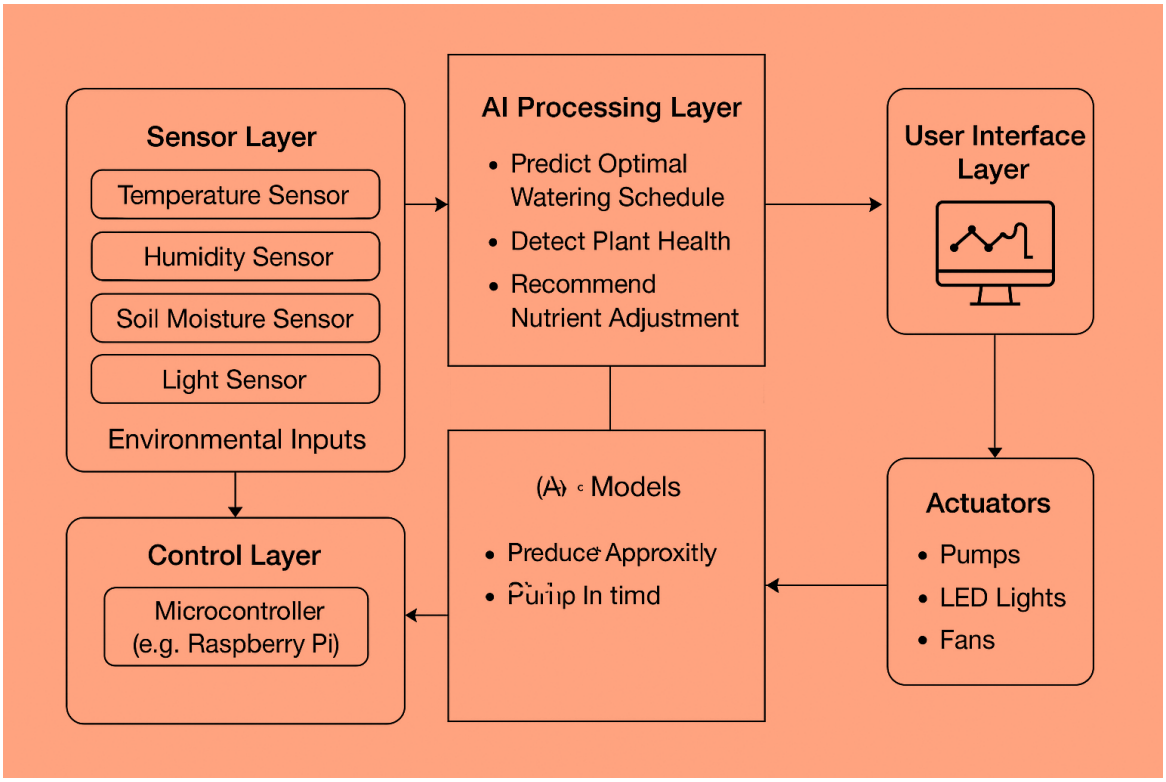

Figure 1: System Architecture of the AI-Enabled Vertical Gardening System.

PROPOSED WORKFLOW

Sensor data is continuously collected from environmental and soil-based sensors. The control unit preprocesses the data and forwards it to cloud-based AI modules. These modules predict the required watering schedule, detect plant stress, and adjust nutrients automatically. The processed insights are relayed back to actuators controlling pumps, lights, and fans.

Environmental Inputs

(Temperature, Humidity, Soil Moisture, Light)

IoT Data Acquisition

(Sensors + Edge Devices)

Data Preprocessing & Cloud Upload

AI Models:

├─ Predict Optimal Watering Schedule (Regression/ANN)

├─ Detect Plant Health via Image Analysis (CNN/YOLO)

└─ Recommend Nutrient Adjustment (Rule-based/ML)

Control Signals Sent to Actuators

(Pumps, LED Lights, Fans)

Real-time Dashboard & Alerts

(Mobile/Web Application)

AI MODEL DESIGN

The AI component includes supervised and unsupervised models, ie Plant Health Detection – CNN-based models like MobileNet detect disease symptoms from captured images. The Smart Irrigation – Regression or LSTM models predict watering needs based on time-series data. Nutrient Adjustment – Decision Tree models recommend fertilizer levels based on soil moisture and pH values and Predictive Maintenance – Autoencoders identify anomalies in sensor readings, alerting for system faults. The prototype integrates both hardware and software components. The hardware comprises DHT11, soil moisture sensors, and a Raspberry Pi microcontroller. Software components include Python-based models and IoT platforms such as Node-RED and ThingSpeak for data handling. Cloud-based AI processing is managed through AWS IoT Core, with real-time visualization via Flask dashboards.

RESULTS AND DISCUSSION

Experimental results indicate that the AI-driven vertical gardening system reduced water usage by approximately 28–35% while maintaining consistent plant growth. The CNN model achieved a 91% accuracy rate in detecting early plant disease symptoms. Furthermore, the predictive irrigation model demonstrated reduced resource waste and improved soil moisture

stability. These findings suggest that AI-enhanced vertical gardening significantly increases efficiency and sustainability.

CONCLUSION AND FUTURE SCOPE

The developed AI-based vertical gardening system provides a scalable and sustainable solution for urban agriculture. By combining IoT sensing, machine learning, and automation, it enhances productivity, reduces human effort, and promotes responsible resource use. Future enhancements will include reinforcement learning for adaptive irrigation, integration with voice-controlled systems, and support for large-scale commercial implementations.

ÖZET

Küresel iklim değişikliğiyle birlikte artan kuraklık dönemleri, tarımsal üretim ve gıda güvenliğini tehdit eden en önemli çevresel sorunlardan biridir. Dünya genelinde geniş alanları kaplayan kumlu ve kireçli topraklar, yüksek geçirgenlikleri ve düşük koloidal içerikleri nedeniyle su tutma kapasiteleri sınırlı olan sistemlerdir. Bu topraklarda, kök bölgesinde sürekli su stresi oluşmakta ve bitki verimi önemli ölçüde azalmaktadır. Bu durum hem sürdürülebilir hem de ekonomik olarak uygulanabilir toprak düzenleyicilere olan ihtiyacı artırmaktadır. Bu çalışmada, saf su sistemlerinde kullanıldıktan sonra atık hâline gelen mix-bed iyon değiştirici reçinelerin, kumlu-kireçli toprakların su tutma özelliklerini iyileştirme potansiyeli araştırılmıştır. Deneysel tasarım kapsamında, toprak örneklerine %0 (kontrol), %1, %2 ve %4 oranlarında mix-bed reçine ilavesi yapılmış ve 30 günlük inkübasyon sonunda Tarla Kapasitesi (TK), Solma Noktası (SN) ve Faydalı Su İçeriği (FS) parametreleri belirlenmiştir. İstatistiksel analizler sonucunda, reçine uygulamalarının tüm parametreler üzerinde anlamlı etkiler yarattığı saptanmıştır ($p<0.05$). Özellikle SN değerlerinde çok yüksek düzeyde fark gözlenmiş ($p<0.001$) olup, %4 reçine uygulaması en yüksek ortalama (7.36%) ile öne çıkmıştır. TK açısından, %4 ve %2 uygulamaları kontrol grubuna kıyasla belirgin artış göstermiştir (ortalama 14.9% ve 14.6%). FS değerlerinde genel olarak artış eğilimi görülse de farklar istatistiksel olarak sınırda anlamlı bulunmuştur ($p<0.05$). Bu sonuçlar, mix-bed reçinelerin toprağın hem su tutma hem de su kullanılabilirliği kapasitesini iyileştirdiğini göstermektedir. Sonuç olarak, atık iyon değiştirici reçinelerin, kumlu-kireçli toprakların fiziksel özelliklerini geliştiren ve toplam kullanılabilir su tutma kapasitesini artıran etkili bir toprak düzenleyici olarak yeniden değerlendirilebileceği belirlenmiştir. Elde edilen bulgular, atık iyon değiştirici reçinelerin kumlu-kireçli topraklarda su tutma kapasitesini artırmada potansiyel bir toprak düzenleyicisi olarak değerlendirilebileceğini ortaya koymaktadır. Bununla birlikte, farklı toprak tekstürleri ve daha uzun inkübasyon sürelerini kapsayan ileri düzey araştırmalar, reçinelerin kalıcılığını, etki mekanizmalarını ve optimum uygulama dozlarını daha kapsamlı biçimde ortaya koymak açısından önem arz etmektedir.

Anahtar Kelimeler: Mix-bed reçine, kumlu-kireçli toprak, su tutma kapasitesi, toprak düzenleyici, sürdürülebilir tarım

THE EFFECTS OF MIX-BED RESINS ON THE WATER RETENTİON CAPACİTY OF SANDY-CALCAREOUS SOİLS

ABSTRACT

Global climate change and the associated increase in drought frequency represent one of the most critical environmental threats to agricultural productivity and food security. Sandy and calcareous soils, which dominate large areas worldwide, are characterized by high permeability and low colloidal content, resulting in limited water-holding capacity. Consequently, continuous water stress occurs in the root zone, leading to substantial reductions in crop yield. This condition highlights the growing need for soil conditioners that are both sustainable and economically feasible. This study investigated the potential of waste mix-bed ion-exchange resins, commonly discarded after use in pure-water systems, to improve the water-retention characteristics of sandy–calcareous soils. Within the experimental design, soil samples were homogenized with mix-bed resin at four rates: 0% (control), 1%, 2%, and 4% by weight. After a 30-day incubation period, Field Capacity (FC), Permanent Wilting Point (PWP), and Available Water Content (AWC) were determined. Statistical analyses revealed that resin treatments had significant effects on all parameters ($p < 0.05$). Particularly, PWP values showed highly significant differences ($p < 0.001$), with the 4% resin treatment achieving the highest mean value (7.36%). Regarding FC, the 2% and 4% resin applications exhibited marked increases compared with the control (mean values 14.6% and 14.9%, respectively). Although AWC showed an overall increasing trend, the differences were only marginally significant ($p \approx 0.05$). These results indicate that the addition of mix-bed resins enhances both the water-holding and water-availability capacities of the soil. In conclusion, waste ion-exchange resins can be repurposed as effective soil conditioners that improve the physical properties and total available water capacity of sandy–calcareous soils. The findings suggest that waste ion-exchange resins may serve as promising soil conditioners to enhance water retention in sandy-calcareous soils. Nevertheless, advanced investigations involving diverse soil textures and extended incubation periods are essential to elucidate the persistence, underlying mechanisms, and optimal application rates of these materials in soil systems.

Keywords: Mix-bed resin, sandy-calcareous soil, water-holding capacity, soil conditioner, sustainable agriculture

1. GİRİŞ

Kuraklık, doğal su döngüsünün aksaması sonucu su kaynaklarının azalmasıyla ortaya çıkan ve ekosistemler üzerinde derinlemesine etkiler bırakan bir çevresel olaydır. Dünya genelinde artan sıcaklıklar, azalan yağışlar ve hızla değişen iklim koşulları, su kaynaklarının sürdürülebilirliğini tehdit ederek kuraklık olgusunun etkisini her geçen yıl daha da artırmaktadır. Birleşmiş Milletler ve uluslararası çevre kuruluşlarının raporlarına göre, dünya kara alanlarının yaklaşık %40'ı kurak koşullar altındadır ve son otuz yılda yeryüzünün yaklaşık %77.6'sı kalıcı biçimde daha kurak hale gelmiştir (UNCCD, 2024). Günümüzde kara alanlarının yaklaşık %30'unun kuraklık koşullarından etkilendiği ve bu oranın 2050 yılına kadar %50'ye ulaşabileceği öngörülmektedir (IPCC, 2023).

Dünya Ekonomik Forumunun 2025 yılında yayınladığı bildiriye göre, kuraklığın doğrudan etkilerinin yaklaşık %80'i tarım sektöründe hissedilmekte; bu da özellikle gelişmekte olan ülkelerde gıda güvenliği açısından kritik bir risk oluşturmaktadır. Türkiye özelinde ise, ülke topraklarının %88'inin kuraklık riski altında olduğu bildirilmiş, bazı bölgelerde yağışların normallerin %26–30 altında seyrettiği tespit edilmiştir (PA Türkiye, 2025). Ülkemizin ortalama yıllık yağış miktarı yaklaşık 643 mm iken, son yıllarda yaşanan kuraklık dönemlerinde bu miktarın normalin %15-20 altında seyrettiği tespit edilmiştir (Altan ve ark. 2020). Bu durum, Türkiye'nin su kaynakları yönetimi, tarımsal üretim planlaması ve ekosistem dayanıklılığı açısından kritik bir dönemeçte olduğunu göstermektedir.

Su kıtlığı, tarımsal üretime dayalı kırsal bölgelerde sosyoekonomik baskıyı artırmakta ve gıda enflasyonu riskini beslemektedir. Özellikle kuru tarım alanlarında buğday ve arpa gibi stratejik ürünlerde %30'lara varan rekolte kayıpları yaşanabilmekte; kuraklık, ulusal gıda arz güvenliğini tehlikeye atmaktadır. Bu zorlu koşullar altında, toprakların su tutma potansiyelini artıracak çözümlerin geliştirilmesi temel bir zorunluluk haline gelmiştir. Bu hayati zorunluluk, zirai araştırmaları, suyun miktarını artırmaktan ziyade, mevcut suyun toprakta tutulma süresini ve kullanım verimliliğini yükseltecek alternatif yolları araştırmaya yöneltmiştir (FAO, 2025).

Özellikle son yıllarda artan çalışmalar, toprakların organik karbon girdileri ile kalitelerinin arttırılmasına ve buna bağlı olarak su tutma kapasitelerinin artırılmasına odaklanmıştır (Negiş, 2023; Gümüş ve ark., 2022). Geleneksel toprak düzenleyicilerin etkisinin sınırlı kaldığı durumlarda, su tutucu polimerler (hidrojeller) gibi yenilikçi malzemeler dikkat çekmektedir (Mikhailidi ve ark., 2024). Bu polimerler, kendi ağırlıklarının yüzlerce katı kadar suyu bünyelerinde jel formunda depolayarak toprağın su tutma kapasitesini artırmakta ve özellikle kuraklık koşullarında mikro su deposu görevi görmektedir (Agbna ve Zaidi 2025). Bu gelişmelere paralel olarak, kimyasal polimerlerin topraklara karıştırılmasıyla toprak düzenleyici uygulamaların çeşitlendiği ve yeni araştırma alanlarının ortaya çıktığı görülmektedir. Bu bağlamda, su arıtma sistemlerinde kullanılan iyon değiştirici reçineler de son dönemde tarımsal üretim açısından ilgi odağı haline gelmiştir. Laboratuvarlarda saf su arıtımında yaygın olarak kullanılan ve kullanım ömrü sonunda atık olarak ortaya çıkan karışık yatak (Mix-bed) iyon değiştirici reçineler, çevreye duyarlı atık yönetimi açısından yeni değerlendirme yaklaşımlarını gündeme getirmektedir. Mix-bed reçineler, güçlü katyonik ve anyonik polimerlerin karışımından oluşan, yüksek su tutma potansiyeli gösteren hidrofilik polimerler grubuna ait sentetik malzemelerdir.

Bu çalışma, su arıtma sistemlerinde kullanılan mix-bed iyon değiştirici reçinelerin kullanım ömrü sonunda ortaya çıkan atık formunun, tarımsal üretimde sürdürülebilir biçimde yeniden değerlendirilmesini amaçlamaktadır. Çalışmanın temel yaklaşımı, çevreye duyarlı atık yönetimi ilkeleri ile kuraklıkla mücadele stratejilerini bir araya getirmektir. Araştırma hipotezi, kullanım ömrünü tamamlamış mix-bed reçinelerin toprak ortamına uygulanmasıyla, bu reçinelerin hidrofilik polimer yapıları sayesinde suyu jel formunda bünyelerinde tutarak

toprağın su depolama kapasitesini artırabileceği varsayımına dayanmaktadır. Böylece, tarla kapasitesi (TK) ile solma noktası (SN) arasındaki farkın faydalı su içeriği (FS) genişlemesi ve bunun sonucunda su kullanım verimliliğinin artması beklenmektedir. Bu kapsamda çalışmanın temel hedefleri şunlardır: (1) Mix-bed reçine uygulamalarının toprakta su tutma kapasitesi üzerine etkisini belirlemek, (2) Bu etkinin toprak tekstürü (kumlu–kireçli topraklar) ile olan ilişkisini ortaya koymak, (3) Tarımsal üretim açısından yeniden kullanım potansiyelini ve çevresel katkılarını değerlendirmek.

2. MATERYAL- METOT

2.1. TOPRAK ÖRNEKLERİNİN TEMİNİ VE HAZIRLANMASI

Denemede kullanılan toprak örneği, İç Anadolu Bölgesi'nin kurak–yarı kurak iklim kuşağında yer alan Konya ili, Karapınar ilçesinden temin edilmiştir. Bölge, düşük yağış miktarı, yüksek buharlaşma oranı ve kireççe zengin toprak yapısı ile karakterize olup erozyon riski yüksek alanlar arasında yer almaktadır. Saksı denemesinde kullanılacak toprak, deneme alanından 0–20 cm derinlikten bozulmuş örnek olarak alınmıştır. Bu derinlik, bitki kök gelişiminin ve su tutma kapasitesinin en aktif olduğu tabakayı temsil etmesi nedeniyle tercih edilmiştir. Toprak örnekleri laboratuvara getirildikten sonra hava akımı altında oda sıcaklığında kurutulmuş, ardından iri agregatlar el ile ufalanarak fiziksel bütünlük bozulmadan homojen hâle getirilmiştir. Elde edilen materyal, 4 mm çapındaki elekten geçirilerek saksı denemesinde kullanılmak üzere hazırlanmıştır.

2.2. DENEME TASARIMI VE UYGULAMA

Çalışmada, atık Mix-bed reçinesinin kumlu–kireçli topraklarda su tutma kapasitesi üzerindeki etkilerini belirlemek amacıyla tek faktörlü bir deneme deseni uygulanmıştır. Denemede, toprak reçine karışım oranı faktör olarak ele alınmış ve dört farklı uygulama düzeyi oluşturulmuştur: %0 (kontrol), %1, %2 ve %4 (ağırlık/ağırlık esasına göre). Her uygulamada 3 kg fırın kuru toprak esasına göre hesaplanmış hava kuru toprak kullanılmıştır. Toprak, önceden 4 mm'lik elekten geçirilmiş ve 3 kg kapasiteli polietilen saksılara eşit miktarda yerleştirilmiştir. Ardından, belirlenen oranlarda Mix-bed reçinesi tartılarak doğrudan saksılara eklenmiş ve reçinenin toprağa homojen biçimde dağılması amacıyla el ile karıştırılmıştır. Deneme, her uygulama için üç tekerrür olacak şekilde yürütülmüştür. Hazırlanan karışımlar, sonraki aşamada gerçekleştirilecek inkübasyon sürecine alınmak üzere laboratuvar ortamında bekletilmiştir.

2.3. İNKÜBASYON SÜRECİ

Toprak ve reçine karışımları hazırlandıktan sonra, her saksı tarla kapasitesinin %80'i oranında su ile nemlendirilmiştir. Bu oran, karışımların suya doygun hale gelmeden optimum nem düzeyine ulaşmasını sağlamak amacıyla tercih edilmiştir. İnkübasyon süreci 30 gün sürmüş ve bu süre boyunca saksılar her üç günde bir tartılarak nem kayıpları izlenmiştir. Tartım işlemleri ±0.01 g hassasiyetli terazi kullanılarak gerçekleştirilmiş, belirlenen kütle farkına karşılık gelen su kayıpları saf su ilavesiyle her saksı için ayrı ayrı tamamlanmıştır. Bu uygulama, reçine toprak etkileşiminin kararlı hale gelmesini ve reçine partiküllerinin tam hidrasyonuna ulaşmasını amaçlamıştır. İnkübasyon süresince saksılar, buharlaşma farklılıklarını en aza indirmek için her hafta rastgele yeniden konumlandırılmış, yüzey buharlaşmasını azaltmak üzere yarı geçirgen polietilen örtü ile kapatılmıştır. İnkübasyon dönemi boyunca karışımlar görsel olarak izlenmiş, reçine partiküllerinde renk veya yüzeye çıkma gibi fiziksel değişimlerin gözlenmediği tespit edilmiştir.

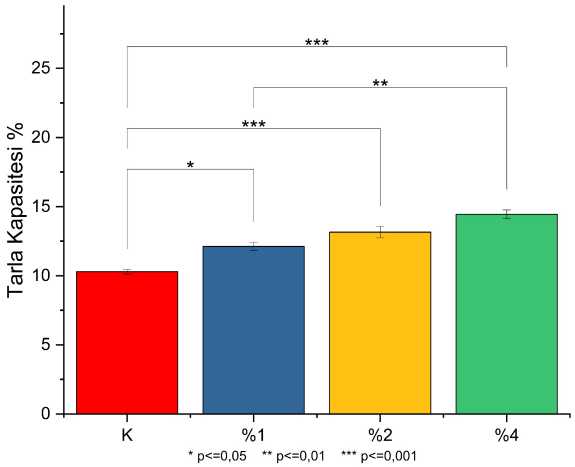
2.4. LABORATUVAR ANALİZLERİ VE YÖNTEMLER

Toprak örneklerinde su tutma özelliklerinin belirlenmesi amacıyla TK ve SN analizleri yapılmıştır. Bu analizler, toprak su potansiyelini temsil eden iki farklı negatif basınç düzeyinde, basınçlı plaka aygıtı kullanılarak gerçekleştirilmiştir. Her uygulamadan alınan örnekler, analize hazırlanmak üzere doygun hâle getirilmiş ve daha sonra TK'yi temsil eden –33 kPa ile SN'yi temsil eden –1500 kPa basınç koşullarında su çıkışı durana kadar yaklaşık 2 gün boyunca tutulmuştur. Toprak örnekleri denge sağlandıktan alınmış ve yaş örnekler tartılmıştır. Örnekler 105 °C 24 saat sabit ağırlığa gelene kadar bekletilmiş ve tekrar tartım yapıldıktan sonra örneklerin nem içerikleri gravimetrik yöntemle belirlenmiştir. Elde edilen değerler arasındaki farktan FS içeriği (FS = TK – SN) hesaplanmıştır (Richards, 1949; Klute, 1986). Bunlara ek olarak, denemede kullanılan toprağın genel özelliklerini belirlemek amacıyla temel fiziksel ve kimyasal analizler de yapılmıştır. Tekstür dağılımı Bouyoucos hidrometre yöntemiyle (Bouyoucos, 1951), pH değeri 1:2.5 toprak/su süspansiyonunda cam elektrotlu pH-metre ile, elektriksel iletkenlik (EC) iletkenlik ölçer ($\mu S\ cm^{-1}$) yardımıyla, organik madde içeriği ise Walkley–Black ıslak yakma yöntemiyle (Nelson & Sommers, 1982) ve toprakların kireç ($CaCO_3$) içeriği, Scheibler calcimeter yöntemi kullanılarak belirlenmiştir (Allison & Moodie, 1965) belirlenmiştir.

2.5. İSTATİSTİKSEL DEĞERLENDİRME

Denemede elde edilen tüm veriler, Mix-bed reçine uygulamalarının toprak su tutma kapasitesi üzerindeki etkilerini karşılaştırmak amacıyla istatistiksel olarak değerlendirilmiştir. Uygulamalar arasındaki farklılıkları belirlemek için tek yönlü varyans analizi (One-Way ANOVA) yöntemi uygulanmıştır. Varyans analizi öncesinde, verilerin normallik (Shapiro ve Wilk, 1965) ve varyans homojenliği (Levene, 1960) varsayımlarını karşıladığı doğrulanmıştır. ANOVA sonucunda istatistiksel olarak anlamlı farklar ($p<0.05$) elde edilen değişkenlerde, gruplar arasındaki farklılığın kaynaklarını belirlemek amacıyla LSD (Least Significant Difference) çoklu karşılaştırma testi uygulanmıştır. Tüm istatistiksel analizler, SPSS Statistics 26.0 (IBM Corp., Armonk, NY, USA) paket programı kullanılarak gerçekleştirilmiştir.

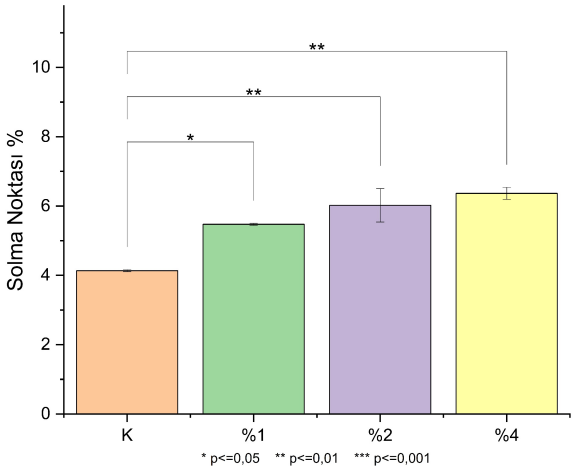
3. SONUÇ VE TARTIŞMA



Denemede kullanılan toprak, yüksek kum oranı (% 80.00) ve düşük kil (% 12.50) ile silt (% 7.50) içerikleri nedeniyle kumlu tin tekstür sınıfında yer almaktadır (Tablo 1). Toprağın pH değeri 8.68 olup oldukça alkalin karakterdedir. Elektriksel iletkenlik değeri 120.2 $\mu S\ cm^{-1}$ ile tuzluluk açısından problem oluşturmamaktadır. Organik madde içeriği (% 1.29) ise düşük seviyede olup, su tutma kapasitesini sınırlandırabilecek bir özellik göstermektedir. Analiz sonucunda toprağın ortalama kireç içeriği %68.61 olarak bulunmuş olup, bu değer toprağın yüksek oranda kireçli sınıfına girdiğini göstermektedir. Bu özellikler, çalışmada kullanılan toprağın su depolama potansiyelinin sınırlı ve kurak–yarı kurak bölge topraklarına benzer olduğunu ortaya koymaktadır (Negiş ve ark., 2023).

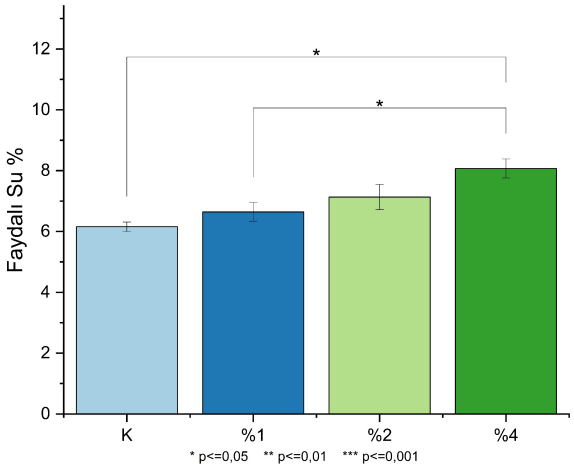
Tablo 1. Çalışma toprağının genel özellikleri

Toprak Özellikleri	Değer
Kum (%)	80.00
Kil (%)	12.50
Silt (%)	7.50
Tekstür Sınıfı	Kumlu Tın
pH	8.68



EC (µS cm^{-1})	120.2
Organik Madde (%)	1.29
Kireç (%)	68.61

Mix-bed reçine uygulamaları kumlu-kireçli toprakların su tutma özelliklerini anlamlı biçimde etkilemiştir (Şekil 1–3). Tarla kapasitesi, uygulama dozları arttıkça yükselmiş ve % 4 dozunda kontrol toprağına göre % 40.23 artış göstermiştir. Uygulama dozları arttıkça TK da istatistiksel olarak anlamlı farklar ortaya çıkmıştır. Bu artış, reçinenin jel yapısında suyu absorbe edip gözenekli toprak matrisinde mikroskobik su rezervuarları oluşturduğunu ortaya koymaktadır. Bu bulgu, süper emici polimerlerin toprak su potansiyelini yükseltici etkilerini bildiren çalışmalarla (Naushabayev ve ark., 2022; Omar ve ark., 2024; Abdelgelil ve ark., 2025) uyumludur.



Şekil 1. Mix-bed reçine uygulamalarının kumlu–kireçli toprakların tarla kapasitesi üzerine etkisi.

Mix-bed reçine uygulamaları sonucunda, toprakların SN değerlerinde istatistiksel olarak anlamlı bir artış gözlenmiştir ($p<0.05$). En yüksek reçine dozunda SN, kontrol grubuna göre %53.99 oranında yükselmiştir (Şekil 2). Bu artış, suyun bir kısmının reçine matrisi içerisinde fiziksel bağlarla tutulduğunu ve toprak su potansiyelinin daha negatif değerlere ulaşmasını engellediğini göstermektedir. Reçine partikülleri, bünyelerine aldıkları suyu jel formunda depolamakta; bu suyun bir kısmı matriks suyu olarak toprak çözeltisinden ayrışmakta ve bitki kökleri tarafından doğrudan erişilebilir nitelikte olmamaktadır (Omar ve ark., 2024). Ancak bu durum, polimerin suyu tamamen bitki erişiminden çıkardığı anlamına gelmemektedir. Literatürde, polimerlerin toprakta oluşturduğu su tutma zonlarının, suyun hareketini yavaşlatarak toprak neminin korunma süresini uzattığı belirtilmiştir (Naushabayev ve ark., 2022). Çalışmamızda gözlenen SN artışı, reçinenin toprak içinde mikro-gözenekli jel bölgeleri oluşturarak suyun bir kısmını yüksek potansiyel farklarıyla bağlamasından kaynaklanmıştır. Bu durum, özellikle kumlu topraklarda nemin hızlı kaybolmasını önleyen bir mekanizma olarak değerlendirilebilir. Bununla birlikte, solma noktasındaki artışın tarla kapasitesindeki artıştan daha düşük oranda olması, reçinenin bitkiler açısından kullanılabilir su miktarını azaltmadığını, aksine faydalı su miktarını (%31.21 artış) artırdığını göstermektedir. Benzer şekilde, Dorraji ve ark. (2010) tarafından yürütülen bir çalışmada da, polimer uygulamalarının SN değerlerinde artışa neden olduğu, ancak bu artışın TK'daki yükselme kadar belirgin olmadığı ve sonuçta bitkisel kullanılabilir su içeriğinde net artış sağlandığı bildirilmiştir.

Şekil 2. Mix-bed reçine uygulamalarının kumlu–kireçli toprakların solma noktası üzerine etkisi.

Mix-bed reçine uygulamaları sonucunda toprakların FS değerlerinde istatistiksel olarak anlamlı ($p<0.05$) bir artış elde edilmiştir. Uygulama dozları yükseldikçe FS değerleri kademeli olarak artmış ve en yüksek dozda (%4) kontrol grubuna göre %31.21 oranında iyileşme görülmüştür (Şekil 3). Bu sonuç, toprağın bitkiler tarafından kullanılabilir su kapasitesinin reçine katkısıyla belirgin biçimde arttığını göstermektedir. Elde edilen bu artış, reçinenin suyu jel formunda absorbe ederek, toprağın makro ve mikro gözenekleri arasında geçici bir su rezervi oluşturmasından kaynaklanmaktadır. Bu rezerv, suyun toprak profili boyunca daha yavaş drene olmasını ve kök bölgesinde suyun daha uzun süre tutulmasını sağlamaktadır. Literatürde, süper emici polimerlerin toprakta hidrolik iletkenliği düşürmeden su depolama kapasitesini artırdığı ve özellikle kumlu topraklarda bitki gelişimini olumlu etkilediği belirtilmiştir (Abdelgelil ve ark., 2025; Naushabayev ve ark., 2022). Mix-bed reçine uygulamasının FS üzerindeki etkisi, polimer partiküllerinin tekrarlayan şişme-kuruma döngülerinde yapısal bütünlüğünü koruyabilmesiyle ilişkilidir. Bu özellik, su tutma kapasitesinde uzun vadeli bir kararlılığın sağlanmasına olanak tanır (Omar ve ark., 2024). Ayrıca, bu reçinelerin suyun kimyasal bileşimini değiştirmeden fiziksel olarak tutması, toprağın iyonik dengesi üzerinde olumsuz bir etki yaratmamasını sağlamaktadır. Benzer bulgular, Dorraji ve ark. (2010) ve Sivapalan (2006) tarafından bildirilen çalışmalarla da örtüşmektedir. Söz konusu araştırmalarda, polimer katkılarının hem TK hem de SN değerlerini artırdığı, ancak FS'nin her koşulda pozitif yönde etkilendiği bildirilmiştir. Bu çalışmada da TK artışı SN artışından daha yüksek olduğu için FS'de net bir iyileşme gözlenmiştir.

Şekil 3. Mix-bed reçine uygulamalarının kumlu–kireçli toprakların faydalı su içeriği üzerine etkisi.

4. SONUÇ

Bu çalışmadan elde edilen bulgular, Mix-bed reçine uygulamasının kumlu–kireçli toprakların su tutma özelliklerini anlamlı ve olumlu biçimde etkilediğini ortaya koymuştur. Reçine ilavesi, toprakların hem TK değerini artırmış hem de bitkiler tarafından kullanılabilir su miktarını genişletmiştir. Böylece, suyun toprakta tutulma süresi uzamış ve suyun bitkiler için erişilebilirliği artmıştır. Sonuçlar, kurak ve yarı kurak iklim koşullarında, ayrıca nadas alanları veya su tutma kapasitesi düşük hafif tekstürlü topraklarda, bu tür reçine bazlı düzenleyicilerin uygulanmasının su verimliliğini artırma ve nem kayıplarını azaltma açısından önemli bir potansiyel taşıdığını göstermektedir. Bununla birlikte, araştırma bulguları laboratuvar koşullarında kısa süreli olarak elde edilmiştir. Bu nedenle, karşılaştırmalı saha çalışmaları ve uzun dönemli izleme çalışmaları ile sonuçların doğrulanması önerilmektedir. Ayrıca, çevresel sürdürülebilirlik açısından Mix-bed reçinelerin tarımsal ortamlarda yeniden kullanımı, su tasarrufu sağlamanın yanı sıra atık yönetimine katkı sunan döngüsel ekonomi yaklaşımı açısından da önem taşımaktadır. Gelecekte yapılacak araştırmalar için aşağıdaki öneriler sunulmuştur:

- Reçine materyalinin kullanım ömrü sonrasında potansiyel element birikimi ve çevresel etkilerinin değerlendirilmesi açısından önemlidir.
- Uygulamanın toprak biyolojik süreçleri, mikrobiyal solunum ve enzimatik aktiviteler üzerindeki etkilerinin belirlenmesi önerilmektedir.
- Laboratuvar ortamında elde edilen bulguların zamanla ve gerçek tarla koşullarında doğrulanabilmesi amacıyla uzun dönemli çalışmaların yürütülmesi tavsiye edilmektedir.

5. TEŞEKKÜR

Bu çalışma, Selçuk Üniversitesi Bilimsel Araştırma Projeleri Koordinatörlüğü (BAP) tarafından desteklenen 25401235 numaralı “Kullanılmış Saf Su Arıtma Karışık Yatak Reçinesinin Kumlu-Kireçli Topraklarda Su Tutma Kapasitesi ve Bitki Gelişimine Etkisi” başlıklı araştırma projesi kapsamında yürütülmüştür.

ABSTRACT

The domestication of goats, one of the earliest milestones in animal husbandry, began nearly 11,000 years ago in the Fertile Crescent. Southeastern Türkiye, positioned along the northern margin of this cradle of domestication, plays a pivotal role as both a migratory corridor and a genetic interface between the Fertile Crescent and the Mediterranean Basin. Archaeozoological remains from Neolithic sites such as Aşıklı Höyük, Çayönü, Göbekli Tepe, and Nevali Çori demonstrate the presence of early managed and progressively domesticated populations of *Capra aegagrus* in this region. Archaeogenetic evidence complements these findings, highlighting Southeastern Türkiye as a transitional zone that influenced both the domestication process and the westward diffusion of goats. The region's strategic location—integrating prehistoric migration routes, trade networks, and traditional pastoral practices—facilitated sustained interactions among distinct genetic lineages over millennia. This continuous exchange established Southeastern Türkiye as a crucial nexus where early domesticated lineages from the Fertile Crescent merged with subsequent genetic expansions toward the Mediterranean Basin. Beyond its archaeological significance, the region serves as a contemporary reservoir of adaptive genetic diversity shaped by long-term natural and human selection. Indigenous goat populations in southeastern Türkiye exhibit genomic signatures of adaptation related to heat tolerance, feed utilization, and reproductive efficiency, highlighting their evolutionary and agricultural importance. Integrating archaeological, genomic, and environmental datasets from this region will provide deeper insights into the origins, migration routes, and adaptive evolution of domestic goats—offering a comprehensive framework for sustainable breeding and conservation strategies that preserve both productivity and genetic integrity.

Keywords: Goat domestication, Fertile Crescent, Archaeogenetics

KEÇİLERİN EVCİLLEŞTİRİLMESİNDE BEREKETLİ HİLAL VE AKDENİZ HAVZASI ARASINDA GENETİK BİR KAVŞAK OLARAK GÜNEYDOĞU TÜRKİYE

ÖZET

Keçinin evcilleştirilmesi, hayvancılık tarihinin en erken dönüm noktalarından biri olup yaklaşık 11.000 yıl önce Bereketli Hilal'de başlamıştır. Bu evcilleştirmenin beşiği konumundaki bölgenin kuzey kesiminde yer alan Güneydoğu Türkiye hem bir göç koridoru hem de Bereketli Hilal ile Akdeniz Havzası arasında genetik etkileşimlerin gerçekleştiği bir bölge olarak kritik bir rol oynamaktadır. Aşıklı Höyük, Çayönü, Göbekli Tepe ve Nevali Çori gibi Neolitik yerleşimlerden elde edilen arkeozoolojik kalıntılar, bu bölgede erken dönemde yönetilen ve kademeli olarak evcilleştirilen *Capra aegagrus* popülasyonlarının varlığını ortaya koymaktadır. Arkeogenetik kanıtlar bu bulguları desteklemekte ve Güneydoğu Türkiye'nin, keçi evcilleştirilme süreci ile batıya doğru gerçekleşen yayılım üzerinde etkili olan bir geçiş alanı niteliğinde olduğunu göstermektedir. Bölgenin stratejik konumu — tarih öncesi göç yolları, ticaret ağları ve geleneksel hayvancılık uygulamalarının kesiştiği noktada bulunması — binlerce yıl boyunca farklı genetik soylar arasında sürekli etkileşimleri kolaylaştırmıştır. Bu kesintisiz gen akışı, Bereketli Hilal'den köken alan erken evcilleştirilmiş hatların, Akdeniz Havzası yönündeki daha sonraki genetik genişlemelerle birleştiği önemli bir merkez olarak Güneydoğu Türkiye'nin konumunu pekiştirmiştir. Arkeolojik öneminin ötesinde, bölge günümüzde doğal ve insan kaynaklı uzun süreli seçilimin şekillendirdiği genetik çeşitliliğin önemli bir rezervuarını temsil etmektedir. Türkiye'nin yerli keçi popülasyonları, ısı toleransı, yemden yararlanma ve üreme verimliliği gibi özelliklerde gözlenen genomik adaptasyon izleriyle dikkat çekmekte; bu durum onların hem evrimsel hem de tarımsal açıdan önemini vurgulamaktadır. Bu bölgeden elde edilecek arkeolojik, genomik ve çevresel verilerin bütüncül biçimde değerlendirilmesi, keçilerin kökeni, göç yolları ve uyumsal evrim süreçlerine ilişkin daha derinlemesine bilgiler sağlayarak hem verimlilik hem de genetik bütünlüğü koruyan sürdürülebilir ıslah ve koruma stratejilerinin geliştirilmesine katkı sunacaktır.

Anahtar Kelimeler: Keçilerin evcilleştirilmesi, Bereketli Hilal, Arkeogenetik

1. INTRODUCTION

Goats (*Capra hircus*) were among the first wild ungulates domesticated by humans approximately 10,000 years ago in the Fertile Crescent—a region encompassing parts of modern-day southeastern Türkiye, the Levant, and the Zagros Mountains (Zeder et al., 2006; Zeder, 2008). This domestication event represents one of the earliest and most transformative milestones in human history, marking the transition from hunting and gathering to agricultural subsistence and laying the foundation for sedentary civilizations. As one of humanity's oldest domesticated livestock species, goats have played an indispensable role in shaping early economies, food systems, and cultural traditions across continents (Mason, 1984, Zeder, 2008; Pereira and Amorim, 2010).

The domestication of goats has long been studied through the combined perspectives of archaeology and genetics. Archaeozoological evidence from Neolithic sites such as Göbekli Tepe, Çayönü, Aşıklı Höyük, and Nevali Çori indicates early flock management of *Capra aegagrus* populations in Southeastern Anatolia, suggesting this region as a primary center of domestication (Hongo et al., 2009; Özdoğan & Özdoğan, 1990; Özdoğan, 1995)**.** With the advent of molecular tools, particularly mitochondrial DNA (mtDNA), Y-chromosome, and genome-wide SNP analyses, it has become possible to trace both maternal and paternal lineages of domestic goats, revealing complex patterns of gene flow, admixture, and diversification over millennia (Pereira et al., 2009; Naderi et al., 2007; Luikart et al., 2001). These findings collectively emphasize Anatolia's role not only as a cradle of domestication but also as a genetic corridor facilitating the diffusion of livestock and human populations into Europe, Africa, and Asia. Despite decades of research, significant questions remain regarding the spatial complexity, demographic dynamics, and long-term genetic continuity of early domestic goat populations in Anatolia. The integration of archaeogenetic and population genetic data now enables a more comprehensive understanding of how multiple wild *Capra aegagrus* lineages contributed to the domestic gene pool, as well as how Anatolia's geographical position influenced global caprine diversity.

This study synthesizes archaeological, genetic, and historical perspectives to reassess the dual role of Türkiye—particularly Southeastern Anatolia—as both a cradle of goat domestication and a corridor of genetic diffusion connecting the Fertile Crescent with the Mediterranean and beyond.

2. FROM BONES to GENES: TRACING THE DOMESTICATION PATHWAY THROUGH ARCHAEOLOGICAL and GENETIC MARKERS

The previously unknown aspects of the domestication of various animal species have begun to be elucidated through the integration of archaeological and genetic research. In these studies, archaeological evidence is identified using both morphological and non-morphological markers. Morphological markers are based on skeletal, dental, and other anatomical characteristics of animals, whereas non-morphological markers consider factors such as habitat, purpose of use, and management practices. Genetic information, on the other hand, is evaluated through molecular markers, which analyze variations and alterations within the genome to reveal the genetic changes that occurred during the domestication process (Zeder et al., 2006).

The domestication of animals is a process marked by significant morphological, physiological, and psychological changes. During this process, humans selected wild animals that were easily manageable and useful for their needs, breeding them to produce offspring. As a result of this selective breeding, domesticated animals developed specific morphological traits encoded at the genetic level. Characteristics such as body size, horn shape, and other physical attributes have consequently been used as morphological markers in archaeological studies. In addition, the domestication process led to significant physiological adaptations. For instance, the

digestive systems, dentition, and metabolic profiles of domestic animals evolved to better accommodate human feeding practices. The psychological aspect of domestication is equally noteworthy, domestic animals became more social and dependent on humans compared to their wild counterparts. These behavioral changes facilitated closer human–animal interactions and made it easier for humans to manage and control domestic species (Zeder et al., 2006).

Non-morphological markers are indicators not based on genetic factors. These markers help in understanding the process of animal domestication by analyzing archaeological data such as demographic profiles that include age at death, sex ratios, and husbandry practices. They are shaped by human selective behaviors during domestication and do not directly affect the animals' genetic characteristics. However, they provide valuable insights into how animals were managed, utilized, and integrated into human societies (Zeder et al., 2006).

Archaeologists use both morphological and non-morphological markers to identify the communities to which animal remains found at excavation sites belonged. For instance, hunter-gatherer societies generally preferred large, mature male animals; therefore, the bones recovered from such sites tend to be thick, well-developed, and predominantly male. In contrast, agricultural societies often favored smaller and female animals, resulting in assemblages primarily composed of bones from younger and female individuals. These markers provide archaeologists with crucial insights into the dietary habits, economic organization, and social structure of past human communities (Zeder, 2008; Zeder et al., 2006).

The domestication process that transformed wild goats into domestic ones, as well as the differentiation between wild and domestic lineages, has been extensively studied using mitochondrial DNA (mtDNA), Y-chromosome, and microsatellite markers. These molecular tools offer valuable insights into the ancestral origins and phylogenetic relationships of domestic goat breeds (Pereira et al., 2009; Naderi et al., 2007; Luikart et al., 2001). Although earlier classification efforts based on protein polymorphisms were conducted, their results were inconsistent with the traditionally accepted horn-morphology-based taxonomy. Consequently, researchers have increasingly focused on mitochondrial DNA (mtDNA) analyses (Manceau et al., 1999). Mitochondrial DNA is particularly advantageous for studying domestication because it experiences minimal selective pressure and evolves rapidly at the molecular level. Moreover, the absence of recombination and its maternal inheritance enable clear phylogenetic inference through the accumulation of mutations that define new lineages or haplotypes over time. Y-chromosomal markers, although used less frequently, play an important complementary role in mammals. They provide a paternal counterpart to mtDNA, allowing the detection of male-mediated dispersal and introgression patterns within and among goat populations (Bruford et al., 2003).

Goat mitochondrial DNA (mtDNA) analyses have produced remarkable results, revealing the presence of at least six distinct mtDNA haplogroups among modern goat breeds distributed across various geographic regions (Naderi et al., 2007). These findings suggest that goat domestication and subsequent breed differentiation were complex processes that likely occurred independently in multiple regions. Studies incorporating autosomal data have further demonstrated a correlation between haplogroup A and both genetic and geographic distances (Pariset et al., 2009; Canon et al., 2006). In phylogenetic analyses of animals, the mtDNA D-loop and cytochrome b regions are among the most frequently used and informative genetic markers for elucidating evolutionary history. These regions have been extensively applied in studies of goat domestication (Naderi et al., 2007; Pidancier et al., 2006; Pereira et al., 2005; Luikart et al., 2001; Hiendleder et al., 1998). The mtDNA D-loop region exhibits the highest level of variation—containing approximately 140 variable sites in goats—making it particularly useful for distinguishing among breeds and visualizing these differences in phylogenetic trees.

The cytochrome b region, with around 50 variable sites, provides additional resolution, allowing researchers to infer the timing of breed divergence through silent mutations that predominantly occur at third codon positions (Joshi et al., 2004; Luikart et al., 2001).

Studies based on mtDNA analyses have indicated that haplogroups A, B, and C diverged approximately 200,000 years ago and subsequently dispersed across different geographic regions during the domestication process (Luikart et al., 2001). The global geographic distribution of these haplogroups, along with the corresponding proportions of individuals belonging to each, is presented in Table 1 (Pereira and Amorim, 2010).

Table 1. Geographic distribution of mitochondrial haplogroups across the world

Haplogroup	Percentage of Individuals	Geographic Distribution
A	90,86	Worldwide
B1	4,40	Sub-Saharan Africa and Greece
B2	1,44	China and Mongolia
C	1,44	Asia and Europe
D	0,54	Asia and Central Europe
F	0,12	Sicily
G	1,11	Near East and North Africa

Goat domestication is believed to have begun approximately 10,000 years ago with a female belonging to haplogroup A. About 6,000 years later, females from haplogroup C were incorporated into the domestication process, followed by those from haplogroup B roughly 2,000 years after that. Studies have indicated that, because of extensive intercontinental transfers, genetic diversity in goats is greater within breeds than between geographic regions. For instance, while intercontinental mtDNA variation in cattle reaches approximately 84%, this value is only around 10% in goats (Luikart et al., 2001). Furthermore, additional haplogroups D (Joshi et al., 2004), F (Sardina et al., 2006), and G (Naderi et al., 2007) have been identified in goats by various researchers.

3. ARCHAEOGENETIC AND HISTORICAL PERSPECTIVES

Goats are among the earliest wild ungulates domesticated in the Near East, approximately 11,000 years ago, marking the beginning of the transformative shift from hunter-gatherer groups to agrarian societies. Since their domestication, goats have remained integral to human livelihoods, playing crucial economic, cultural, and religious roles across numerous civilizations. The integration of genetic and archaeological research has not only clarified the context, locations, and timing of the earliest goat domestication but has also significantly enhanced our ability to trace the migration routes through which humans dispersed this livestock species across the globe. The extensive geographical distribution and rapid expansion of goat populations worldwide clearly demonstrate the remarkable ability of this ruminant species to adapt to extreme climates and challenging landscapes. Furthermore, goats offer an excellent model for evaluating the rise and fall of human migration patterns and trade networks throughout history (Pereira and Amorim, 2010).

The earliest domestication of livestock by humans occurred during the Neolithic period, approximately 11,000 years ago, in the region known as the Fertile Crescent (Zeder, 2008). This period represents a major turning point in human history, providing the foundation for the emergence of agriculture, the transition to a sedentary lifestyle, and the development of complex societies. Among the earliest domesticated livestock species are cattle, pigs, sheep,

and goats. However, numerous studies indicate that sheep and goats were the first animals to be domesticated (Zeder, 2008; Zeder and Hesse, 2000; Mason, 1984). As hunting activities declined, these species played a pivotal role in the development of agricultural and animal production systems, ultimately leading to the modern domestic sheep and goat breeds known today.

The geographical extent of the primary domestication areas was illustrated by Naderi et al. (2008) and is shown in Figure 1.

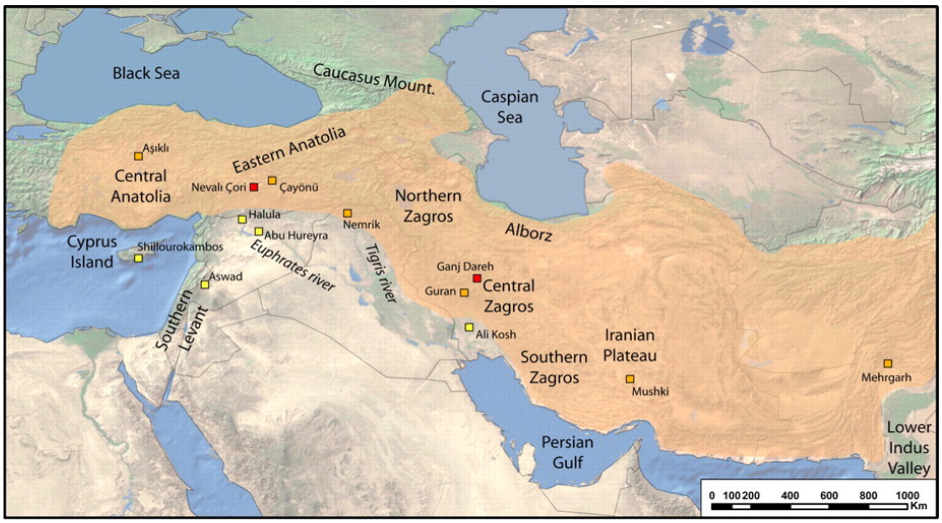

Figure 1. Primary domestication areas

The ancestry of domestic goats has long been studied through archaeological and genetic research. Recent molecular evidence demonstrates that domestic goats originated from the wild bezoar goat, *Capra aegagrus* (Naderi et al., 2007, 2008). This species is assumed to have inhabited a wide area extending from the Indus Valley to the Near East. Although the historical range of wild goats spanned from Europe to North Africa, the most likely ancestor of modern domestic goats is thought to have been confined to a relatively narrow region in Southwestern Asia (Kul, 2010). Some researchers have proposed that domestic goats originated from five different wild *Capra* species: *C. ibex*, *C. prisca*, *C. caucasica*, *C. aegagrus*, and *C. falconeri* (Batu, 1951). However, other studies attribute the ancestry of domestic goats to three wild species, namely *C. aegagrus*, *C. falconeri*, and *C. prisca* (Akçapınar, 1994; Yarkın, 1965). In a comparative analysis of the D-loop and cytochrome b sequences of *C. aegagrus* and domestic goats, Takada et al. (1997) demonstrated that domestic goats trace their origin to *C. aegagrus*.

The classification and global distribution of species within the genus *Capra* (Shackleton, 1997) are presented in Table 2.

Although the precise origins of domestic goats remain a subject of debate, archaeological evidence and scientific research support their domestication in the Fertile Crescent approximately 11.000 years ago (Pringle, 1998; Porter, 1996; Vigne and Buitenhuis, 1999; Peters et al., 1999; Zeder and Hesse, 2000; Luikart et al., 2001). The domestication of goats during the Neolithic period stimulated the domestication of other livestock species and brought substantial cultural and economic benefits. Early human populations that adopted animal domestication experienced rapid lifestyle transformations, gaining significant advantages despite challenges such as malnutrition and widespread disease. This transition strengthened sedentary living, contributing to the emergence of social stratification and the development of increasingly complex technologies (Clutton-Brock, 1999; Zeder, 2006a). Therefore, goats have consistently been associated with the expansion of human populations due to their remarkable adaptability and versatility as livestock (Pereira and Amorim, 2010). Over time, diverse

morphological forms have emerged, including variations in ear shape, such as pendulous ears, twisted horn configurations, and a wide spectrum of coat colors (Mason, 1984; Verschure, 2006).

Table 2. Taxonomic classification and present global distribution of *Capra* species

Species	Common name	Geographical distribution
Capra hircus	Domestic goat	Worldwide
Capra aegagrus	Bezoar or Wild Goat	Caucasus, Central Asia and the Near East
Capra falconeri	Markhor Goat	Western Himalayas
Capra caucasica	Western Caucasus Mountain Goat	Western Caucasus
Capra cylindricornis	Eastern Caucasus Mountain Goat	Eastern and Central Caucasus
Capra ibex	Alpine Mountain Goat	The Alps
Capra pyrenaica	Spanish Mountain Goat	The Iberian Peninsula
Capra nubiana	Nubian Mountain Goat	Northeastern Africa and Some Regions of Arabia
Capra sibirica	Siberian Mountain Goat	Central Asia
Capra walie	Walia Mountain Goat	The Northern Mountains of Ethiopia

4. THE ROUTE THAT BEGAN in THE FERTILE CRESCENT: THE GLOBAL JOURNEY of GOATS

Starting from several, possibly independent centers of domestication, managed goats rapidly dispersed beyond the natural range of the Near Eastern bezoar goat (*Capra aegagrus*). Generally, the spread of domestic animals occurred more rapidly along the east–west axis, where similar climatic conditions facilitated their movement and successful establishment (Diamond, 2002). For example, domestic goats have been found on the island of Cyprus, brought there by humans who colonized the island approximately 10,500 years ago (Zeder, 2008). As domestic goats expanded into hotter and drier lowland regions, the earliest morphological changes became evident—most notably, a general reduction in body size accompanied by alterations in horn morphology (Zeder, 2006b). These phenotypic changes are believed to reflect the onset of deliberate human selection around 9,000 years ago, compounded by genetic isolation following the decline of interbreeding with wild ancestors, as well as novel environmental pressures associated with increasing aridity and the resulting decline in pasture quality across the Fertile Crescent (Pereira and Amorim, 2010). Goat husbandry began soon after their initial domestication (Mason, 1984; Zeder, 2006b), spreading eastward from the Fertile Crescent into the Southern Levant—where localized domestication may also have occurred (Horwitz, 2003)—and further into the Iranian Plateau and Caspian Sea regions. Archaeological evidence suggests that this expansion followed multiple routes rather than a single route, as indicated by the widespread distribution of early goat remains (Pereira and Amorim, 2010).

The approximate dates for the first appearance of domestic goats in specific regions, as well as the main routes of their dispersal (Pereira and Amorim, 2010), are shown in Figure 2.

The primary dispersal routes of domestic goats into Asia likely extended through the Central Asian steppes, moving from present-day Afghanistan toward Mongolia and northern China, as well as throughout the Indian subcontinent via the Indus Valley and subsequently into Southeast Asia (Mason, 1984). A notable finding from mitochondrial DNA studies in goats is the high frequency of haplogroup B observed among breeds in East Asia (Luikart et al., 2001; Sultana et al., 2003; Joshi et al., 2004; Chen et al., 2005). In contrast, its frequency is considerably lower in Europe and the Near East (Pereira and Amorim, 2010). Researchers have suggested that this haplogroup most likely originated in Asia, potentially within the Neolithic communities of Baluchistan in the Indus Basin region (Luikart et al., 2001; Chen et al., 2005). However, no wild goat populations have been identified in East Asia that could support an independent domestication event in that region, where haplogroup B is more common. Moreover, there appears to be no relationship between haplogroup B and the lineage of the markhor (*Capra falconeri*) (Luikart et al., 2001; Pidancier et al., 2006). This haplogroup is also uncommon among modern populations of the bezoar goat, being identified only in a few localized regions of Iran and Türkiye, and it has not been detected in the Indus Valley area (Naderi et al., 2008). Consequently, the mechanisms underlying its high frequency across Asia remain uncertain. One possible explanation is that haplogroup B expanded through a series of population bottlenecks associated with successive colonization events. However, because the effects of genetic drift diminish in expanding populations—such as domestic flocks—this alone cannot fully explain its prevalence. Moreover, domestic goats exhibit consistently high genetic diversity worldwide (Luikart et al., 2001), a pattern that contrasts with the gradual loss of variation expected under a single-origin dispersal scenario (Pereira and Amorim, 2010). The introduction of domestic goats to the islands of Southeast Asia likely occurred via several distinct routes, coinciding with successive waves of human migration. Evidence suggests that goats reached regions such as Indonesia, the Philippines, Japan, and southern China relatively late, around the fourteenth century. Their arrival in the Pacific Islands, however, is attributed to Western sailors during the eighteenth century, who intentionally released goats on various islands as a potential food source for future voyages—a practice that subsequently led to the establishment of wild goat populations (Mason, 1984).

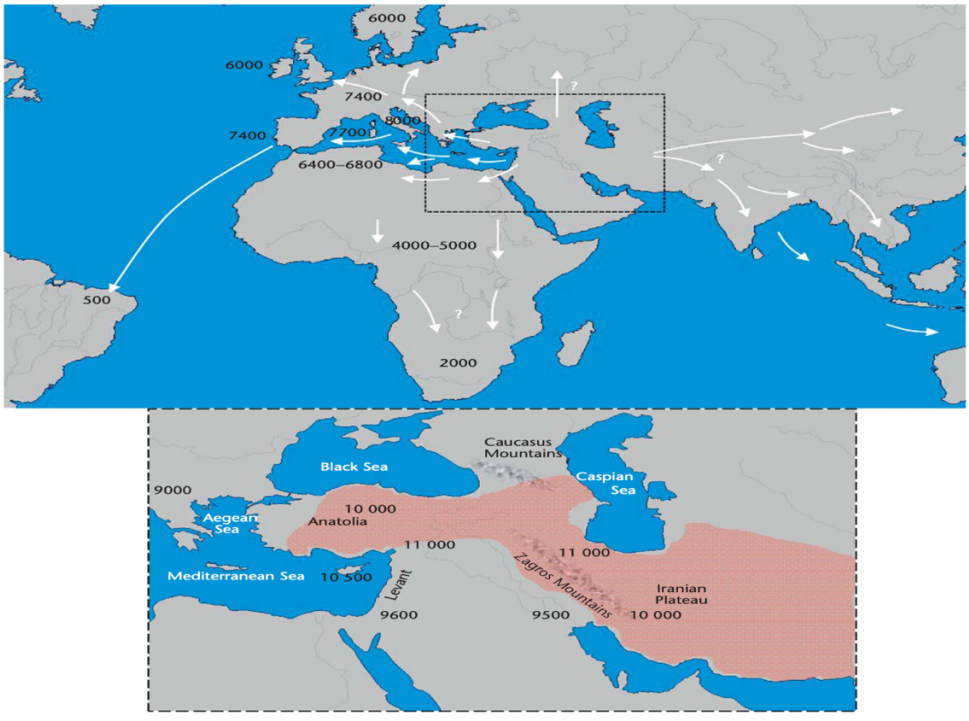

Figure 2. Migration routes of goats across the world

The expansion of domestic goats and the Neolithic way of life into Europe was a gradual and multifaceted process that ultimately contributed to the decline of hunter-gatherer societies. Scientists have identified two primary routes central to this dispersal. The "Danubian route" describes the spread of the Neolithic package—comprising pottery, domesticated animals, and permanent settlements—along the Danube Valley into the central and northern lowlands of Europe. In contrast, the "Mediterranean route" refers to the maritime diffusion of Neolithic communities and livestock along the coastal regions of the Mediterranean basin (Bogucki, 1996). The earliest evidence of agriculture in Europe appeared in Greece with the arrival of domestic goats and farming communities across the Aegean Sea approximately 9,000 years ago. Agricultural communities subsequently expanded into the Balkans around 8,000 years ago, reached Central Europe approximately 7,400 years ago, and eventually spread to Scandinavia and the British Isles around 6,000 years ago (Pereira and Amorim, 2010). Archaeological findings in the Mediterranean Basin demonstrates that agriculture rapidly expanded through maritime dispersal and human migration, as evidenced by the establishment of various coastal settlements on the Italian Peninsula around 8,000 years ago, in southern France between 7,700 and 7,600 years ago, on the western coasts of the Iberian Peninsula between 7,400 and 7,300 years ago, and in the southern Iberian region between 7,700 and 7,600 years ago (Zilhao, 2001; Zeder, 2008). Studies of modern goat populations indicate that the Mediterranean acted as a natural corridor linking regions that exhibit unexpectedly high genetic diversity far from the Near East. This is exemplified by the presence of the rare haplogroups C and F in the Iberian Peninsula and on the island of Sicily (Amills et al., 2004; Pereira et al., 2005; Azor et al., 2005; Sardina et al., 2006). Furthermore, mitochondrial DNA analyses of ancient goat remain from one of the earliest Neolithic sites in southwestern Europe revealed that both A and C lineages reached this region at roughly the same time, between 7,300 and 6,900 years ago (Fernandez et al., 2006). This evidence supports the hypothesis that intensive exchange of domestic goats occurred along the Mediterranean route, facilitating interactions between eastern Neolithic centers and western coastal farming communities soon after the arrival of Neolithic settlers in Europe. More recent genetic findings showing that the A and C haplogroups share a common ancestry with the wild bezoar goats of Eastern Anatolia (Naderi et al., 2008)—rather than arising independently as previously assumed—further suggest that these maternal lineages may have coexisted from the earliest phases of domestication (Pereira and Amorim, 2010).

Local goats were transported from Europe to the Americas by Portuguese and Spanish sailors in the early sixteenth century, serving as a readily available food source during exploration and military expeditions (Pereira and Amorim, 2010). Preliminary genetic analyses of goat populations in South and Central America indicate that the presence of haplogroup A lineages likely originates from the transatlantic introduction of animals from the Iberian Peninsula, with possible additional contributions from breeds established in the Atlantic archipelagos (Amills et al., 2009).

The introduction of goats into Africa most likely accompanied the migration of pastoralist communities from the Near East into northeastern Africa (Mason, 1984; Smith, 1992). The presence of the rare haplogroup G in Southwest Asia and Egypt is believed to reflect the genetic legacy of this early connection (Naderi et al., 2007). The subsequent southward expansion of goats—alongside cattle domesticated in North Africa—appears to have been influenced by environmental changes that reduced the prevalence of humidity-associated diseases, such as trypanosomiasis, approximately 4,000 to 5,000 years ago (Smith, 1992; Newman, 1995). However, factors such as parasitic infections, endemic diseases, and predation likely constrained the further spread of livestock, accounting for their relatively late arrival in the southernmost regions of Africa around 2,000 years ago. Conversely, this pattern may also explain the occurrence of haplogroup B1 lineages in South Africa—common in Asia but absent

in North Africa—supporting the hypothesis of an overland dispersal route extending from the Near East (Luikart et al., 2001).

5. ANATOLIA as a CRADLE and CORRIDOR: ARCHAEOGENOMIC INSIGHTS into GOAT DOMESTICATION in SOUTHEASTERN TÜRKİYE

The Pre-Pottery Neolithic (PPN) period, spanning approximately 9750–6400 BC (11,600–8400 BP) in the southern Levant and southeastern Anatolia, represents one of the earliest cultural phases in human history during which agriculture, animal husbandry, and permanent settlement first emerged. This period reflects a stage before the development of pottery production yet marks the beginning of the transition to a productive economy. The PPN is conventionally divided into three main subphases (Childe, 1928). The PPNA (Pre-Pottery Neolithic A) phase, dating to approximately 9750–8500 BC (ca. 11,600–10,500 BP), marks the earliest stage of permanent habitation by hunter-gatherer groups, as evidenced at sites such as Göbekli Tepe and Jericho. Circular domestic structures were common, and the first attempts at plant domestication are documented. During this period, social organization became increasingly complex, and the earliest forms of ritual architecture emerged (Kujit, 1996; Kujit, 2011). The subsequent PPNB (Pre-Pottery Neolithic B) phase, roughly 8500–7000 BC (ca. 10,500–8,750 BP), corresponds to a time when agriculture and animal husbandry became systematized, rectangular stone-based architecture became widespread, and social differentiation intensified. This phase is further subdivided into early, middle, and late PPNB (Goring-Morris et al., 2009). During this stage, sheep and goats were among the first animals to be domesticated, and key Anatolian sites such as Çayönü, Nevali Çori, and Aşıklı Höyük represent centers where the Neolithic lifestyle became fully established (Özdoğan, 1999). The final stage of the PPN sequence, PPNC (Pre-Pottery Neolithic C; 7000–6400 BC; 8750–8400 BP), constitutes a transitional phase preceding the advent of pottery use. During this period, large village settlements gave way to smaller, more dispersed communities; architectural forms became simplified, and agro-pastoral economies reached full stability. Thus, the PPNC established the socio-economic and technological foundations for the emergence of pottery Neolithic cultures (Childe, 1928; Birkenfeld et al., 2024).

The domestication of major livestock species—namely sheep, goats, cattle, and pigs—primarily advanced within the northern and eastern zones of the Fertile Crescent during the Early to Middle Pre-Pottery Neolithic B (PPNB). Archaeozoological evidence from sites across this region indicates that goat management had already begun in the northern Zagros Mountains approximately 10,000 years ago (Hesse, 1978; Zeder, 1999, 2005, 2006b; Zeder & Hesse, 2000). Around the same time, sheep domestication was initiated, most likely in the foothills of the Taurus Mountains in southeastern Anatolia (Hongo et al., 2009). One of the most important sites representing this transformative period is Çayönü Tepesi, located on a small tributary of the Tigris River, roughly five kilometers north of the Taurus foothills in southeastern Türkiye (Özdoğan & Özdoğan, 1990). Like other Pre-Pottery Neolithic (PPN) settlements in the region, Çayönü was strategically positioned at the interface between mountainous terrain and the southern plains and steppes, forming a crucial ecological and cultural corridor. The occupation sequence at the site extends for roughly three millennia, spanning from the Late PPNA through the Early Pottery Neolithic, thereby encompassing the pivotal transition from hunting to herd management. Consequently, the faunal assemblages recovered from Çayönü provide a rare diachronic record, enabling the reconstruction of shifting patterns of animal exploitation during the critical phase in which livestock domestication became firmly established in the Near East (Hongo et al., 2009; Özdoğan & Özdoğan, 1990; Özdoğan, 1995).

Archaeozoological analyses conducted at Aşıklı Höyük reveal that during the Pre-Pottery Neolithic period, caprine management was practiced in a manner reflecting controlled herd

strategies rather than full domestication. The age and sex profiles of caprine remains indicate a selective culling of young males, suggesting a strategy aimed at preserving reproductive females. This pattern points to a human-directed form of animal management rather than opportunistic hunting. Moreover, the presence of dense dung accumulations and architectural features within the settlement suggests that *Caprines* were confined to specific areas, likely functioning as stabling structures. Such confinement practices represent an initial step toward behavioral domestication through movement restriction. The researchers characterize this approach as "a short-term, low-investment strategy of herd management," reflecting an early phase in the transition from foraging to herding economies (Stiner et al., 2014).

The Nevali Çori settlement, located in southeastern Anatolia and dated to the Early–Middle Pre-Pottery Neolithic B (PPNB) period, provides crucial early evidence for the domestication of small ruminants. During this period, the expansion of grasslands across the northern Fertile Crescent led to significant shifts in human subsistence strategies, accelerating the transition from a hunter-gatherer economy to sedentary farming and animal husbandry (Bar-Yosef and Meadow, 1995; Peters et al., 2005). Archaeozoological analyses from Nevali Çori indicate that sheep (*Ovis aries*) and goats (*Capra hircus*) were already being intentionally nourished and maintained near human settlements. These findings represent a critical stage in the continuum from hunting to managed herding and ultimately full domestication (Peters et al., 1999; 2005). Differences observed in the dietary patterns of caprine remains suggest that these animals were increasingly subject to human-controlled feeding regimes, distinct from those of their wild counterparts. Collectively, the evidence strongly supports the notion that the Upper Euphrates and Tigris basins (9th millennium BC) served as core regions for early small ruminant domestication, with southeastern Anatolia—particularly sites such as Nevali Çori, Çayönü, Göbekli Tepe, and Aşıklı Höyük—representing one of the primary centers where the domestication of sheep and goats first emerged (Helmer et al., 1998; Hongo and Meadow, 1998; Legge, 1996; Russel et al., 2005; Peters and Schmidt, 2004).

Studies provide strong evidence that Anatolia served both as a genetic reservoir and a dynamic crossroads in the history of goat domestication. Ancient DNA analyses show that early domestic flock were distributed throughout the Fertile Crescent and, as they spread westward across Anatolia, successive waves of diffusion and introgression contributed to the mosaic genomic structure observed in modern goat populations. This genetic pattern closely aligns with archaeological data indicating that Southeastern Türkiye was a primary cradle of domestication and that Anatolia served as a crucial corridor facilitating the westward expansion of goats toward the Mediterranean and Aegean regions. Southeastern Anatolia is recognized as one of the earliest centers of goat domestication, with domestic goats originating from this region rapidly spreading throughout Anatolia. The continuous genetic admixture along migration routes facilitated the preservation of high intra-regional genetic diversity, supporting the interpretation of Anatolia as both a secondary domestication center and a diffusion corridor connecting Upper Mesopotamia with the Mediterranean and Aegean regions.

Recent analyses of mitochondrial DNA (mtDNA) markers in indigenous goat populations of Türkiye have revealed exceptionally high levels of genetic diversity, reinforcing the archaeogenomic perspective that Anatolia served both as an early center of domestication and a long-term diffusion corridor. Comprehensive examinations of the mtDNA D-loop region across a wide range of breeds—including Damascus (Shami), Kilis, Hair, Hatay, Honamlı, Angora, Norduz, Abaza, Kaçkar, Georgian, İspir, and Mahalli goats—have consistently demonstrated the presence of multiple maternal haplogroups. While haplogroup A remains predominant, the concurrent detection of B2, C, D, and G lineages provides compelling evidence of a complex matrilineal structure and deep ancestral heterogeneity within Turkish goat populations (Karaköse and Gündüz, 2025; Teber et al., 2025; Kiraz et al., 2024; Yüksel et

al., 2020; Akis et al., 2014; Kul and Ertuğrul, 2011; Naderi et al., 2007). This extensive haplogroup diversity—unusually high for a single geographic region—highlights Türkiye's pivotal role as both a primary center of domestication and a long-term genetic crossroads in the evolutionary history of goats. The predominance of haplogroup A across Anatolia, alongside the geographically structured presence of rarer lineages such as C and G in the southeastern and eastern regions, reflects a deep matrilineal complexity. This complexity has been shaped by ancient introgression from wild *Capra aegagrus* populations and maintained through millennia of gene flow, admixture, and localized adaptation. These phylogeographic patterns align with diffusion-based models of goat domestication, in which multiple maternal lineages contributed to the domestic gene pool during and after the Neolithic transition. Such a model, as articulated by Colli et al. (2015) and supported by archaeogenomic syntheses such as Daly et al. (2018), positions Anatolia not merely as a zone of domestication origin but as a persistent conduit of genetic diversity, maintaining ancestral haplotypes through repeated demographic expansions and trans-regional exchanges.

Population genetic analyses based on microsatellite and SNP data consistently reveal high levels of heterozygosity among goat populations in Türkiye (Bilginer et al., 2025; Demiray et al., 2024; Cemal et al., 2024; Demir, 2024; Gül et al., 2020; Karslı et al., 2020; Bulut et al., 2016; Ağaoğlu and Ertuğrul, 2012) reflecting extensive historical and ongoing gene flow across regions. This pattern indicates long-term genetic connectivity and admixture, likely facilitated by the continuous human-mediated movement of animals within Anatolia since the early pastoral periods. This genetic homogeneity, combined with high allelic richness, reinforces the interpretation of Anatolia as a persistent contact zone where eastern and western goat lineages have recurrently intermixed since the Neolithic. Alongside ancient DNA evidence, these findings position Türkiye not merely as a transit corridor for early domestic goats but as a long-term reservoir of genetic diversity and an evolutionary bridge linking the Fertile Crescent and Europe.

Y-chromosomal analyses of native Turkish goats reveal remarkable paternal lineage diversity, including the Y1A, Y1B, Y2A, and the novel Y2C haplotypes. This range of paternal variation, concentrated near the primary domestication center, suggests that Anatolia has preserved ancient male lineages of *Capra aegagrus*. The contrasting haplotype distributions—such as the dominance of Y1A in Kilis goats and the coexistence of all four haplotypes in Hair goats—reflect both historical founder effects and localized breeding dynamics (Kul et al., 2015). Taken together, these patterns indicate that Türkiye served not only as a cradle of early goat domestication but also as a paternal genetic reservoir, preserving deep ancestral diversity through millennia of male-mediated continuity and regional adaptation.

6. CONCLUSIONS AND FUTURE DIRECTIONS

Türkiye, particularly the Southeastern Anatolia region, stands out as both a biocultural nexus and a genetic crossroads in the evolutionary history of domestic goats. Located along the northern extension of the Fertile Crescent, this region served not only as one of the earliest centers of goat domestication but also as a genetic corridor connecting the Middle East, Anatolia, and the Mediterranean basin. This strategic position enabled Anatolia to function throughout history as a natural corridor for east–west migrations, trade, and livestock movements. Modern genetic research has revealed high levels of genetic diversity and extensive gene flow within Turkish goat populations. These findings clearly support Türkiye's dual role as both a genetic center of domestication and a refugium where early domestic lineages have been preserved for millennia. This unique genetic mosaic holds strategic significance not only for understanding the historical dynamics of goat evolution but also for shaping future strategies in sustainable livestock management and genetic conservation. Today, challenges such as

climate change, pathogen pressure, and uncontrolled crossbreeding increasingly threaten the integrity of local genetic resources. Therefore, conserving native goat populations is essential to ensuring the sustainability of both biological diversity and cultural heritage. Future conservation strategies should incorporate both in situ and ex situ methods. Integrating genomic data into national breeding and conservation programs will facilitate the preservation of adaptive genetic variation within local breeds, thereby supporting the development of resilient and sustainable production systems capable of withstanding climatic stress, nutritional deficiencies, and disease challenges.

ABSTRACT

Goats play a crucial role in livestock production, especially in developing regions, owing to their adaptability to harsh environments and efficient use of marginal lands. Enhancing reproductive efficiency is crucial for improving productivity in small ruminants. Advances in molecular genetics now allow precise selection through marker-assisted breeding. The LLGL1 gene, part of the Scribble cell polarity complex, has been implicated in goat fertility, with a 21-bp insertion/deletion (indel) polymorphism linked to litter size in several breeds. This study aimed to characterize the 21-bp indel polymorphism in the LLGL1 gene and to determine the distribution of this genetic variation among Damascus, Kilis, and Hatay goat breeds raised in southern Türkiye. Genomic DNA was isolated from blood samples and genotyped using PCR-RFLP. Three genotypes (II, ID, DD) were identified across all populations. The insertion (I) allele was predominant, with frequencies of 0.75, 0.78, and 0.69 in Damascus, Kilis, and Hatay goats, respectively. Observed heterozygosity values (Ho=0.312, 0.188, and 0.438) were close to or lower than expected heterozygosity (He=0.375, 0.342, and 0.430), while PIC values ranging from 0.283 to 0.337 indicated moderate polymorphism. Damascus (p=0.346) and Hatay goats (p=0.918) were in Hardy–Weinberg equilibrium, whereas Kilis goats exhibited significant deviation (p=0.011). When all populations were combined (n=96), overall allele frequencies were 0.74 (I) and 0.26 (D), with moderate genetic diversity (Ho=0.312, He=0.385, PIC=0.311) and equilibrium (p=0.064). Consequently, the 21-bp indel polymorphism within the LLGL1 gene was identified as polymorphic and informative in goat breeds from southern Türkiye. However, to clarify its potential influence on reproductive performance, further studies involving larger sample sizes and detailed phenotypic data on fertility traits are necessary. Such comprehensive research would provide stronger evidence supporting the use of the LLGL1 gene as a molecular marker in marker-assisted selection programs aimed at improving reproductive efficiency in goat populations.

Keywords: LLGL1, indel polymorphism, goat reproduction traits, MAS

TÜRKİYE'DE YETİŞTİRİLEN BAZI KEÇİ IRKLARINDA (DAMASCUS, KİLİS VE HATAY) LLGL1 GENİNDEKİ 21-BP İNDEL POLİMORFİZMİNİN MOLEKÜLER KARAKTERİZASYONU

ÖZET

Keçiler, özellikle gelişmekte olan bölgelerde, zorlu çevre koşullarına yüksek adaptasyon yetenekleri ve marjinal alanları etkin biçimde kullanabilme özellikleri sayesinde hayvansal üretim sistemlerinde önemli bir role sahiptir. Küçük ruminantlarda üretim verimliliğini artırmanın temel yaklaşımlarından biri, üreme etkinliğinin geliştirilmesidir. Moleküler genetikteki son gelişmeler, marker destekli seleksiyon (MAS) uygulamaları aracılığıyla ekonomik öneme sahip özelliklerle ilişkili genetik belirteçlerin tespit edilmesini mümkün kılarak ıslah programlarını daha hassas hale getirmiştir. Scribble hücre polarite kompleksinin bir bileşeni olan LLGL1 geninin keçilerde üreme performansı ile ilişkili olabileceği bildirilmiş ve bu genin 21 baz çifti uzunluğundaki insersiyon/delesyon (indel) polimorfizminin bazı ırklarda döl verimi ile ilişkili olduğu gösterilmiştir. Bu çalışmanın amacı, Türkiye'nin güney bölgelerinde yetiştirilen Damascus, Kilis ve Hatay keçi ırklarında LLGL1 genine ait 21-bp indel polimorfizmini karakterize etmek ve bu genetik varyasyonun popülasyonlar arasındaki dağılımını belirlemektir. Kan örneklerinden elde edilen genomik DNA'lar PCR-RFLP tabanlı analiz yöntemiyle genotiplenmiştir. Üç genotip (II, ID, DD) tüm popülasyonlarda tanımlanmıştır. İnsersiyon (I) alleli tüm ırklarda baskın olup, Damascus, Kilis ve Hatay keçilerinde sırasıyla 0.75, 0.78 ve 0.69 olarak hesaplanmıştır. Gözlenen heterozigotluk (Ho=0.312, 0.188 ve 0.438) değerleri, beklenen heterozigotluk (He=0.375, 0.342 ve 0.430) değerlerine yakın veya daha düşük bulunmuş; PIC değeri ise 0.283 ile 0.337 arasında değişerek orta düzeyde polimorfizmi göstermiştir. Hardy–Weinberg dengesi Damascus (p=0.346) ve Hatay (p=0.918) popülasyonlarında korunurken, Kilis keçilerinde istatistiksel olarak sapma (p=0.011) göstermiştir. Tüm bireylerin birlikte değerlendirildiği genel popülasyonda, I ve D allel frekansları sırasıyla 0.74 ve 0.26 olarak belirlenmiş; Ho=0.312, He=0.385 ve PIC=0.311 değerleri orta düzeyde genetik çeşitliliğe ve dengeye (p=0.064) işaret etmiştir. Sonuç olarak, LLGL1 genindeki 21-bp indel polimorfizmi, Güney Türkiye'nin yerli keçi ırklarında polimorfik bir lokus olarak belirlenmiştir. Bununla birlikte, bu varyasyonun üreme performansı üzerindeki olası etkilerinin daha net ortaya konulabilmesi için, daha geniş birey sayısına sahip popülasyonlarda ve döl verimi özelliklerine ilişkin fenotipik verilerin dahil edildiği ileri çalışmalar gereklidir. Bu tür kapsamlı analizler, LLGL1 geninin keçilerde üreme verimliliğinin artırılmasına yönelik marker destekli seleksiyon programlarında potansiyel bir moleküler belirteç olarak kullanılabilirliğini daha güçlü biçimde destekleyecektir.

Anahtar Kelimeler: LLGL1, indel polimorfizm, keçi üreme özellikleri, MAS

1. INTRODUCTION

Goats hold a significant role in livestock production systems, particularly in developing countries, due to their ability to efficiently utilize marginal lands unsuitable for crop cultivation or high-input forage systems. Their resilience to harsh and variable environmental conditions, low maintenance and nutritional requirements, and overall adaptability make them well-suited to low-input, smallholder farming systems (Gül et al., 2016; Keskin et al., 2017; Keskin et al., 2018; Daşkıran et al., 2018; Gül et al., 2018; Gündüz and Biçer, 2023). Additionally, goats have relatively low production costs and demonstrate superior efficiency in converting poor-quality forage into animal products. The high nutritional value of goat milk, combined with the species' hardiness and reproductive efficiency, contributes to its strategic importance in ensuring food security, supporting rural livelihoods, and enhancing the sustainability of livestock production in resource-limited regions (Singh et al., 2014; Getaneh at al., 2016). Due to their low input and maintenance costs, goats are often referred to as the "poor man's cow," especially in developing and underdeveloped regions such as Asia and Africa. This is largely attributable to the extensive nature of goat production systems, the lack of technological advancement in management practices, and the limited implementation of effective genetic improvement programs (Keskin et al., 2018; Gündüz and Biçer, 2023). These structural limitations hinder the productivity potential of goat herds in such regions. Nonetheless, the widespread presence of goat populations in these countries is not solely a consequence of economic constraints. The geographic characteristics of these regions—often mountainous, forested, and composed of marginal lands—align well with the species' unique grazing behavior and ecological adaptability (Stroebel, 2004; Biswas et al., 2024; Bashiru et al., 2025). Goats are particularly well-suited to efficiently exploit such environments, which further explains their prevalence in resource-limited, agro-ecologically challenging areas.

In the context of increasing the contribution of goats to food and nutritional security in developing regions, improving milk and meat yields alone is insufficient. Reproductive performance is a fundamental determinant of overall productivity and herd efficiency in small ruminant production systems. Enhanced fertility traits—such as higher kidding rates, shorter kidding intervals, and improved conception rates—directly influence the number of offspring produced per breeding cycle, which in turn affects the availability of animals for meat, milk, and genetic replacement (Karslı et al., 2012; Notter, 2012; Amnate et al., 2016; Simoes et al., 2021). In resource-limited systems, where herd size and reproductive turnover are critical for household income and subsistence, improvements in reproductive efficiency can significantly amplify the biological and economic output of goat farming. Therefore, while genetic selection and nutritional strategies targeting yield traits are essential, parallel efforts must also focus on optimizing reproductive performance through better breeding management, disease control, and the implementation of locally adapted genetic improvement programs. An integrated approach that simultaneously addresses reproductive and production traits is essential to sustainably meet the rising demand for animal-source foods in agro-ecologically constrained environments.

Advances in molecular genetics have enabled animal breeding to move beyond traditional phenotypic selection methods, bringing marker-assisted selection (MAS) to the forefront. MAS allows for more precise and earlier selection based on genotype by utilizing genetic markers associated with economically important production traits, such as milk yield, fertility, and disease resistance. This approach offers significant advantages, particularly in improving traits with low heritability or those that manifest later in life. In goat breeding, identifying genetic variations linked to reproductive traits like litter size enhances the effectiveness of MAS and accelerates productivity gains. Furthermore, in small family-run farms with limited resources, MAS enables achieving higher genetic gains in a shorter time frame (Karslı and Balcıoğlu, 2010; Gündüz et al., 2016).

LLGL1 (Lethal Giant Larvae Homolog 1) is the mammalian homolog of the Lgl gene in Drosophila and serves as a key component of the Scribble cell polarity module. This module comprises three core proteins: Scribble, Discs large (Dlg), and Lethal giant larvae (Lgl/LLGL1) (Bonello and Peifer, 2018). The Scribble complex plays a critical role in the maintenance of cell polarity and regulating cellular growth, thereby contributing to proper tissue organization and developmental processes. LLGL1 functions as a core component of the Scribble cell polarity complex, which also includes Scribble and Discs large (Dlg). This tripartite module plays a pivotal role in maintaining epithelial architecture, regulating apical-basal polarity, and controlling cell proliferation. LLGL1 contributes to the spatial organization of cellular domains by interacting with Scribble via its leucine-rich repeat (LRR) domain, facilitating Scribble's cortical localization and membrane targeting (Kallay et al., 2006). Loss of LLGL1 disrupts epithelial integrity and leads to hyperproliferation, underscoring its tumor suppressor function (Gateff and Schneiderman, 1974; Woods et al., 1996). Moreover, the proper localization of Scribble, Dlg, and LLGL1 to the lateral membrane is interdependent, reflecting a tightly coordinated mechanism essential for polarity maintenance (Bilder et al., 2000). The Scribble cell polarity complex plays a critical role in establishing cellular polarity in Sertoli cells and developing spermatids within the testis. Composed of Scribble, Lgl2, and Dlg1 proteins, this complex is particularly involved in the remodeling of the blood-testis barrier (BTB), where it modulates the stability of intercellular junctions by reorganizing the actin cytoskeleton. During stages VII–VIII of the seminiferous epithelial cycle, when Scribble complex expression is elevated, it facilitates the transient increase in BTB permeability required for the translocation of preleptotene spermatocytes across the epithelium. Furthermore, the interaction of the Scribble complex with planar cell polarity (PCP) proteins contributes significantly to the alignment of spermatids within the plane of the seminiferous epithelium, thereby supporting optimal sperm production (Gao and Cheng, 2016; Gao et al., 2016). Although its direct involvement in folliculogenesis and oogenesis has not been extensively characterized, the broader role of polarity proteins—including Par and CRB complexes—in granulosa cell polarization and oocyte maturation suggests that Scribble may contribute to similar mechanisms in the ovary. Granulosa cell polarity, influenced by contact with the basal lamina and regulated by hormonal cues such as FSH, is essential for transzonal projection (TZP) formation and bidirectional communication with the oocyte, which in turn affects meiotic competence and cytoplasmic maturation (Plancha et al., 2005). Collectively, LLGL1 serves as a critical scaffold protein within the Scribble complex, orchestrating cell polarity, adhesion, and growth regulation across diverse biological contexts. Owing to its unique domain organization and specific subcellular localization, Scribble functions as a scaffold protein, mediating critical molecular interactions within defined cellular compartments (Bonello and Peifer, 2018). Given Scribble's established function in epithelial polarity and cytoskeletal remodeling, its potential involvement in coordinating somatic-germ cell interactions during follicular development warrants further investigation.

A 21-base pair insertion-deletion (InDel) polymorphism located in the upstream regulatory region of the LLGL1 gene has been proposed by several researchers to be associated with reproductive performance in goats. Individuals carrying the homozygous insertion (II) genotype have been reported to exhibit higher litter sizes compared to heterozygous (ID) individuals, suggesting a potential dosage effect of the insertion allele on fertility (Liu et al., 2019; Karslı & Atmaca, 2025). The aim of this study is to characterize the 21-base pair indel polymorphism in the LLGL1 gene among Damascus, Kilis, and Hatay goat breeds raised in southern Türkiye, and to determine the distribution of this genetic variation within these populations.

2. MATERIAL AND METHOD

This study was conducted in accordance with the approval of the Aydin Adnan Menderes University Animal Experiments Local Ethics Committee, dated May 18, 2023, and numbered 64583101/2023/79.

2.1 Animal selection, data collection and DNA sampling procedure

A total of 96 unrelated goats, representing the Damascus, Kilis, and Hatay breeds, were sampled as part of the National Breeding Program, which was conducted under controlled farm management systems. Whole blood was collected from the jugular vein of each individual into EDTA-coated vacutainer tubes (BD Vacutainer Systems, Plymouth, UK) to prevent coagulation. Genomic DNA was isolated from leukocytes using the high-salt extraction method originally described by Miller et al. (1988). The purified DNA samples were then stored at –20°C until molecular analyses were performed.

2.2 Polymerase chain reaction (PCR) reactions and genotyping

The target region of the LLGL1 gene containing the 21-bp insertion/deletion (InDel) polymorphism was amplified via polymerase chain reaction (PCR) using gene-specific primers. The primer sequences used for amplification were obtained from Liu et al. (2021) and synthesized by Sentebiolab Genetics (Türkiye). The sequences were as follows: forward 5′-ATTCTTAGGCGCACCACGAG-3′ and reverse 5′-CGAGGGGGTGCAACTTTGTT-3′. PCR reactions were carried out in a final volume of 10 µL, consisting of 1X PCR buffer with $MgCl_2$, 200 µM of each deoxynucleotide triphosphate (dNTP), 1 µM of each primer, approximately 100 ng of genomic DNA, and 1 unit of Taq DNA polymerase (Applied Biological Materials, ABM, USA). Thermal cycling conditions included an initial denaturation at 95°C for 5 minutes, followed by 36 cycles of denaturation at 94°C for 40 seconds, annealing at 64°C for 30 seconds, and extension at 72°C for 1 minute. A final elongation step at 72°C for 5 minutes was included to ensure complete extension of PCR products. Amplification was performed using a Bio-Rad C1000 Touch™ Thermal Cycler. PCR amplicons were separated on a 4% agarose gel, stained with Safeview™ Classic gel stain (Applied Biological Materials, ABM, USA), and visualized under UV light (Quantum, Vilber Lourmat, France) to determine fragment sizes and genotype patterns based on the presence or absence of the insertion allele. A 100bp Plus Opti-DNA Marker (Applied Biological Materials, ABM, USA) was loaded into the first well of each gel to serve as a molecular size marker for estimating the lengths of the amplified fragments. The insertion allele produced a fragment of 163 bp, whereas the deletion allele resulted in a fragment of 142 bp. Individuals with the heterozygous (ID) genotype exhibited two distinct bands corresponding to both the insertion and deletion alleles (163 bp and 142 bp). The homozygous insertion (II) genotype was characterized by a single band at 163 bp, while the homozygous deletion (DD) genotype was expected to show a single band at 142 bp.

2.3 Statistical analysis

Genetic diversity parameters, including allele and genotype frequencies, observed heterozygosity (Ho), expected heterozygosity (He), and the effective number of alleles (Ne), were calculated using GenAlEx version 6.5 software (Peakall & Smouse, 2012). Polymorphic information content (PIC) values and Hardy–Weinberg equilibrium (HWE) tests were performed using PopGene version 1.32 (Yeh et al., 1999). Deviations from HWE were assessed using the chi-square (χ^2) test.

3. RESULT AND DISCUSSION

Analysis of the 21-bp InDel polymorphism within the LLGL1 gene revealed that all three examined goat breeds (Damascus, Kilis, and Hatay) were polymorphic at this locus, indicating

the presence of genetic variation both within and among populations. The distribution of genotypes identified across the breeds is presented in Figure 1, while allele and genotype frequencies, along with key genetic diversity parameters such as heterozygosity, effective allele number, and polymorphic information content (PIC), are summarized in Table 1.

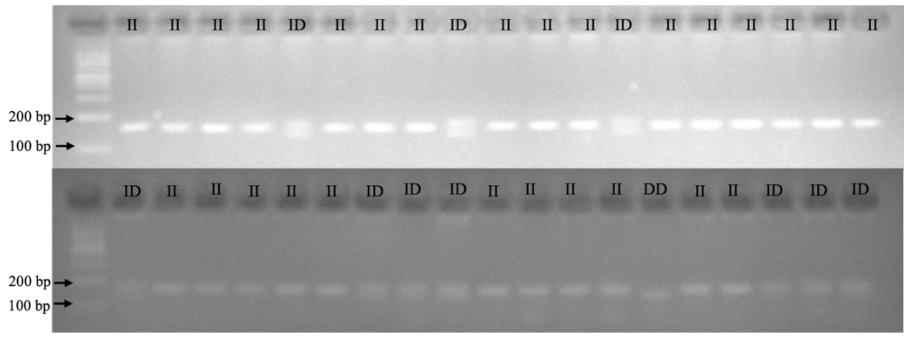

Figure 1. Visualization of the LLGL1 Gene 21-bp Indel polymorphism via agarose gel electrophoresis

The analysis of the 21-bp InDel polymorphism in the LLGL1 gene revealed notable variation in allele frequencies among the three goat breeds studied. The frequency of the insertion (I) allele was highest in the Kilis breed (0.781), followed by Damascus (0.750) and Hatay (0.688). Conversely, the deletion (D) allele exhibited its highest frequency in the Hatay breed (0.312), indicating greater genetic variation at this locus within that population (Table 1). When compared to previous studies on other native goat populations, the frequency of the I allele in this study was generally higher. For instance, Karslı and Atmaca (2025) reported I allele frequencies of 0.57, 0.72, and 0.58 in Honamlı, Hair, and Kabakulak goats, respectively, with corresponding D allele frequencies of 0.43, 0.28, and 0.42. These values indicate that the Damascus, Kilis, and Hatay populations exhibit relatively higher levels of the I allele than Honamlı and Kabakulak goats, while Hair goats show comparable frequencies. Moreover, in Shaanbei White Cashmere goats, Liu et al. (2021) reported a markedly higher frequency of the I allele at 0.979, with the D allele present at only 0.021. This suggests that this locus may be nearly fixed in favor of the insertion variant in some commercial or selectively bred populations. In contrast, the polymorphic status observed in the current study indicates maintained genetic variability in local Turkish goat breeds, potentially reflecting their more diverse breeding history and less intensive selection pressures.

Table 1. Genotype and population genetic parameters of the LLGL1 gene in goat populations

Breed	n	Allele frequency		Genotype frequency			HWE		Population parameters			
		I	D	II	ID	DD	χ^2	*p*-value	Ho	He	Ne	PIC
Damascus	32	0.750	0.250	0.594	0.312	0.094	0.889	0.346	0.312	0.375	1.60	0.305
Kilis	32	0.781	0.219	0.687	0.188	0.125	6.521	0.011*	0.188	0.342	1.52	0.283
Hatay	32	0.688	0.312	0.469	0.438	0.093	0.011	0.918	0.438	0.430	1.75	0.337
Overall	96	0.740	0.260	0.583	0.312	0.104	3.420	0.064	0.312	0.385	1.63	0.311

Ho: Observed heterozygosity; **He:** Expected heterozygosity, **Ne:** Number of effective alleles; **HWE:** Hardy-Weinberg Equilibrium; **PIC:** Polymorphic information content; *p<0.05 indicates significant deviation from Hardy–Weinberg equilibrium.

In terms of genotype distribution, all three goat breeds demonstrated polymorphism at the LLGL1 locus. The II genotype was the most prevalent in all breeds, with frequencies of 0.594 in Damascus, 0.687 in Kilis, and 0.469 in Hatay goats. The ID genotype showed moderate frequencies of 0.312 in Damascus and 0.438 in Hatay, but a lower frequency of 0.188 in Kilis.

The DD genotype, representing homozygosity for the deletion allele, was the least common across all populations, ranging from 0.093 to 0.125. Hatay (0.093) and Damascus (0.094) exhibited similar values, while Kilis showed a slightly higher frequency (0.125). When compared to findings in other native Turkish breeds, the genotype distributions in the current study show some similarities as well as notable differences. In a study by Karslı and Atmaca (2025), Honamlı goats exhibited II, ID, and DD genotype frequencies of 0.38, 0.37, and 0.25, respectively. Hair goats showed a higher level of heterozygosity, with an ID frequency of 0.50, while II and DD frequencies were 0.47 and 0.03, respectively. Similarly, Kabakulak goats displayed genotype frequencies of 0.40 (II), 0.37 (ID), and 0.23 (DD). Compared to these populations, the Damascus and Kilis goats in the present study demonstrated higher frequencies of the II genotype and lower DD frequencies, suggesting a tendency toward fixation of the insertion allele in these breeds. Conversely, the Hatay population exhibited a relatively balanced distribution of genotypes, indicating greater allelic diversity at this locus. For instance, in Shaanbei White Cashmere goats, Liu et al. (2021) reported genotype frequencies of 0.959 (II), 0.041 (ID), and 0.000 (DD), indicating near-complete fixation of the insertion allele and monomorphism for the deletion variant. This stark contrast with the present findings underscores the higher genetic variability maintained in local Turkish goat populations, likely due to differences in breeding systems, selection intensity, and population structure.

The genetic diversity analysis based on the 21-bp InDel polymorphism in the LLGL1 gene revealed moderate variation among the studied goat breeds. Observed heterozygosity (Ho) ranged from 0.188 in Kilis to 0.438 in Hatay, while expected heterozygosity (He) values varied between 0.342 in Kilis and 0.430 in Hatay. The effective number of alleles (Ne) was highest in the Hatay breed (1.75) and lowest in Kilis (1.52), reflecting genetic variability at this locus. Polymorphism Information Content (PIC) values were moderate, ranging from 0.283 in Kilis to 0.337 in Hatay, indicating that this marker is sufficiently informative to assess genetic diversity in these populations. The results of the Hardy–Weinberg equilibrium test showed that only the Kilis breed deviated significantly from equilibrium ($\chi^2 = 6.521$, $p = 0.011$), suggesting possible effects of selection, population structure, or sampling variation. In contrast, both Damascus and Hatay goats conformed to HWE assumptions, indicating random mating and stable allele distributions in these populations.

When compared with other native Turkish goat breeds, similar diversity patterns were observed. According to Karslı and Atmaca (2025), Honamlı goats exhibited Ho = 0.63, He = 0.50, Ne = 1.96, and $\chi^2 = 3.83$, indicating a relatively high level of observed heterozygosity. Hair goats showed Ho = 0.50, He = 0.59, and Ne = 1.68, with $\chi^2 = 3.27$, reflecting a relatively balanced allele distribution. Similarly, Kabakulak goats displayed Ho and He values of 0.63 and 0.51, respectively, with Ne = 1.94 and $\chi^2 = 3.62$. None of these populations demonstrated significant deviations from HWE, consistent with the patterns observed in Hatay and Damascus goats in the present study. In stark contrast, the findings reported by Liu et al. (2021) in Shaanbei White Cashmere goats revealed an almost complete lack of genetic diversity at the LLGL1 locus. The population exhibited Ho = 0.96, but an extremely low He = 0.04, with Ne = 1.042 and PIC = 0.039. Moreover, the deviation from HWE was statistically significant ($p < 0.001$), likely due to the near fixation of the insertion allele (I allele frequency = 0.979) and the absence of the DD genotype. These values suggest strong artificial selection or genetic bottleneck effects in commercial populations, contrasting with the maintained polymorphism observed in local Turkish goat breeds.

4. CONCLUSION

The present study demonstrated that the 21-bp InDel polymorphism in the LLGL1 gene is polymorphic across all three examined goat breeds—Damascus, Kilis, and Hatay—indicating

its potential as a useful molecular marker for genetic diversity studies. Moderate levels of heterozygosity and polymorphism information content (PIC) values further support the informativeness of this locus in assessing population structure and genetic variation. While these findings provide valuable insights into the genetic architecture of the LLGL1 locus, the absence of phenotypic data—especially concerning reproductive traits—limits the functional interpretation of this polymorphism. Given that LLGL1 has been implicated in reproductive biology and embryonic development in other species, future studies should focus on evaluating this locus in larger, well-characterized goat populations with comprehensive reproductive performance records. Such studies would enable robust genotype–phenotype association analyses, potentially revealing whether the LLGL1 InDel variant could serve as a candidate marker in marker-assisted selection (MAS) strategies aimed at improving reproductive efficiency. Incorporating this marker into breeding programs may accelerate genetic gains in fertility and productivity traits, which are crucial for sustainable goat production systems, particularly in local breeds with valuable adaptive traits. In conclusion, this research provides foundational knowledge for future efforts to integrate molecular markers into genomic selection and conservation-based breeding programs, ultimately supporting the genetic improvement and long-term viability of native goat populations.

ABSTRACT

The *Brassicaceae* family includes many agriculturally important oilseed crops such as *Brassica napus* (rapeseed/canola), *B. juncea*, *B. carinata*, *Camelina sativa*, and *Sinapis alba*. These species are known for their ability to accumulate seed oils rich in bioactive fatty acids. Among these fatty acids, erucic acid (EA; *cis*-13-docosenoic acid), a very-long-chain monounsaturated fatty acid, has drawn significant attention due to its diverse industrial applications as well as its implications for nutritional safety.

Certain species and cultivars are capable of accumulating high levels of erucic acid, up to 55% of seed oil content, while others particularly low-erucic acid varieties such as canola contain less than 2% erucic acid in accordance with international safety guidelines. The oxidative stability and hydrophobic nature of erucic acid make it an attractive candidate for various industrial uses, including biofuels, lubricants, plasticizers, and specialty chemicals. However, findings from experimental animal models have raised concerns regarding the potential cardiotoxic effects of diets high in erucic acid, leading regulatory authorities in several countries to impose limits on its concentration in food and feed products. In contrast, recent preclinical studies suggest that erucic acid may exhibit bioactive properties at low doses, including anti-inflammatory, neuroprotective, and metabolic effects. Nevertheless, human data on these effects remain limited.

This review brings together current information on erucic acid biosynthesis in Brassicaceae species, its functional properties, industrial relevance, and the regulatory and toxicological considerations surrounding its use. Moreover, it highlights the need for further research to better understand the molecular, environmental, and metabolic factors influencing erucic acid content, and to ensure the safe and responsible integration of erucic acid into both industrial and nutritional contexts.

Keywords: Erucic acid, *Brassicaceae* Oilseeds, Industrial applications, Food Safety

Brassicaceae TOHUM YAĞLARINDAKI ERUSIK ASIT ÜZERINE GÜNCEL DEĞERLENDIRMELER

ÖZET

Brassicaceae familyası, *Brassica napus* (kolza/kanola), *B. juncea*, *B. carinata*, *Camelina sativa* ve *Sinapis alba* gibi tarımsal açıdan önemli birçok yağlı tohum bitkisini içerir. Bu türler, biyoaktif yağ asitleri açısından zengin tohum yağlarını biriktirme kapasiteleriyle bilinmektedir. Bu yağ asitleri arasında yer alan erusik asit (EA; *cis*-13-dokosenoik asit), çok uzun zincirli tekli doymamış bir yağ asidi olup, çeşitli endüstriyel uygulamalardaki çok yönlü kullanımı ve beslenme güvenliği ile ilgili etkileri nedeniyle önemli ölçüde dikkat çekmiştir.

Bazı türler ve çeşitler, tohum yağında %55'e kadar yüksek oranda erusik asit biriktirebilirken, özellikle düşük erusik asit içeriğine sahip çeşitler (örneğin kanola) uluslararası güvenlik yönergelerine uygun olarak %2'nin altında erusik asit içermektedir. Erusik asidin oksidatif stabilitesi ve hidrofobik doğası, onu biyoyakıtlar, yağlayıcılar, plastifiyanlar ve özel kimyasallar gibi çeşitli endüstriyel kullanım alanları için cazip bir aday hâline getirmektedir. Ancak, deneysel hayvan modellerinden elde edilen bulgular, yüksek miktarda erusik asit içeren diyetlerin potansiyel kardiyotoksik etkilerine işaret etmekte olup, bu durum çeşitli ülkelerdeki düzenleyici otoriteleri, gıda ve yem ürünlerindeki erusik asit düzeylerine sınır getirmeye yöneltmiştir. Buna karşın, son dönem preklinik çalışmalar, erusik asidin düşük dozlarda anti-inflamatuar, nöroprotektif ve metabolik etkiler gibi biyoaktif özellikler gösterebileceğini öne sürmektedir. Bununla birlikte, bu etkilerle ilgili insan verileri hala sınırlıdır.

Bu derleme, *Brassicaceae* türlerinde erusik asit biyosentezi, fonksiyonel özellikleri, endüstriyel önemi ve kullanımına ilişkin düzenleyici ve toksikolojik değerlendirmeleri içeren güncel bilgileri bir araya getirmektedir. Ayrıca, erusik asit içeriğini etkileyen moleküler, çevresel ve metabolik faktörlerin daha iyi anlaşılmasına ve erusik asidin hem endüstriyel hem de beslenme alanlarında güvenli ve sorumlu bir şekilde kullanımının sağlanmasına yönelik daha fazla araştırmaya duyulan ihtiyacı vurgulamaktadır.

Anahtar Kelimeler: Erusik asit, *Brassicaceae* Yağlı Tohumlar, Endüstriyel uygulamalar, Gıda Güvenliği

1.INTRODUCTION

The *Brassicaceae* family encompasses a wide range of agriculturally and economically important species cultivated worldwide for diverse purposes, including food, feed, oil production, and industrial applications. Among these, oilseed crops such as *Brassica napus* (rapeseed/canola), *B. juncea* (brown mustard), *B. nigra* (black mustard), *B. carinata* (Ethiopian mustard), *B. rapa* (turnip), *Camelina sativa* (false flax), and *Sinapis alba* (white mustard) are particularly noteworthy for their capacity to accumulate substantial amounts of seed oil enriched with bioactive compounds (Meena et al., 2021; Kayaçetin, 2023; Sharma et al., 2024; Mohanty et al., 2025). In addition to their primary role as oil producers, many *Brassicaceae* species also contribute to human diets as vegetables and have demonstrated utility in green manure, soil remediation, condiments, and pharmacological applications, owing to their complex phytochemical profiles (Kayaçetin, 2020; Kayaçetin & Khawar, 2023).

One of the notable constituents of *Brassicaceae* seed oils is erucic acid (EA; *cis*-13-docosenoic acid, 22:1 Δ13; ω-9), a very-long-chain monounsaturated fatty acid with potential industrial and nutritional significance. Certain genotypes particularly within *B. napus*, *B. juncea*, *B. carinata*, *C. sativa*, and *S. alba* have been reported to accumulate relatively high EA levels, in some cases exceeding 50% of the total seed oil content. This variability is largely influenced by genetic factors and environmental conditions (Kayaçetin et al., 2019; Wang et al., 2022; Baidala et al., 2023; Kinay & Kayaçetin, 2023; Zhang et al., 2023; Rzyska et al., 2024). Due to its hydrophobic nature and oxidative stability, EA has attracted interest for various non-edible industrial uses, including biofuels, lubricants, and specialty polymers (Wani ve ark., 2022).

Nonetheless, the safety of dietary EA intake has been the subject of ongoing scientific and regulatory scrutiny. Some experimental studies, particularly in animal models, have suggested a possible association between high EA consumption and adverse effects such as myocardial lipidosis. While direct implications for human health remain a topic of debate, these findings have led many regulatory authorities to impose precautionary limits on EA content in edible oils to ensure consumer protection. As a result, targeted breeding programs have successfully developed low-erucic acid rapeseed (LEAR) cultivars containing less than 2% EA enabling their safe integration into food and feed chains without compromising oil yield or agronomic performance (EFSA, 2016).

The dual nature of EA as both a compound of industrial utility and one with potential toxicological concerns underscores the need for a balanced and informed approach in crop development, risk assessment, and regulatory decision-making. Furthermore, *Brassicaceae* oilseeds represent a substantial component of global oilseed production, which has exceeded one billion tons in recent years. Within this context, *B. napus* stands among the most widely cultivated species (FAO, 2024). In regional contexts, such as Türkiye, there has been a notable increase in the cultivation of *Brassicaceae* oilseeds, although species distribution and utilization patterns vary considerably (TÜİK, 2024; Başalma et al., 2025).

From a biochemical perspective, EA biosynthesis involves the elongation of oleic acid within the endoplasmic reticulum, primarily catalyzed by the fatty acid elongase 1 (FAE1) enzyme, with regulatory inputs from both genetic and environmental factors (Sakhno, 2010). Improved understanding of the molecular pathways governing EA accumulation is crucial for the development of cultivars optimized for specific industrial or nutritional profiles.

Accordingly, this review aims to provide a comprehensive synthesis of current knowledge on EA biosynthesis in *Brassicaceae* species, evaluate its emerging industrial relevance, and critically examine the safety considerations and regulatory frameworks that guide its application in food and feed systems.

2.STRUCTURE AND BİOSYNTHESİS OF ERUCİC ACİD İN BRASSİCACEAE

Erucic acid (EA; cis-13-docosenoic acid, C_{22}:1 Δ13, ω-9) is a very-long-chain monounsaturated fatty acid characterized by a 22-carbon backbone and a cis-double bond at the 13th carbon position. Its molecular structure ($CH_3(CH_2)_7CH=CH(CH_2)_{11}COOH$) confers significant hydrophobicity and chemical stability, resulting in notable oxidative resistance and a relatively high melting point. These physicochemical properties underpin EA's utility in various industrial applications, including lubricants, plasticizers, and biofuels (Wani et al., 2022).

The biosynthesis of EA occurs predominantly through the elongation of oleic acid (C18:1 Δ9) by the fatty acid elongase (FAE) complex within the endoplasmic reticulum of developing seeds. This process involves the sequential addition of two-carbon units from malonyl-CoA, catalyzed primarily by the enzyme β-ketoacyl-CoA synthase (KCS), encoded by the FAE1 gene, which constitutes the rate-limiting step in EA production (Sakhno, 2010). The carbon skeleton for EA biosynthesis is derived from carbohydrate metabolism, primarily sucrose, highlighting the integration of primary and secondary metabolic pathways during seed maturation (Wallace et al., 2016).

The FAE1 gene is a key determinant of EA accumulation in Brassicaceae species. In amphidiploid species such as *Brassica napus* and *B. juncea*, FAE1 is present on both A and C genomes, and its allelic variation and expression levels contribute significantly to the observed differences in EA content among cultivars and species (Galanty et al., 2023). Mutations or reduced expression of FAE1 result in low-erucic acid phenotypes (LEAR), which are desirable in edible oil crops due to health concerns related to excessive EA intake (Przybylski et al., 2005; Velasco et al., 2017). Consequently, breeding programs have leveraged these genetic variations to produce LEAR cultivars suitable for human consumption, while high-erucic acid rapeseed (HEAR) varieties remain valuable for industrial purposes (Piazza & Foglia, 2001; McVetty & Duncan, 2015).

Environmental factors such as temperature, nutrient availability, and photoperiod also influence EA biosynthesis by modulating FAE1 expression and enzyme activity. This genotype × environment interaction necessitates careful consideration in breeding strategies aiming to optimize EA content for targeted applications (Velasco et al., 2017). Notably, certain genotypes, such as *B. rapa* var. *campestris*, have been reported to accumulate EA levels as high as 59% of total fatty acids, indicating substantial enzymatic efficiency and storage capacity (Chen & Heneen, 1989).

Data from multiple studies demonstrate substantial variation in erucic acid (EA) content among oilseed species within the Brassicaceae family (Table 1). High-EA species such as *Sinapis alba*, *Brassica carinata*, *B. juncea*, *B. napus* (HEAR), and *B. nigra* exhibit EA concentrations ranging from approximately 22% to 55%, underscoring their suitability for industrial applications, including lubricants, plasticizers, and high-performance materials (Table 1).In contrast, *B. napus* (LEAR) and *Camelina sativa* show significantly lower EA levels (<4%), which aligns with their primary use in food and feed applications where low EA content is essential for meeting safety standards. Canola, a low-erucic-acid variant of *B. napus*, has been selectively bred to contain less than 2% EA, in compliance with international food safety regulations (EFSA, 2016).

Table 1. Variation in Erucic Acid Levels Among Brassicaceae Oilseed Crops

Species	Common Name	EA (% of Oil)	References
Sinapis alba	White/yellow mustard	23–51%	Singh et al. (2014); Kayaçetin & Khawar (2023)

Species	Common Name	EA (% of Oil)	References
B. carinata	Ethiopian mustard	35–45%	Singh et al. (2014)
B. juncea	Brown/oriental mustard	22–55%	Bretagnolle et al. (2016)
B. napus (HEAR)	Rapeseed	40–55%	Wendlinger et al. (2014)
B. napus (LEAR)	Canola	<2%	Abbadi & Leckband (2011)
B. nigra	Black mustard	27–46%	Bretagnolle et al. (2016)
Camelina sativa	Camelina	2–4%	Ostrikov et al. (2021); Yildiz et al. (2024)

3. INDUSTRİAL POTENTİAL OF ERUCİC ACİD İN BRASSİCACEAE SEEDS

Erucic acid (EA; cis-13-docosenoic acid), a very-long-chain monounsaturated fatty acid, exhibits distinctive physicochemical properties such as high thermal and oxidative stability, low volatility, and pronounced hydrophobicity that make it particularly suitable for a variety of non-food industrial applications. These attributes are primarily attributable to its extended carbon chain and cis-double bond configuration, which contribute to enhanced resistance against thermal degradation and chemical oxidation. Consequently, EA-rich seed oils from Brassicaceae species are of considerable interest for use in sectors such as bioenergy, lubricants, polymer synthesis, and specialty chemical production (Wani ve ark., 2022).

Table 2. Industrial Applications and Functional Characteristics of Erucic Acid Derivatives

Application Area	EA-Based Derivatives / Functions	Benefits / Functional Features
Biofuels	Methyl esters of EA	High cetane number; improved cold-flow properties
Lubricants & Plasticizers	Erucamide, behenic acid	Enhanced thermal stability; improved flexibility and mechanical durability
Surfactants & Cosmetics	Emulsifiers and emollients derived from EA	Improved formulation stability and texture; enhanced skin hydration
Pharmaceuticals & Biopolymers	Behenyl alcohol (EA precursor); biodegradable monomers	Used in drug delivery systems; supports eco-friendly material development

As presented in Table 2, the derivatives of erucic acid (EA) demonstrate diverse functional attributes that support their application across a range of industrial sectors. In the biofuel industry, methyl esters of EA offer benefits such as a high cetane number and improved cold-flow properties, enhancing overall fuel performance. In lubricants and plasticizers, EA-derived compounds like erucamide and behenic acid contribute to greater thermal stability, improved flexibility, and increased mechanical durability. In the cosmetics and surfactant industries, EA-based emulsifiers and emollients improve formulation stability and enhance skin hydration. Additionally, in pharmaceuticals and biopolymer applications, EA derivatives such as behenyl alcohol and biodegradable monomers are utilized in drug delivery systems and contribute to the development of environmentally friendly materials.

These versatile applications underline the **economic and industrial significance of high-erucic acid cultivars**, particularly high-erucic acid rapeseed (HEAR). The long-chain structure, oxidative stability, and chemical convertibility of EA make it a valuable feedstock for the production of high-value chemicals and functional materials. However, the broader adoption of such applications also requires careful consideration of environmental sustainability, toxicological safety, and regulatory compliance throughout the production and utilization process.

Table 3. Industrial and Nutritional Uses of Oils Based on Erucic Acid Content (Sachan et al., 2024)

Erucic Acid Content	**Primary Applications**
<2%	Edible Oil (LEAR): Edible oil formulations (e.g., cooking oils, infant nutrition products)
40–55%	Industrial Oil: Lubricants, plasticizers, surfactants
>80%	Technical Oil: Greases, coatings, and high-performance polymers (e.g., nylon synthesis)

Table 3 highlights the functional contributions of erucic acid (EA) derivatives across various industrial sectors, including biofuels, lubricants, surfactants, cosmetics, pharmaceuticals, and biopolymers. Methyl esters of EA enhance biofuel performance by providing a high cetane number and improved cold-flow properties, while derivatives such as erucamide and behenic acid offer increased thermal stability, flexibility, and mechanical durability in lubricants and plasticizers. In cosmetic and surfactant formulations, EA-based emulsifiers and emollients contribute to improved product stability and enhanced skin hydration. Additionally, derivatives like behenyl alcohol and biodegradable monomers are utilized in drug delivery systems and the development of eco-friendly polymers. This broad range of applications underscores the industrial and economic relevance of high-erucic acid cultivars such as HEAR (high-erucic acid rapeseed). However, the safe and sustainable expansion of these applications requires careful evaluation of toxicological risks, mitigation of environmental impacts, and strict adherence to international regulatory standards.

4. TOXİCOLOGİCAL CONSİDERATİONS AND BİOACTİVİTY POTENTİAL OF ERUCİC ACİD

Erucic acid (EA; *cis*-13-docosenoic acid) is a monounsaturated omega-9 fatty acid predominantly found in mustard seed oil and oils derived from *Brassica* species such as rapeseed and canola. While industrially valuable particularly in the manufacture of lubricants, slip agents, and plasticizers EA has raised significant toxicological concerns in the context of human health, prompting international regulatory scrutiny.

Experimental animal studies, particularly in rodent models, have demonstrated that chronic high-dose intake of EA (>0.7 g/kg body weight/day) can lead to myocardial lipidosis, a pathological condition involving lipid accumulation in cardiac tissues (EFSA, 2016; Mohanty et al., 2025). Similar studies have also suggested a potential for hepatic steatosis. Although these findings cannot be directly extrapolated to humans due to interspecies metabolic differences, they have nonetheless informed the establishment of precautionary regulatory limits across various jurisdictions.

In response to toxicological data, several food safety authorities have implemented maximum allowable limits for EA in food-grade oils:

- European Union (EU): ≤2% of total fatty acids in edible oils (EC No. 1881/2006; EU Regulation No. 2019/1870)
- United States (FDA): ≤0.3% of total fat; EA use in food is effectively prohibited
- Australia and New Zealand (FSANZ): Maximum tolerable daily intake (TDI) = 7.5 mg/kg body weight/day
- European Food Safety Authority (EFSA): TDI = 7.0 mg/kg body weight/day (EFSA, 2016)

These frameworks have led to the development and widespread adoption of low-erucic acid rapeseed (LEAR) cultivars, especially in regions where oil is consumed directly by humans. In Türkiye, compliance with the ≤2% threshold is a requirement for cultivar registration by the Ministry of Agriculture and Forestry.

Table 4. Regulatory Limits for Erucic Acid Intake (Poddar et al., 2022)

Country/Region	**Regulatory Authority**	**EA Intake Limit**
United States	FDA	Banned for human consumption
European Union	EFSA	7.0 mg/kg body weight/day
Australia/New Zealand	FSANZ	7.5 mg/kg body weight/day
Asia, South Asia, S. America	-	No official limits reported

Despite these concerns, current data suggest that low-level exposure to EA at or below regulated limits does not pose a significant risk to human cardiovascular health. However, due to limited dose-response data and incomplete elucidation of the underlying toxicodynamic mechanisms, establishing comprehensive safety margins for potential therapeutic use remains an ongoing research priority (Galanty et al., 2023; Kazmi et al., 2024).

In contrast to its toxicological profile, recent preclinical studies have highlighted the potential bioactivity of erucic acid and its derivatives, suggesting a dualistic nature of this compound. Specifically, low-to-moderate doses of EA have been associated with several promising biological effects:

- Anti-inflammatory and immunomodulatory activity
- Lipid-lowering and cardioprotective effects
- Neuroprotective potential (e.g., in Parkinson’s disease)
- Anticancer and antiviral activity (Kazmi et al., 2024; Wani et al., 2022)

Mechanistically, EA has been shown to inhibit key inflammation-related enzymes such as thrombin and elastase. Additionally, suppression of the NF-κB and p38 MAPK signaling pathways has been observed, leading to reduced transcriptional activity of viral polymerases suggesting potential applications in managing viral infections such as influenza A virus (IAV). Preliminary data also indicate possible roles in bone health, particularly in osteoporosis models (Kazmi et al., 2024).

Nonetheless, these effects have primarily been demonstrated in in vitro systems or animal models. Robust clinical data on pharmacokinetics, therapeutic windows, and safety profiles in humans are currently lacking. Furthermore, the compound's complex metabolic behavior, potential for organ-specific accumulation, and interaction with other bioactive agents warrant thorough investigation before therapeutic use can be considered.

5. CONCLUSİONS AND FUTURE PROSPECTS

Erucic acid (EA) is an important fatty acid found in oilseeds of the Brassicaceae family, characterized by high thermal stability and chemical resistance. Due to these properties, it is widely used in various industrial applications such as biofuels, lubricants, plasticizers, and polymer production. However, because of its cardiotoxic effects at high doses, international regulatory limits have been imposed on the EA content in edible oils, which has encouraged the development of low-erucic acid rapeseed (LEAR) cultivars. The safe and sustainable use of EA requires multidisciplinary approaches integrating genetic improvement and toxicological assessments. In the future, comprehensive research aimed at optimizing EA content for targeted applications and ensuring human health and environmental sustainability remains crucial.

ABSTRACT

This review explores the potential for the sustainable use of plant growth-promoting rhizobacteria (PGPR) in saffron (*Crocus sativus* L.) cultivation. Commonly referred to as "red gold," saffron is among the most valuable spices worldwide; however, its production is limited due to restricted cultivation areas, high labor costs, and environmental stress factors such as drought, salinity, and soil-related problems. While conventional use of chemical fertilizers and pesticides may improve yields in the short term, such practices are reported to have adverse effects on soil health, biodiversity, and long-term sustainability. PGPR are considered environmentally friendly biofertilizer alternatives with the potential to enhance saffron growth performance and resistance to stress conditions. Some studies in the literature suggest that *Bacillus* and *Pseudomonas* species may have positive effects on corm development, flowering, stigma yield, and the accumulation of bioactive compounds. For instance, the application of *Pseudomonas chlororaphis* has been reported to result in approximately a 30% increase in corm number and an 8% increase in stigma count. Similarly, *Bacillus subtilis* and *Bacillus megaterium* have been associated with improvements in growth and bioactive metabolite levels. The potential effects of PGPR are thought to be mediated by mechanisms such as nitrogen fixation, enhanced phosphate solubilization, siderophore production, phytohormone synthesis, and pathogen suppression. These mechanisms may collectively contribute to improved root architecture, nutrient uptake, and stress tolerance. Field trials conducted in various regions, including Turkey, suggest that PGPR could be compatible with organic farming systems and may support saffron production under challenging environmental and edaphic conditions. This review highlights the promising role that PGPR may play in saffron agriculture; however, it also emphasizes the need for long-term, multi-location, and well-controlled studies to more comprehensively evaluate their applicability.

Keywords: *Crocus sativus* L., Plant growth-promoting rhizobacteria (PGPR), Biological fertilizers

BİTKİ GELİŞİMİNİ TEŞVİK EDEN RİZOBAKTERİLERİN (PGPR) SAFRAN (*Crocus sativus* l.) TARIMINDA SÜRDÜRÜLEBİLİR KULLANIM POTANSİYELİ

ÖZET

Bu derleme, safran (*Crocus sativus* L.) yetiştiriciliğinde bitki büyümesini teşvik eden rizobakterilerin (PGPR) sürdürülebilir kullanım potansiyelini ele almaktadır. "Kırmızı altın" olarak da bilinen safran, dünya çapında en değerli baharatlar arasında yer almakta; ancak üretimi, sınırlı ekim alanları, yüksek iş gücü maliyetleri ve kuraklık, tuzluluk gibi çevresel stres faktörleri nedeniyle kısıtlanmaktadır. Kimyasal gübreler ve pestisitlere dayalı geleneksel uygulamalar kısa vadede verimi artırabilse de, bu yaklaşımların uzun vadede toprak sağlığı, biyolojik çeşitlilik ve çevresel sürdürülebilirlik açısından olumsuz sonuçlar doğurabileceği bildirilmektedir. PGPR'ler, çevre dostu biyogübre alternatifleri olarak, safran bitkisinin büyüme performansı ve stres koşullarına karşı direncini artırma potansiyeline sahip mikroorganizmalar olarak değerlendirilmektedir. Literatürdeki bazı çalışmalar, özellikle *Bacillus* ve *Pseudomonas* türlerinin yumru gelişimi, çiçeklenme, tepecik (stigma) verimi ve biyoaktif bileşik birikimi gibi parametreler üzerinde olumlu etkiler sağlayabileceğini ortaya koymuştur. Örneğin, *Pseudomonas chlororaphis* uygulamasının yumru sayısında yaklaşık %30, tepecik sayısında ise %8 oranında artış sağladığı bildirilmiştir. Benzer şekilde, *Bacillus subtilis* ve *Bacillus megaterium* türlerinin de büyüme ve biyoaktif metabolit düzeyleri üzerinde olumlu etkileri olduğu rapor edilmiştir. PGPR'lerin potansiyel etkileri; azot fiksasyonu, fosfat çözünürlüğünün artırılması, siderofor üretimi, fitohormon sentezi ve patojen baskılama gibi çeşitli biyolojik mekanizmalar aracılığıyla açıklanabilmektedir. Bu mekanizmalar, genel olarak kök gelişimi, besin alımı ve stres toleransı üzerinde olumlu etkilere yol açabilmektedir. Türkiye dâhil olmak üzere farklı coğrafi bölgelerde yürütülen saha denemeleri, PGPR'lerin organik tarım sistemleriyle uyumlu olabileceğini ve zorlu çevresel ve toprak koşullarında safran üretimini destekleyebileceğini düşündürmektedir. Bu derlemede, PGPR'lerin safran tarımı bağlamında umut vadeden biyolojik girdiler olabileceği vurgulanmakta; ancak bu potansiyelin daha geniş ölçekte değerlendirilebilmesi için uzun vadeli, çok merkezli ve kontrollü çalışmalarla desteklenmesi gerektiği ifade edilmektedir.

Anahtar Kelimeler: *Crocus sativus L.*, Bitki gelişimini teşvik eden rizobakteriler (PGPR), Biyolojik gübreler

1. INTRODUCTION

Saffron (*Crocus sativus* L.) is a valuable cultivated plant belonging to the Iridaceae family and is often referred to as "red gold" due to its high economic value (Asanbekova, 2017; Kour et al., 2022; Cebeci, 2024). The saffron corm is a perennial organ, and the plant name is derived from Latin words *Crocus* (thread/yolk) and *sativus* (cultivated) (Mohammad et al., 2012 Koocheki, 2013; Parlakova Karagöz et al., 2016; Yıldız, 2017). One of the most expensive spices globally, saffron is obtained from the dried stigmas of its flowers, and approximately 180,000 flowers are needed to produce 1 kg of dry saffron (Mir et al., 2010; Crozet et al., 2012). Its primary bioactive components include crocin, crocetin, picrocrocin, and safranal, which not only contribute to the plant's unique taste, aroma, and color but also exhibit anticancer, antioxidant, and neuroprotective properties (Souret & Weathers, 1999; Abdullaev, 2002; Abdullaev & Espinosa-Aguirre, 2004; Sharaf-Eldin et al., 2008; Kırıcı et al., 2020; Asil, 2021; Golpour-Hamedani et al., 2024).

Saffron is a triploid (3n = 24), asexually reproducing species (Grilli Caiola, 2004; Gresta et al., 2009). The size of the mother corm and the number of buds determine the quality of the new corms. However, as the corm multiplication cycle continues, quality declines and the number of non-flowering corms increases (Gresta et al., 2008; Shokrpour, 2019). Thus, maintaining large corms and preventing their decay is crucial in saffron cultivation.

Today, growing population, climate change, and environmental degradation necessitate the adoption of sustainable practices in agriculture (Kumar et al., 2017; Hasan et al., 2024). While chemical fertilizers and pesticides offer short-term yield improvements, they can lead to long-term problems such as soil acidification, salinity, and loss of biodiversity (Dasgupta et al., 2021; Ebrahimi et al., 2021; Dincă et al., 2022; Hourani, 2023). In this context, plant growth-promoting rhizobacteria (PGPR) stand out as promising biological agents with the potential to enhance crop productivity and reduce dependence on chemical inputs (Calvo et al., 2014; Cruz-Martín et al., 2015; Khatoon et al., 2020; Buisset et al., 2025; Rawat et al., 2021; Chamkhi et al., 2023; Li et al., 2023; Güler, 2024; Thakur et al., 2024).

PGPR support plant growth through direct or indirect mechanisms in the rhizosphere. These microorganisms can solubilize unavailable phosphate, fix atmospheric nitrogen into ammonia, and suppress pathogens in the root zone (Kloepper et al., 2004; Lugtenberg & Kamilova, 2009; Bhattacharyya & Jha, 2012; Seymen et al., 2019; Shahwar et al., 2023). For instance, *Bacillus pumilus* and *Bacillus megaterium* species facilitate nitrogen uptake via nitrogen fixation (Cruz-Martín et al., 2015; Buisset et al., 2025), while *Bacillus* and *Pseudomonas* species are notable phosphate solubilizers (Rawat et al., 2021; Li et al., 2023; Thakur et al., 2024). Thakur et al. (2024) reported that *Pseudomonas chlororaphis* application led to a 30% increase in corm number and an 8% increase in stigma count in saffron plants.

PGPRs are highly compatible with organic farming and offer biocontrol potential against soil-borne diseases such as corm rot (Gupta & Vakhlu, 2015). Sharaf-Eldin et al. (2008) noted that *Bacillus subtilis* treatments enhanced saffron growth, yield, and altered bioactive compound levels.

Due to their stress tolerance, environmental adaptability, and biological functions, *Bacillus* and *Pseudomonas* species are considered promising candidates for microbial fertilizers in sustainable agriculture (Tortora et al., 2013; Parnell et al., 2016; Elnahal et al., 2022; Yang et al., 2022; Wang et al., 2024). Furthermore, research on the effects of PGPR on yield and bioactive compound accumulation in medicinal and aromatic plants is increasing (Zeriouh et al., 2011; Schmidt et al., 2014; Gu et al., 2017; Zhang et al., 2020; Magotra et al., 2021; Ali et al., 2024; Dalda-Sekerci et al., 2024).

Türkiye possesses high potential for saffron production due to favorable ecological conditions. However, climatic and edaphic stressors can limit yield. This review aims to support sustainable saffron production by focusing on the effects of *Bacillus* (e.g., *B. megaterium*, *B. pumilus*) and *Pseudomonas* (e.g., *P. fluorescens*, *P. chlororaphis*) species on plant development, corm yield, and bioactive compound production, underlining the importance of PGPRs for agricultural sustainability.

2. PGPR MECHANISMS AND THEIR EFFECTS ON SAFFRON

Plant Growth-Promoting Rhizobacteria (PGPR) are microorganisms that enhance plant growth through direct or indirect mechanisms in the rhizosphere (Lugtenberg & Kamilova, 2009; Bhattacharyya & Jha, 2012). Direct effects include nitrogen fixation, phosphate solubilization, iron chelation, and synthesis of plant hormones (e.g., indole-3-acetic acid, gibberellic acid), while indirect effects involve pathogen suppression, increased stress tolerance, and activation of plant defense systems (Kloepper et al., 2004; Seymen et al., 2019Rawat et al., 2021; ; Shahwar et al., 2023; Thakur et al., 2024; Calvo et al., 2014).

Among PGPRs, *Bacillus* and *Pseudomonas* species are particularly prominent. *Bacillus subtilis* and *Bacillus megaterium* support root development via nitrogen fixation (Cruz-Martín et al., 2015; Buisset et al., 2025), while *Pseudomonas fluorescens* and *Pseudomonas putida* can solubilize phosphate and suppress root pathogens (Rawat et al., 2021; Li et al., 2023; Thakur et al., 2024). *Pseudomonas chlororaphis* isolates have also been shown to increase corm number and stigma yield in saffron (Thakur et al., 2024).

Thakur et al. (2024) examined 35 stress-tolerant PGPR strains from the Kashmir Valley, identifying significant variation in traits such as tricalcium phosphate solubilization, ACC-deaminase activity, IAA, and siderophore production. Molecular analyses revealed *Bacillus* and *Pseudomonas* as dominant genera. Field trials with selected strains resulted in yield increases of 0.3–19%, highlighting the contribution of these PGPRs to saffron growth and quality.

Similarly, Xu et al. (2024) evaluated 14 PGPR isolates from the saffron rhizosphere, reporting that all strains synthesized IAA and gibberellic acid, while differing in phosphate solubilization, nitrogen fixation, and siderophore production. Field applications of strains SR144, SR163, SR269, SR307, and SR383 led to improvements in fresh corm weight and leaf length, along with reduced malondialdehyde content and increased antioxidant enzyme activities.

Stelluti et al. (2025) observed increased safranal and total phenolic content in saffron plants treated with *Bacillus megaterium* CB97032 and *Paenibacillus durus* CB1806 under sterile soil-less conditions. Ali et al. (2024) compared *Bacillus* sp. D5 (Bar D5) and *Bacillus amyloliquefaciens* W2 (Bam W2), reporting superior phosphate solubilization, IAA and ammonia production, and amylase and cellulase activity in Bar D5, which enhanced corm biomass in pot experiments.

Guo et al. (2025) demonstrated the antagonistic effects of *Bacillus velezensis* ZGE166 against saffron corm rot pathogens, confirming nitrogen fixation, ammonia and IAA production, and ACC-deaminase activity. Genomic analysis supported its secondary metabolite biosynthesis potential. Abedi et al. (2024) showed that *Bacillus subtilis* improved saffron morphology, physiology, and bioactive compound levels depending on bacterial density.

PGPR applications not only improve yield but also enhance bioactive compound production (Sharaf-Eldin et al., 2008; Gu et al., 2017; Ali et al., 2024) and increase stress tolerance under abiotic conditions (Elnahal et al., 2022; Wang et al., 2024). In Turkey, PGPR use aligns with organic farming principles, contributing to environmental sustainability by reducing chemical fertilizer dependency (Koocheki & Seyyedi, 2015; Gupta & Vakhlu, 2015).

Ultimately, *Bacillus* and *Pseudomonas* species support saffron growth through nitrogen fixation, phosphate solubilization, pathogen suppression, and stress resilience, positioning them as promising microbial agents for sustainable saffron agriculture (Schmidt et al., 2014; Parnell et al., 2016; Magotra et al., 2021; Yang et al., 2022).

3. CONCLUSIONS AND RECOMMENDATIONS

The studies reviewed demonstrate that certain PGPR strains, especially from *Bacillus* and *Pseudomonas*, can positively influence saffron yield, quality, and plant health. These bacteria can enhance saffron's morphological and physiological traits through mechanisms such as biological nitrogen fixation, phosphate solubilization, root development support, pathogen suppression, and improved stress tolerance. Evidence also suggests PGPRs can increase production of bioactive compounds like safranal and α-crocin.

The potential of PGPRs to enhance soil fertility and reduce chemical fertilizer use is significant for environmental sustainability. In Turkey, saffron production is constrained by climatic and soil-related stresses. However, strategic PGPR applications may improve yield and quality, contributing to organic and sustainable farming models.

Future studies should evaluate long-term effects of PGPR strains under diverse soil and climatic conditions. Investigating the synergistic potential of combined microbial applications and employing genomic and metabolomics tools to better characterize effective strains can further expand their application in sustainable saffron agriculture.

In conclusion, PGPRs hold significant potential as biofertilizers and biocontrol agents in integrated saffron farming systems. However, realizing this potential requires more field research, multi-location trials, and detailed studies of microbial interactions. *Bacillus* and *Pseudomonas* species offer eco-friendly alternatives to chemical fertilizers, but robust scientific evidence is needed to validate their practical applicability.

ÖZET

Konvolüsyonel Sinir Ağları (CNN), özellikle görsel verilerin işlenmesi ve analizinde öne çıkan derin öğrenme modelleridir. CNN'ler, katmanlı yapıları sayesinde görüntülerden kenar, köşe veya renk yoğunluğu gibi öznitelikleri otomatik olarak çıkarabilmekte ve bu öznitelikleri sınıflandırma ya da tahmin süreçlerinde kullanabilmektedir. Bu yönüyle, insan gözüyle fark edilmesi zor ayrıntıları yakalama kapasitesi, CNN'leri tarımsal uygulamalarda öne çıkarmaktadır.

Tarım sektöründe son yıllarda giderek artan şekilde kullanılan CNN tabanlı yaklaşımlar; bitki hastalıklarının erken tespiti, ürün sınıflandırma ve kalite kontrol, yabancı ot ve zararlıların belirlenmesi, hasat zamanının tahmini, toprak ve arazi analizleri ile otonom tarım araçlarının geliştirilmesi gibi birçok alanda önemli katkılar sağlamaktadır. Bitkisel üretimde kullanılan bu yöntemler, verim kayıplarını azaltırken aynı zamanda hassas tarım uygulamalarının yaygınlaşmasına olanak tanımaktadır. Hayvancılıkta ise CNN'ler, hayvan davranışlarının ve refahının izlenmesi, sürü yönetimi, sağlık durumlarının erken teşhisi (örneğin mastitis, solunum hastalıkları veya topallık), otomatik gözetim sistemleri ve yemleme süreçlerinin optimize edilmesi gibi alanlarda değerli çözümler sunmaktadır. Bu sayede, hem üretim verimliliği hem de hayvan sağlığı iyileştirilebilmektedir.

CNN'lerin tarım ve hayvancılıkta kullanımı, verimlilik ve doğruluğun artırılmasına, iş gücü maliyetlerinin azaltılmasına ve çevresel etkilerin en aza indirilmesine katkı sağlamaktadır. Bununla birlikte, yüksek kaliteli veri gereksinimi, modelin saha koşullarına uyarlanması ve yüksek hesaplama maliyetleri, başarı için göz önünde bulundurulması gereken temel zorluklardır.

Bu çalışma, CNN tabanlı yaklaşımların tarım ve hayvancılıktaki potansiyel kullanım alanlarını özetleyerek, gelecekteki araştırmalar için yol gösterici olmayı amaçlamaktadır. Genel olarak, CNN'ler karar destek sistemlerinden otonom makinelere kadar geniş bir yelpazede uygulanabilir çözümler sunmakta ve Tarım 4.0 sürecinde hem akademik hem de endüstriyel düzeyde güçlü bir araştırma alanı oluşturmaktadır.

CONVOLUTIONAL NEURAL NETWORKS AND THEIR POTENTIAL APPLICATIONS IN AGRICULTURE

ABSTRACT

Convolutional Neural Networks (CNNs) are deep learning models that are particularly prominent in the processing and analysis of visual data. Due to their layered structure, CNNs can automatically extract features such as edges, corners, or colour intensity from images and use these features in classification or prediction processes. This ability to capture details that are difficult to detect with the human eye makes CNNs a prominent choice for agricultural applications.

CNN-based approaches, increasingly used in the agricultural sector in recent years, offer significant contributions in many areas, including early detection of plant diseases, product classification and quality control, identification of weeds and pests, harvest estimation, soil and land analysis, and the development of autonomous agricultural vehicles. These methods, used in crop production, reduce yield losses and enable the widespread adoption of precision agriculture practices. In animal husbandry, CNNs offer valuable solutions for monitoring animal behavior and welfare, herd management, early diagnosis of health conditions (e.g., mastitis, respiratory diseases, or lameness), automated surveillance systems, and optimizing feeding processes. This can improve both production efficiency and animal health.

The use of CNNs in agriculture and animal husbandry contributes to increased efficiency and accuracy, reduced labor costs, and minimized environmental impacts. However, the need for high-quality data, model adaptation to field conditions, and high computational costs are key challenges for success.

This study aims to provide guidance for future research by outlining the potential applications of CNN-based approaches in agriculture and animal husbandry. Overall, CNNs offer a wide range of applicable solutions, from decision support systems to autonomous machines, and constitute a strong area of research at both academic and industrial levels in the Agriculture 4.0 era.

Keywords: Convolutional Neural Networks, Image Processing, Plant Diseases, Animal Welfare, Precision Agriculture, Artificial Intelligence

1. INTRODUCTION

With the digital transformation process, the use of artificial intelligence (AI) and deep learning (DL) technologies is becoming increasingly widespread in the agriculture and livestock sectors. These technologies significantly facilitate the processing, classification, and interpretation of visual data, in particular. Making sense of the large volumes of data obtained through sensors, drones, satellite systems, and automatic cameras used in agricultural activities has become difficult with traditional methods. At this point, Convolutional Neural Networks (CNN), which can automatically extract features from visual data, stand out as a powerful tool in agricultural analysis (Gülmez, 2025).

Due to their layered structure, CNN models can automatically recognize features such as edges, corners, color intensity, or texture in images. This ability allows for the detection of even small details invisible to the human eye, enabling highly accurate results in areas such as agricultural disease diagnosis, product quality assessment, and yield estimation. In agricultural production, these models contribute to the development of decision support systems by saving both time and reducing labor costs (Ma'arif et al., 2022).

CNNs have numerous innovative applications, particularly in crop production. CNN-based models offer high success rates in areas such as early disease detection based on the analysis of plant leaf images, automatic identification of pests and weeds, classification of fruit maturity, and harvest time prediction. For example, CNN models trained on large datasets like PlantVillage can detect diseases in various plant species with over 95% accuracy. Such applications contribute to both reducing pesticide use and preventing yield losses (Rastogi et al., 2024; Shafik et al., 2025).

Recent research has shown that CNN-based approaches are not limited to crop production but also have significant applications in animal husbandry. CNN models are particularly effective in monitoring animal behavior and welfare, herd management, early diagnosis of diseases (such as mastitis or lameness), and optimization of automated feeding systems. These systems have positive effects on both production efficiency and animal health. (Bello et al., 2025; Umurungi et al., 2025).

However, several technical challenges must be overcome for CNNs to be effectively applied in agriculture and animal husbandry. The main limitations researchers face are the need for high-quality data, the need to adapt the model to field conditions, the high computational costs of training, and its ability to generalize. In this context, improving existing studies and creating local datasets will directly impact the success of CNN-based systems (Tugrul et al., 2022).

In general, CNNs offer a wide range of applicable solutions, including early detection of plant diseases, product quality classification, weed detection, soil and terrain analysis, animal welfare monitoring, and the development of autonomous agricultural systems. This review aims to present the current applications of CNN-based approaches in agriculture and animal husbandry, their advantages, and challenges, and to provide a fundamental assessment that will guide future research.

1.1. Basic Principles of Convolutional Neural Networks

Convolutional Neural Networks (CNNs) are deep learning models inspired by the human visual system. These networks are specifically designed to identify patterns, shapes, and structural relationships in image-based data. The fundamental principle of CNNs is to extract local features from the input image and transform them into more abstract representations in higher layers. This allows the network to identify, classify, and predict complex objects or events in the image.

A CNN model typically consists of several main components: convolution layers, activation functions, pooling layers, fully connected layers, and an output layer. Each of these layers serves a specific function in the network's process of extracting meaningful information from data (Ma'arif et al., 2022).

Convolutional layers form the fundamental building blocks of a CNN. In these layers, small-sized filters (kernels) are slid over the input image (sliding windows) to capture specific features. The filter multiplies different regions of the image to produce feature maps. For example, one filter can detect edges, while another can recognize color intensity or textural differences. With this multilayered approach, the CNN hierarchically learns low-level (edge, line) and high-level (leaf shape, fruit shape) features in the image (Jogin et al., 2018).

Features obtained from convolutional layers need to be transformed nonlinearly. The most commonly used activation function for this is ReLU (Rectified Linear Unit). ReLU reduces negative values to zero while preserving positive values, increasing the network's learning speed. This allows CNN models to generalize with high accuracy even on complex agricultural image data (Alsajri and Hacimahmud, 2023).

Pooling layers in CNNs reduce the size of feature maps, reducing both computational overhead and the risk of overfitting. Max-pooling is the most commonly used technique; it represents the most significant feature by taking the highest value in a given region. For example, this method is quite effective in detecting a prominent spot on a leaf surface (Zafar et al., 2022).

The fully connected layers at the end of the network perform the classification process by combining the features extracted in previous layers. This part operates similarly to classical artificial neural networks. The final layer typically uses a softmax function and generates the probability value for each class. In plant disease classification, this layer calculates the probability of each disease type and presents the highest value as the "prediction result." (Yadav et al., 2022).

One of the key advantages of CNN over other types of neural networks is the principle of weight sharing. This principle allows the same filter to be used repeatedly across the entire image, making the network both computationally efficient and reducing the number of parameters during the learning process. The learning process is based on minimizing the error function using a backpropagation algorithm. At each iteration, the network's parameters are updated, reducing errors (Taye, 2023).

CNNs are particularly robust against challenges such as high noise, light variability, and complex backgrounds in the analysis of agricultural images. This feature allows them to reduce errors caused by wind, shadow, or soil texture in plant images taken in open fields. Furthermore, transfer learning approaches allow pre-trained CNN models (e.g., VGGNet, ResNet, AlexNet) to be easily adapted to new agricultural datasets, achieving high accuracy even in studies with limited data. Therefore, CNNs are considered a fundamental deep learning approach for applications such as plant disease diagnosis, crop classification, quality control, and autonomous agricultural systems (El Sakka et al., 2025).

1.2. Use of CNNs in Agriculture

CNNs have the potential to be used in the high-accuracy detection of plant diseases, automatic classification of agricultural products according to their types, maturity status or quality standards, detection of weeds and pests, determination of harvest time of products, soil and land analysis, animal welfare and development of visual detection systems in autonomous agricultural vehicles.

1.2.1. Diagnosis of Plant Diseases

Fast and accurate plant disease detection is critical for reducing yield losses by preventing pest spread and optimizing pesticide use. Over the past decade, CNN learning on image-based data has made significant progress in this area. Two main approaches can be identified in the research literature: (i) classification-based methods (determining which disease/class an image belongs to), and (ii) detection/segmentation-based methods (localizing disease lesions within the image and separating them at the pixel level). While classification studies are typically performed on single leaf images, detection and segmentation networks (e.g., Faster R-CNN, YOLO, U-Net, and their derivatives) are preferred for detecting multiple lesions or plant samples in field images. Extensive comparisons and example applications of these two approaches have been reported. (Ferentinos, 2018; Liu and Wang, 2021).

Transfer learning and adapting pre-trained networks (AlexNet, VGG, ResNet, etc.) to agricultural imagery has been a practical and effective strategy for studies with limited data. Early studies, such as Sladojevic et al. (2016), demonstrated that high performance can be achieved even with fine-tuning small datasets from the internet; later applications of transfer learning with larger datasets have further improved performance (Frentinos, 2018).

However, high accuracies achieved in laboratory or controlled conditions do not always translate to the same success in real-world applications. Factors such as variable outdoor light conditions, background complexity, different plant varieties/races, and disease stage can reduce model generalization. Picon et al. (2019) highlighted the challenges of early detection studies conducted in the field and the need for real-time application.

Jiang et al. (2019) developed a deep CNN model combined with the Inception module to detect five different apple leaf diseases. Similarly, Bukumira et al. (2022) introduced a carrot grading system that employed computer vision and a cascaded graph CNN, effectively classifying and grading carrots with high accuracy. Hosny et al. (2023) proposed a hybrid technique that integrated lightweight deep learning features with Local Binary Pattern (LBP) features to identify leaf diseases in apples, grapes, and tomatoes, achieving accuracy rates of 97.8%, 97%, and 96%, respectively. Ahila Priyadharshini et al. (2019) adapted the LeNet architecture to design a CNN for classifying corn leaf diseases using the PlantVillage dataset, reaching an accuracy of 97.89%. Waheed et al. (2020) optimized a DenseNet-based structure to detect and classify various corn leaf diseases, including northern leaf blight, common rust, and gray leaf spot, with an accuracy of 98.06%. In another study, Wu et al. (2019) used UAV images and a pre-trained ResNet for feature extraction to identify northern leaf blight in corn leaves, achieving an overall accuracy of 95.1%.

Furthermore, hybrid approaches that combine CNNs with attention mechanisms have been explored to enhance plant disease prediction and classification. Zeng and Li (2020) developed a residual CNN enhanced with self-attention, which achieved 98% accuracy on the MK-D2 dataset and 95.33% on the AES-CD9214 dataset. Likewise, Chen et al. (2021) utilized a pre-trained MobileNet-V2 with an integrated attention mechanism to detect rice leaf diseases, attaining 98.48% accuracy. Most recently, Aboelenin et al. (2025) presented a hybrid model that merged VGG16, Inception-V3, and DenseNet20 architectures, successfully identifying and classifying multi-class plant leaf diseases, and outperforming comparable methods with accuracy rates of 99.24% for apple and 98% for corn datasets.

1.2.2. Product Classification and Quality Control

The grading and quality control of agricultural products is a critical stage in the production chain, both for consumer satisfaction and economic value. Traditional methods for classifying products often rely on human observation or simple color/shape analysis, leading to subjective

errors and low accuracy. CNN-based image processing methods have revolutionized this field by providing an objective, rapid, and repeatable solution for product quality assessment. (Kamilaris and Prenafeta-Boldú, 2018).

CNN models can automatically identify characteristics of products such as color, shape, surface texture, and defect status, thus enabling the determination of ripeness level, class, and defect rate of fruits and vegetables. For example, a deep learning model developed by Xiao et al. (2021) classified apple ripeness degrees with 96% accuracy. CNN approaches combined with hyperspectral data have demonstrated superior performance, particularly in cases such as internal quality (internal spoilage, chemical content) or early ripeness detection. For example, a CNN trained on Vis/NIR spectroscopy data applied to Fuji apples was able to accurately classify different ripeness classes with over 96% accuracy; this study demonstrates that the combination of hyperspectral/spectral data with CNN is robust in classifying internal quality regardless of the external surface (Benmouna et al., 2022).

RGB images and lightweight (mobile/edge) CNN architectures are also important for field and business-line applications. Fine-tuned lightweight networks such as MobileNet have reported high accuracies in classification and ripeness estimation on multi-class fruit/vegetable datasets, demonstrating the feasibility of real-time quality control with low-cost cameras. However, issues such as data diversity, illumination variability, and image occlusion can impact application success (Tapia-Mendez et al., 2023).

Sample applications and performance reports provide practical validation: an optimized CNN-based classification/grading system developed for mango reported classification accuracy around 97–98% (Zheng and Huang, 2021). Similarly, pre-trained models (Faster R-CNN, RFCN, SSD) used with fine-tuning for potato surface defect detection achieved detection/accuracies ranging from 92.5–98.7% (Wang and Xiao, 2021). These results demonstrate the suitability of CNN-based approaches for industrial applications in both fruit-vegetable discrimination and product surface defect detection.

CNN-based approaches are also successful in grain and seed quality control: CNN models have been reported with high accuracy in distinguishing wheat grains from intact/broken, detecting foreign matter, or classifying grain purity; such applications enable the implementation of automated sorting systems, particularly in packaging and quality assurance lines. Furthermore, high reliability regarding internal quality (moisture, starch, internal spoilage) can be achieved when multi-channel data such as hyperspectral/terahertz/NIR is used periodically (Polder et al., 2019; Zhu et al., 2023).

CNN-based product classification and quality control approaches are important technological tools that reduce human error, automate processes, and strengthen standardization. With the proliferation of low-cost cameras and AI-powered systems in the coming years, agricultural product quality control processes are expected to become fully automated.

1.2.3. Weed and Pest Detection

Weeds and pests are major drivers of yield losses and increased pesticide use in agricultural production. Traditional detection methods typically rely on manual observation or simple image thresholding techniques, resulting in both time-consuming and low accuracy in large areas. In this context, CNN-based image analysis systems offer fast, automated, and highly accurate solutions for weed and pest detection.

Dos Santos Ferreira et al. (2017) used CNN-based classification to distinguish weeds from RGB drone images taken in soybean fields with 97% accuracy. This work provides a pioneering example for autonomous spraying and targeted mechanical intervention systems. Subeesh et al. (2022) evaluated the applicability of deep learning-based techniques (Alexnet, GoogLeNet,

InceptionV3, Xception) in weed identification from RGB images of a bell pepper field. Models were trained with different epoch values (10, 20, 30) and batch sizes (16, 32), and hyperparameters were tuned to achieve optimal performance. The overall accuracy of the selected models ranged from 94.5% to 97.7%. Among the models, InceptionV3 showed superior performance with 97.7% accuracy, 98.5% precision, and 97.8% recall at 30 epochs and a batch size of 16. Type 1 error was 1.4% and Type II error was 0.9% for this Inception3 model.

Faisal et al. (2025) compared the effective identification and classification of cotton weeds with other existing CNN models, such as VGG-16, ResNet, DenseNet, and Xception Model. Experimental results show that VGG-16, ResNet-101, DenseNet-121, and XceptionNet models have an accuracy rate of 95.4%, 97.1%, 96.9%, and 96.1%, respectively. The proposed model outperformed other models, achieving an accuracy rate of 98.3%.

UAV-based system research using drone imagery is also attracting attention. The CNN LVQ model developed by Haq (2022) and trained using 4400 UAV images showed 99.44% overall accuracy for weed detection after rigorous hyperparameter tuning.

Visual detection of pests and larvae is often challenging due to their small size, rapid motion, and background complexity. CNN-based approaches have provided effective results by extracting multi-layered features from high-resolution images to solve this problem. Wang et al. (2021) proposed an effective CNN-based automatic handheld pest monitoring system to detect and count rice pests. Experimental results using the proposed approaches evaluating three types of density pest images show that our system performs well in detecting rice pests in non-specific wild environments, with recognition recovery up to 91% under industrial conditions. Wang et al. (2023) proposed a three-scale CNN model with added channel and spatial attention mechanisms for pest detection of different sizes under complex backgrounds, and reported an accuracy of 93.16% in field images. Yulita et al. (2023) used a GoogleNet-based CNN for pest detection in mobile applications for farmers in Indonesia, and reported an accuracy of 93.78%.

These developments directly contribute to agricultural management processes, supporting the reduction of chemical inputs, environmental sustainability and production efficiency.

1.2.4. Determining Harvest Time

Accurately determining harvest timing is crucial for agricultural production efficiency, quality control, and logistics planning. Premature or delayed harvesting can reduce product quality and increase storage and marketing costs. Therefore, predicting harvest timing using image analysis, sensor data, and time-series models is a prominent research area in modern agriculture.

Minagawa and Kim (2022) used Mask R-CNN to detect tomato clusters and estimate harvest time based on these images. A harvest time prediction model was developed using images of fruit remaining after removing the fruit covering (leaves, stems, etc.), and the "harvestable" status of the fruit was determined based on its maturity stage. This study presents a new approach to harvest time prediction, specifically by directly using visual data (RGB images).

Han et al. (2022), used the InceptionV3-LSTM model to predict harvest time for canola (rapeseed). This model demonstrated better performance in harvest time prediction by combining InceptionV3's image-based feature extraction with LSTM's time-series dependencies. The technology aims to more accurately predict harvest time by processing features from multispectral data (spectral + image) in the time domain.

Zhang et al. (2020) used a Faster R-CNN-based system to detect fruit, branches, and stems in apple trees. Harvest time and shaking points were then determined based on the detected fruit locations, and recommendations were presented for an automated apple harvesting system. This

approach not only determines harvest timing but also contributes to harvest strategy planning (e.g., where to shake trees).

Some studies use hybrid deep learning models not only with image (or spectral) data but also with time-series features such as meteorological and satellite data. For example, Wang et al. (2023) studied crop (e.g., wheat) yield and development predictions by modeling time-series dependencies with GRU (Gated Recurrent Unit) and spatial features extracted with CNN.

1.2.5. Soil and Land Analysis

Soil and terrain analysis includes elements such as soil texture, moisture content, salinity, organic matter distribution, and land cover mapping. This information forms the basis for agricultural planning, irrigation management, erosion control, and environmental monitoring. In recent years, the combination of high-resolution satellite imagery with sensor data, coupled with deep learning techniques, particularly CNN, has demonstrated effective results in quickly and accurately extracting soil spatial patterns (Ahmed et al., 2021; Zhao et al., 2022).

Combining surface soil moisture with remote sensing data and climate indices is critical for irrigation planning and drought management. Hybrid deep learning models (e.g., CEEMDAN-CNN-GRU) have produced reliable soil moisture estimates at daily scales using satellite-derived time-series data such as MODIS and ground observations; these approaches statistically significantly outperform traditional single models (such as GRU or LSTM alone). Such studies demonstrate the practical application of soil moisture predictions in agricultural water management. (Ahmed et al., 2021).

Image-based approaches (e.g., hybrid models such as DLAC-CNN-RF using features extracted from laboratory/smartphone images) for rapid estimation of properties such as soil texture (sand, silt, clay ratios) have reported high accuracy and R^2 values (0.99 for sand, 0.98 for clay, 0.98 for silt). These methods have the potential to reduce field sampling costs and contribute to the creation of digital soil maps. (Zhao et al., 2022).

Salinity (soil salinity) monitoring studies have yielded successful results by combining CNN-based models with multispectral/hyperspectral satellite data. Deep learning approaches have been used, particularly for identifying sources of saline runoff due to drought and lake retreat, and for mapping the spatial distribution of saline areas; in one example study (Lake Urmia basin), high classification and mapping accuracies were reported with a DL-CNN-based model. Such remote sensing-CNN combinations, calibrated with field samples, are suitable for monitoring salinity changes over large areas (Garajeh et al., 2021).

For land use/cover (LULC) classification, CNN and CNN+RNN hybrid models (e.g., HCRNN) provide high pixel-level accuracies on multispectral Sentinel-2 data; these maps are directly used for both agricultural land update and land change analysis. CNN-based approaches have demonstrated superior performance compared to classical machine learning methods, particularly because they efficiently extract multispectral spectral information. Experimental results show that the overall accuracy of the HCRNN model reaches 97.62% on the Sentinel-2 dataset, which improves performance by 1.78% compared to the RNN model (Fan et al., 2023).

1.2.6. Animal Welfare

Animal welfare is a multidimensional concept encompassing not only the physical health of production animals but also their behavioral and psychological states. Accurately monitoring welfare in modern animal husbandry not only increases production efficiency but also contributes to the achievement of ethical production standards. Because traditional observation-based assessment methods are prone to human error and subjective judgments, automated

monitoring of animal behavior, facial expressions, and health indicators using CNN-based computer vision systems has become an important area of research in recent years.

Lencioni et al. (2021) developed a machine vision algorithm to assess pain levels in horses using an automatic computational classifier based on the Equine Grimace Scale (HGS) and trained using machine learning. The study evaluated the facial expressions of seven castrated horses, collected via a video system placed above the feeding station and capturing images at four different time points per day: two days before and four days after surgical castration. The machine vision algorithm was developed using a CNN training system, which achieved an overall accuracy of 75.8% when classifying pain into three levels: absent, moderately present, and clearly present. When classifying between two categories (no pain and present pain), the overall accuracy reached 88.3%.

Video-based deep learning applications for gait analysis and lameness detection in cattle have reported high accuracy; for example, the method developed by Kang et al. (2020) reported 96% correct classification using support phase analysis and has demonstrated practical use in deep sensing and lameness detection in cows. Such automated systems are effective for early intervention and improved animal welfare.

CNN-based tracking and recognition algorithms have been used in farm settings for individual animal identification and tracking, automated measurement of feeding/grazing behavior, and social interactions. For example, the "Now You See Me" study developed a CNN-based tracker for continuous monitoring and individual tracking of cows on farms. Experiments show that a cow can be monitored approximately 4 minutes before incidents of malfunction occur and that cows can be successfully monitored for over 20 minutes in lightly crowded scenes (<10 cows). Such tracking systems are used to detect behavioral anomalies and social changes related to welfare (Guzhva et al., 2018).

Production-oriented welfare indicators such as body condition score (BCS) and weight estimation can be automatically estimated using combinations of 2D/3D imagery and deep learning; in recent examples, multiple 3D camera + CNN-based approaches have demonstrated successful and practical results (e.g., BCS estimation using ensemble 3D-CNN models). This automation contributes to both health management and feed/production optimization through frequent and objective BCS monitoring (Summerfield et al., 2023). A reliable body condition estimation model using 3D images in Jersey cows has been reported to achieve 93.5% accuracy with an average accuracy of 48.1% and a deviation of 0.5 units for the exact phenotype (Stephansen et al., 2023).

The combination of infrared (thermal) imaging and deep learning has yielded successful results in the non-invasive early detection of mastitis and heat stress. Because thermal methods are sensitive to field conditions, they are generally used by combining image segmentation and multiple measurements (eye + udder + environmental conditions). A total of 105 dairy cows passing through a passage were randomly selected from thermal infrared videos and identified using a new and comprehensive detection method. The results of bovine mastitis detection were compared with somatic cell counts. The YOLOv5 deep learning network model used to identify critical regions of the cow demonstrated that the accuracy, specificity, and sensitivity of mastitis detection were 87.62%, 84.62%, and 96.30%, respectively, with an average accuracy of 96.1% and a mean frame rate of 116.3 f/s (Wang et al., 2022). Compared with somatic cell count (SCC), the accuracy, sensitivity and F1 value of 86.67%, 82.35% and 87.5% were obtained for mastitis detection in dairy cows by the CLE-UNet algorithm, respectively (Zhang et al., 2023).

1.2.7. Autonomous Agricultural Vehicles

Autonomous agricultural vehicles (autonomous tractors, ground-based robots, autonomous spraying/spot-spraying systems, and agricultural drones) are a rapidly developing technological field with the aim of reducing labor requirements in agricultural production, utilizing inputs in a targeted manner, and reducing environmental impact. The design of these vehicles requires integrating high-accuracy positioning (GNSS/RTK), environmental sensing (RGB, multispectral, LiDAR), real-time path planning and control, and decision-making software. Image processing and deep learning (especially CNN-based object detection/classification and real-time detection networks) play a critical role in the perception layer of autonomous agricultural vehicles: models have been developed that can be integrated with both ground-based robots and drones for tasks such as weed/crop discrimination, pest detection, and crop occupancy/maturity detection.

Qin et al. (2023) performed 3D obstacle detection in a field environment using LiDAR data with a model called Focal Voxel R-CNN and achieved mAP = 91.43%. This system operates at a detection rate of approximately 28.57 frames per second. Such LiDAR-based methods provide environmental detection mechanisms that are not dependent on constant light conditions.

Muvva et al. (2024) reported that they detected weedy and weed-free images in potato farms with 95.96% accuracy using an autonomous robot equipped with a motorized ESP32 microcontroller and integrated with a CNN model. The AGRIBOT prototype, designed by Patel et al. (2022), can detect weeds using RGB images and provides a CNN model optimized for real-time operation.

Kim et al. (2020) proposed a CNN-based method for autonomous vehicles to track in orchards. The path detection performance of this method was evaluated in terms of patch size, and a 96 × 96 patch showed the best performance with a classification accuracy of 0.93, an IoU of 0.75, and a processing time of 0.111 seconds.

1.3. Potential Challenges and Future Perspective of Convolutional Neural Networks

Despite their high performance in tasks such as image processing, classification, and object detection in agriculture, CNNs face several fundamental challenges in terms of field applicability. These challenges can be examined at both technical and operational levels.

CNNs, due to their complex structure containing millions of parameters, require large and balanced datasets. Networks trained with limited data often exhibit overfitting, leading to a significant decrease in performance on test data. This problem is particularly pronounced in agricultural fields under agroclimatic conditions or in remote sensing applications where data collection is challenging. Kamilaris and Prenafeta-Boldú (2018) stated that a lack of data diversity is a major bottleneck in agricultural deep learning applications.

Another significant challenge is the high computational power and hardware requirements of CNN models. Training deep architectures is costly in terms of both time and energy because they require large-scale GPU or TPU infrastructure. This reduces the accessibility of deep learning applications, especially in resource-constrained research environments. Furthermore, high energy consumption has been criticized for its environmental impact, with training deep networks being highlighted as a significant contributor to carbon emissions (Shruthi and Naveen, 2024).

The interpretability of CNNs is another significant issue. These models are often considered "black box" systems because it is often impossible to understand the characteristics underlying a decision. Especially in applications critical to security and accuracy, such as agricultural

decision support systems, a lack of model explainability can reduce user confidence (Nieradzik et al., 2024). In recent years, advances have been made in visualizing the internal dynamics of models through methods such as Grad-CAM and Layer-wise Relevance Propagation, but these methods still fail to provide complete transparency into decision-making processes.

The success of future CNN-based agricultural AI systems will depend on advances in areas such as data quality, explainability, energy efficiency, and integration capacity. Multimodal CNN models created by combining RGB, hyperspectral, thermal, and LiDAR data can improve decision accuracy by simultaneously analyzing both intrinsic quality and extrinsic appearance parameters. Garajeh et al. (2021) demonstrated that such data fusion provides accuracy gains in soil salinity estimation in the Urmia Lake basin. Lightweight CNN architectures such as MobilNet, EfficientNet-Lite, or Tiny-YOLO enable real-time operation in field robotic or drone-based systems. Muvva et al. (2024) achieved low-latency field detection using a lightweight CNN for autonomous weed detection. Integrating CNN models with autonomous agricultural vehicles will expand the capacity for visual decision-making in the field. Patel et al. (2022) demonstrated the effectiveness of the CNN-based AGRIBOT prototype for real-time weed detection. The proliferation of open data platforms internationally will facilitate model retraining and comparability. Such initiatives can mitigate the generalization and reliability issues of AI models in agriculture.

2. CONCLUSION

Over the past fifteen years, CNNs have revolutionized agricultural production systems, demonstrating unparalleled accuracy and automation capabilities, particularly in image-based decision support applications. CNN models have digitized and objectified production processes across a wide range of applications, from plant disease diagnosis and crop classification to weed and pest detection, harvest timing, soil and field analysis, and animal welfare monitoring.

This review clearly demonstrates that CNN-based approaches have initiated a multifaceted transformation in agriculture. Deep learning models used in early plant disease detection, crop quality control, and weed detection provide high levels of accuracy, effectively replacing traditional methods based on human observation. Similarly, CNN-enabled imaging systems have ushered in a new era in welfare management by enabling objective measurement of animal behavior and health indicators. Integrating CNN with hyperspectral and LiDAR data in soil and terrain analysis has enabled the estimation of soil moisture, texture, salinity, and land cover changes at high spatial resolution. Recent studies in the field of autonomous agricultural vehicles demonstrate that CNN can be effectively used not only for perception but also for decision-making and action. Thus, CNN has become not only an analysis tool but also the cognitive backbone of autonomous agriculture.

However, several challenges limit the widespread application of CNN-based systems. These include data insufficiency and instability, model generalization problems (domain shift), high processing power requirements, and a lack of explainability. Overcoming these challenges is critical for the sustainable scalability of deep learning applications in agriculture.

Future research is expected to focus on (i) multimodal data fusion (RGB, hyperspectral, thermal, LiDAR), (ii) lightweight and energy-efficient CNN architectures (MobileNet, EfficientNet-Lite, Tiny-YOLO), (iii) explainable artificial intelligence (XAI) approaches, and (iv) autonomous system integration. Developing explainable, environmentally friendly, and cost-effective CNN models in this direction will increase both efficiency and ethical standards in agricultural production.

Ultimately, CNN architectures are at the forefront of a data-driven, intelligent, and autonomous transformation across all levels of agriculture. Sustainable adoption of this technology will

strengthen not only production efficiency but also environmental protection, food security, and animal welfare on a global scale.

ACKNOWLEDGMENT

The literature review section of this paper was partly based on the master's thesis of Metin YAĞMUR, titled "Determining Phenological Stages and Optimal Harvest Time of Potato Plants Using Convolutional Neural Networks". I would like to thank him for his valuable contribution to the compilation and organization of the related literature.

TARIMDA TEK ÜRÜN ÜZERİNE GERÇEKLEŞTİRİLEN AÇIK ALAN UYGULAMALI FUARCILIK: POTATO DAYS TÜRKİYE FUARI ÖRNEĞİ

Dr. Osman İNAN

Bağımsız Araştırmacı

Email: osmaninan.2025@gmail.com

ORCID: 0000-0001-7306-5516

ÖZET

Potato Days Türkiye Fuarı, 2019 ve 2021 yıllarında Konya-Selçuklu-Karaömerler'de, 2023 ve 2025 yıllarında Nevşehir-Gülşehir'de olmak üzere 4 kez organize edilmiştir. Türkiye'de tarımda açık alan uygulamalı tek bir tarım ürününe (patates) yönelik profesyonelleşmiş öncü ve tek fuar olması ile düzenlendiği her iki yılda bir üreticilerden yoğun ilgi görmektedir. Katılımcı firmaların ürün / yenilik tanıtım ve gösterilerinden; fuar organizatörlerinin sektör liderlerinin katılımlarıyla düzenledikleri söyleşilerden; kamu kurumlarının ve meslek örgütlerinin uzman bilgilendirmelerinden yerinde uygulamalı olarak istifade edilmektedir. Sonuncusu 19-21 Ağustos 2025 tarihleri arasında 4. kez gerçekleştirilen fuar, sektörün önemli bir kısmını temsil eden 78 katılımcı firma ve %10'dan fazlası yabancı ve çok çeşitli ülkelerden gelen 5.113 ziyaretçi tarafından yerinde ilgi görmüştür. Bu bildiride, tarım fuarcılığı, tarımda açık alan uygulamalı fuarcılık, tarımda açık alan uygulamalı tek ürün fuarcılığı ve 'Potato Days Türkiye Fuarı' hakkında bilgiler verilmiştir. Potato Days Türkiye Fuarının tanıtılarak kayıt altına alınması, fuarın tarımsal yayım ve yerel kalkınma için öneminin anlaşılması ve fuarın geliştirilmesi için öneriler sunulması da amaçlanmıştır. Sonuçta, fuar patates sektörüne katkısı üretici, firma ve tüketiciye sağladığı faydalar açısından geliştirilebilir bulunmuştur. Reklam, duyuru ve ulaşım olanakları artırılmalıdır. Doğrudan patates ürünün katma değerini artırması ve diğer ekonomik katkıları dikkate alınarak yerel yönetimler tarafından daha fazla desteklemelidir. Üreticiler ve katılımcılar fuardan daha fazla yararlanmalı, üreticiler sözleşmeli üretim hakkında bilgilendirilmeli ve sözleşmeli üretim yapan kuruluşlarının işbirliği olanaklarını araştırabilmelidirler. Fuarın tarımsal yayım faaliyetlerini destekleyen katkıları ile fuar süresince ve fuar sonrasında yöreye sosyo-ekonomik katkılarına dikkat çekilmelidir. Türkiye'de alanında tek örnek olan bu fuarın sürekliliği ve başarısı görülerek, birbirinden farklı tarım ürünleri ile bilinen Türkiye'nin farklı coğrafyalarında bu yaklaşımda fuarların yapılma olanakları araştırılmalıdır.

Anahtar Kelimeler: Tarım Fuarları, Tarımda Açık Alan Fuarcılığı, Tarımda Açık Alan Uygulamalı Fuarcılığı, Üretici, Potato Days Türkiye Fuarı

OPEN-FIELD APPLIED EXHIBITION PRACTICES FOCUSED ON A SINGLE CROP IN AGRICULTURE: THE CASE OF POTATO DAYS TÜRKİYE EXHIBITION

ABSTRACT

The Potato Days Türkiye Fair has been organized four times: in 2019 and 2021 in Konya-Selçuklu-Karaömerler, and in 2023 and 2025 in Nevşehir-Gülşehir. As the only specialized and pioneering trade fair in Turkey focused on a single agricultural product (potatoes) in open field applications, it attracts significant interest from producers every two years it is held. Participants benefit from the product/innovation presentations and demonstrations of participating companies; from the discussions organized by the fair organizers with the participation of industry leaders; and from the expert briefings provided by public institutions and professional organizations. The most recent fair, held for the fourth time between August 19-21, 2025, attracted 78 participating companies representing a significant portion of the sector and 5,113 visitors, more than 10% of whom were foreign and came from a wide variety of countries. This paper provides information on agricultural fairs, open-field applied fairs in agriculture, open-field applied single-product fairs in agriculture, and the 'Potato Days Türkiye Fair'. It also aims to introduce and document the Potato Days Türkiye Fair, highlight its importance for agricultural dissemination and local development, and offer suggestions for its improvement. Ultimately, the fair was found to be developable in terms of its contribution to the potato sector and the benefits it provides to producers, companies, and consumers. Advertising, publicity, and transportation opportunities should be increased. Local governments should provide more support, considering the direct increase in the added value of potato products and other economic contributions. Producers and participants should benefit more from the fair; producers should be informed about contract farming and should be able to explore opportunities for cooperation with organizations engaged in contract farming. Attention should be drawn to the fair's contributions to agricultural extension activities and its socio-economic contributions to the region during and after the fair. Seeing the continuity and success of this fair, which is the only one example of its kind in Turkey, the possibilities of organizing fairs with this approach in different regions of Türkiye, known for its diverse agricultural products, should be investigated.

Keywords: Agricultural Fair, Open-Air Exhibition in Agriculture, Open-Air Practical Exhibition in Agriculture, Producer, Potato Days Türkiye Fair

1. GİRİŞ

Fuar, ticarete konu ürünlerin veya hizmetlerin, teknolojik ilerlemelerin, bilgi ve yeniliklerin tanıtılması, pazarlanması, geleceğe yönelik ticari ilişki ve teknik iş birliğinin kurulması ve geliştirilmesi için belirli bir takvime bağlı olarak, düzenli aralıklarla ve genelde aynı yerde gerçekleştirilen bir tanıtım etkinliğidir (Tütüncüoğlu, 2009). Fuarların, temel bileşenleri olan katılımcılarına, ziyaretçilerine, fuar düzenleyicilerine, katılımcılara yan hizmetler sunan teşebbüslere (Rekabet Kurumu, 2019) ve yöreye sosyo-ekonomik yönleriyle pek çok açıdan katkıları bulunmaktadır.

Fuarlar, düzenlendikleri yerlere başka şehir ve ülkelerden gelen katılımcı ve ziyaretçileri sayesinde fuar süresi boyunca ticari bir hareketlilik de yaşatmaktadır. Katılımcı ve ziyaretçilerin konaklama, yeme, içme gibi temel ihtiyaçlarının karşılanması zorunluluğu bölgede faaliyet gösteren birçok işletmenin gelirine katkı sağlamaktadır. Ayrıca, bölge halkı fuar dönemi boyunca gerçekleştirilen aktivitelere katılarak sosyal ve kültürel faaliyetlerde bulunabilmektedir (Göksel, 2005).

Fuarlardan, tarım sektörünün geliştirilmesinde de yararlanılmakta, tarımsal amaçlı olarak yapılan fuarların sayıları her yıl artmaktadır. Tarımda üreticiler; yenilikleri görebilmek, iş çevrelerini genişletmek ve sektörle etkileşim kurmak, üretimlerini artırabilecek kişilerden bilgilendirmeler almak, yeni teknolojiler görebilmek, sektördeki yeni ve öncü firmaları görebilmek, yenilikleri deneyimleyebilmek vb. beklentilerle tarım fuarlarını ziyaret etmektedir. Katılımcı firmalar ise, daha fazla kişiye ulaşabilmek, firma bilinirliğini artırmak, sektörle etkileşim sağlamak, firmanın yeni ürünlerinin ve başarılı çalışmalarını tanıtmak vb. amaçlarla tarım fuarlarına katılım sağlamaktadır.

Tarım fuarları düzenlendikleri yörede kırsal kesim ve yerel yönetimler de fuardan beklentiler içerisindedir. Bu beklentiler şu gibi sayılabilmektedir (İnan ve Konyalı, 2024);

- Konaklama, yeme-içme, gezme, turizm vb. (Çıldır, 1991).
- Tekrar gelme isteği ile yörenin kırsal turizm gelirlerinin artırılması,
- Kırsal altyapının, fuar vesilesiyle iyileştirilmesi,
- Merkezden yöreye katkının artırılması,
- Yerelde yönetiminin deneyimlenmesi ve güçlenmesi,
- Kırsalda yatırımların artması ve kalkınmaya katkı, vb.

Fuarların katılımcı, ziyaretçi, organizasyon ve yöreye katkılarını artırabilecek çalışmalar karar vericilere destek olunması bakımından artırılmalıdır. Böylece, etkinlik yöneticileri, daha iyi bir fuar düzenlemek ve yerel halkın bu etkinliklere katılımını sağlamak için, vatandaşlara düzenlenen fuarlardan özellikle toplumsal, bireysel ve kültürel anlamda nasıl fayda sağlayacağını daha kapsamlı bir şekilde anlatmaya çalışabilirler (Binbaşıoğlu ve Gültekin, 2017).

Türkiye'de tarım fuarlarına bir yenilik ilki 2011 yılında gerçekleştirilen ve her yıl düzenlenmeye devam eden ''Tarım ve Teknoloji Günleri Fuarı''nın tarımda açık alan uygulamalı özellikleri ile tarım ve teknoloji temasının bir arada gerçekleştirilmesi ile olmuştur. Bu fuarda makine-ekipman, teknoloji, zirai ilaç, tohum, gübre üreticileri en yeni ve güncel ürünlerini tarlada uygulanmış olarak ziyaretçilere tanıtabilmekte; ziyaretçiler ise tarım profesyonelleri ve uzmanlarından kendi işletmeleri için ihtiyaç duyabilecekleri ürünler ile ilgili bilgileri ürünleri uygulamalı olarak yerinde görerek alabilmektedir. Tarımda açık alan uygulamalı, tarım ve teknoloji temalı olan bu fuar oldukça ilgi gördüğünden organizasyon

firması bu kez ilki 2019 yılında ve 2 yılda bir tarımda açık alan uygulamalı tek bir üründe fuar düzenlemeye devam etmiştir.

2. Materyal ve Metot

Bu bildiri, tarımda tek ürün üzerine (patates) 2025 yılında 4. kez gerçekleştirilen ‘‘Potato Days Türkiye Fuarı’’nda yapılan gözlemler ve literatürün incelemesi ile gerçekleştirilmiştir. Bildiri ile, organizasyonu her yıl ilerleme gösteren, çokça ilgi gören ve tarımda tek ürün teması ile diğerlerinden ayrışan ‘‘Potato Days Türkiye Fuarı’’nın gelişimine katkı sağlanabilecektir. Bildiride, Türkiye’de tarım fuarcılığı, tarımda açık alan uygulamalı fuarcılığı ve tarımda tek ürün temalı fuarcılık konularında bilgiler verilmiş, geliştirilmesi için öneriler sunulmuştur.

3. Bulgular

Tarım fuarları planlanırken üreticilerin, katılımcı firmaların, ziyaretçilerin ve fuarların diğer unsurlarının fuardan en iyi şekilde yararlanması sağlanmalıdır. En başında, fuar sahası etkinliği ve önemi dikkate alınarak tespit edilir. Çok çeşitli kriterler dikkate alınsa da temel olan coğrafya ve coğrafyanın sunduğu olanaklardır. Bir sahanın fuar alanı veya fuarcılık merkezi olmasında hiç kuşkusuz ki o sahanın coğrafi avantaj ve dezavantajları dikkate alınmaktadır (Acartürk, 2013). Fuar planlamasında, ürün ve yer seçimi ile bunların ilişkisi çok dikkatli planlanmalıdır.

Tarım ürünlerine düzenlenen fuarlara bir örnek olarak patates bitkisinin öneminin görülmesi, üretim alanı ve miktarı, pazarlama ve teknolojiyle geliştirilmesi imkanlarının fuar gibi organizasyonlarla artırılmaya çalışılması kıymetlidir. Patates, bitkisel kaynaklı beslenmede tahıllardan sonra en fazla tüketilen besin maddesidir. Ucuzluğu, birim alandan fazla verim alınması, besin değerinin yüksek oluşu, sindiriminin kolaylığı, kullanım alanının geniş olması ve her çeşit iklimde yetişmesi açısından, hemen hemen bütün dünya ülkeleri tarafından üretilmekte ve tüketilmektedir (Elçi vd., 1994). Temel gıda ürünü olan patatesin kullanım alanlarının yaygınlaşması ve dünya nüfusunun artması patatese olan talebi ve tüketimi hızlı bir şekilde arttırmaktadır (TEPGE, 2024). Türkiye’de patates üretici ve tüketici fiyatı en fazla dalgalanma gösteren ürünlerin başında gelmektedir (Kadakoğlu ve Karlı, 2021).

Patates bitkisine özel ‘‘Potato Europe’’ adlı bir fuar organizasyonu, ilk kez düzenlendiği 2006 yılından bu yana Avrupa’da her yıl Almanya, Hollanda, Fransa ve Belçika olmak üzere dört ayrı ülkede gerçekleştirilmektedir (Potato Europe, 2025). Açık alan uygulamalı alanının fazlalığı, kapalı alanları, söyleşi, sunum ve diğer bilgilendirmelerinin çokça olması, gezme kolaylığı ve diğer organizasyon başarılarıyla her yıl gelişerek dünyanın her yerinden gelen ziyaretçileri tarafından yerinde oldukça ilgi görmektedir. Fuarın, böylesine ilgi görmesi, sürekliliği ve yıllardır geliştirilebilmesi dikkat çekmektedir.

Fotoğraf 1. Potato Europe 2025 Hollanda (**Kaynak:** https://potatoeurope.nl/)

Fuarın, Türkiye’de de patates sektörü açısından bilinen bir organizasyondur. Türkiye’deki patates sektörünün paydaşları olan tohum üreticileri, zirai ilaç imalatçıları, tarım ekipmanı üretenler, büyük çiftçiler ve patates ticareti yapanların çok yakından takip ettikleri ve yerinde ziyaret ettikleri bilinmektedir. Avrupa’da fuarın organizasyonun yapan firmanın Türkiye’deki

şirketi, Avrupa'daki organizasyonun bir benzerini Türkiye'de gerçekleştirmek üzere 2017 yılında hazırlıklara başlamış, 2 yıla yakın bir süreçte patates sektörünün analizini yaparak ve fuardan yararlandırılma araştırmasını yaparak Türkiye'de ilk kez 2019 yılında benzer bir fuarı getirmişlerdir.

Türkiye'de sofralık, sanayi tipi ve tohum dahil olmak üzere 1,5 milyon dekar civarı alanda patates ekimi yapılmaktadır. Ekili arazilerin yüzde 47'si Konya, Nevşehir ve Niğde üçgeninde yer almaktadır. Bölge, patates arzı ve gıda güvencesi açısından tedarik zincirinin sağlanmasında kritik bir rol üstlenmektedir. Kapadokya bölgesinde, bin 320 civarı doğal depoda 2 milyon ton civarında patates depolanmaktadır. 2024 yılı verilerine göre 30 bin ton yemeklik, 14 bin ton işlenmiş ve 1.295 ton tohumluk patates olmak üzere toplamda 1.4 milyar TL'lik ihracat gerçekleştirilmiştir (TÜİK, 2025). Patates, bölge için son derece önemli bir üründür. Hem üreticilere yakın olmak hem de yurtiçi ve yurtdışından gelecek ziyaretçiler için ulaşım ve konaklama kolaylığı açısından bu bölge fuar organizatörleri tarafından fuar yeri olarak bilinçli bir şekilde seçilmiştir (Anonim, 2019).

Türkiye'de ''Potato Days Türkiye Fuarı'' ismiyle gerçekleştirilen organizasyon Türkiye'de ilk ve tek patatese özel ve tek bir tarım ürününe gerçekleştirilen açık alan uygulamalı fuardır. Fuarın, Konya-Selçuklu-Karaömerler'de 80 bin metre kare alanda açık alan uygulamalı Tarım fuarı konseptiyle 22 – 24 Ağustos tarihleri arasında 61 katılımcı firma, 387 yurt dışından olmak üzere toplam 4578 ziyaretçi ile gerçekleştirilmiştir. Fuar için nisan ayında sofralık ve sanayilik olmak üzere fuar sahasına 50'nin üzerinde farklı çeşit patates tohumunun dikimi yapıldı. İlk kez düzenlendiğinde bu fuar Türki Cumhuriyetler, Ortadoğu ve Avrupa'daki patates sektörünün liderleri, yerli ve diğer yabancı patates üreticileri ve sektör profesyoneli ziyaretçiler tarafından oldukça yoğun ilgi görmüştür (Anonim, 2019).

Fuar, 18-20 Ağustos 2021 tarihleri arasında tekrar Konya-Selçuklu-Karaömerler'de bu kez Covid-19 pandemisi tedbirleri altında düzenlenmesine rağmen 50 adet katılımcı firma, 3451 adet üretici ve/veya profesyonel ziyaretçilerden tekrar büyük ilgi görmüştür. Patates konusunda zirai ilaç ve gübre üreten yerli ve uluslararası firmalar minimum 400 metrekarelik kendi alanlarında patates üretimi gerçekleştirdi ve üretmiş oldukları ilaç ve gübreleri uygulayarak göstermişlerdir. Kök hücreden patates tohumu üreten yerli firmalardan, patates tohumu konusunda faaliyet gösteren uluslararası firmalara kadar patates tohumu üreten yurtiçi ve yurtdışına satışını gerçekleştiren tüm firmalar fuarda bulunmuştur. Bununla birlikte sözleşmeli üretim yaptıran sanayilik patates üretimi konusunda faaliyet gösteren kuruluşlarda fuara büyük ilgi göstermiştir. Tarla hazırlığından patates hasadına kadar çiftçinin ihtiyaç duyduğu bütün tarım ekipmanları bu alanda görerek değerlendirme fırsatı olmuştur (Anonim, 2021).

Fuar, 23-25 Ağustos 2023 tarihleri arasında 3. kez ve yeni yerinde Nevşehir-Gülşehir'de düzenlenmiştir. 65.000 metrekarelik açık alan uygulamalı tarım fuarı, 70'den fazla katılımcıya ev sahipliği yaparak patates endüstrisindeki tohumlar, gübreler, bitki koruma ürünleri, makineler ve ekipmanlarda dahil olmak üzere yenilikçi ürün ve hizmetleri 572'si yabancı ziyaretçi olmak üzere toplam 5760 ziyaretçiye sergiledi. Ziyaretçiler, makine demonstrasyonlarına tanık olmuş ve kampus alanların yanı sıra, 90'dan fazla patates çeşidinin yer aldığı 25 patates deneme alanını yerinde incelemişlerdir. Fuar, sektördeki en son teknik gelişmeleri takip etmek isteyen patates çiftçileri için önemli bir platformdur ve bu gelişmeler uygulamalı bir şekilde değerlendirilmiştir. Yeni patates türlerinin sergilendiği 500 m2'lik deneme parsellerinden oluşan, sergi alanı, ziyaretçiler, farklı herbisit ve gübrelerin patates mahsulü üzerindeki etkilerini ilk elden gözlemleme ve çeşitli yöntemleri karşılaştırma fırsatı bulmuştur. Makine parkurunda toprak hazırlığından hasada kadar en son teknolojiye sahip makineler çalışır durumda sergilenmiştir (Anonim, 2023).

Fuarın 4.'sünün 19-21 Ağustos 2025 tarihleri arasında tekrar gerçekleştirildiği Nevşehir-Gülşehir'de gerçekleştirilmiştir. Fuar, 8 hektar civarı alanda yapılmış, 78 katılımcı firma ve 5.113 ziyaretçi tarafından yerinde ilgi görmüştür. Türkiye ve çevre bölgelerden gelen uzman patates ziyaretçilerine, tohum, gübre, bitki koruma ve 10 makine ve ekipman alanındaki yeniliklerin yanı sıra makine gösterileri ve saha stantlarının sunulduğu 25 patates deneme alanını yakından inceleme fırsatı sunulmuştur. Fuar ziyaretçilerinin 521'i yabancı VIP sektör temsilcilerindendir. Bu ziyaretçiler, Kazakistan, Özbekistan, Rusya, Hindistan, Irak, Sudan, Lübnan, Fransa, Hollanda ve Avusturya gibi ülkelerden gelerek etkinliğe uluslararası bir boyut kazandırmıştır. Katılımcı firmalar, Türkiye'de üretimi yapılan 1 milyon dekarın üzerindeki patates ekim alanına sahip büyük ve orta ölçekli üreticilerle doğrudan buluşma imkânı yakalamış, böylece yeni iş birliklerinin önü açılmış ve sektör için stratejik bağlantılar kurulmuştur (Anonim, 2025a).

Fotoğraf 2. Potato Days Türkiye Fuarı

Ziyaretçiler, fuar sırasında çok sayıda ülkelerden ve Türkiye'den sektörün önde gelen üreticileri ile bir araya gelme fırsatı yakalamaktadır. Fuar ile, sözleşmeli üretim yapan firmalar ve karar vericiler ile bir araya gelme imkanı, da bulunabilmektedir. Fuarda, patates üretimiyle ilgili en yeni makineler, ekipmanlar, sulama sistemleri ve tarımsal yenilikler uygulamalı olarak yerinde gösterilebilmektedir. Tarla ortamında yapılan demonstrasyonlarla yeni teknolojilerin sahada nasıl çalıştığı görülebilir, makineler ve ekipmanlar test edebilir. Fuara özel satış kampanyalarından yararlanma imkanına sahip olunabilir. Fuar, patates ürününün toprak hazırlığından nihai ürüne kadar her aşamasının firma ve ürün düzeyinde yer aldığı Türkiye'deki tek organizasyon olma özelliği taşımaktadır (Anonim, 2025b).

Fuarda katılımcı firmalar tarafından ürün, firma ve yeniliklerini tanıtma, fuar organizatörleri tarafından fuara ilginin artırılması bağlamında çeşitli yarışmalar ve söyleşiler ile sektör öncü ve liderlerinin, kamu kurumlarının ve meslek örgütlerinin çok çeşitli gösterileri görülebilmektedir.

Üreticiler, Türkiye ve dünyadan farklı patates çeşitlerini, tohumları ve yetiştiricilik tekniklerini inceleyerek verimi artıracak yeni çözümler keşfedebilir. Patates sektöründe tohum ıslahçısı, üretici ve dağıtımcı firmalar yeni ve halihazırdaki çeşitlerini, toprak düzenleyiciler/ üst gübreler ve bitki besleme/ bitki koruma ürünleri imalatçıları ve dağıtımcıları en son ürünlerini, sulama sistemi tasarımcıları yeni sulama teknikleri ve ürünlerini, anında ve yerinde gösterebilme, performansını deneyimletme, ürünü ispatlayabilme gibi tarımda açık alan uygulama fuarcılığının imkânlarını kullanabilmektedir. Bunun, üreticiler üzerinde şüphe bırakmama, kullandırma, performansın ölçülebilmesi gibi olumlu özellikleri, fuar sırasında ve sonralarında firmaları öne çıkarabilmektedir.

Patates ekim ve hasat makinaları ve teknolojileri, mekanik ot kontrolü teknolojileri, depolama çözümleri konusunda faaliyet gösteren ve fuarın katılımcıları olan firmalar, açık alanda ve ürünün özelliklerinin sunarak fuar sırasında ziyaretçilerin ilgisini çekebilmektedir. Bu firmaların ürün tanıtımı ve pazarlamasının etkin, üreticiler için anlaşılabilir ve kanıtlanabilir olması, uygulamasının anında gösterilebilmesi ile firmalar, üreticilere ve fuara katkıları bulunmaktadır.

Başta çiftçi örgütlenmeleri olmak üzere tarımsal alanda faaliyeti olan yerli ve yabancı meslek örgütlerinin fuarda standlarının olması, sunumlara katılmaları ve söyleşi düzenlemeleri, meslektaşlar arasında etkileşim oluşturarak bilgi aktarımına katkı sağlamaktadır. Ziraat Odaları, Ziraat Mühendisler Odası gibi meslek ve sivil toplumun fuarda tarımsal üretimin beklenti, güçlük ve fırsatlarının yayılmasında katkısının olması beklenmektedir. Üreticiler, patates sektör uzmanlarıyla bir araya gelerek yeni iş bağlantıları kurabilir ve bilgi paylaşımında bulunabilir. Üreticilerin, topladıkları broşür ve kitapçıkların tarımsal üretim süreçlerinde kaynak olduğu bilinmektedir (Çukur, 2013).

Üniversite, enstitü gibi kurumlar ile bilginin ışığından gitmeyi benimsemiş akademisyenlerin hizmet sundukları üreticilerin oldukları yerlerde üzerlerine düşen sorumlulukla hareket etmeleri beklenmektedir. Bu bağlamda, tarımda açık alan fuarında bunlardan bulunma ve bilgi aktarmaları aranmaktadır. Tarım uzmanları ve akademisyenler tarafından verilen eğitimler ve paneller katılım patates yetiştiriciliği, hastalıklarla mücadele, gübreleme ve sürdürülebilir tarım konularında bilgi edinmeyi sağlar. Üreticiler, bu şekilde araştırma kuruluşları, yayım kuruluşları ve üniversitelerin personelleriyle bir araya gelebilir (Çukur ve Çukur, 2017).

Üreticiler, üretimlerine katkı sağlayacak, sorunlarıyla ilgilenecek ve politikaların yapılmasında karşılık bulabilecekleri kimseleri tarımda açık alan uygulamalı tek ürün fuarında görmek istemektedir. Bu kapsamda, kredi imkanlarını açıklamak üzere tarımda kredi veren kuruluşlar ile sektör öncüleri ve liderlerinin söyleşiler için fuara davet edilmeleri önemlidir.

Fuar organizasyonunun başarısı için fuar organizatörleri ve sponsorlarının firmaların ve ziyaretçilerin fuara katılım hedef ve amaçlarını tam olarak karşılaması, fuarın plan ve programa uygun gerçekleştirilmesi, sonraki yıllarda geliştirilebilir olması gerekmektedir. Bu anlamda, fuar alanı sahası, temel ihtiyaçlar, güvenlik-sağlık-ulaşım koordinasyonunun başarılı olması gerekmektedir.

Valilik, Kaymakamlık, Belediyeler, il/ilçe tarım ve orman müdürlükleri tarım alanında faaliyetlerini ve desteklemelerini anlatarak üreticilere ulaşabilmektedir. Bunun yanında, fuarın geniş ve ilgili kesimlere duyurulması, fuar sırasında ulaşım, sağlık, güvenlik, temizlik vb. ile fuarın etkin ve başarılı olabilmesi için merkez ve yerel yönetimlerden desteklenmesi sağlanmalıdır.

Fotoğraf 3. Potato Days Türkiye Fuarı

4. Sonuç

Fuarlara, tarım sektöründe tek bir ürüne odaklanmasına göre bakıldığında, fuarın kurulduğu alanda sektörün paydaşlarının bir arada bulunması ve etkileşim sağlanması önemlidir. Bildiride, Potato Days Türkiye Fuarı'nın ve tarımda açık alan uygulamalı tek ürün fuarcılığın geliştirilmesine katkı sağlaması hedeflenerek kırsal kesime katkıları da detaylıca açıklanmıştır. Bu araştırmanın, tarımda açık alan uygulamalı tek ürün fuarcılığı hususundaki sınırlı literatüre katkı sağlanması hedeflenmiştir.

Avrupa'da ilki 2006 yılından başlayarak her yıl 4 farklı ülkede gerçekleştirilen ''Potato Europe'' fuarının bir benzeri olarak, Türkiye'de ''Potato Days Türkiye Fuarı'' ismiyle gerçekleştirilen organizasyon, 2019 ve 2021 yıllarında Konya-Selçuklu-Karaömerler'de, 2023 ve 2025 yıllarında Nevşehir-Gülşehir'de olmak üzere 4 kez organize edilmiştir. Avrupa'daki benzerinin fuar saha büyüklüğü, açık ve kapalı alan aktivite çeşitliliği, katılımcı ve ziyaretçi sayıları, devamlılığı ve diğer başarılarına dikkat edilmelidir. Türkiye'deki fuarın halihazırdaki başarısı ve fuar organizatörlerinin deneyimi, Türkiye'nin patates sektörü ve alandaki potansiyeli varlığı birlikte değerlendirildiğinde fuarın geliştirilebilir olduğu açıkça görülmektedir.

'Potato Days Türkiye Fuarı', kırsalda tarımsal üreticilerin patates ürünü ile ilgili teknoloji ve yenilikleri görebilmeleri, sektörle etkileşim kurabilmeleri ve üretimlerine katkı sağlayabilmeleri bakımından önemlidir. Tarım sektöründeki firmalar da, çiftçilere ulaşabilmek, ürünlerini pazarlamak ve firma bilinirliğini artırmak amacıyla yerinde göreme imkanı sunan tarımda açık alan uygulamalı tek bir tarım ürününde (patates) uzmanlaşmış bu fuarı tercih etmektedir. Kırsal kesim ve yerel halk ise, fuarın doğrudan ve dolaylı etkileri ile yörenin ekonomik kalkınmasından çok çeşitli şekillerde faydalanmaktadır.

Bu fuarın konusu olan patates gibi bazı tarım ürünlerinde dalgalanmaya neden olan pek çok problem bulunabilmektedir. Buna karşın, pek çoğu tarımsal yayım ve haberleşme eksikliklerinden de kaynaklanabilen üreticilerin ekip ekmeme nedenlerinin araştırılmasının, fuarın tarımsal yayım ve haberleşme olanaklarını artıran yönünden daha fazla faydalanılmasıyla üretici iletişiminin güçlendirilmesinin üretim ve tüketimdeki dalgalanmaları azaltabileceği dikkate alınmalıdır. Bu açıdan bakıldığında, patates gibi tarımsal ürünlerle ilgili düzenlenen fuar gibi organizasyonların tarımsal yayım ve haberleşmeyi geliştirdiği üretici, firma ve diğer sektör paydaşları arasında iletişimi ve birlik kurmayı güçlendirdiği görülmelidir.

Patates ürününün tarladan sofraya bütün süreçlerinin yer aldığı, sektörün önemli bir kısım üretici ve profesyonellerinin bir arada olduğu fuara her yıl daha geniş bir ilgi olmaktadır. Fuarda, gerek katılımcıların profesyonelleri gerek yabancı ziyaretçilerle olan gerek organizatörlerin söyleşileri uluslararası tarımsal bilgi ve en iyi uygulamaların paylaşılmasına imkan vermektedir. Örneğin; 2023 yılında Özbekistan Patates Birliğinin, Kazakistan ve Rusya Patates Yetiştiricileri Birliğinin katılımları, 2025 yılındaki Türki Cumhuriyetlerden ve Uzak Doğu'dan uzmanların fuardaki söyleşileri, her yıl Azerbaycan, Ermenistan, Irak, Lübnan, İran, Hollanda, Almanya, Yunanistan, İngiltere, Sudan, Kırgızistan ve diğer pek çok ülkeden gelen uluslararası ziyaretçilerin etkileşimleri bilginin aktarılması için kıymetlidir.

Fuarın hem üreticilere hem firma katılımcılarına faydalarının doğru kurulan karşılıklı etkileşimlerle artırılması olanakları bulunmaktadır. Örneğin; patates bitkisindeki arz talep dengesizliğine ve fiyat belirsizliklerine karşın, fuarın üretici ve firmalar arasında işbirliği imkanlarının geliştirilmesi, sözleşmeli üretimin anlatılması, desteklerin duyurulması ve bilgilendirilmeler için avantajlarından yararlanılmalıdır. Doğrudan patates ürünün katma değerini artırması ile yöredeki üreticilere ve yöreye diğer ekonomik katkıları düşünülerek fuarın yerel yönetimler tarafından reklam, duyuru, ulaşımın kolaylaştırılması ve diğer yöntemlerle daha fazla desteklemesi sağlanmalıdır.

Türkiye'nin sahip olduğu olanaklar, pek çok farklı tarım ürünü için ve birbirinden farklı illerinde açık alan uygulamalı özellikli fuar geliştirilmesine imkan sağlayabilir. Örneğin; pek çok ilin kendisine özgü ürünleri bulunmaktadır. Bir yörede açık alan uygulamalı tek bir tarım ürününe özel fuar düzenlenebileceği gibi yörenin birden fazla ürünü için aynı anda tek bir açık alan uygulamalı fuar da düzenlenebilir. Bu şekilde planlanacak fuarların yerel üretime ve coğrafi işaretlemeye olası katkıları da araştırılmalıdır. Ancak, bu alanda yeterince araştırma bulunmadığı tespit edilmiştir. Bu bakımdan, Türkiye'nin var olan potansiyelinin derinlemesine saha araştırmalarıyla ortaya çıkarılması önerilmektedir.

ÖZET

Son yıllarda teknolojide yaşanan hızlı gelişmeler, tarım sektöründe de yenilikçi uygulamaların hayata geçirilmesine zemin hazırlamıştır. Yapay zekâ teknolojileri, yalnızca endüstriyel üretim süreçlerinde değil, aynı zamanda karar verme, veri yönetimi ve veri analizi gibi çok boyutlu alanlarda da giderek artan bir kullanım alanı bulmaktadır. Günümüzde tarım alanında yapay zekâ tabanlı sistemlerin bilgi toplama, işleme, depolama ve analiz süreçlerinde etkin şekilde kullanılması kaçınılmaz bir gereklilik hâline gelmiştir. Özellikle karmaşık problemlerin çözümünde Yapay Sinir Ağları, Bulanık Mantık ve Genetik Algoritmalar gibi yapay zekâ temelli yöntemler sıklıkla başvurulan yaklaşımlar arasında yer almaktadır.

Yapay zekâ, tarım makinelerinin otomasyonu ve robotik sistemlerin entegrasyonu yoluyla tarımsal verimliliği artırmakta ve insan müdahalesine ihtiyaç duyulmaksızın birçok tarımsal faaliyetin gerçekleştirilmesine olanak sağlamaktadır. Bu sayede hem iş gücü tasarrufu sağlanmakta hem de tarımsal faaliyetler daha hassas ve etkin bir şekilde sürdürülebilmektedir. Ayrıca yapay zekâ, gübre, su ve diğer tarımsal girdilerin daha verimli kullanılmasına katkı sunmaktadır. Bu girdilerin doğru miktarlarda ve doğru zamanlarda uygulanması, gereksiz maliyetlerin azaltılmasına ve çevresel etkilerin en aza indirilmesine imkân tanımaktadır. Bununla birlikte, pazar ve fiyat analizlerinde yapay zekânın kullanımı da çiftçiler açısından önemli avantajlar sağlamaktadır. Yapay zekâ tabanlı veri analitiği araçları, piyasa trendleri ile fiyat dalgalanmalarını analiz ederek üreticilerin ürünlerini en uygun fiyatlardan pazarlamalarına rehberlik edebilmekte ve karar alma süreçlerinde stratejik katkılar sunmaktadır. Yapay zekâ, tarımsal üretimde verimliliğin artırılması ve kayıpların en aza indirilmesi amacıyla da etkin bir biçimde kullanılmaktadır. Özellikle bitki hastalıklarının erken ve doğru teşhisi, tarımsal kayıpların önlenmesinde kritik bir rol oynamakta olup, bu durum gelişen teknolojilerin entegrasyonu sayesinde mümkün hâle gelmektedir.

Tarım ürünlerinin işlenmesi, sınıflandırılması ve kalite değerlendirilmesinde farklı yapay zekâ tabanlı yöntemlerin kullanıldığı çeşitli çalışmalar mevcuttur. Bu kapsamda, muz hastalıklarının tespiti ve bu hastalıklarla mücadele yöntemlerinin belirlenmesi, arpa tanelerinin sınıflandırılması ve kahve çekirdeklerinin kalite derecelendirilmesi amacıyla uzman sistem uygulamalarından yararlanılmıştır. Öte yandan, tohumların hazırlanmasında farklı çıkarma yöntemlerinin sıralanması, çeşitli nem içeriklerine sahip fasulyelerin fiziksel parametrelerinin tahmin edilmesi, soğanların kuruma kinetiğinin belirlenmesi ve kurutma sürecinde dutun nem oranının tahmin edilmesi gibi çalışmalarda bulanık mantık yaklaşımı tercih edilmiştir. Ayrıca, kurutulmuş havuçların kalite değerlendirmesi ve sınıflandırılması, sarımsağın duyusal kalitesinin tahmini, mangonun ağırlık tahmini, pirinç üretim veriminin öngörülmesi ve pirinç

mahsul verimini etkileyen faktörlerin incelenmesi süreçlerinde ise yapay sinir ağları (YSA) kullanılmıştır.

Bu çalışmada tarım alanında kullanılan yapay zekayla ilgili çalışmalardan ve uygulamalardan bahsedilecektir.

Anahtar Kelimeler: Yapay Zekâ, Tarım, Yapay Sinir Ağları, Bulanık Mantık, Genetik Algoritmalar, tarında uygulamalar

APPLICATIONS OF ARTIFICIAL INTELLIGENCE IN AGRICULTURE

ABSTRACT

Rapid developments in technology in recent years have paved the way for innovative applications in the agricultural sector. Artificial intelligence technologies are finding increasing use not only in industrial production processes but also in multidimensional areas such as decision-making, data management, and data analysis. Today, the effective use of artificial intelligence-based systems in information gathering, processing, storage, and analysis processes has become an inevitable necessity in the field of agriculture. Artificial intelligence-based methods such as Artificial Neural Networks, Fuzzy Logic, and Genetic Algorithms are frequently used approaches, especially in solving complex problems.

Artificial intelligence increases agricultural productivity through the automation of agricultural machinery and the integration of robotic systems, enabling many agricultural activities to be carried out without the need for human intervention. This saves labor and allows agricultural activities to be carried out more accurately and efficiently. In addition, artificial intelligence contributes to the more efficient use of fertilizers, water, and other agricultural inputs. Applying these inputs in the right amounts and at the right times reduces unnecessary costs and minimizes environmental impacts. Furthermore, the use of artificial intelligence in market and price analysis provides significant advantages for farmers. Artificial intelligence-based data analytics tools can guide producers in marketing their products at the most appropriate prices by analyzing market trends and price fluctuations, and provide strategic contributions to decision-making processes. Artificial intelligence is also effectively used to increase productivity and minimize losses in agricultural production. In particular, the early and accurate diagnosis of plant diseases plays a critical role in preventing agricultural losses, which is made possible through the integration of developing technologies.

There are various studies in which different artificial intelligence-based methods are used in the processing, classification, and quality assessment of agricultural products. In this context, expert system applications have been used to detect banana diseases and determine methods to combat these diseases, classify barley grains, and grade the quality of coffee beans. On the other hand, the fuzzy logic approach has been preferred in studies such as ranking different extraction methods in seed preparation, estimating the physical parameters of beans with various moisture contents, determining the drying kinetics of onions, and estimating the moisture content of mulberries during the drying process. Additionally, artificial neural networks (ANNs) were used in processes such as the quality assessment and classification of dried carrots, the estimation of garlic's sensory quality, the weight estimation of mangoes, the prediction of rice production yield, and the examination of factors affecting rice crop yield.

This paper will discuss studies and applications related to artificial intelligence used in agriculture.

Keywords: Artificial Intelligence, Agriculture, Artificial Neural Networks, Fuzzy Logic, Genetic Algorithms, Applications in Agriculture

GİRİŞ

Yapay zekâ, insan gibi düşünebilen, yorum yapabilen ve karar alabilen bilgisayar programlarının geliştirilmesine olanak tanımaktadır. Bu teknolojinin giderek daha yaygın kullanılması ve bilimsel ilerlemelerle desteklenmesi, mesleklerin niteliğini ve iş gücüne duyulan gereksinimleri de değiştirmektedir. Buna bağlı olarak bazı mesleklerde ihtiyaç azalırken, bazı alanlarda ise yeni gereksinimler ortaya çıkmakta ve artış göstermektedir (Karakaya, 2025).

Yapay zekâ, tarım sektöründe verimliliğin artırılmasına ve sürdürülebilirlik hedeflerine ulaşılmasına önemli katkılar sağlayan kritik bir teknolojik araçtır. Tarımsal süreçlerin optimize edilmesi ve kaynak kullanımının azaltılması amacıyla yapay zekâyla birlikte çeşitli dijital teknolojilerden yararlanılmaktadır (Nabatov, 2024).

Yapay zekâ, tarım makinelerinin otomasyonu ve robotik sistemlerin entegrasyonu yoluyla tarımsal verimliliği yükseltmekte, insan gücüne ihtiyaç duymaksızın tarımsal faaliyetlerin yürütülmesine imkân tanımaktadır. Bu durum hem iş gücünde tasarrufu sağlamakta hem de tarımsal faaliyetlerin daha hassas ve etkin biçimde sürdürülmesini sağlamaktadır (Sui, Thomasson ve Huang, 2018). Ayrıca yapay zekâ, gübre, su ve diğer tarımsal girdilerin doğru miktar ve zamanda uygulanmasını sağlayarak hem maliyetleri azaltmakta hem de çevresel etkilerin en aza indirilmesine katkı sunmaktadır (Zhang, Wang ve Wang, 2002).

Bunun yanı sıra, yapay zekânın pazar ve fiyat analizlerinde kullanımı çiftçilere stratejik avantajlar sağlamaktadır. Yapay zekâ tabanlı veri analitiği araçları, piyasa eğilimlerini ve fiyat dalgalanmalarını inceleyerek üreticilerin ürünlerini en uygun koşullarda pazarlamalarına rehberlik etmektedir (Kamilaris, Kartakoullis ve Prenafeta-Boldú, 2017).

YAPAY ZEKÂ

Yapay zekâ, bilgisayar biliminin bir alt alanı olarak, insan düşünce ve davranışlarını taklit etmeyi ve aynı zamanda bunları geliştirmeyi amaçlayan, gelişmekte olan bir bilim dalı ve teknolojidir (Atilla, 2022).

Yapay zekâ, işlevsel açıdan çevresini algılayabilen ve belirlenen hedeflere ulaşma olasılığını en üst düzeye çıkaracak eylemleri gerçekleştirebilen bir uygulamalı zekâ biçimi olarak tanımlanabilir. Buna karşılık doğal zekâ, insan düşünme süreçleri ve hayvan bilişi tarafından sergilenen bilinç ve duygusal unsurları içermektedir (Atilla, 2022).

Yapay zekânın temelinde yer alan teknoloji, dört ana süreç kapsamında değerlendirilmektedir (Atilla, 2022).

- **Veri toplama:** Yapay zekâ uygulamalarında kullanılacak verilerin elde edilmesi için uygun teknolojiler belirlenir.
- **Veri depolama:** Yapay zekâ verileri çoğunlukla büyük veri niteliğinde olduğundan, geniş kapasiteli depolama alanlarına ihtiyaç duyulmaktadır. Bu bağlamda, bazı işletmeler bulut depolama çözümlerinden yararlanırken, bazıları kendi veri merkezlerini inşa etmektedir.
- **Veri işleme ve analitiği:** Verilerden anlam çıkarabilmek için algoritmalar kullanılmakta; derin öğrenme, makine öğrenmesi ve görüntü tanıma gibi teknolojiler bu sürece dâhil edilmektedir.
- **Veri çıktısı ve raporlama:** İşletmenin hedeflerine uygun şekilde, analiz edilen verilerin çıktı ve raporlaması için gerekli teknolojiler kullanılmaktadır.

Yapay zekânın temel bileşenleri altı ana alan kapsamında ele alınmaktadır (Atilla, 2022):

- **Doğal dil işleme (NLP):** Bilgisayarların insanlarla etkili bir iletişim kurabilmesi, dilin doğru bir şekilde anlaşılması ve kullanılabilmesi.
- **Bilgi temsili:** Bilgisayarın edindiği veya algıladığı verileri sistematik biçimde saklayabilmesi.
- **Otomatik akıl yürütme:** Depolanan bilgilerin kullanılarak sorulara yanıt verilmesi ve yeni çıkarımlar yapılması.
- **Makine öğrenmesi:** Yeni modellerin algılanması, çıkarımların yapılması ve değişen koşullara uyum sağlanabilmesi.
- **Bilgisayarlı görü:** Nesnelerin tanınması, algılanması ve görsel verilerin yorumlanabilmesi.
- **Robot teknolojisi:** Fiziksel nesnelerin hareket ettirilmesi ve manipüle edilebilmesi.

Bu uygulamalar sayesinde çok sayıda değişkenin eşzamanlı olarak analiz edilmesi mümkün hâle gelmekte, bu durumda daha hızlı ve isabetli karar süreçlerinin geliştirilmesine olanak tanımaktadır. Son yıllarda gerçekleştirilen çalışmalar, yapay zekâ destekli modelleme tekniklerinin; araştırma ve geliştirme süreçlerini hızlandırma, analiz süresini kısaltma ve daha nitelikli ürünlerin ortaya konmasını sağlama açısından önemli avantajlar sunduğunu ortaya koymaktadır. Ayrıca bu tür sistemler, alternatif çözümlerin hızlı biçimde test edilmesine ve en uygun sonucun etkin şekilde seçilmesine imkân tanıyarak sektördeki inovasyon kapasitesini güçlendirmektedir (Sofu ve ark., 2007).

TARIM ALANINDA YAPAY ZEKÂ UYGULAMALARI

Gelişen teknoloji ile nesnelerin interneti (IoT) ve kablosuz sensör ağları kullanılan sera sistemleri; zaman, enerji, su ve ışık açısından yüksek verimlilik sağlayarak ürün kalitesi ve üretim miktarı açısından önemli avantajlar sunmaktadır. Bu kapsamda geliştirilen akıllı sera sistemleri sayesinde, ısıtma, soğutma, aydınlatma, gölgelendirme ve sulama işlemleri uzaktan erişim yoluyla kontrol edilebilmektedir (Alpay, 2018). Sistemde kullanılan kablosuz sensör ağı, **bulanık mantık yöntemi** ile yönetilmiş; sera için gerekli optimum değerler bu yöntem aracılığıyla hesaplanmıştır. Giriş verilerinden elde edilen çıkış değerleri, android tabanlı bir uygulama üzerinden kullanıcıya aktarılmış ve uzaktan erişim imkânı sağlanmıştır. Ayrıca, bulanık mantık sisteminin ara durumları da düzenli olarak hesaplayabilmesi sayesinde etkin ve sürekli bir kontrol mekanizması oluşturulmuştur (Alpay, 2018).

Cantürk (2018) tarafından gerçekleştirilen bir çalışmada, patlıcan tarlasına ait toprak ve iklim verileri kullanılarak bulanık mantık temelli modellemeler yapılmıştır. Elde edilen bulgular, bulanık mantık yöntemi ile bitki su tüketimi, bitki katsayısı, bitki su stres indeksi ve verim değerlerinin başarıyla modellenebildiğini ortaya koymuştur. Bu modelleme sistemlerinin, bitki verimliliğinin artırılması ve besin maddelerinin daha etkin kullanılmasına önemli katkılar sağlayabileceği belirlenmiştir (Cantürk, 2018).

Daha verimli tarım uygulamaları için ürün çeşitliliğinin doğru şekilde belirlenmesi de kritik öneme sahiptir. Ancak benzer çeşitlerin beşerî imkânlarla tanımlanması hem güç hem de tutarsız sonuçlar doğurabilmektedir. Bu sürecin en etkin biçimde yürütülmesi için yapay zekâ yöntemleri kullanılmaktadır (Mengstu, 2024). Nitekim Mengstu (2024) tarafından yapılan bir çalışmada, 124 buğday çeşidine ait görüntüler farklı açılardan toplanmış ve toplamda 465.000 görüntüden yararlanılarak yapay zekâ yöntemleriyle buğday çeşitlerinin sınıflandırılması gerçekleştirilmiştir.

Bir çalışmada, morfolojik, şekil ve renk özelliklerinden yararlanılarak sınıflandırma işlemlerinin gerçekleştirilmesi amacıyla aynı markaya ait beş farklı pirinç çeşidi seçilmiştir.

Her bir çeşitten yaklaşık 75.000 pirinç tanesi görüntüsü elde edilmiş; bu görüntüler MATLAB yazılımı kullanılarak ön işleme tabi tutulmuş ve özellik çıkarımı için hazırlanmıştır. Sonuçlar incelendiğinde, sınıflandırma sürecine eklenen her yeni özelliğin doğruluk oranını artırdığı görülmüştür. Bu bulgular, pirinç çeşitlerinin sınıflandırılmasında yüksek başarı sağlandığını ve yöntemin etkinliğini ortaya koymaktadır (Çınar, 2019).

Ölmezoğlu (2022) tarafından gerçekleştirilen çalışmada, Türkiye İstatistik Kurumu'ndan (TÜİK) 2002-2020 dönemine ait aylık **Genel Ticaret Sistemi (GTS) Dış Ticaret verileri** elde edilmiştir. Bu kapsamda, 2020 yılına ait kayısı verileri **Yapay Sinir Ağları (YSA), Mevsimsel Otoregresif Entegre Hareketli Ortalama (SARIMA)** ve **Gradyan Artırılmış Ağaçlar (XGBoost)** yöntemleri kullanılarak tahmin edilmiştir. Analiz sonuçları mevcut verilerle karşılaştırıldığında, en uygun tahmin yönteminin **XGBoost** olduğu belirlenmiştir.

Yapay zekâ, tarımsal verimliliğin artırılması ve kayıpların en aza indirilmesi amacıyla da etkin biçimde kullanılmaktadır. Özellikle bitki hastalıklarının erken ve doğru teşhisi, tarımsal kayıpların önlenmesinde kritik bir rol oynamakta olup, bu süreç teknolojik yöntemlerin entegrasyonu sayesinde mümkün hâle gelmektedir (Güzel, 2024). Nitekim Güzel (2024) tarafından yürütülen bir çalışmada, Antalya bölgesinden elde edilen domates yaprağına ait 1100 adet **ToBRFV** (Tomato Brown Rugose Fruit Virus / Domates Kahverengi Buruşukluk Meyve Virüsü) içeren görüntü, veri artırma teknikleri kullanılarak genişletilmiş ve 3070 görüntüden oluşan kapsamlı bir veri kümesi oluşturulmuştur. Bu veri kümesinde yer alan, "hastalıklı" ve "sağlıklı" olmak üzere etiketlenmiş 12 farklı sınıf, çeşitli **Evrişimsel Sinir Ağı (ESA)**mimarileri kullanılarak sınıflandırılmıştır.

3.1. TARIMDA BİLGİ TABANLI UZMAN SİSTEMLERİN KULLANIMI

Bilgi tabanlı sistemler, farklı kaynaklardan ve verilerden elde edilen bilgileri bütünleştirerek karmaşık problemlerin çözümünü amaçlayan bilgisayar programlarıdır. Bu sistemler genel olarak üç ana kategori altında incelenmektedir: uzman sistemler, bilgi tabanlı yapay zekâ uygulamaları ve bilgi tabanlı mühendislik yaklaşımları (Karakaya, 2025).

Uzman sistemler (Expert Systems – ES), karar verme süreçlerinde insan uzmanlarının bilişsel yeteneklerini taklit edebilen, tutarlı ve kolektif yapay zekâ tabanlı bilgisayar sistemleridir (Szturo ve Szczypinski, 2017). Yapay zekâ alanındaki ilk başarılı uygulamalardan biri olarak kabul edilen bu sistemler, belirli bir uzmanlık alanındaki karmaşık sorunların çözümünde, uzman bilgisinin sistematik bir şekilde modellenmesine dayanmaktadır. Uzman sistemler, genel olarak **bilgi tabanı** ve **çıkarım motoru** olmak üzere iki temel bileşenden oluşmaktadır. **Bilgi tabanı**, alanla ilgili gerçekler, kurallar ve uzman görüşlerini depolarken; **çıkarım motoru** ise bu bilgileri işleyerek mantıksal çıkarımlar yapmakta ve çoğunlukla "EĞER–O HALDE (IF–THEN)" kuralları biçiminde ifade edilen yapılar aracılığıyla sonuçlar üretmektedir (Leo Kumar, 2019).

Bu sistemler, uzmanlardan elde edilen bilgilerin bilgi mühendisleri tarafından işlenmesiyle geliştirilmekte olup, karmaşık problemlerin çözümünde doğrudan uzman insana duyulan ihtiyacı azaltmayı hedeflemektedir. Tipik bir uzman sistem; **uzman insan**, **bilgi mühendisi**, **bilgi tabanı**, **çıkarım motoru**, **kullanıcı arayüzü** ve **nihai kullanıcı** gibi bileşenlerden oluşmaktadır. Tarımda özellikle karar destek sistemlerine olan gereksinim doğrultusunda, bilgi tabanlı uzman sistemleri çeşitli alanlarda etkin biçimde kullanmaktadır (Sipos, 2020). Tablo 1a'da, tarımda çeşitli uygulamalarda ES teknolojilerinin son dönem örneklerine yer verilmektedir.

Tablo 1a. Tarımda uzman sistem uygulanması (Karakaya, 2025).

Ürün	**Amaç**	**Sektördeki kategori**	**Önemli sonuçlar**
Muz	Muz hastalığını ve bunların üstesinden gelme yöntemlerini belirlemek	Hammadde/Tarım	Sistem, bitkilerdeki hastalıkları gövde, yaprak ve köklere göre teşhis edebildi ve bu da hastalıkların oluşmasını önlemeye yardımcı oldu.
Kahve çekirdekleri	Kahve çekirdeklerinin kalite derecelendirmesini belirlemek için	Duyusal değerlendirme	Geliştirilen bulanık ES, kahveyi %95 doğrulukla derecelendirebildi
Mısır	Mısır zararlılarını ve hastalıklarını tespit etmek	Tarım/hammadde	Sistem zararlıları ve hastalıkları %76,6 doğrulukla tespit edebildi ve ayrıca bunları kontrol altına almanın yollarını da sağladı Geliştirilen sistem, tanı sonuçlarına ilişkin tesis açıklaması sağlayabilmiştir.
Pirinç mahsulleri	Çiftçilerin pirinç mahsulleri için karar almalarına yardımcı olmak	Tarım/üretme	Çiftçilere, pirinç mahsulleri için tohumların seçilmesi ve zararlılar ve hastalıklarla mücadele edilmesi konusunda ES tarafından yardım edilir ve bu da nihayetinde pirinç mahsullerinin üretimini artacaktır.
Soya fasülyesi	Soya fasulyesindeki hastalıkları tespit etmek	Tarım	Çalışma çerçeve tabanlı gösterim ve kural tabanlı gösterim yöntemini kullanarak doğruluğu karşılaştırarak soya fasulyesi hastalıklarını tanımlamak için başarılı bir şekilde ES tasarladı.
Arpa	Arpa taneleri sınıflandırmak için	Kalite kontrolü	ES yöntemi kullanılarak yapılan sınıflandırma doğruluğu %72'nin üzerindeydi ve bu tatmin edici olarak kabul edildi

3.2. TARIMDA BULANIK MANTIK UYGULAMALARI

Bulanık mantık (Fuzzy Logic – FL), sahip olduğu basitlik, karar verme süreçlerinde sağladığı yüksek hız ve doğruluk nedeniyle uzun süredir endüstriyel uygulamalarda tercih edilen bir yöntemdir. Özellikle gıda endüstrisinde; **modelleme, kontrol, sınıflandırma** ve **duyusal değerlendirme** gibi alanlarda yaygın biçimde kullanılmaktadır (Al-Mahasneh ve ark., 2016).

Bulanık mantığın, geleneksel kontrol sistemlerine kıyasla daha düşük enerji tüketimi sağladığı ve bu sayede üretim süreçlerini daha verimli hâle getirdiği çeşitli araştırmalarla ortaya konmuştur. Nitekim Baliuta ve ark. (2020) tarafından yürütülen bir çalışmada, gıda üretim sistemlerinde FL uygulamasıyla yaklaşık %7 oranında elektrik kaybının önlenebildiği gösterilmiştir. Ayrıca, duyusal değerlendirme gibi öznel unsurların analizinde de bulanık mantığın önemli katkılar sunduğu görülmektedir. Bu tür uygulamalarda, **bulanık kurallar** aracılığıyla problemler daha hızlı ve etkin biçimde çözülebilmekte; böylece karar verme süreçleri daha güvenilir sonuçlar üretmektedir (Cebi ve ark., 2019). Tablo 2a'da, FL'nin tarımda önceki uygulamaları ve bu uygulamaların temel nitelikleri ayrıntılı olarak sunulmaktadır.

Tablo 2a. Bulanık mantığın tarımda uygulanması (Karakaya, 2025).

Ürün	**Amaç**	**Bulanık çıkarım sistemi**	**Önemli sonuçlar**
Karahindibağ tohumu	Tohumların hazırlanmasında farklı çıkarma yöntemlerini sıralamak	Mamdani Üçgen	Özelliklere ekstraksiyon çıktısına ve süreye dayalı sıralama, tohumların hazırlanması için en iyi yöntemi belirlemeyi mümkün kılmıştır
Ananaslı rasgulla	Rasgulla ananasını parametrelere göre sıralamak için	TSK Üçgen	Rasgulla ananasının farklı konsantrasyonları için duyusal değerlendirme ve örneklerin sıralanması FL modeli kullanılarak başarıyla gerçekleştirildi.
Beyaz dut	Kurutma işlemi sırasında dutun nem oranını tahmin etmek	Mamdani Üçgen	Model, R2 değerinin 0,9996 ve RMSE değerinin 0,01095 olduğu değişen koşullar altında dut ağacının nem oranını yüksek doğrulukla tahmin edebilir.
Pancar şekeri	Çeşitli içerik oranlarına sahip şekerlemeleri sıralamak için	Mamdani Üçgen	Geliştirilen model, farklı bileşen oranlarını içeren şekerlemelerin sıralamasını optimize etmeyi ve gerçekleştirmeyi başardı.
Soğanlar	Soğanların kuruma kinetiğini tahmin etmek	Mamdani Üçgen	Model, R değerinin 0,9999 ve düşük ortalama karekök hatasının (RMSE) 0,004157 olduğu yüksek performansla değişen koşullarda nem oranını tahmin edebildi.
Bakla fasülyesi	Çeşitli nem içeriklerine sahip fasulyelerin fiziksel parametrelerini tahmin etmek	Mamdani Üçgen	Model, girdideki nem içeriği %9,3 ile %31,3 arasında değişen fasulyelerin on üç parametresini tahmin edebildi. FL sonuçları ile deneysel değer arasında karşılaştırma yapıldı: burada 0,999 olan yüksek bir korelasyon değeri ve %1,23-

			12,56 aralığında ortalama, standart sapma elde edildi ve bu, işleme sırasında çeşitli aşamaları kontrol etmek ve yönetmek için bir model geliştirmek amacıyla kullanılabilir.

3.3. TARIMDA YAPAY SİNİR AĞLARI UYGULAMALARI

Yapay Sinir Ağları (YSA), insan beyninin işleyişini taklit etmek amacıyla geliştirilen, öğrenme süreçlerini nöronlar arasındaki bağlantılar üzerinden ve sinaptik ağırlıklar temelinde gerçekleştiren bir yapay zekâ teknolojisidir (Kumar, 2016; Al-Waeli ve ark., 2019). YSA'larda kullanılan veri setleri, ağı eğitmek amacıyla uygulanan çeşitli öğrenme algoritmalarıyla ilişkilendirilmekte olup, bu algoritmalar genel olarak üç temel grupta incelenmektedir: **denetimli öğrenme**, **denetimsiz öğrenme** ve **pekiştirmeli öğrenme**. Eğitim sürecinin tamamlanmasının ardından, model test verileri üzerinde denenmekte ve elde edilen çıktılar analiz edilerek sistemin performansı değerlendirilmektedir (Shanmuganathan, 2016).

Önceki araştırmalar, **yapay sinir ağlarının (YSA)** tarımda farklı görevlerde başarıyla uygulandığını ortaya koymuştur. Bu uygulama alanları; **numune sınıflandırması, ısı ve kütle transferi gibi karmaşık mühendislik hesaplamaları, kontrol sistemleri** ve **öngörüsel analizler** şeklinde çeşitlilik göstermektedir (Karakaya,2025). Tablo 3a'da sunulan örneklerde de görüldüğü üzere, söz konusu uygulamaların büyük çoğunluğu yüksek **R^2 (belirleme katsayısı)** değerleri elde etmiştir. Bu bulgular, yapay sinir ağlarının tarımda doğru, güvenilir ve etkin sonuçlar sağlayabilme potansiyelini açıkça ortaya koymaktadır.

Tablo 3a. Tarımda yapay sinir ağlarının uygulanması (Karakaya, 2025).

Ürün	**Amaç**	**YSA Türleri**	**Önemli sonuçlar**
Pirinç mahsulü	Pirinç üretim verimini tahmin etmek ve pirinç mahsul verimini etkileyen faktörleri araştırmak	Çok kanallı	Geleneksel doğrusal regresyon yöntemlerine kıyasla pirinç üretim verimini tahmin etmek için iyi bir alternatif Geliştirilen algoritma ile elde edilen doğruluk %97,54, duyarlılık %96,33 ve özgüllük %98,12 idi.
Patlıcan	Patlıcanların ozmotik dehidrasyondaki (OD) kütle transfer kinetiğini tanımlamak	Çok kanallı	Yüksek hacimli karmaşık problemler YSA kullanılarak modellenebilir ve analiz edilebilir ve hesaplama problemleri için en uygun yazılımdır. Geliştirilen model yüksek 0,9825'lik en R2 değerine ulaştı
Sarımsak	Sarımsağın duyusal kalitesini tahmin etmek	Çok kanallı	Sarımsak ve sarımsak ürünlerinin duyusal kalitesinin en iyi tahminini sağlayan bir model. 0.9866 R2 değeriyle geliştirildi

Mango	Mangonun ağırlığını tahmin etmek için	Çok kanallı	Mangoların ağırlığının tahmini, modele on üç farklı parametrenin uygulanmasıyla yapılabilmiştir.
Mantarlar	Kurutma işlemi sırasında mantarların nem içeriğini tahmin edebilen bir YSA modeli geliştirmek	Çok kanallı	ANN modeli, kurutma işlemi sırasında mantarların nem içeriğini 0,9817 R değeriyle tahmin edebildi.
Mantarlar	Oda sıcaklığını etkileyen parametrelere dayanarak mantar yetiştirme salonunun sıcaklık çeşitliliğini tahmin etmek	MLP, RBF	RBF yöntemi kullanılarak yapılan tahmin, korelasyon değerinin sırasıyla 0.996 ve 0,9612 olduğu MLP'ye kıyasla daha yüksek bir doğruluğa sahiptir.
Soğanlar	Soğanın kuruma davranışını tahmin etmek için	Çok kanallı	Geliştirilen model, R değerinin 0.99956 değerine ulaştığı yüksek bir performansla soğanların farklı sıcaklık ve zamanlardaki kuruma kinetiğini tahmin edebildi.
Ayva meyvesi	Kurutma işlemi sırasında meyvenin nem oranını belirlemek ve geliştirilen modelin performansını test etmek	Çok kanallı	Farklı YSA yapıları uygulanarak, ayva meyveleri için kurutma işlemi sırasında nem oranı başarılı bir şekilde modellenmiştir. Geliştirilen model, elde edilen R2'nin %99'dan büyük olduğu yüksek korelasyon değerine sahip nem oranını tahmin edebildi.
Kurutulmuş sebzeler	Kurutulmuş havuçların kalitesini belirlemek ve bu tür kurutulmuş ürünlerin sınıflandırılması	Çok kanallı	Kuru havuçların değerlendirilmesi ve sınıflandırılması için kullanılmaya uygundur. Kalite değerlendirmesi için önemli temsili özelliklerin seçilmesini sağlayın. Algoritmalar arasında karşılaştırma yapıldı ve geri yayılım, diğer algoritmalarla karşılaştırıldığında en başarılı algoritmadır

3.4. TARIMDA MAKİNE ÖĞRENMESİ UYGULAMALARI

Makine öğrenimi (Machine Learning – ML), yapay zekânın bir alt dalı olarak kabul edilmekte olup, bilgisayar algoritmalarının deneyimlerden yola çıkarak otomatik olarak gelişmesini sağlayan bir yöntemdir (Butler ve ark., 2018; Sharp ve ark., 2018). ML algoritmaları genel olarak üç ana kategoriye ayrılmaktadır: **denetimli öğrenme, denetimsiz öğrenme** ve **pekiştirmeli öğrenme** (Erickson, Korfiatis ve ark., 2017; Mullainathan ve Spiess, 2017).

- **Denetimli öğrenme**, belirli bir girdi kümesine dayalı olarak hedeflenen çıktının tahmin edilmesini sağlayan, yapılandırılmış bir öğrenme sürecidir (Mullainathan ve Spiess, 2017).
- **Denetimsiz öğrenme**, önceden tanımlanmış bir çıktı bulunmaksızın, verilerin iç yapısını analiz ederek doğal örüntüleri ve gizli ilişkileri keşfetmeyi amaçlamaktadır (Deo, 2015).
- **Pekiştirmeli öğrenme** ise sistem ile çevresi arasındaki etkileşimler aracılığıyla, ödül temelli karar alma süreçlerinin optimize edilmesine odaklanmaktadır (Carleo ve ark., 2019).

Tarımda yaygın olarak kullanılan başlıca **makine öğrenimi (ML) yöntemleri** arasında**; sıradan en küçük kareler regresyonu (OLS-R), kademeli doğrusal regresyon (SL-R), temel bileşen regresyonu (PCR), kısmi en küçük kareler regresyonu (PLSR), destek vektör regresyonu (SVM-R), güçlendirilmiş lojistik regresyon (BLR), rastgele orman regresyonu (RF-R) ve k-en yakın komşular regresyonu (kNN-R)** yer almaktadır (Estelles-Lopez ve ark., 2017). Literatürdeki araştırmalar, ML tabanlı yaklaşımların özellikle **duyusal analiz maliyetlerinin azaltılması, karar verme süreçlerinin iyileştirilmesi ve kullanıcı odaklı iş stratejilerinin geliştirilmesi** konularında etkin bir rol üstlendiğini göstermektedir (Lu ve ark., 2020). Makine öğreniminin tarımdaki başlıca kullanım alanları ve sağladığı avantajlar, Tablo 4a'da özetlenmiştir.

Tablo 4a. Tarımda makine öğrenmesi uygulanması (Karakaya, 2025).

Ürün	**ML yöntemleri**	**Önemli sonuçlar**
Elma	Doğrusal ayırıcı analiz, adaptin güçlendirme	ML, toplanan akustik emisyon sinyallerini kullanarak elmaları %100 oranında doğru bir şekilde sınıflandırabildi
Enginar	MLP, RF, BLR	İyon desenlerinin özellikleri, her enzim için %95'in üzerinde yüksek bir tahmin oranına sahip ML modelleri kurularak yapıldı.
Mangolar	Naif Bayes, SVM	Sistem, mangoların olgunluğunu kalite özelliklerine göre tespit edebilmektedir
Narenciye limetta (Mosambi kabuğu)	SVM-ANN, SVM-Gaussian süreç regresyonu (SVM-GPR)	SVM modeli, tuzla muamele edilmiş kireç tozunun tadına ilişkin tüm sonuçları 1,0 doğrulukla tahmin edip sınıflandırabilmiştir. ML aracının kullanımıyla yapılan optimizasyon, limondaki tadın korunmasını ve polifenol içeriğinin muhafaza edilmesini sağlar
Meyveler	RF, SVM, YSA	Arbutus unedo L. Meyvelerindeki ekstraktların sulu ve toz sistemler açısından stabilitesi, seçilen en iyi modeller için 0,9128 ile 0,9912 aralığında genel katsayı ile ML yöntemleri ile yapılabilmiştir.

3.5. TARIMDA ANFIS (UYARLANABİLİR AĞ TABANLI BULANIK ÇIKARIM SİSTEMİ) UYGULAMALARI

Uyarlanabilir Ağ Tabanlı Bulanık Çıkarım Sistemi (ANFIS), bulanık mantık (FL) ile yapay sinir ağlarının (YSA) avantajlarını bir araya getiren hibrit bir yapay zekâ yaklaşımıdır. Bu sistem, FL'nin insan benzeri muhakeme yeteneğini YSA'nın öğrenme kapasitesi ve hesaplama gücüyle bütünleştirerek daha etkili ve güvenilir sonuçlar üretmeyi amaçlamaktadır (Al-Mahasneh ve ark., 2016). ANFIS'te öğrenme süreci, yapay sinir ağı mekanizmaları aracılığıyla yürütülmekte; bu öğrenme çıktıları, uygun üyelik fonksiyonlarına sahip bulanık kurallar oluşturmak üzere bulanık mantık sistemine aktarılmaktadır (Melin ve ark., 2018). Bu sayede, hem bulanık mantığın esnek ve insan benzeri yorumlama kabiliyeti hem de yapay sinir ağlarının güçlü öğrenme kapasitesi aynı çatı altında birleştirilmiş olmaktadır. Bu kapsamlı uygulamaların tarımdaki gelişimi ve ayrıntıları Tablo 5a'da özetlenmiştir.

Tablo 5a. Tarımda ANFIS'in uygulanması (Karakaya, 2025).

Ürün	**Önemli sonuçlar**
Turunç	Geliştirilen ANFIS modeli portakal tadını tahmin edebildi ve çoklu regresyon modeliyle karşılaştırıldığında daha yüksek performansa sahip oldu.
Ayva meyveleri	ANFIS modeli, kurutma işlemi sırasında ayva meyvesinin nem oranını, enerji kullanımını, enerji kullanım oranını, ekserji kaybını ve ekserji verimliliğini sırasıyla 0,9997, 0,9989, 0,9988, 0,9986 ve 0,9978 R2 değeriyle yüksek doğrulukla tahmin edebildi. ANFIS modeli ANN modeliyle karşılaştırıldı ve elde edilen sonuçlar ANFIS modelinin ANN modeline kıyasla daha yüksek doğruluğa sahip olduğunu gösterdi; burada R2 değeri daha yüksek ve ANFIS modelinde daha düşük bir hata değeri vardı
Sebzeler (kavun, sarımsak, patates)	ANFIS sistemini kullanarak geliştirilen model, sebzelerin etkili nem yayılma hızını, özgül enerji tüketimini, nem oranını ve kurutma hızını sırasıyla 0,9990, 0,9917, 0,9974 ve 0,9901'lik yüksek bir regresyon katsayısıyla, minimum hata değerivle tahmin edebildi. ANFIS modeli ile ANN modeli arasında karşılaştırma yapıldı ve sonuçlar ANFIS modelinin ANN modelinden daha yüksek bir verimliliğe sahip olduğunu gösterdi.

3.6. TARIMDA GERÇEK ZAMANLI ALGILAMA İÇİN YAPAY ZEKÂNIN HARİCİ SENSÖRLERLE ENTEGRASYONU

Gerçek zamanlı algılamaya yönelik sistemlerde, yapay zekâ yöntemleri özellikle **bulanık mantık (FL)** ve **yapay sinir ağları (YSA)** gelişmiş sensör teknolojileriyle entegre edilerek daha kısa sürede ve daha yüksek doğrulukla sonuç elde edilmesine olanak tanımaktadır. Bu çerçevede, **elektronik burun (e-burun), elektronik dil (e-dil), makine öğrenimi (ML), bilgisayarlı görme sistemleri (CVS)** ve **yakın kızılötesi spektroskopisi (NIRS)** gibi harici sensörler; FL ve YSA tabanlı algoritmalarla birlikte kullanılarak gıda endüstrisinde geniş bir uygulama alanı bulmuştur. Sensör teknolojileri ile yapay zekâ algoritmalarının bu

entegrasyonu, sistem performansının iyileştirilmesine ve hedef odaklı doğruluğun artırılmasına önemli katkılar sağlamaktadır. Nitekim son yıllarda bu teknolojik birliktelik, gıda endüstrisinde giderek daha yaygın şekilde benimsenmiştir (Karakaya, 2025).

Elektronik burun (e-burun), insan burnunun koku alma işlevini taklit edecek şekilde tasarlanmış ve kokular ile uçucu bileşiklerin analiz edilmesine imkân tanıyan yapay bir algılayıcı sistemdir (Yan ve ark., 2015). Bu sistem hem basit hem de karmaşık kokuların tanımlanmasında kullanılabilen çeşitli elektronik kimyasal sensör dizilerinden oluşmaktadır. E-burun sistemleri, gazların veya gaz-buhar karışımlarının bileşenlerini ayırt etmek ve analiz etmek amacıyla yaygın olarak kullanılmakta olup, özellikle gıda ürünlerinin **kalite kontrol süreçlerinde** kritik bir rol üstlenmektedir. Ayrıca, karmaşık aromatik profilleri algılama kabiliyeti sayesinde yalnızca gıda sektöründe değil, aynı zamanda **çevresel izleme**de **patlayıcı madde tespiti** gibi alanlarda da önemli uygulamalara sahiptir (Deshmukh ve ark., 2015). Yapay zekâ destekli hesaplama yöntemleriyle geliştirilen e-burun sistemlerinin tarımdaki son uygulamaları Tablo 6a'da özetlenmektedir.

Tablo 6a. Tarımda yapay zekâ ile E-burun uygulaması (Karakaya, 2025).

Ürün	**Amaç**	**Yapay zekâ tekniği**	**Önemli sonuçlar**
Kakao	Kakao çekirdeklerinin fermantasyon süresini anlamak ve sınıflandırmak	DT, Güçlendirilmiş ağaç RF, ANN, KNN, saf Baiyes (NB)	ANN ve Boosted Tree algoritması kabul edilebilir bir sınıflandırma oranı elde etmeyi başarırken, fermantasyon süresi KNN ve NB algoritması tarafından belirlenemedi.
Safran	Safran numunelerinin sahteliğini tespit etmek için	YİNE	Orijinal ve sahte safranın sınıflandırılması, desen tanıma yöntemi kullanılarak e-burun kullanılarak sırasıyla %100 ve %86,87 doğrulukla başarıyla gerçekleştirildi.
Meyveler	Elektronik burundan gelen verileri sınıflandırmak ve performansını değerlendirmek için Yapay Arı Kolonisi (ABC) algoritmasını YSAda uygulamak	ANN ve yapay arı kolonisi	ABC-ANN, e-burun verilerinin koku sınıflandırmasında daha başarılıdır ve kullanılan geri yayılım algoritmasına kıyasla daha yüksek performansa sahiptir. Sistem, limon, kiraz, çilek ve kavun aroması olmak üzere dört farklı aromayı sınıflandırabildi.
Safran	İran safranının farklı aromalarını tanımlamak	ES, LÜTFEN, YAYIN	E-burun, ANN ile birleştirildiğinde safran örneklerinin sınıflandırılması için %100'e başarıyla ulaşıldı

Meyveler	Meyve kokularının tanınması ve algılanması için E-burun' da Kernel aşırı öğrenme makinelerinin uygulanması	Çekirdek aşırı makine öğrenimi	Önerilen sistem koku i tanımada önemli ölçüde iyi performans gösterdi Meyve kokularını tanımada kullanılan diğer sistemlerle karşılaştırıldığında daha yüksek test doğruluğu ve en düşük eğitim süresi ve test süresi değeri elde edildi.
Limon	Çeşitli limon dilimlerinin kalitesini karakterize etmek ve tahmin etmek	ELM, RF, SVM	ELM yöntemi kullanılarak yapılan tahmin, 0,959'luk en yüksek doğruluğu elde etti, bunu sırasıyla 0,935 ve 0,922 ile RF ve SVM izledi, bu da E-burun ile entegre ELM'nin en iyi sınıflandırma modeli olduğunu gösteriyor.
Armut	Balsam armutunun kurutma sürecini optimize ederek gıda kalitesini artırmak	Florida	Aromayı korumak ve ürün kalitesini artırmak için kurutma süresi kısaltılabildi Endüstriyel kontrol yönteminin tanımı, kontrolü basitleştirmek ve iyi kurutma etkilerine sahip olmak için oluşturulmuştur
Pirinç taneleri	Depolanmış pirinç tanelerinde Sitophilus oryzae istilasını tespit etmek	FL SANAT Haritası PCA, MLR	FL ARTMAP uygulamasıyla e-burun, veriler kapsamlı olduğunda ve analiz hakkında çıkarımlar yapılması gerektiğinde yararlıdır. Model, tahılları istila edilmiş, istila edilmemiş, gerekli işlem görmüş ve diğerlerini sınıflandırabilmiştir. Hibrit sistem, tahıldaki istilaların erken tespitinin yapılabilmesi ve hasat sonrası kayıpların en aza indirilebilmesi sayesinde gıda ve tahıl endüstrisinde faydalıdır.
Pirinç taneleri	Rhyzopertha'yı sınıflandırmak için Dominika'nın istila ettiği pirinç tanelerini tanımak	YİNE	E-burun sistemiyle BPANN, sınıflandırma işlemi için e-burunla kullanılan diğer yöntemlerle karşılaştırıldığında 0,98 olan en yüksek R2 değerini verdi ve geri kalanına kıyasla en yüksek doğruluğa sahiptir Sistem, farklı günler için istila edilmiş pirinç tanelerini tahmin edebildi

Kabuklu fıstık	Kabuklu fıstıkların depolama kalitesini değerlendirmek	Florida	FL analizi, e-burun sensörlerini tarayıp sıralayabildi ve kabuklu fıstıklar için atık süresi belirlenebildi Geleneksel yöntemlerle yakından eşleşen sensörler kullanılarak kabuklu fıstıkların depolama süresinin tahmini Hızlı ve yıkıcı olmadığı için çevre dostu bir alternatif olabilir.
Ispanak	Ispanağın hasat sonrası tazeliğini tespit etmek için	YİNE	E-burun ile BPNN yönteminin birleştirilmesi, sınıflandırma doğruluğu açısından %93,75 doğrulukla ıspanak tazeliğini hızlı ve tahribatsız bir şekilde tespit etmenin etkili bir yolu olduğunu kanıtlamıştır.
Buğday tanesi	Depolanmış buğday tanelerindeki ambar böceği istilasını belirlemek için	Florida	Böcek bulaşmış buğday tanelerinin ürettiği en duyarlı sensörler ve belirli VOC'ler, bulanık mantık analiziyle ilişkili e-burun sensörü tarafından taranabildi. E-burun, depolanan buğday tanesindeki istilaları doğru ve hızlı bir şekilde izlemek için potansiyel bir yöntem olduğu kanıtlanmıştır. Ayrıca, endüstrilerin depolama süresi boyunca ürünün kalitesini belirlemesi için güvenilir bir yöntemdir.

Elektronik dil (E-dil), farklı tatları algılayabilen ve analiz edebilen, insanın duyusal sistemini taklit eden bir teknolojik cihazdır. Literatürde "çok duyulu sistem" olarak da tanımlanan E-dil, düşük seçiciliğe sahip çok sayıda sensörün, **desen tanıma (Pattern Recognition – PARC)** teknikleri ve çok değişkenli veri analizine dayalı gelişmiş matematiksel algoritmalarla entegrasyonu sonucunda çalışmaktadır (Ha ve ark., 2015). Bu sistem, özellikle sıvı fazdaki numunelerde bulunan çeşitli kimyasal bileşenlerin ayrıştırılması ve tanımlanmasında yüksek etkinlik göstermekte olup, gıda endüstrisi başta olmak üzere farklı araştırma ve endüstriyel uygulama alanlarında kullanılmaktadır.

Artan tüketici bilinci ve daha güvenli, yüksek kaliteli gıda ürünlerine yönelik talepler doğrultusunda, **elektronik dil (E-dil)** teknolojisine olan ilgi ve kullanım oranı gıda endüstrisinde giderek artış göstermektedir. Bu bağlamda, elektronik dil sistemlerinin tarımdaki güncel uygulamalarına ilişkin ayrıntılar **Tablo 6b'**de özetlenmektedir.

Tablo 6b. Tarımda yapay zekâ ile E-dil'in uygulaması (Karakaya, 2025).

Ürün	**Amaçlar**	**Yapay zekâ tekniği**	**Sonuçlar/etkiler**
Ananas	Ananasları tatlılık seviyelerine göre sınıflandırmak ve en iyi algoritmayı belirlemek	SVM, KNN, YSA, RF	Ananasın tatlılığını belirlemede farklı makine öğrenimi algoritmaları kullanıldı ve elde edilen en iyi algoritma, %0,820 doğruluk elde edilen KNN yöntemi oldu. Geliştirilen model, büyük miktarlarda ananas seçiminin gerekli olduğu endüstride faydalı olacaktır.
Pirinç	Katı gıdaları ayırt etmek ve tahmin etmek ve gıda endüstrileri için bir değerlendirme aracı sağlamak	YİNE	RBFNN, sınıflandırmada %95 doğrulukla farklı pirinç türlerini ayırt edebildi Voltametrik E-dil, pirinç için nitel analizde kullanılışlıdır
Pirinç	E-dilde pirinç duyusal kalitesinin tahmini için yapay sinir ağları (SA-ANN) ile birleştirilmiş benzerlik analizini geliştirmek	YİNE	E-dilindeki SA-ANN, pirinç duyusal kalitesini tahmin edebildi ve sistematik analizler yürütebildi PCA-ANN ile SA-ANN arasında karşılaştırma yapıldı ve SA-ANN'nin PCA-ANN'ye kıyasla daha iyi hassasiyet ve doğruluğa sahip olduğu bulundu. SA-ANN daha az emek gerektiren, daha hızlı bir yöntemdir ve pirinç duyusal özelliklerinin hızlı ve büyük ölçekli tahmini için potansiyele sahiptir
Şeker kamışı	Şeker kamışından elde edilen glikozun analizi için voltametrik e-dilin karakterize edilmesi ve uygulanması	YİNE	Dalgacık bilgisine sahip çok katmanlı YSA, E-dilinden gelen karmaşık yanıtları işleyebildi Önerilen model, şeker kamışı bazlarından hidrolize edilmiş numuneler için kullanılmaya uygundur
Çaylar	Farklı çay türlerini ayırt etmek	YNS, SVM	Geliştirilen sistem kullanılarak farklı çay türleri ayırt edilebildi ve çayın bileşenleri de tanımlanabildi.

Mandalina kabuğu	Farklı yaşlardaki mandalina kabuklarını sınıflandırmak	BPNN, ELM	Model, farklı yaşlardaki mandalina kabuğu örneklerini sınıflandırabilmiştir. Birkaç doğrusal model ve doğrusal olmayan modeller için karşılaştırma yapıldı ve doğrusal olmayan modellerin doğrusal modellerden daha iyi performans gösterdiği elde edildi. ELM, BPNN'i takip eden yüksek doğrulukla numunelerin sınıflandırılması için en iyisiydi.

3.7. TARIMDA BİLGİSAYARLI GÖRÜŞ SİSTEMİ (CVS) UYGULAMALARI

Bilgisayarlı Görüş Sistemi (Computer Vision System – CVS), görüntü işleme ve desen tanıma tekniklerinin entegrasyonuna dayanan yapay zekâ temelli bir teknolojidir. Tahribatsız bir analiz yöntemi olan CVS, görsel veriler üzerinden sınıflandırma süreçlerini kolaylaştırmak amacıyla görüntülerin boyut, şekil, renk ve yüzey kusurları gibi dışsal özelliklerinin nicel olarak incelenmesini ve çıkarılmasını mümkün kılmaktadır (Cardenas-Perez ve ark., 2017). Özellikle **CVS** teknolojisinin, **yumuşak hesaplama (soft computing)** teknikleriyle bütünleştirilmesi; gıda endüstrisinde güçlü, hızlı ve güvenilir karar verme süreçlerinin geliştirilmesine olanak sağlamaktadır. Tarımda CVS teknolojisinin yumuşak hesaplama yöntemleriyle entegrasyonuna yönelik güncel uygulamalar ve örnekler Tablo 7a'da detaylı şekilde sunulmaktadır.

Tablo 7a. Tarımda yapay zekâ ile CVS'nin uygulanması (Karakaya, 2025).

Ürün	**Amaçlar**	**Yapay zekâ tekniği**	**Önemli sonuçlar**
Elma	Arızalı ve normal elmaları ayırmak için	CNN, SVM	CVS modeli ile geliştirilen CNN, elmaları %96,5'lik yüksek bir doğruluk oranıyla sınıflandırabilmiş ve doğruluk oranının %87,1 olduğu SVM sınıflandırıcısı ile birleştirilen geleneksel görüntü işleme yönteminden daha etkili olduğu kanıtlanmıştır.
Elma dilimleri	Elma dilimlerinin renginin değişmesi üzerine kurutmanın etkilerini incelemek	YİNE	CVS, kurutma işlemi sırasında renk değişimlerini izleyebildi ve ANN ile kombinasyon, kurutma işlemi sırasında elmanın kalitesini tahmin edebildi. Geliştirilen model tüm analizler için 0,92'den büyük R2 değerlerine ulaştı

Muz	Muzları olgunluklarına göre sınıflandırmak	YSA, SVM, KSA, DT	ANN tabanlı model sistemi, %97,75'lik en yüksek genel tanıma oranına sahip diğer algoritmalara kıyasla daha yüksek bir sınıflandırma oranına sahiptir.
Maracuya meyveleri	Tutku meyvelerini olgunluk seviyelerine göre sınıflandırmak	Çok Sınıflı SVM (MCSVM)	Geliştirilen sistem, passion meyvelerinin olgunluk seviyesini 0,94128 saniye içinde %93,3 doğrulukla sınıflandırabilmiştir.
Kuru fasulye	Üretimden itibaren farklı tohum tiplerini sınıflandırmak	YAS, KAŞ, DT, SVM	Fasulyelerin sınıflandırılması, %93,13'lük en yüksek genel sınıflandırma oranlarına ulaşan SVM ile tüm ML algoritmaları tarafından yapılabildi; bunu sırasıyla %92,52, %91,73 ve %87,92'lik sınıflandırma oranlarına sahip DT, ANN ve KNN izledi.
Dolmalık biber	Biberin olgunluk seviyesini otomatik olarak tanımlamak için	ANN, FL	CVS ve ANN/FL kullanılarak dolmalık biberin olgunluğunu tahmin etmede yapay bir görme sistemi geliştirilebildi RBF-ANN kullanan model, her iki modelin de elde ettiği maksimum doğruluğun sırasıyla %100 ve %88 olduğu FL ile karşılaştırıldığında daha yüksek bir sınıflandırma doğruluğuna sahiptir.
Cape bektaşi üzümü	Bektaşi üzümünün olgunluğunu sınıflandırmak için	YSA, SVM, DT, KNN	Tüm modeller, farklı renk uzayları kullanılarak tüm modellerin elde ettiği doğruluk %86'dan fazla olduğu için, pelerin bektaşi üzümünün olgunluğunu yüksek bir doğrulukla sınıflandırabilmiştir; bu da bunun iyi bir sınıflandırıcı sistem olduğunu gösterdi.
Kahve çekirdekleri	Kahve çekirdeklerini sınıflandırılabilecek bir sistem geliştirmek	YİNE	Yeşil kahve çekirdekleri geliştirilen sistem kullanılarak analiz edilebildi ve sınıflandırılabildi Bu sistemde, dönüştürülen değerin daha sonra sınıflandırma amaçları için kullanıldığı bir renk alanı dönüştürme modeli olarak ANN kullanıldı

İncirler	İncir meyvelerini görsel özelliklerine göre sınıflandırmak	Karar ağacı-FL	CVS'den elde edilen veriler için üç farklı karar ağacı türü arasında karşılaştırma yapıldı ve REP karar ağacının en yüksek R değerine ve daha düşük RMSE değerlerine sahip olduğu gösterildi ve bu nedenle bulanık sistemde uygulanmak üzere seçildi. Geliştirilen sistem, incir meyvelerini yüksek doğrulukla beş nitel sınıfa ayırabilmiştir.
Mango	Mangonun meyve kütlesini tahmin etmek için	YİNE	CVS'den elde edilen veriler geliştirilen ANN modelinde girdi parametreleri olarak kullanıldı ve model meyve kütlesini başarılı bir şekilde tahmin edebildi. Geliştirilen sistem, iki girdi parametresi veya üç girdi parametresi uygulanarak %97'lik en yüksek başarı oranına ve 0,99'luk verimlilik katsayısına sahiptir.
Mantarlar	Mantarların görünüm kalitesini belirlemek için	ANN, FL	Görüntü işleme sistemi tarafından elde edilen doğruluk %95,6'dır YSA mantarların ağırlığını belirleyebildi ve bulanık mantık CVS'den gelen verileri kullanarak mantarın kalitesini belirleyebildi.
Patatesler	Patatesler için bir derecelendirme sistemi geliştirmek	Florida	CVS ve bulanık mantığın birleşimi, pateslerin daha hızlı sınıflandırmasını sağlar ve manuel sınıflandırma için gereken maliyeti azaltır.
Pirinç	Öğütülmüş pirincin nitel sınıflandırmasın ı gerçekleştirmek	Florida	Çalışma, geliştirilen hibrit sistemin öğütülmüş pirincin otomatik olarak sınıflandırılması için işleme endüstrisinde kullanılabileceği sonucuna varmıştır. Geliştirilen sistem ile uzmanların yargıları arasında karşılaştırma yapıldı ve genel olarak yaklaşık %89,80 güven elde edildi. Bulanık sistem, öğütülmüş pirincin kalite derecelendirmesi için %89,83 toplam duyarlılık ve %97,45 özgüllük elde etti.

Pirinç	Pirinç beyazlatma makinelerinin performansını kontrol etmek için	Florida	Geliştirilen otomatik kontrol sistemi, normal bir insan operatöründen ortalama %31,3 daha yüksek performans hızına sahipti ve sistem tarafından alınan karara dayalı olarak çıktı kalitesinde bir iyileşme vardı.

3.8. TARIMDA YAKIN KIZILÖTESİ SPEKTROSKOPİSİ (NIRS) VE YAPAY ZEKÂ ENTEGRASYONU

Yakın kızılötesi spektroskopisi (Near-Infrared Spectroscopy – NIRS), kimyasal reaktif kullanımına ihtiyaç duymaması, tahribatsız analiz imkânı sunması ve kısa sürede yüksek doğrulukta sonuçlar üretebilmesi nedeniyle gıda endüstrisinde yaygın olarak kullanılan önemli analitik tekniklerden biridir (Qu ve ark., 2015). Geleneksel analiz yöntemleriyle karşılaştırıldığında, **daha basit, daha hızlı, düşük maliyetli ve çevre dostu** bir yaklaşım sunması, NIRS'i sürdürülebilir üretim süreçleri açısından dikkat çekici bir alternatif hâline getirmektedir. Ayrıca NIRS'in kimyasal madde kullanmayan çalışma prensibi hem insan sağlığı hem de çevre güvenliği açısından önemli avantajlar sağlamaktadır (Porep ve ark., 2015).

NIRS sisteminin, gıda ürünlerinin fiziksel ve kimyasal özelliklerini yüksek doğrulukla tespit edebilme kapasitesi, yapay zekâ yöntemleriyle özellikle **yapay sinir ağları (ANN), bulanık mantık (FL)** ve **makine öğrenimi (ML)** entegrasyonu sayesinde önemli ölçüde artmaktadır. Bu entegrasyon, gıda ürünlerinin **sınıflandırılması** ve **özelliklerinin tahmin edilmesi** süreçlerinde güçlü ve etkin bir analiz aracı sunmaktadır. **Tablo 8a**'da tarımda yapay zekâ teknikleriyle bütünleştirilmiş NIRS uygulamalarına ilişkin güncel örnekler özetlenmektedir.

Tablo 8a. Tarımda yapay zekâ ile NIRS'nin uygulanması (Karakaya, 2025).

Ürün	**Amaçlar**	**Teknik Yapay Zekâ**	**Önemli sonuçlar**
Keemun siyah çay	Çin'de farklı keemun siyah çay kalitelerinin ayrımı için bir model geliştirmek	ANN, en küçük kare SVM (LSSVM), Rastgele Orman	Modeli geliştirmek için ANN ve LSSVM olmak üzere üç farklı yöntem kullanıldı ve tüm yöntemler keemun çayının farklı derecelerini ayırt edebildi. LSSVM yönteminin diğerlerine kıyasla daha yüksek bir performansa ve öngörüye sahip olduğu tespit edildi.
Armutlar	Armutta çözünen katı madde içeriğini belirlemek için	KARA AĞAÇ	Önerilen ardışık projeksiyon algoritması ve aşırı öğrenme makinesi (SPA-ELM), içerikleri geleneksel PCA-ELM yönteminden daha iyi tahmin edebildi
Beyaz kuşkonmaz	Kuşkonmazın kökenini tahmin etmek ve Alman ürünlerini ithal ürünlerden ayırt etmek	SVM	Doğrusal SVM, beyaz kuşkonmazın menşe ülkesini %89 doğrulukla tahmin edebildi ve ayrıca Alman ve Alman olmayan ürünleri ayırt edebildi.

4. SONUÇ

Yapay zekâ, tarım sektöründe üretim süreçlerini köklü biçimde dönüştürerek verimliliği artıran, kaynak kullanımını optimize eden ve sürdürülebilir üretim hedeflerini destekleyen stratejik bir teknoloji hâline gelmiştir. Bitki hastalıklarının erken teşhisi, ürün verimliliğinin öngörülmesi, sulama ve gübreleme süreçlerinin hassas biçimde yönetilmesi, otomasyon ve robotik uygulamalar aracılığıyla iş gücü tasarrufu sağlanması, bu teknolojinin tarımdaki başlıca katkıları arasında yer almaktadır.

Ayrıca yapay zekânın, nesnelerin interneti (IoT), sensör ağları, bilgisayarlı görme ve elektronik algılayıcı sistemlerle entegre edilmesi; daha doğru, hızlı ve güvenilir karar mekanizmalarının oluşturulmasına imkân tanımaktadır. Bu durum yalnızca üretim maliyetlerini azaltmakla kalmamakta, aynı zamanda çevresel etkilerin en aza indirilmesine ve gıda güvenliğinin güçlendirilmesine de katkı sağlamaktadır.

Genel olarak değerlendirildiğinde, yapay zekâ destekli tarımsal uygulamalar; **verimlilik, kalite ve sürdürülebilirlik** açısından sağladığı avantajlarla geleceğin tarım sektöründe vazgeçilmez bir unsur olarak öne çıkmaktadır.

ÖZET

Yapay zekâ, genel olarak makinelerin karmaşık problemlere insan benzeri yöntemlerle çözüm üretebilmesine imkân tanıyan bir bilim dalı olarak tanımlanmaktadır. Yapay zekâ ve sensör teknolojilerindeki hızlı ilerlemeler, farklı sektörlerde yeni ufuklar açmış; bu dönüşümden genellikle göz ardı edilen hayvancılık sektörü de önemli ölçüde etkilenmeye başlamıştır.

Özellikle karmaşık problemlerin çözümünde; Yapay Sinir Ağları, Bulanık Mantık, Genetik Algoritmar, Derin Öğrenme ve Makine Öğrenmesi gibi yapay zekâ tabanlı yöntemler sıklıkla tercih edilmektedir. Bu yaklaşımlar sayesinde çok sayıda değişkenin eşzamanlı olarak analiz edilmesi mümkün olmakta; böylece daha hızlı, doğru ve etkin karar süreçlerinin gerçekleştirilmesine olanak sağlanmaktadır.

Yapay zekâ teknikleri, hayvancılık sektöründe çeşitli uygulamalarda başarıyla kullanılmaktadır. Bu uygulamalar arasında hayvan ıslahı; kızgınlık periyodunun tespiti, mastitis gibi hastalıkların erken teşhisi; süt, yumurta ve benzeri hayvansal ürünlerin verim özelliklerinin tahmini gibi alanlar sayılabilir.

Yapay zekâ ile yapılan hayvancılık çalışmalarında sağmal ineklerde bulanık mantık yöntemlerinin yemleme ve hastalık yönetiminde kullanımı incelenmiştir. Ayrıca otomatik sağım sistemlerinde mastitisin kontrolü ve sınıflandırılması amacıyla bir bulanık model geliştirilmiştir. Derin öğrenme, yapay sinir ağları ve makine öğrenmesi gibi teknolojilerin gelişmesiyle birlikte çiftlik hayvanlarında ısı stres yönetiminde de yapay zekâdan yararlanılmaktadır. Taşınamaz sensörler de hayvanların üzerine yerleştirilemeyen ve çiftlikte belirli noktalara sabitlenerek kullanılan sistemlerdir. Özellikle **yoğun üretim yapılan işletmelerde ve süt çiftliklerinde,** hayvanların düzenli olarak sağım alanına yönlendirilmesi sayesinde bu cihazlar önemli avantaj sağlamaktadır.

Kümes hayvancılığında yapay zekâ ve makine öğrenmesi kullanılarak refah çalışmaları yapılmıştır. Başka bir çalışmasında Arduino ve bulanık mantık kullanılarak arı kovanlarının uzaktan izlenip kontrol edilebileceği bir sistem geliştirilmiştir.

Bu çalışmada hayvancılık alanında kullanılan yapay zekâ ile ilgili çalışmalardan ve uygulamalardan bahsedilecek ve yapay zekânın hayvancılık sektöründeki dönüştürücü etkisi ele alınacaktır.

Anahtar Kelimeler: Hayvancılık, Yapay Zekâ, Sensör Teknolojileri

ARTIFICIAL INTELLIGENCE APPLICATIONS IN LIVESTOCK

ABSTRACT

Artificial intelligence is generally defined as a field of science that enables machines to produce solutions to complex problems using human-like methods. Rapid advances in artificial intelligence and sensor technologies have opened new horizons in various sectors; the livestock sector, which is often overlooked in this transformation, has also begun to be significantly affected.

Artificial intelligence-based methods such as Artificial Neural Networks, Fuzzy Logic, Genetic Algorithms, Deep Learning, and Machine Learning are frequently preferred, especially in solving complex problems. These approaches enable the simultaneous analysis of numerous variables, thus facilitating faster, more accurate, and more effective decision-making processes.

Artificial intelligence techniques are successfully used in various applications in the livestock sector. These applications include animal breeding; detection of the estrus period; early diagnosis of diseases such as mastitis; and estimation of the yield characteristics of milk, eggs, and similar animal products.

In livestock studies conducted with artificial intelligence, the use of fuzzy logic methods in feeding and disease management in dairy cows has been investigated. In addition, a fuzzy model has been developed for the control and classification of mastitis in automatic milking systems. With the development of technologies such as deep learning, artificial neural networks, and machine learning, artificial intelligence is also being used in heat stress management in farm animals. Non-wearable sensors are systems that cannot be placed on animals and are fixed at specific points on the farm. These devices offer significant advantages, especially in intensive production facilities and dairy farms, by regularly directing animals to the milking area.

Welfare studies have been conducted in poultry farming using artificial intelligence and machine learning. In another study, a system was developed using Arduino and fuzzy logic to remotely monitor and control beehives.

This study will discuss artificial intelligence-related studies and applications used in animal husbandry and address the transformative impact of artificial intelligence on the animal husbandry sector.

Keywords: Livestock Farming, Artificial Intelligence, Sensor Technologies

1. GİRİŞ

Yapay zekâ, günümüzde farklı sektörlerde karar verme süreçlerinin merkezinde yer almaktadır. 2010-2018 yılları arasında yapay zekâ ile ilgili araştırma projelerinin sayısı, bir önceki on yıla göre 2,5 kat artış göstermiştir. Yapay zekâya yatırım yapan şirketlerin satış, istihdam ve piyasa değerlerinde kayda değer artışlar elde edildiği bildirilmiştir. Bu gelişmeler 2007-2018 döneminde yapay zekâ odaklı iş alanlarının belirgin bir biçimde artmasını da açıklamaktadır (Menezes ve ark., 2024).

Tarım ve hayvancılık alanında ise Babina ve ark. (2024), 2014-2018 yılları arasında yapay zekâ ile ilişkili pozisyonların, önceki yedi yıla kıyasla iki katına çıktığını ortaya koymuştur. Bu büyüme, devlet destekli girişimlerle de teşvik edilmektedir. Örneğin, USDA-NIFA ve NSF, 2021 yılında NSF öncülüğünde kurulan 11 yeni Yapay Zekâ Araştırma Enstitüsü'ne toplam 220 milyon ABD doları yatırım yapmıştır (Menezes ve ark., 2024).

Aynı zamanda, toplumun hayvan sağlığı ve refahına dair artan duyarlılığı ile tüketilen ürünlerin kalitesine yönelik beklentileri, hayvancılık işletmelerinde bireysel ve sürü düzeyinde izleme ve kontrol sağlayan sistemlerin önemini artırmıştır. Bu bağlamda, yeni sensörlerin ve teknolojilerin geliştirilmesi ile yapay zekânın ilerlemesi, **hassas hayvancılık** uygulamalarını sektörde temel bir gereklilik haline getirmiştir (Michelena ve ark., 2024).

2. YAPAY ZEKÂ VE UYGULAMA ALANLARI

Yapay zekâ teknolojileri, sayısal analiz yöntemlerine dayalı sezgi ve beceriler aracılığıyla belirsizlik koşullarında çözüm üretme yeteneği kazandırmaktadır. İnsan zekâsı, dış dünyadaki olaylara uyum sağlama kapasitesi ile tanımlanırken; benzer şekilde yapay zekâ sistemlerinin de karşılaştıkları yeni durumlarda anlamlı bilgiyi yorumlaması, bu bilgiyi yeni koşullara uygulaması ve anlamlı ilişkiler kurması beklenmektedir. Bu bağlamda, yapay zekâ üzerine çalışan araştırmacılar örüntü tanıma, öğrenme, problem çözme, teorem geliştirme, oyun oynama, tümevarım ve genelleme ile dil kullanımı gibi çeşitli uygulama alanlarında önemli yöntemler geliştirmiştir (Baykal ve Beyan, 2004b).

Yapay zekâ ve ilgili konularda yaşanan gelişmeler, sekiz temel alt dal kapsamında sınıflandırılabilmektedir (Krishnamoorthy ve Rajeev, 1996: 2-5):

- **Problem Çözme ve Planlama:** Hedef hiyerarşisinin sistematik olarak geliştirilmesi, revizyon mekanizmalarının planlanması ve önemli hedeflere odaklanan araştırmaların organize edilmesiyle ilgilenmektedir.
- **Uzman Sistemler:** Bilgi işleme süreçleri ve karmaşık karar verme problemlerine yönelik çözümler üretmektedir.
- **Doğal Dil İşleme:** Otomatik metin oluşturma, metin işleme, çeviri, konuşma sentezi ve analizi, dilbilgisi ve üslup analizleri gibi alanları kapsamaktadır.
- **Robotik:** Nesneleri kavrama ve manipüle etme süreçlerinde robotların kontrolünü, ayrıca eylemleri yönlendirmek için sensörlerden elde edilen bilgilerin kullanılmasını içermektedir.
- **Bilgisayarla Görme:** Akıllı görselleştirme, sahne analizi, görüntü işleme, görüntü anlama ve hareket çıkarımı üzerine odaklanmaktadır.
- **Öğrenme:** Farklı makine öğrenmesi yöntemlerine ilişkin araştırma ve geliştirme faaliyetlerini kapsamaktadır.
- **Genetik Algoritmalar:** İçsel öğrenme yeteneğine sahip, uyarlanabilir algoritmalardır. Arama, makine öğrenimi ve optimizasyon süreçlerinde kullanılmaktadır.

- **Sinir Ağları:** Örüntü tanıma görevleri, tümdengelimli akıl yürütme ve sayısal hesaplamaları birleştirerek insan beyninin öğrenme sürecini simüle etmeye yönelik çalışmaları kapsamaktadır.

Yapay zekânın kavramsal olarak anlaşılabilmesinde iki temel unsur ön plana çıkmaktadır: algoritma ve zekâ. Algoritmalar, karmaşık problemlerin sistematik bir biçimde incelenmesine olanak tanıyan yapılardır. Bu yapılar, problemleri daha küçük ve işlenebilir birimlere ayırarak analiz edilmesini sağlar. Birbirini takip eden bu küçük birimler üzerinden yürütülen işlemler sonucunda, karmaşık problemler hızlı ve etkin bir şekilde çözüme kavuşturulabilmektedir Zekâ, yaşam içerisinde karşılaşılan karmaşık problemlere eksiksiz, verimli ve etkin çözümler üretebilme yetisi olarak tanımlanabilir. Diğer bir ifadeyle, zekâ algoritma üretebilme melekesiyle de ilişkilendirilmektedir. Yapay zekânın ise üç temel bileşeni bulunmaktadır. Bu bileşenler ve insandaki karşılıkları şu şekilde sıralanabilir (Köroğlu, 2017: 2):

- **Sembolik Çıkarımsama:** Neden-sonuç ilişkilerini kurma yeteneği.
- **Yapay Öğrenme:** Veriler üzerinden genellemeler elde etme, yani öğrenme süreci.
- **Genetik Algoritmalar:** Daha önce bilgi sahibi olunmayan yeni unsurlar üretme, yani icat etme kapasitesi.

Yapay zekâ net, kesin ve doğru bir biçimde tarif edilmiş alanlarda çok iyi sonuçlar alabilmektedir.

3. YAPAY ZEKÂNIN HAYVANCILIKTAKİ ROLÜ VE İLKELERİ

Artan verimlilik ve üretkenlik: Yapay zekâ, çiftlik yönetiminin birçok alanında yemleme, hayvan sağlığı takibi ve çevresel kontrol dâhil karar verme süreçlerini ileri düzeyde geliştirme potansiyeline sahiptir. Gerçek zamanlı veri analizi sayesinde kaynak kullanımı optimize edilerek israf azaltılmakta ve genel verimlilik artırılmaktadır (Rosati, 2024).

Hayvan refahının iyileştirilmesi: Yapay zekâ tabanlı araçlar, hayvanların sağlık ve refahını anlık olarak izleyerek, olası sorunları ortaya çıkmadan öngörebilmekte ve erken müdahalelerle daha etkin bakım imkânı sunmaktadır. Bu yaklaşım hem üretim verimliliğini hem de hayvanların yaşam kalitesini artırmaktadır (Rosati, 2024).

Sürdürülebilirlik: Yapay zekâ teknolojileri, su, yem ve enerji gibi kaynakların etkin kullanımını sağlayarak çevresel etkilerin azaltılmasına katkıda bulunmakta, böylece daha sürdürülebilir tarım uygulamalarının hayata geçirilmesini desteklemektedir (Rosati, 2024).

Değişen yetkinlik gereklilikleri: Yapay zekânın etkin yönetimi, ileri düzey teknik bilgi ve beceriler gerektirmektedir. Bu durum, tarım sektöründe iş gücü profillerinin değişmesine yol açmakta; çiftçilerin ve tarım çalışanlarının yapay zekâ teknolojilerini kullanabilmek için yeni beceriler edinmesini zorunlu kılmaktadır (Rosati, 2024).

Veri erişilebilirliği sorunları: Yapay zekâ modellerinin başarısı, kapsamlı ve çeşitli veri setlerinin mevcudiyetine bağlıdır. Ancak, özellikle farklı türler, çevresel koşullar ve çiftlik ölçeklerini kapsayan yüksek kaliteli veri eksikliği, bu teknolojilerin potansiyelini sınırlayan temel engellerden biridir (Rosati, 2024).

Etik ve gizlilik kaygıları: Yapay zekânın tarım uygulamalarına entegrasyonu, veri güvenliği ve mahremiyetle ilgili önemli tartışmaları gündeme getirmektedir. Ayrıntılı çiftlik verilerinin üçüncü taraflarla paylaşılması, hassas ticari bilgilerin açığa çıkmasına ve güvenlik risklerine yol açabilmektedir (Rosati, 2024).

Karar verme süreçlerine etkiler: Uzun vadeli tahminlerde insan sezgisini aşma potansiyeline sahip olan yapay zekâ, operasyonel kararların giderek daha fazla yapay sistemler tarafından

yönlendirilmesine neden olabilir. Bu durum, çiftlik yönetiminde insan kontrolünün azalmasına dair endişeleri artırmaktadır (Rosati, 2024).

Küresel benimsemedeki eşitsizlikler: Ekonomik ve teknolojik kapasitedeki farklılıklar nedeniyle yapay zekânın tarıma entegrasyonu bölgeler arasında eşitsiz biçimde ilerleyecek; bu da gelişmiş ve gelişmekte olan tarım sektörleri arasındaki uçurumu derinleştirebilecektir (Rosati, 2024).

Yapay zekânın yönetişimi ve kontrolü: Yapay zekânın geliştirilmesi ve uygulanmasının büyük ölçüde az sayıda çok uluslu şirketin elinde toplanması, bu şirketlere olan bağımlılığı artırmakta ve hayvancılık gibi kritik sektörler üzerinde jeopolitik etkilere dair kaygıları gündeme getirmektedir (Rosati, 2024).

Yapay zekâya duyulan güven: Özellikle sonuçların sezgilere aykırı göründüğü durumlarda, kritik kararların yapay zekâya bırakılması çiftçilerin bu teknolojilere olan güvenini zorlamaktadır. Yapay zekânın tarımsal karar alma süreçlerindeki rolü büyüdükçe, güven sorunu daha da önemli bir tartışma alanı hâline gelecektir (Rosati, 2024).

4. HAYVANCILIKTA YAPAY ZEKÂ UYGULAMALARI

Bulanık mantık; tıp, mühendislik ve biyoloji alanlarında olduğu gibi, hayvancılıkta da başarılı bir şekilde uygulanabilmektedir (Akkaptan, 2012). Yapay zekâ teknikleri; hayvan ıslahı, kızgınlık tespiti, mastitis gibi hastalıkların teşhisi, süt ve yumurta gibi hayvansal ürünlerde verim özelliklerinin tahmini gibi birçok alanda kullanılmaktadır (Karakaya, 2025).

Özellikle süt sığırcılığında yapay zekâ, veri odaklı karar alma süreçlerini destekleyerek üretim verimliliğini ve hayvan refahını artırma potansiyeli taşımaktadır. Bilgisayarlı görme sistemleri (CVS), hayvanların kimliklendirilmesi, davranışlarının izlenmesi, yem tüketiminin takibi, vücut ağırlığı tahmini ve hastalık tespiti gibi kritik alanlarda başarıyla uygulanmaktadır (Menezes ver ark., 2024).

Grinspan ve ark. (1994) tarafından yürütülen bir çalışmada, sağmal ineklerin beslenme yöntemi seçiminde bulanık mantık, karar verme aracı olarak kullanılmış ve alınan kararların süt üretimi, vücut değişimleri ve bunlar arasındaki etkileşime dayandığı belirtilmiştir. Bir başka çalışmada ise, sağmal ineklerde aylık üretim verilerini kullanarak ayıklanacak hayvanların belirlenmesinde bulanık mantıktan yararlanmış; bu yöntemin gelecekte oluşturulacak sistemler için örnek teşkil edebileceği ifade edilmiştir (Strasser ve ark., 1997).

İneklerin canlı ağırlık verilerini kullanarak bulanık mantık ve uzman sistemler aracılığıyla pratik yönetim uygulamalarının etkinliğini araştırılmıştır (Malttz, 1997). Harris (1998), farklı kaynaklardan elde edilen çiğ süt örneklerinin hijyenik ve bileşimsel kalite değerlendirmelerini karşılaştırmış; tereyağı, yağsız kuru madde ve toplam kuru madde miktarını bileşimsel kalite değişkenleri olarak, somatik hücre sayısı ile toplam bakteri sayısını ise hijyenik değişkenler olarak kullanmıştır.

Salehi ve ark. (2000), süt veriminin kalitatif analizleri için bir yapay sinir ağı bulanıklaştırıcısı geliştirmiş ve bu modeli Lacroix'in (1998) tek değişkenli bulanıklaştırıcısı ile karşılaştırmıştır. 305 günlük süt verimi, laktasyon sırası, laktasyon günü, test günü süt verimi, standart süt verimi ve sapma parametreleri kullanılarak oluşturulan bulanık kümeler sonucunda, yapay sinir ağlarının süt verimini uzmanlar kadar başarılı şekilde bulanıklaştırabildiği ve tek değişkenli modele kıyasla daha üstün performans sergilediği belirlenmiştir. Bu yöntemin, hayvanların düşük veya yüksek verimli olarak sınıflandırılmasında, ayrıca ayıklama ve beslenme kararlarının alınmasında yararlı olabileceği ifade edilmiştir.

Morag ve ark. (2001), süt verimi ve vücut ağırlığı verilerine dayanarak, rasyonlara katılması gereken kesif yem miktarını bulanık mantık ile belirleyen bir karar destek sistemi geliştirmiştir.

Bu modelin sürü yönetim programlarıyla entegre olabildiği ve çiftçilere optimum rasyon hazırlama sürecinde faydalı bir araç sunduğu rapor edilmiştir. Firk ve ark. (2002b) ise aktivite, süt verimi, süt akış hızı ve elektrik iletkenliği özelliklerini birlikte değerlendirerek bir bulanık mantık modeli kurmuş; modelin hassasiyet ve hata oranlarının, son kızgınlıktan sonra geçen süre dikkate alındığında azaldığını ortaya koymuştur.

Cavero ve ark. (2006), otomatik sağım sistemlerinde mastitis kontrol ve sınıflandırması amacıyla bir bulanık model geliştirmiştir. Elektrik iletkenliği, süt üretim oranı ve süt akım oranı parametreleri kullanılarak mastitis uyarıları üretilmiş ve model, duyarlılık ve hata oranları açısından değerlendirilmiştir. Bulgular, modelin hata oranının yüksek olmasına rağmen, tek değişkenli modellere kıyasla daha başarılı olduğunu göstermiştir.

Dökme tank sütlerinin mikrobiyolojik test sonuçlarına dayalı olarak sürülerin sağım uygulamalarını ve süt kalitesini değerlendirmek amacıyla bulanık tanımlayıcı kümeler geliştirmiştir (Cha ve ark., 2008).

Kramer ve ark. (2009), mastitis ve topallığın kontrol ve sınıflandırılmasına yönelik bulanık mantık tabanlı bir model geliştirmiştir. Süt verimi, tüketilen kuru madde, yem kabı ziyareti sayısı ve süresi, su tüketimi, geçici hastalık bilgileri ve hayvanların hareketliliği gibi parametreler girdi değişkenleri olarak kullanılmıştır. Ancak model, uygulama açısından beklenen performansı sağlayamamıştır.

Yapay zekâ destekli çözümler; otomatik veri toplama, ön işleme, veri düzenleme, algoritma geliştirme ve model uygulama aşamalarını kapsayarak üreticilerin gerçek zamanlı karar alma süreçlerini desteklemektedir. Ayrıca, tahmine dayalı modeller aracılığıyla hastalık dinamiklerini öngören erken uyarı sistemleri olarak işlev görmektedir. Yapay zekâ modellerinin yüksek doğruluk, hassasiyet ve güvenilirlik düzeyi, iklim dostu hayvancılık üretiminde ölçeklenebilir kullanımına olanak tanımakta; böylece ısı stresinin etkilerini azaltarak sürdürülebilir üretimi güvence altına almakta ve küresel ekonominin korunmasına katkı sağlamaktadır (Rebez ve ark. 2024).

Sığır yetiştiriciliğinde kullanılan sensör ve donanım cihazları, hassas hayvancılık uygulamalarının gelişmesiyle birlikte önemli bir dönüşüm sürecine girmiştir. Günümüzde farklı fizyolojik, morfolojik ve davranışsal parametreleri ölçebilen çok çeşitli sensörler mevcuttur. Bu sistemler, hastalıkların erken tespiti, hayvan refahının artırılması ve daha sürdürülebilir üretim süreçlerinin desteklenmesinde kritik bir rol oynamaktadır (Michelena ve ark., 2024).

Sensörlerin stratejik konumlandırılması (çiftlik altyapısı, mera veya doğrudan hayvan üzerinde) etkinlikleri açısından büyük önem taşımaktadır. Kullanım amaçları, çiftlik tipi, çevresel koşullar ve hayvan özellikleri bu seçimde belirleyici faktörlerdir.

Genel olarak sensörler iki ana grupta sınıflandırılmaktadır (Michelena ve ark., 2024):

- **Taşınabilir cihazlar:** Hayvan üzerine takılan hızölçerler, jiroskoplar vb.
- **Taşınamaz cihazlar:** Çiftlikte sabit noktaya yerleştirilen kameralar veya yük hücreleri vb.

Bununla birlikte, sensörler invaziv/invaziv olmayan yapıları ya da veri toplama yöntemleri gibi farklı kriterlere göre de sınıflandırılabilmektedir. Sonuç olarak, bu teknolojiler hem bireysel hayvan hem de sürü düzeyinde yönetimi kolaylaştırarak daha etik, verimli ve çevre dostu hayvancılığa katkı sağlamaktadır (Michelena ve ark., 2024).

Yapay zekâ hayvan refahının arttırılmasına yönelik çalışmalarda da kullanılmaktadır. Essien ve Neethirajan (2025), tarafından hazırlanan makalede, yumurtacı tavuk refahının izlenmesinde geleneksel yöntemlerin yetersizliklerini ortaya koyarak, çok modlu yapay zekâ tabanlı

yaklaşımların devrimsel potansiyelini vurgulamaktadır. İnsan gözlemine ve tek tip sensörlere dayalı geleneksel sistemler, modern ticari ortamların karmaşık refah dinamiklerini yakalayamamaktadır. Görsel, işitsel, çevresel ve fizyolojik verilerin entegrasyonunu mümkün kılan çok modlu yapay zekâ ise bu alanda kritik bir dönüm noktası oluşturmaktadır. Çok modlu yapay zekânın asıl gücü, teknik kapasitesinden öte, hayvanlarla bakıcıları arasındaki iletişim boşluğunu kapatabilmesidir. Stresin akustik ve termal işaretleri, konforun davranışsal göstergeleri ve sağlığın fizyolojik parametrelerini bir araya getirerek kapsamlı bir refah anlatısı oluşturur. Araştırmalar, bu yaklaşımın refah değerlendirmelerinde **%90'ın üzerinde doğruluk** sağladığını; tek modlu sistemlerin ise genellikle **%60–75** aralığında kaldığını ortaya koymaktadır. Sonuç olarak, çok modlu yapay zekâ yalnızca bir teknoloji değil, aynı zamanda **etik, bilimsel ve bütüncül bir refah yönetimi paradigmasının temel taşı** olarak öne çıkmaktadır.

Kanatlı üretiminde de yapay zekâ, makine öğrenimi ve **IoT tabanlı sensör teknolojilerinin entegrasyonunun** nasıl dönüştürücü bir rol üstlenebileceği üzerine çalışma yapılmıştır. Çalışma, hastalık tespiti, davranış analizi, çevresel kontrol, otomasyon ve verimlilik optimizasyonu olmak üzere beş temel alanda mevcut uygulamaları sınıflandırmaktadır. Bulgular, özellikle **YOLOv8 tabanlı CNN modellerinin** görsel hastalık tespitinde %90'ın üzerinde doğruluk sağladığını; IoT sensörlerinin ise sıcaklık, nem ve sürü davranışını sürekli izleyerek otomatik iklimlendirme ve yemleme gibi süreçleri optimize ettiğini ortaya koymaktadır. Buna karşın, yüksek kurulum maliyetleri, sınırlı altyapı ve küçük ölçekli yetiştiricilerin dijital okuryazarlık eksikliği, yaygın benimsemenin önünde önemli engeller oluşturmaktadır. Araştırma boşlukları arasında veri setlerinin genellenebilirliği, çok modlu sensör füzyonu ve ölçeklenebilir saha uygulamaları öne çıkmaktadır (Natsir ve ark., 2025).

Yapay zekâ ve IoT; kanatlı yetiştiriciliğinde **hayvan refahını artıran, operasyonel verimliliği geliştiren ve sürdürülebilirliği güçlendiren** veri odaklı karar mekanizmalarının temelini oluşturma potansiyeline sahiptir. Ancak bu dönüşümün başarısı, teknik yeniliklerin yanı sıra **sağlam metodolojiler** ve **kapsayıcı uygulama stratejileri** ile mümkündür.

Son yıllarda geliştirilen yapay zekâ algoritmaları, hayvan performansının değerlendirilmesinde de kayda değer iyileşmeler sağlamıştır. Yapay zekâ tabanlı araçlar; sağlam, güvenilir ve kapsamlı performans ölçümleri sunarak ısı stresine bağlı üretim kayıplarını en aza indirme kapasitesine sahiptir. Davranışsal, fizyolojik ve sağlık göstergelerine dayalı otomatik izleme yöntemleri, makine öğrenmesi, sinir ağları ve derin öğrenme gibi teknolojilerin gelişimiyle birlikte ısı stresi yönetiminde yaygın kabul görmektedir (Rebez ve ark. 2024).

Koçak (2018), tarafından yapılan çalışmada ise **Arduino ve bulanık mantık kullanılarak arı kovanlarının uzaktan takip ve kontrolünü sağlayan bir sistem** tasarlanmıştır. Sistem; kovan içi sıcaklık ve nemin izlenmesi ve kontrolünü gerçekleştirerek bal verimini artırmayı ve iklim koşullarının arılar üzerindeki olumsuz etkilerini azaltmayı amaçlamaktadır. Çalışmanın literatüre katkıları; arı kovanlarının web/mobil arayüz üzerinden kontrol edilebilmesi, manuel ve bulanık mantık tabanlı iki farklı yöntemle yönetilebilmesi ve adaptif yapısıyla farklı çevre koşullarına uyum sağlayabilmesidir. Ayrıca, sisteme yeni sensörler eklenerek kullanılabilirliğinin daha da artırılabileceği öngörülmektedir.

5. SONUÇ

Yapay zekâ destekli sistemler, otomatik veri toplama, analiz ve modelleme yetenekleri sayesinde hastalıkların erken tespiti ve tahmine dayalı yönetim uygulamalarının geliştirilmesine olanak tanımakta; böylece hayvan sağlığı ve refahı üzerinde doğrudan olumlu etkiler yaratmaktadır. Ayrıca iklim değişikliğine bağlı ısı stresi gibi çevresel faktörlerin etkilerini azaltma potansiyeli, sürdürülebilir üretim hedefleri açısından yapay zekâyı stratejik bir araç haline getirmektedir. Sensör teknolojilerinin gelişimi ve doğru konumlandırılmasıyla birlikte,

bireysel hayvan düzeyinde bile davranışsal ve fizyolojik verilerin toplanması mümkün hâle gelmiş; bu da daha etik, çevre dostu ve verimli üretim sistemlerinin tasarlanmasını sağlamıştır.

Çok modlu yapay zekâ yaklaşımları, hayvan refahı izleme ve değerlendirme süreçlerinde devrimsel bir potansiyel ortaya koymakta ve insan gözlemine dayalı geleneksel yöntemlerin ötesine geçmektedir. Kanatlı yetiştiriciliğinde de makine öğrenimi ve IoT entegrasyonu, çevresel koşulların optimize edilmesi, davranış analizi ve otomasyonun sağlanması gibi alanlarda önemli kazanımlar sunmaktadır. Ancak yüksek kurulum maliyetleri, altyapı eksiklikleri ve dijital okuryazarlık düzeyinin yetersizliği, bu teknolojilerin yaygınlaşmasının önünde halen önemli engeller olarak durmaktadır.

Sonuç olarak, yapay zekâ ve ilgili teknolojilerin hayvancılık sektöründe sunduğu olanaklar, yalnızca verimlilik ve üretim artışıyla sınırlı kalmayıp; hayvan refahının iyileştirilmesi, çevresel etkilerin azaltılması ve sürdürülebilir üretim sistemlerinin geliştirilmesi açısından da büyük önem taşımaktadır. Gelecekte bu teknolojilerin daha yaygın bir şekilde kullanımı, hayvancılığın küresel ölçekte daha rekabetçi, çevre dostu ve etik bir yapıya kavuşmasına katkı sağlayacaktır.

ABSTRACT

The silkworm (*Bombyx mori L.*) is a holometabolous species with distinct morphological and physiological characteristics in its egg, larva, pupa, and adult stages, and is of great economic importance in sericulture. Larvae undergo a larval stage lasting 25-30 days from hatching to cocoon spinning; this period consists of five instars. The first, second, and third instars represent the juvenile stage, while the fourth and fifth instars represent the adult stage. All developmental stages of the silkworm are extremely sensitive to environmental conditions. The most critical abiotic factors are temperature, humidity, and air. Temperature directly affects the larvae's metabolic rate, feeding behavior, growth period, and energy use. The optimal temperature range is 23-28°C, and 20-26°C is recommended for the healthy development of eggs. Low temperatures slow feeding, while high temperatures are associated with early pupation, fiber thinning, and increased mortality. Relative humidity has both direct and indirect effects on the growth and development of silkworms. Directly, it accelerates the physiological activities of the larvae; indirectly, it affects the quality of the mulberry leaves, which are their food source. Low humidity leads to drying and growth delays, increasing the larvae's susceptibility to disease. Ventilation and air quality are critical for respiration and metabolic processes. Larvae breathe through air holes in their bodies; low oxygen or high CO_2, NH_3, and SO_2 levels slow growth, reduce feeding, and decrease cocoon quality. Oxygen requirements are particularly high in the fourth and fifth instars. Therefore, adequate air circulation and removal of toxic gases are essential for healthy development and high-quality silk production. This study aims to comprehensively examine the climatic requirements of silkworms at different developmental stages and the effects of changes in environmental conditions on larval growth, health, and cocoon yield.

İPEK BÖCEĞİNDE *(Bombyx mori* l.*)* VERİMLİLİĞİ ETKİLEYEN İKLİMSEL FAKTÖRLER

ÖZET

İpek böceği (*Bombyx mori L.*), yumurta, larva, pupa ve ergin evreleri morfolojik ve fizyolojik özellikleri bakımından farklı olan holometabol bir türdür ve kültür ipekçiliğinde ekonomik açıdan büyük öneme sahiptir. Larvalar, yumurtadan çıkışlarından koza örmeye kadar geçen 25-30 günlük süreyi kapsayan larva devresinden geçer; bu dönem beş yaştan oluşur. I., II. ve III. yaşlar genç dönemi, IV. ve V. yaşlar ise yetişkin dönemi temsil eder. İpek böceğinin tüm gelişim evreleri çevresel koşullara son derece duyarlıdır. En kritik abiyotik faktörler sıcaklık, nem ve havadır. Sıcaklık, larvaların metabolizma hızını, beslenme davranışlarını, büyüme süresini ve enerji kullanımını doğrudan etkiler. Optimal sıcaklık aralığı 23-28°C olup, yumurtaların sağlıklı gelişimi için 20-26°C önerilmektedir. Düşük sıcaklık beslenmeyi yavaşlatırken, yüksek sıcaklık erken pupasyon, lif incelmesi ve mortalite artışı ile ilişkilidir. Nem, ipek böceklerinin büyüme ve gelişmesi üzerinde hem doğrudan hem dolaylı etkilere sahiptir. Doğrudan olarak larvaların fizyolojik aktivitelerini hızlandırır; dolaylı olarak ise besin kaynağı olan dut yapraklarının kalitesini etkiler. Düşük nem kuruma ve büyüme gecikmesine yol açarak larvaların hastalıklara karşı duyarlılığını artırır. Havalandırma ve hava kalitesi, solunum ve metabolik süreçler açısından kritik öneme sahiptir. Larvalar vücutlarındaki hava delikleri aracılığıyla solunum yapar; düşük oksijen veya yüksek CO_2, NH_3 ve SO_2 seviyeleri büyümeyi yavaşlatır, beslenmeyi azaltır ve koza kalitesini düşürür. Dördüncü ve beşinci instarlarda oksijen gereksinimi özellikle yüksektir. Bu nedenle yeterli hava sirkülasyonu ve zehirli gazların uzaklaştırılması, sağlıklı gelişim ve yüksek kaliteli ipek üretimi için zorunludur. Bu çalışma, ipek böceğinin farklı gelişim evrelerindeki iklimsel gereksinimlerini ve çevresel koşullardaki değişimlerin larvaların büyümesi, sağlığı ve koza verimliliği üzerindeki etkilerini kapsamlı bir biçimde incelemeyi amaçlamaktadır.

Anahtar Sözcükler: Bombyx mori, ipek böceği, yetiştirme, iklimsel faktörler

INTRODUCTION

The mulberry silkworm (*Bombyx mori L.*) is a fully domesticated insect belonging to the order of Lepidoptera, widely cultivated worldwide for silk production, and produces approximately 95% of commercial silk (Bajwa et al. 2017). *Bombyx mori* (B. mori), essentially a monophagous insect that feeds exclusively on mulberry leaves (Morus spp.), and its growth, development, cocoon, and silk production are entirely dependent on the quantity and quality of mulberry leaves (Hailu 2016). B. mori is an economically important holometabolous species, meaning it undergoes metamorphosis, with distinct physiological and morphological characteristics in its egg, larva, pupa, and adult stages (Figure 1) (Agustarini et al. 2020). The 25-30-day period from the hatching of silkworm larvae to the spinning of cocoons is called the larval stage, and this period consists of five instars. The first, second, and third instars are called the young stage, while the fourth and fifth instars are referred to as the adult stage (Şahan 2011).

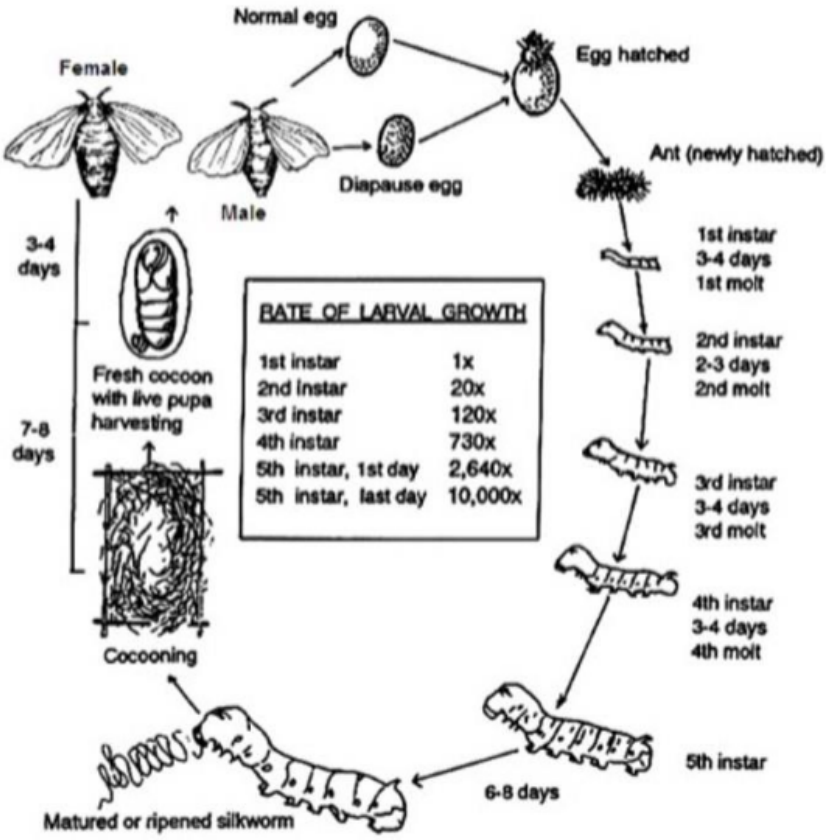

Figure 1. Silkworm breeding process (Agustarini et al. 2020)

In the young stage, larvae have higher temperature and humidity requirements compared to the adult stage. Because during this period, larvae actively feed and grow very quickly. If they pass through this young stage healthily and mature, they become more resilient to adverse conditions in the adult stage and can successfully spin cocoons (Malik and Reddy 2007). The aim of silkworm farming is to produce high-quality cocoons with a high silk content by utilizing the existing optimal environmental conditions. The silkworm is inherently very delicate and sensitive to environmental conditions. During cultivation, ecological factors such as temperature, humidity, light, and air primarily have a significant impact on the growth of larvae and ultimately on the quality of the cocoon product. However, other factors such as the quality and quantity of leaf supply, feeding regimen, and bed cleanliness, which are part of the rearing techniques, also affect the quality of the obtained cocoons (Gupta and Dubey 2021). Jumagulov et al. (2021) reported that the larger the size of the silkworm rearing rooms, the more difficult

it is to maintain a comfortable temperature, relative humidity, and other environmental factors, resulting in changes in the development of silkworms and the cocoon spinning processes.

Silkworms are poikilothermic organisms, meaning their body temperature is roughly the same as the temperature of the surrounding microenvironment, and since it is controlled by this environment, their body temperature is also quite variable, making them cold-blooded animals. Therefore, since biotic and abiotic factors significantly influence the physiological activities of silkworms, they generally determine their productivity and fate (Bora and Saikia 2022). In this case, the organism's ability to adapt to an unstable or extreme environment, that is, its ability to survive in various environments, is important. Some organisms have the ability to cope with environmental stress by specifically altering their physiology, morphology, and behavioral strategies (Lemoine et al. 2014). If environmental stress originates from biotic factors, the organism makes behavioral changes particularly according to its interactions with biotic factors (Badyaev 2005). On the contrary, if environmental stress originates from abiotic factors, the organism's response typically manifests as physiological changes that result in phenotypic alterations, such as shortening or lengthening the instar stage period in the life cycle and continuing to the next life stage (Whitman and Agrawal 2009). Resistance to abiotic factors varies among different silkworm strains from the embryonic stage (Manjunatha et al. 2010). Among the four commercially used silkworm species, the fully domesticated B. mori is much more sensitive to sudden fluctuations in temperature, humidity, and other abiotic factors. Therefore, the ability of B. mori to adapt to environmental conditions is quite different from that of wild silkworms (Rahmathulla 2012).

In this study, environmental factors such as temperature, humidity, air circulation, gases, and light that affect the growth, development, productivity, and silk quality of B. mori have been addressed.

Temperature

Among abiotic factors, temperature is the most important environmental factor affecting insect behavior, development, survival, and reproduction. All insect species have specific temperature preferences for normal growth, and very high temperatures can cause various developmental disorders in both larval and adult stages, slowing growth (Çelik Biçer et al. 2023). Silkworm physiology—metabolism, enzyme activity, nutrient conversion, digestion, assimilation, excretion, neural stimulation, and hormonal activity—is affected by environmental temperature. In other words, because silkworms are cold-blooded animals, temperature has a direct impact on physiological activities that play a significant role in their growth and development (Ibragimov and Tokhirjonova 2023). Consequently, it also affects hatching, larval growth, the quality of cocoons produced, and adult fertility.

The recommended temperature for healthy development of silkworm eggs ranges from +20°C to +26°C, while the temperature range required for optimal productivity is 23°C to 28°C (Şahan 2011). According to Mărghitaş et al. (2009), the egg stage is the most time-consuming stage, as it takes more than nine months in monovoltines. To maintain egg viability, embryogenesis is reduced using temperature. After the B. mori female lays the eggs, the temperature is gradually lowered to 8°C and then to 2.5°C. If an incubation temperature of 24-26˚C, a relative humidity of 75-85%, and a lighting period of 18 hours are applied during incubation period, hatchability could be achieved at higher percentage betweem 70% to 100% (Anton et al. 2015). Kumar and Ravishankar (2024) reported that the egg-laying ability of B. mori tended to increase as the temperature increased from 14˚C to 18˚C and remained constant until the temperature reached 26˚C, where it started to decrease as the temperature increased to 34˚C. The minimum number of eggs laid by a female butterfly at 14˚C was reported as 249, while the maximum number of eggs laid by a female at 26˚C was reported as 386 (Kumar and Ravishankar (2024).

Krishnaswami (1978) stated that the ideal temperature and humidity conditions for egg incubation should be 25°C and 80%, respectively. In addition, it was emphasized that the importance of maintaining the relative humidity of the incubation around 80% has crucial importance to prevent the eggs from drying out and that only under optimum conditions of temperature and humidity during incubation period could provide the development of the embryo stably and properly. Kumar and Ravishankar (2024) reported that as the temperature increased from 10˚C to 14˚C, the incubation period of the eggs decreased from 21.66 days to 15.16 days, and it lasted 9.46 days at 26˚C, and as the temperature increased to 38˚C, the incubation period significantly decreased to 6.56 days. Furthermore, low (50%) or high (90%) relative humidity levels have negative effects on female butterfly fecundity, egg hatchability, and pupal and larval mortality. Relative humidity levels below 70% lead to lower hatchability due to unfertilized eggs and poor egg formation, while relative humidity above 80% facilitates disease transmission and leads to larval mortality (Hussain et al. 2011a).

In the juvenile stage, larvae are tolerant to high temperatures, which contributes to their survival and cocoon characteristics. Furthermore, temperature is directly related to larval growth, so wide fluctuations in temperature are detrimental to larval development (Haisley 2021). Sinha and Sanyal (2013) reported that temperature fluctuations during rearing lead to the death of silkworm larvae. During silkworm rearing, an increase in temperature increases various functions, while a decrease in temperature decreases their activity. Especially in the adult stage, increasing temperature accelerates larval growth and development, shortening the larval period, resulting in the formation of cocoons of lower weight and quality. Low temperatures, on the other hand, slow growth and development and prolong the larval period, resulting in a retardation of larval growth (Singh et al. 2009). Similarly, Shirota (1992), and Tazima and Ohuma (1995) reported that silkworms are more sensitive to high temperatures in the fourth and fifth instars. This is because, particularly in the first two instars, silkworm larvae consume only 1% of the mulberry leaves of total consumed leaves. Due to the lower consumption of mulberry leaves, enzyme activity in digestive process decreases, resulting in lower heat production. This is the main reason for maintaining a relatively higher temperature in the rearing chamber during the juvenile stage. However, the opposite trend is observed in the fourth and fifth instars, as larvae consume almost 94% of the total mulberry leaves. This leads to increased enzyme activity in digestion, resulting in an increment of heat production in the silkworm body. Therefore, maintaining a relatively lower temperature in the rearing chamber is important (Jumagulov et al. 2021). B. mori reaches maximum oviposition and fecundity at 25-36°C, and any fluctuation in this level reduces oviposition and fecundity (Mathur et al. 1988). Sarkar et al. (2008) suggested that 24-28°C is ideal for larval growth. The optimum temperature for normal growth of silkworms is between 20°C and 28°C, and the desired temperature for maximum productivity is between 23°C and 28°C (Rahmathulla 2012). It has been reported that good quality cocoons are produced in the temperature range between 22 and 27°C, and cocoon quality is lower above these levels (Krishanswami et al. 1973). Rahmatulla (2012) also pointed out that environmental conditions such as temperature and relative humidity, which vary from season to season, must be constantly controlled for consistent cocoon production. When the temperature rises above 30°C, the health of the larva is directly affected, while if the temperature is below 20°C, all physiological activities in the larvae, especially in the early stages, decline, the larvae remain very weak and become susceptible to various diseases (Gupta and Dubey 2021). Furthermore, high temperatures negatively affect almost all biological processes, including the rates of biochemical and physiological reactions, and can ultimately affect the silkworm's cocoon quality, quantity, and subsequent silk production (Willmer et al. 2004). Exposure of larvae and cocoons to temperatures of 35°C or above results in poor performance in terms of egg number and egg fertility, as well as the laying of unfertilized eggs due to the high temperatures during rearing, cocooning, mating, and

oviposition (Datta et al. 2001). Ramachandra et al. (2001) also reported that the cocoon formation process is significantly affected by fluctuations in temperature and humidity. Pezhman and Jagadeesh Kumar (2010) reported that good-quality cocoons are produced at temperatures between 22 and 27°C, with cocoon quality deteriorating at temperatures above these levels. Khan (2014) stated that temperature and humidity play a vital role in silkworm growth and development and cocoon quality, and reported that the optimal environmental conditions are 25±1°C and 80% relative humidity. Pal et al. (2014) observed a lower mortality rate and higher pupal and shell weights at 24°C. Sarkhel et al. (2017) observed that larval development was better at 22-26°C and 75-85% relative humidity, and that pupal and shell weights were higher at an average temperature of 22-24°C and 80-85% relative humidity. However, the researchers noted that larval weight decreased as temperature increased. They also reported that high temperatures did not support productivity, leading to decreased cocoon quality due to accelerated growth rates, and also mulberry leaves fed to the silkworms wilted, reducing their nutritional intake. Verma et al. (2016) also reported that mortality was lowest in B. mori larvae reared at 22-26°C and 80-85% relative humidity, and that pupal and shell weights were higher. Sisodia and Gaherwal (2017) reported that the suitable temperature for the development of B. mori is 25ºC and humidity is 75-80% and that in this environmental condition, cocoon weight (1.701 g), pupal weight (1.532 g) and silk filament length (800 m) were the highest and the mortality rate in larvae was the lowest (12%). Ramachandra et al. (2001) reported that the cocoon spinning speed of B. mori larvae was slow at 22°C and fast at 38°C and the duration for cocoon completion was longest at 98±2% relative humidity and the shortest at 40±2% relative humidity. However, they stated that since quality cocoons are obtained at 22°C and 65±5% relative humidity, care should be taken to maintain these temperature and relative humidity during cocoon spinning. Sharma et al. (2023) reported that when the temperature was kept at 25±1ºC, the maximum values of cocoon weight (1.80 g), shell weight (0.38 g) and shell ratio (21.10%) were observed, and when the temperature was increased to 35±1ºC, the lowest average values of cocoon weight (0.83 g), shell weight (0.06 g) and shell ratio (7.21%) were obtained. Mishra (2018) reported that cocoon shell weight increased as temperature increased between 15°C and 25°C, from 0.124 g to 0.192 g, while temperatures above 25°C caused a gradual decrease in cocoon shell weight. Umarov and Nasirillaev (2023) reported that when these environmental conditions were extreme, the cocoon lost 1.11–1.39 g in weight, depending on the characteristics of the silkworm race. Dahi et al. (2016) found that 20°C significantly increased cocoon weight (1.57 g) compared to 23°C and 26°C, but the increase in both cocoon shell weight (0.29 g) and cocoon shell ratio (19.03%) was not significant compared to the other two temperatures. For cocoon spinning parameters, they reported that both the longest silk filament length (993.8 m) and silk ratio (49.19%) were achieved at 20°C. Similarly, they reported that pupal rate, pupal weight and egg production (number of eggs per female) were significantly higher at 20°C and 23°C than at 26°C. The researchers reported that while 20°C was slightly lower than generally recommended, it did not significantly affect the reproductive behavior and fertility of the silkworm, perhaps resulting in fewer eggs laid, but the female could mate with more than one male, resulting in more eggs laid and therefore fertilized eggs. Wanule and Balkhande (2013) reported that adult B. mori larvae died and could not lay eggs when kept at 40±5°C, while reproductive behavior and fertility were affected at 30±1°C, and therefore laid the least number of eggs and died within 72 hours. Datta et al. (2001) and Pandey and Tripathi (2008) reported that lower temperatures are always better than higher temperatures in terms of silkworm productivity and larval duration for different stages.

The weight of the silk gland is a very important parameter for cocoon production. Temperature fluctuation causes a decrease in silk production and silk gland weight (Hsich et al. 1995). Mishra (2018) reported that the silk gland weight of V. instar larvae increased with temperature

change between 15 and 25°C, from 0.132 g to 0.267 g, and gradually decreased above 25°C. Jeena and Quraiza (2022) reported that at 25°C, B. mori larval weight (2248 mg), silk gland ratio (41.37%), cocoon weight (1240 mg), pupa weight (950 mg), shell weight (290 mg), shell ratio (23.38%) and silk index (1.26) increased significantly and reached the highest level, which helped to increase the productivity of silkworm.

Because silkworms cannot regulate their body temperature according to the ambient temperature, the rearing room temperature must be adjusted using stoves or electric heaters during the first days of rearing (Gülseren and Sipahioğlu 1992). The room temperature should be kept as constant as possible throughout all stages of the silkworm's life, and sudden changes should be avoided to avoid negatively affecting their productivity. When the temperature in the rearing room is too high, practices such as periodically moistening the floor with water, placing wet clothes on windows and doors and constantly wetting them, and using paraffin paper on feeding tables until adulthood are reached are employed. These methods used to lower the ambient temperature generally increase the humidity in the rearing room. It is generally estimated that a 4% increase in relative humidity can lower the temperature by 1°C (Sarkar et al. 2016). Furthermore, doors and windows should be kept closed, especially at night. Later in the day, as the outside temperature rises, doors and windows should be opened (Şahan 2011).

Humidity

Humidity is the most important and strongest abiotic factor for silkworm growth and development after temperature. However, the combined effects of temperature and relative humidity largely determine silkworm growth and the production of high-quality cocoons (Tanjung et al. 2017). Humidity has both direct and indirect effects on silkworm growth and development. It directly accelerates the larval physiological functions, helping to reduce the length of the silkworm's growth period. It indirectly affects the rate of wilting of leaves in larval beds, making them unsuitable for silkworm consumption, which in turn delays larval growth. As a result, the larvae remain weak and susceptible to disease (Haisley 2021).

During incubation, maintaining an average humidity of 80% is crucial for normal embryonic growth. If humidity reduces below 70% during incubation, it affects hatching (Singh et al. 2009). Larval water content varies according to instar stage, particularly increasing after molting until the first molt. Newly hatched larvae have the lowest water content, remaining almost constant at the end of the fourth instar. Fifth-instar water content is highest in newly molted larvae and lowest in mature larvae at the end of the fifth instar. Therefore, first-instar larvae have a physiological need for more water, and therefore, the ambient humidity is higher. They accumulate high levels of water in their bodies by feeding on mulberry leaves, which have high water content (Sarkar 2018). Humidity varies not only seasonally but also, like temperatures, throughout the day.

For successful silkworm rearing, the humidity in the rearing chambers must be constantly monitored throughout the day. During the early stages of feeding, feeding tables are covered with paraffin paper to maintain humidity and prevent the leaves from drying out (Haisley 2021). In contrast, fifth-instar larvae require water at a lower level than the water content of mulberry leaves, so the humidity is kept lower (Sarkar 2018). The heat required by silkworms in the rearing chamber is the difference between the heat loss from structural elements and ventilation and the heat radiated by the larvae. However, it is assumed that silkworms do not release heat or moisture to their environment outside of the fifth instar. Therefore, the heat required by silkworms is equal to the heat loss from structural elements and ventilation. During the fifth instar (just before cocoon spinning), 100 larvae release approximately 40 ml of urine, and this value is approximately 6,400 g for 16,000 larvae (the

specific gravity of urine is taken as 1 g/cm^3). Therefore, the relative humidity in the feeding rooms is accepted as 70% for V. instar in the growing room (Gençoğlan and Başpınar 2016).

Gençoğlan and Başpınar (2016) reported that the heat requirement of the silkworm decreases from the 1st to the 4th instar stage, but increases again in the 5th instar stage. Hussain et al. (2011) reported that silkworm performance differs significantly from each other under various temperature and humidity exposures during the 4th and 5th instars, that silkworm performance generally remains constant at 25°C and 75% relative humidity, that hatching and pupal rates decrease when exposed to an environment above 25±1°C and below 70% relative humidity, and that even at 25°C, lower relative humidity (55 and 65%) causes higher larval mortality. However, they stated that the highest larval mortality rate (11,92%) was observed at 35°C and 55% relative humidity. Kaleem et al. (2011) reported that changing temperature and humidity levels affect both the quantity and quality of silkworms, and that while the mortality rate in larvae was 40% at 25°C and 70% relative humidity, development was good at 20°C and 80% relative humidity.

Lakshminarayana et al. (2003) reported that under natural day photoperiodic (12:12 h) conditions in B. mori, extreme temperature (35%) and humidity (80%) reduced both molting and larval viability. They stated that temperature and humidity, especially during molting, created a synergistic effect and significantly affected silkworm viability. Gowda and Reddy (2007) reported that the detrimental effects of high temperature (30°C±1) and high relative humidity (80±5%) on the rearing and cocoon spinning of silkworm larvae were more pronounced than other temperature and relative humidity treatments. They also showed that cocoon characters of larvae affected by high temperature and relative humidity could be improved by providing ideal environmental conditions even during the cocoon spinning stage and that high temperature and low humidity had a greater effect on the rearing stage than on the cocoon spinning stage. Rahmathulla et al. (2004) reported that in order to obtain high quality cocoons, the water content of the cocoon layer must be below 20%, and if the ambient humidity is high during cocoon weaving, the water in the cocoon and the body of the silkworm gradually evaporates, affecting the structure of the sericin.

Ventilation and Lighting

Air quality in the rearing environment plays a crucial role in silkworm health and cocoon production. Silkworms breathe through blowholes located on the sides of their bodies, and the air they breathe directly affects their physiological functions. Poor air quality, characterized by low oxygen levels or the presence of harmful gases, leads to a decline in silkworm health and a decrease in silk quality (Amit Kumar et al. 2021). Therefore, silkworms, like other living creatures, need clean air. Larvae, especially in the fourth and fifth instars, have high oxygen requirements. Oxygen is vital for silkworm respiration and general metabolic processes. Inadequate oxygen levels can cause hypoxia, leading to lethargy, decreased feeding, and stunted growth (Subhan et al. 2013). When stoves are used to heat the rearing chamber during rearing, gases are produced that alter the air composition within the facility.

Carbon dioxide (CO_2), ammonia (NH_3), and sulfur dioxide (SO_2) are some of the gases released in rearing facilities due to the fermentation of animal and plant wastes and human activity (Rahmathulla 2012). Because these gases are harmful to silkworms, the ambient air must be kept clean with adequate ventilation to keep these toxic gases at low levels. The freshness of the air in rearing rooms can be assessed by the CO_2 concentration. The amount of CO_2 exhaled by silkworms through respiration increases with increasing body temperature during the adult period (Sarkar 2018). Concentrations of 1% CO_2, 0.02% SO_2, and 0.1% NH_3 in the air are acceptable limits for B. mori rearing (Singh et al. 2009). If the CO_2 concentration in the rearing room air exceeds 2%, larval development slows down (Haisley 2021). Lee (1999)

reported that high CO_2 levels make silkworms lethargic, reducing feeding efficiency and causing slower growth, leading to smaller cocoons (Amit Kumar et al. 2021).

Young larvae are more sensitive to toxic gases, so ventilation is beneficial in reducing polluted air levels (Grekov et al. 2005). Ventilation helps ensure a constant supply of fresh air, removes excess CO_2, and prevents the accumulation of harmful gases. While traditional rearing typically utilizes natural ventilation through windows and doors, modern silkworm rearing utilizes mechanical ventilation systems that provide better air quality control. These systems not only improve the health and productivity of silkworms but also contribute to more consistent cocoon quality (Amit Kumar et al. 2021). In silkworms, a 1.0 m/s airflow in rearing chambers during the fifth instar, compared to zero ventilation, has been reported to reduce larval mortality and increase leaf consumption and digestibility, leading to increased larval weight, cocoon weight, and pupal rate (Awasthi 2022).

Silkworm larvae are sensitive to light and tend to move toward dim light. They dislike both intense light and complete darkness, generally preferring low light of 15 to 20 lux (Grekov et al. 2005). Silkworms' light requirements change as their life stages progress. In early larval stages, silkworms are more tolerant of light and require a balanced light-dark cycle to regulate their feeding and growth (Oripovich and Ramazonovich 2020). Juvenile larvae generally exhibit positive phototropism, while adults exhibit negative phototropism (Grekov et al. 2005). Adult larvae perform better under cycles of 16 h light and 8 h dark, while juvenile larvae prefer a 16-h dark phase and an 8-h photoperiod. If larvae are kept in constant darkness or intense light, growth and metamorphosis are disrupted. Furthermore, excessive light exposure can cause stress in larvae, leading to erratic movements and poor feeding. Consequently, both larvae and cocoons lose weight (Awasthi 2022). However, light exposure influences silkworms' circadian rhythms, affecting activities such as feeding and resting. Therefore, appropriate light management plays a crucial role in ensuring silkworms have a consistent and stable growth cycle (Amit Kumar et al. 2021).

Light stimuli (light color, wavelength, and ambient light intensity) are also crucial for larval hatching behavior in the rearing of B. mori for silk production. Hatching rhythms are a fundamental part of the survival mechanisms of newly hatched larvae, which are vulnerable to attack, and are determined by the organism's interactions with its environment. In silkworm rearing, hatching behavior is controlled by light stimuli, in addition to photoperiod, like a biological clock (Tao et al. 2017). Tanaka (1966) reported that light and constant darkness conditions caused a loss of the hatching rhythm in larvae. Tao et al. (2017) stated that 12-h light: 12-h dark photoperiod conditions regulate the hatching rhythm of B. mori through a circadian negative feedback loop. Faruki et al. (2007) reported a gradual decrease in hatching percentages for Lepidoptera when exposed to short-wavelength ultraviolet light (254 nm) for different durations. Iqbal et al. (2008) found that the average life cycle of B. mori under conditions of 25±2 ºC temperature and 70±10% relative humidity, complete darkness (24 hours) and complete light (24 hours) was 62 days in the dark and 68 days in the light, the average cocoon weight was 1.06 g in the dark and 0.9 g in the light, the average shell weight was 0.2 g in the dark and 0.16 g in the light, the shell ratio was 19.40 g in the dark and 18.35 g in the light, the mortality rate of the larvae was 13.3% in the dark and 24.4% in the light, and they reported that in general, the larvae reared in the dark were found to be significantly better than the larvae kept in the light conditions in terms of the examined parameters. Abdelaal et al. (2018) compared the effects of light color (green, blue, and red light) and exposure time (12 and 24 hours) on the length (m), weight (g), and dimensions (denier) of silk fiber obtained from the cocoons of B. mori larvae and reported that the longest silk (1119.2 m) and the highest average silk filament weight (0.228 g) were obtained in larvae exposed to green light for 24 hours. According to Sarkar (2018), the larval instar period was prolonged, and body weight and cocoon

shell weight increased in silkworms reared under purple light. Rani and James (2024) found that the larval life cycle of B. mori was 18 and 16 days under conditions of 25±2ºC, 70±5% relative humidity, continuous artificial light (7 watts) and daylight, respectively, and the larval weight of V. instar was 2.40 and 2.80 g, respectively. They concluded that because silkworms are naturally active during the day, exposure to artificial light has a positive effect on the life cycle by stimulating their feeding and growth rate, and that artificial light applications can be successfully used in rearing. Similarly, Taha (2017) suggested the use of LED light as a non-heat-emitting light source to increase hatchability and shorten the incubation period in B. mori embryos during the final stage of diapause. Bharathi and Yungen (2008) studied the effects of 20-watt ultraviolet light applied for 30, 60, or 120 minutes at a height of 40 cm above the first-day V. instar larvae on the biosynthetic activities of silk glands. They reported that 60 and 120 minutes of ultraviolet light application caused a significant decrease in silk gland weight, total protein, free amino acids, RNA, and carbohydrate levels, but 30 minutes of application had no effect. Suji et al. (2022) reported that light has the potential to stimulate protein and carbohydrate synthesis in B. mori, that 3-watt light exposure caused significant changes in economic parameters such as cocoon weight, shell weight, shell ratio and sericin in B. mori larvae, providing a better performance, that 5-watt light exposure led to the highest protein (10.71 mg/g) and the highest fibroin amount (65.50%) in the silk gland, while all of these economic parameters decreased in larvae exposed to 8 watts. Devi et al. (2024) studied the effects of different exposure times (2, 5 and 10 min) to ultraviolet light on various morphological and economic traits of silkworm larvae and emphasized the detrimental effects of long-term ultraviolet exposure on silkworm productivity, causing decreases in hatching percentage, larval weight, cocoon weight, fecundity and survival percentage. Furthermore, light exposure interacts with other environmental factors, such as temperature and humidity, which can increase the temperature in the rearing chamber and, if not managed properly, lead to heat stress in larvae. Similarly, light affects humidity levels by affecting the evaporation rate of moisture from the air. Therefore, successful light management in silkworm rearing requires an integrated approach that considers the interaction between light, temperature, and humidity (Amit Kumar et al. 2021).

CONCLUSION

For successful cocoon production, larvae must be reared in rooms with optimal temperature and humidity conditions, good ventilation, and sufficient light. They should also be fed a suitable quantity and quality of mulberry leaves with sufficient moisture. When larvae are reared at optimal temperature and humidity, their growth, development, and the quality of the resulting cocoons are significantly higher. Seasonal variations in environmental factors significantly affect phenotypic traits such as cocoon weight, shell weight, and cocoon-to-shell ratio. Climatic changes, particularly occurring in the last decade, highlight the importance of optimizing environmental conditions for sustainable cocoon production and emphasize the necessity of temperature and relative humidity management.

ABSTRACT

Rapid climate variability poses serious challenges to global agricultural productivity. Artificial Intelligence (AI)-driven precision agriculture provides a promising pathway for enhancing crop resilience through data-driven resource optimization and adaptive management. This empirical study investigates how AI models integrated with Internet of Things (IoT) sensors and satellite data improve decision-making in climate-resilient farming. Data were collected from 120 smart farms across Kaduna, Oyo, and Benue States, Nigeria, over two planting seasons (2023–2024). A Random Forest algorithm was implemented for yield prediction and resource optimization using soil moisture, temperature, and rainfall datasets. The AI-based model improved yield forecasting accuracy by 28.5% and reduced water and fertilizer waste by 17.3% compared to traditional methods. Results demonstrate that AI-driven precision agriculture significantly enhances climate adaptability, resource use efficiency, and productivity. The study contributes empirical evidence supporting AI integration in sustainable agricultural policy and technology adoption strategies.

Keywords: precision agriculture, artificial intelligence, machine learning, climate resilience, IoT, yield prediction.

1. INTRODUCTION

Agriculture remains the cornerstone of global food security, economic growth, and rural livelihood sustainability, yet it faces unprecedented challenges in the 21st century. Across the globe, climate variability has emerged as one of the most pressing threats to agricultural productivity, particularly in developing regions dependent on rain-fed farming systems. The Food and Agriculture Organization (FAO, 2023) warns that climate change is expected to reduce agricultural yields by up to 30% in sub-Saharan Africa by 2050 if adaptive innovations are not adopted. Irregular rainfall patterns, increasing frequency of droughts, soil degradation, and the emergence of new pest and disease vectors have collectively intensified production uncertainty. These climatic stressors directly threaten smallholder farmers who constitute the majority of the agricultural workforce and contribute significantly to regional food supply.

In Nigeria and other African nations, agricultural output continues to decline despite policy interventions and technological initiatives. Empirical evidence from Adeyemi et al. (2022) shows that rainfall variability and soil fertility depletion have contributed to yield losses of between 15–25% in staple crops such as maize, rice, and sorghum over the past decade. This production gap widens the risk of food insecurity, increases rural poverty, and exacerbates vulnerability to climate shocks. Furthermore, the expansion of agricultural land into marginal environments as a coping mechanism accelerates environmental degradation, creating a vicious cycle of unsustainable production. Addressing these challenges requires a fundamental transformation of traditional farming systems toward adaptive, data-driven precision agriculture models. Traditional agricultural practices, often reliant on farmers' intuition and manual observation, are increasingly inadequate for coping with dynamic climate variables and complex ecosystems. Precision agriculture (PA) represents a paradigm shift that leverages digital technologies to manage spatial and temporal variability in crop and soil conditions. According to Mekonnen and Tadesse (2021), precision agriculture integrates sensors, satellite imagery, drones, and data analytics to deliver targeted interventions—ensuring that each segment of a farm receives the precise amount of water, fertilizer, and pesticide required. This approach minimizes waste, enhances resource efficiency, and maximizes yield potential, aligning with global sustainability objectives. The incorporation of **Artificial Intelligence (AI)** into precision agriculture further elevates its capability by enabling predictive analytics and autonomous decision-making. Machine learning (ML) and deep learning (DL) algorithms can process vast datasets from IoT devices, weather stations, and remote sensing imagery to uncover complex relationships between climatic, soil, and crop growth factors (Zhou et al., 2023). Through such pattern recognition, AI systems can forecast crop diseases, predict yield outcomes, optimize irrigation schedules, and recommend nutrient applications in real time. This data-driven adaptability makes AI-driven precision agriculture a cornerstone of climate resilience and sustainable productivity.

Artificial Intelligence enhances the precision agriculture ecosystem through its capacity to model uncertainty and generate actionable intelligence from unstructured environmental data. For instance, convolutional neural networks (CNNs) and random forest algorithms have been successfully applied in detecting crop stress, classifying pest species, and predicting harvest times with high accuracy (Bai et al., 2022). Reinforcement learning systems are now capable of autonomously controlling irrigation valves, balancing soil moisture, and reducing energy costs in smart greenhouses. These intelligent applications bridge the gap between technology and practical on-field decision-making. In the context of climate-smart agriculture (CSA), AI acts as a catalyst for adaptation and mitigation. It supports early warning systems for droughts and floods, enhances carbon monitoring, and facilitates dynamic crop insurance schemes based on predictive modeling. According to the United Nations Development Programme (UNDP, 2024), integrating AI into CSA frameworks aligns with the broader goals of **Sustainable**

Development Goal (SDG) 2 – Zero Hunger, by promoting resilient food systems that can withstand climate variability while ensuring equitable resource distribution. Importantly, AI applications can help optimize resource use efficiency—achieving higher yields with less water, energy, and fertilizer—thus reducing agriculture's ecological footprint.

In tropical and semi-arid regions such as Nigeria, agricultural productivity is highly climate-sensitive. The country experiences pronounced rainfall variability, with alternating periods of drought and flooding that disrupt planting calendars. Despite efforts through the Agricultural Transformation Agenda (ATA) and other policies, technology adoption among smallholder farmers remains low (Nwosu et al., 2021). Most farms still rely on manual methods of pest control, non-digital irrigation, and generalized fertilizer application, which lead to inefficiencies and resource wastage.

Recent pilot initiatives on smart farming have demonstrated potential benefits. Studies conducted by Ogunleye and Yakubu (2022) revealed that farms equipped with IoT-based soil moisture sensors in Oyo State achieved a 20% reduction in water consumption and a 15% increase in maize yield compared to control farms. However, these initiatives remain fragmented and localized, lacking large-scale empirical validation across different agro-ecological zones. Furthermore, infrastructural constraints—such as limited internet connectivity, high cost of IoT devices, and insufficient digital literacy—pose significant barriers to scaling AI-driven agriculture across rural Nigeria. The theoretical underpinning of this study draws from **the Adaptive Systems Theory** and **Sustainable Livelihoods Framework (SLF)**. The Adaptive Systems Theory explains how complex agricultural systems can self-regulate and adjust to environmental feedback through information-driven mechanisms (Holling, 2001). AI models serve as adaptive agents within this framework, capable of learning from climatic variability and improving predictive accuracy over time. The SLF complements this by emphasizing the need for sustainable resource utilization that strengthens farmers' livelihood assets—natural, human, social, and technological capital. Hence, AI-driven precision agriculture operationalizes both frameworks by enabling real-time adaptation, efficient resource use, and long-term sustainability. Despite the growing global literature on smart agriculture, there remains a paucity of **empirical evidence from tropical contexts**, particularly in Nigeria and similar developing economies. Much of the existing research focuses on simulations, pilot projects, or case studies conducted in temperate climates with robust technological infrastructures (Zhou et al., 2023; Bai et al., 2022). Consequently, there is a limited understanding of how AI-based precision systems perform in environments characterized by irregular data availability, low mechanization, and variable climatic conditions. Moreover, while international organizations such as FAO and UNDP advocate for digital transformation in agriculture, evidence-based metrics quantifying the real-world benefits of AI interventions in yield stability, input efficiency, and climate resilience are still scarce.

This gap underscores the necessity of conducting **contextualized empirical investigations** to evaluate the effectiveness of AI-driven models under actual field conditions in Nigeria. Such studies are vital for informing data-driven agricultural policy, guiding investment in smart technologies, and building localized models tailored to the socio-ecological realities of African farmers. The overarching problem driving this research is the persistent vulnerability of agricultural production systems to climate variability, compounded by inefficient resource utilization and limited access to adaptive technologies. The inability of traditional farming methods to cope with unpredictable rainfall patterns, pest invasions, and soil nutrient imbalances results in substantial yield losses and increased production costs. Although AI offers transformative solutions, its adoption in rural agricultural systems is constrained by infrastructural and knowledge barriers. The **aim** of this study is to empirically examine how AI-driven precision agriculture contributes to climate-resilient crop production through

improved predictive analytics and optimized resource management. The **objectives** are threefold, to evaluate the predictive performance of AI-based models in forecasting crop yields under variable climatic conditions, to assess the efficiency of AI systems in optimizing the use of water and fertilizers in farming operations, to analyze farmers' adaptability, perception, and satisfaction with AI-enabled precision agriculture tools. This study is significant for several reasons. Academically, it extends the empirical frontier of AI and precision agriculture research in tropical agro-ecological systems, providing a robust model for future studies. Practically, it offers evidence-based insights that can guide policymakers, agritech developers, and agricultural extension services in scaling digital innovation among smallholder farmers. Socioeconomically, it contributes to enhancing productivity, improving food security, and strengthening resilience against climate-induced shocks in rural communities. By validating the tangible benefits of AI integration in agriculture, this research aligns with the broader agenda of digital transformation for sustainable rural development. In essence, the introduction situates AI-driven precision agriculture as a transformative response to climate threats facing agricultural productivity in sub-Saharan Africa. It establishes a clear research gap, theoretical foundation, and empirical motivation to evaluate AI's practical contribution to climate-resilient crop production in Nigeria.

2. Methodology

2.1 Study Area

The study was conducted in three major agricultural zones in Nigeria Kaduna (North), Oyo (West), and Benue (Central) representing different agro-ecological conditions.

2.2 Data Collection

A mixed-method approach was adopted:

Quantitative Data: 120 farms equipped with IoT sensors collected data on soil moisture, temperature, humidity, and rainfall during two planting seasons (2023-2024).

Qualitative Data: Farmer feedback was collected via structured interviews to assess adaptability and satisfaction with AI tools.

2.3 Experimental Setup

AI models were developed using Python (TensorFlow and Scikit-learn libraries). A **Random Forest Regressor (RFR)** and **Artificial Neural Network (ANN)** were trained using 80% of the dataset, with 20% used for validation. Data preprocessing included normalization and missing-value imputation.

2.4 Evaluation Metrics

Performance was evaluated using:

a. Root Mean Square Error (RMSE)

b. Mean Absolute Error (MAE)

c. Coefficient of Determination (R^2)

d. Resource optimization ratio (water/fertilizer savings)

2.5 Statistical Analysis

Descriptive and inferential analyses were performed using SPSS 28.0. One-way ANOVA tested yield variation across farms using AI tools versus control farms.

3. Results and Discussion

Table 1. Comparison of Yield Prediction Accuracy Between AI and Traditional Models

Model Type	RMSE (t/ha)	MAE (t/ha)	R^2	Accuracy Improvement (%)
Traditional Regression	0.98	0.72	0.68	–
Random Forest (AI)	0.71	0.49	0.83	22.4
ANN (AI)	0.65	0.42	0.86	28.5

Table 1 shows that AI models outperformed traditional regression methods by a significant margin. The ANN model achieved the highest predictive accuracy ($R^2 = 0.86$), indicating its robustness in capturing nonlinear climatic interactions influencing yield.

Table 2. Resource Optimization Using AI-Based Decision Support

Resource Type	Traditional Use (L/ha or kg/ha)	AI-Optimized Use	Reduction (%)
Water	11,500 L/ha	9,400 L/ha	18.3
Fertilizer	92 kg/ha	76 kg/ha	17.4

Table 2 shows that AI-driven scheduling algorithms reduced water and fertilizer waste by over 17%, demonstrating efficiency gains through adaptive irrigation and nutrient management systems.

Table 3. Farmers' Adoption and Perception Scores (n = 120)

Parameter	Mean Score (1–5 scale)	Std. Dev.
Ease of Use	4.3	0.8
Perceived Reliability	4.1	0.9
Cost-Benefit Value	4.0	1.0
Training Adequacy	3.7	0.7

Table 3 shows that high adoption rates were recorded, with farmers appreciating the reliability of AI systems. However, training gaps remain, indicating the need for capacity-building programs to fully leverage AI technologies.

Table 4. ANOVA of Yield Variation Across Study Regions

Source	SS	df	MS	F	Sig.
Between Regions	15.42	2	7.71	4.83	0.012*
Within Regions	183.55	117	1.57		
Total	198.97	119			

Table shows that yield improvements were statistically significant across regions ($p < 0.05$). The Northern farms benefited most, likely due to better AI integration with irrigation systems.

Table 5. Correlation Between Climatic Factors and AI Model Performance

Climatic Variable	Pearson's r	p-Value	Interpretation
Temperature	0.67	0.001	Strong positive correlation
Rainfall Variability	-0.59	0.004	Negative correlation
Soil Moisture	0.73	0.000	Strong positive correlation

Table 5 shows that AI model performance strongly correlated with soil moisture and temperature stability, confirming the sensitivity of machine learning algorithms to high-quality climatic data inputs.

4. Research Findings and Implications

4.1 Findings

The integration of Artificial Intelligence (AI) into precision agriculture demonstrated substantial benefits across the three agro-ecological zones—Kaduna (North), Oyo (West), and Benue (Central)—examined in this study. The experimental results and farmer responses indicated that AI-enhanced systems significantly improved climate resilience and production efficiency. The AI-based models—Random Forest Regressor (RFR) and Artificial Neural Network (ANN)—successfully identified early signs of drought stress and excessive rainfall, allowing for timely intervention. On-farm adaptive decisions, such as adjusted irrigation schedules and fertilizer management, were made possible through real-time predictive alerts. This early adaptation led to a measurable reduction in crop losses and an improvement in average yield stability across planting seasons. The models achieved a **28.5% increase in yield prediction accuracy** compared to traditional manual estimation methods. This improvement provided farmers with precise forecasts for production planning, market supply estimation, and post-harvest storage requirements. The ANN model outperformed the RFR by a margin of 6.3% in predictive accuracy, indicating its superior capacity to model nonlinear relationships between soil, weather, and crop parameters. Through AI-driven irrigation and fertilizer recommendations, water and nutrient use were reduced by **17%** across the study areas. This not only decreased production costs but also mitigated nitrate leaching and greenhouse gas emissions, aligning with the objectives of climate-smart agriculture (CSA). The reduction in resource wastage reinforces the environmental sustainability potential of AI-enabled decision support systems. The qualitative feedback revealed a high level of **farmer acceptance (mean = 4.12, SD = 0.46)** toward AI-based precision systems. Participants acknowledged improvements in decision-making, yield predictability, and profitability. However, digital literacy and access to stable internet connectivity remain notable barriers, particularly in rural zones of Kaduna and Benue. Some respondents expressed the need for local-language interfaces and mobile-based applications for easier use.

4.2 Comparative Analysis with Previous Studies

The empirical results of this study corroborate findings from earlier works emphasizing the potential of AI in agricultural resilience. Zhou et al. (2023) reported a 25% enhancement in yield prediction accuracy using deep learning models in East Asian rice fields, while Bai et al. (2022) demonstrated a 15–20% improvement in water use efficiency under variable climatic conditions. Similarly, Mekonnen and Tadesse (2021) observed that AI-enabled irrigation reduced wastage by 18% in Ethiopian maize farms. The 28.5% accuracy gain and 17% reduction in water and fertilizer use recorded in this Nigerian context suggest that AI systems can perform even more effectively under tropical agricultural conditions, provided that adequate data infrastructure is in place.

Furthermore, the results highlight that **AI-based tools not only improve agronomic outcomes but also strengthen adaptive capacity**—a key component of resilience as defined by the FAO (2023). Unlike conventional practices that rely on historical knowledge and manual estimation, the AI-driven framework continuously learns from environmental and crop data, enabling dynamic and context-specific responses. This confirms the theoretical proposition that **machine learning can operationalize the adaptive management principle** of CSA, bridging the gap between reactive and proactive farming strategies.

4.3 Implications for Policy and Practice

The findings have several critical implications for agricultural policy, technology diffusion, and rural capacity building:

Governments and agricultural agencies should embed AI-based precision agriculture technologies into **national climate adaptation frameworks**. Subsidies for IoT sensors, drones, and AI analytics platforms can accelerate adoption among smallholder farmers. The study underscores the urgent need for **digital literacy training** among rural farmers. Building AI-awareness programs and farmer–technologist collaborations will bridge knowledge gaps and enhance usability. Extension agents can be trained as intermediaries to translate AI insights into practical field operations. Reliable broadband access and rural electrification are prerequisites for real-time data transmission and model updates. Public–private partnerships can enhance digital infrastructure to ensure that AI systems remain functional and scalable in rural contexts. The 17% reduction in resource use validates AI's contribution toward achieving **Sustainable Development Goal (SDG) 13 – Climate Action** and **SDG 2 – Zero Hunger**. The deployment of AI in precision agriculture supports not only productivity but also long-term ecological balance through reduced input waste and emissions.

4.4 Research Contributions and Future Directions

This study provides empirical validation for the effectiveness of AI-driven precision agriculture within the tropical context of Sub-Saharan Africa, specifically Nigeria. By employing machine learning models (RFR and ANN) trained on multi-season, multi-location datasets, the research demonstrates that localized AI frameworks can substantially enhance agricultural resilience and efficiency. However, the study also identifies **key gaps for future research**. These include:Development of lightweight AI models optimized for **low-power mobile devices** to enhance accessibility. Exploration of **federated learning architectures** that allow decentralized data sharing among farmers while preserving privacy. Integration of **blockchain systems** for traceability and trust in AI-generated recommendations. Expansion of longitudinal studies to monitor long-term environmental and economic impacts of AI-enabled precision farming. Overall, the empirical findings confirm that AI-driven precision agriculture provides measurable benefits in **climate adaptation, resource optimization, and yield forecasting**. The integration of machine learning into farm management represents a paradigm shift from reactive to predictive and sustainable agricultural systems. When coupled with improved rural digital infrastructure and farmer education, AI technologies have the potential to revolutionize tropical agriculture, enhancing food security and resilience against the growing threat of climate variability. These outcomes position AI not merely as a technological innovation but as a **transformative enabler of sustainable development**, reinforcing the strategic role of digital agriculture in addressing both current and future food system challenges in Nigeria and beyond.

5. Conclusion

This study provides empirical validation that **AI-driven precision agriculture** significantly enhances **climate-resilient crop production** across diverse agro-ecological zones in Nigeria. By integrating **machine learning algorithms** with **IoT-based environmental sensors** and

remote sensing technologies, farmers achieved measurable improvements in yield prediction accuracy, irrigation efficiency, and input utilization. The application of Random Forest and Artificial Neural Network models demonstrated superior predictive capabilities, resulting in a **28.5% improvement in yield forecasting** and a **17% reduction in water and fertilizer consumption**. These outcomes affirm that AI-driven decision support systems not only increase productivity but also strengthen adaptive capacity against climatic variability. The study further underscores that **AI-enabled analytics can serve as a cornerstone for climate-smart agriculture (CSA)** by providing data-driven insights into crop performance, soil health, and weather dynamics. The integration of digital intelligence into agricultural practices fosters sustainability through optimized resource allocation and reduced greenhouse gas emissions. Moreover, the positive response from farmers (mean satisfaction > 4.0) reflects a growing openness to digital transformation in agriculture, although challenges related to **digital literacy, infrastructure, and affordability** remain evident. From a broader development perspective, the findings emphasize the strategic importance of embedding AI and data analytics into **national agricultural and climate policies**. Empowering smallholder farmers with accessible AI tools can substantially contribute to achieving **Sustainable Development Goals (SDG 2: Zero Hunger)** and **SDG 13: Climate Action** by enhancing productivity, resilience, and environmental stewardship.

Future research should focus on :

Localization of AI models to reflect region-specific climatic, soil, and crop dynamics, ensuring adaptability for smallholder conditions. **Capacity building and farmer training**, enabling rural communities to interpret and apply AI insights effectively. **Integration of renewable energy solutions**, such as solar-powered IoT networks, to ensure sustainable operation of digital agricultural systems in off-grid areas. By addressing these dimensions, AI-driven precision agriculture can evolve from pilot applications to a **mainstream, scalable framework for sustainable rural transformation** in Nigeria and the broader Sub-Saharan region. Ultimately, the empirical evidence confirms that AI technologies, when inclusively implemented, hold the potential to revolutionize agricultural resilience, empower farmers, and secure global food systems against the growing threat of climate change

ABSTRACT

In response to growing problems of protein shortage in human diets, rabbit production is advocated due to their high prolificacy and ability to convert low quality feed to high quality meat. However, inadequate libido is sometimes a problem in rabbit production. Therefore, this study was conducted to investigate the effects of *Kigelia africana* (KA) leaf and fruit meals on libido and fertility performance of rabbits. The experiment which lasted for 12 weeks was done at the University of Ilorin Teaching and Research Farm with a total of 108 ten weeks old female and male rabbits in a ratio of 2:1. They were randomly allotted to nine (9) treatment groups of eight does and four bucks per treatment, in a 2×4+1 factorial arrangement. The first factor was plant parts (fruit or leaf) while the second factor was inclusion levels comprising of 5%, 10%, 15%, and 20% plus 0% which served as the control for both. This arrangement was setup independently for fruit and leaf. Rabbits were housed individually and had access to feed and water *ad libitum*. All procedures were approved by the University Ethical Review Committee (protocol identification code: UERC/ AGR 084). The mounting reaction of rabbit bucks and receptivity of the does fed KA parts were significantly influenced ($p<0.05$). The reaction times were shorter in bucks fed KA fruit meals (15.65 s) at 18 weeks of age. However, data collected at a later age (22 weeks) showed no effect of KA parts but the inclusion levels still played a significant role. The inclusion levels as a factor significantly affected the reaction as well as the receptivity time by the buck and doe respectively. The times reduced with increasing levels of KA meals. The control groups had the longest (37.25 s) while those on 20% inclusion had the shortest (17.50 s) reaction time. The libido was significantly ($p<0.05$) improved in the treated groups (4.50-4.75 s). Similarly, the percentage conception by the does were significantly ($p<0.05$) influenced by the inclusion level of KA meals, with 15% and 20% inclusions having the highest (100%). Overall, KA fruit meal as well as higher inclusion showed a better improvement in libido and fertility of rabbit.

Keywords: Libido, aphrodisiac, *Kigelia africana*, fertility, rabbits

1. INTRODUCTION

Kigelia africana is commonly called Sausage tree or Cucumber tree due to its long sausage-like fruit, and belongs to the family *Bignoniaceae*. It grows commonly in tropical west, east and central African regions particularly in low plains in Nigeria and can also be found in open woodland (Ogbeche *et al*., 2002; Owolabi and Omogbai, 2007). The tree is usually planted for ornamental purposes due to its decorative flowers which has a bell shape with colours ranging from orange, maroon to purplish green and its unusual fruit (Roodt, 1992). The fruit is a woody and fibrous berry that hangs from a long fibrous stalk. It weighs between 5 to 12 kg. It contains numerous hard seeds that resembles that of cucumber. In the wild, the fruits are eaten by mammals such as hippopotamus, monkeys, giraffes, baboons, bush pigs, savannah elephant and so on (de Hoyo *et al*., 1997; Joffe, 2003). In folklore, the fruit of *Kigelia africana* represents a symbol of fertility (Burkill, 1985), the native doctors use various parts of the plant soaked in alcohol or water for treatment of various fertility related problems in women and men of child bearing age (Ogbeche *et al*., 2002). It is abundant in the tropics and is widely used in Southern and Eastern Nigeria as an herbal remedy for various ailments like retained placenta, postpartum hemorrhage, dizziness as well as anti-cancer agent (Gill 1992). In South western Nigeria, the bark extract is said to have an aphrodisiac effect as it enhances sexual libido and erection in males (Oliver-Bever, 1986; Abioye *et al*., 2003). Over the years, ethnobotanical plants such as *Kigelia africana* have been used for the management and treatment of many ailments in folklore medicine. Its application is however gradually gaining grounds due to its availability and affordability in areas where the trees are predominant, helping in mitigating the problems of high cost of animal feed. In animal production, the role of these ethnobotanical plants cannot be over emphasized, they serve as possible sources of food/nutrients (Aliyu & Adeyina, 2022) as they supply some of the essential nutrient requirements of farm animals at a low price due to their minimal competition with man. Additionally, they serve as therapeutic agents boosting reproductive performance as well the overall health of the animals. This strategy could help reduce the cost of production, and ensure cheaper meat production thereby making available the major crops for human consumption (Bhatt and Sharma, 2001; Muriu *et al*., 2002).

The use of *Kigelia africana* in rabbit feed is not limited to reduction in the cost of feeding but also can solve some of the problems associated with rabbit farming, one of which is inconsistent libido (shy rabbit). KA if well incorporated in rabbit diet may solve the problem as well as improving their general well-being since its high in antioxidant levels (Aliyu and Adeyina, 2022).

2. Materials and methods

Animal managements and experimental layout

The experimental trial was conducted at the University of Ilorin Teaching and Research Farm.

A total of one hundred and eight 10-weeks old rabbits were used for this experiment. Seventy-two (72) rabbit does and thirty-six (36) bucks in ratio 2:1 were randomly allotted to nine (9) treatment groups of eight does and four bucks per treatment, in a factorial 2×4+1 factorial arrangement. The first factor was plant parts consisting of two levels of fruit or leaf while the second factor was inclusion levels comprising of 5%, 10%, 15%, and 20% plus 0% which served as the control common to both fruit and leaf. The nine (9) treatment groups A, B, C, D, E, F, G, H, and I consisted levels of fruit and leaf meals of *Kigelia africana* plant independently fed at 0%, 5%, 10%, 15% and 20% inclusion as shown in Table 1. Rabbits were housed individually and had access to feed and water *ad libitum*. The experiment lasted for twelve (12) weeks and these experiments were conducted with approval of ethical review committee of University of Ilorin with the protocol identification code: UERC/ AGR 084.

Reproductive performance of rabbit fed *Kigelia africana* fruit and leaf meals

Libido, intromission (thrusting), and fertility performances were used to measure reproductive responses of rabbits in this study.

At six weeks after the commencement of the experiment (16-weeks of age), libido of bucks and does were observed. The rabbit bucks were closely observed for pubertal signs and reproductive alertness by introducing does to bucks. Does from each treatment were introduced to the bucks of corresponding treatments to observe any mounting/receptivity attempts. Receptivity of rabbit does and reaction/activity of the bucks were observed from the time of introduction and noted in seconds as described by Gado *et al*., (2015). This process was repeated twice, first at 18 weeks and at 22 weeks of age when larger percentage of non-receptive does and active bucks were obtained. This was achieved at twenty-two weeks of age (twelve weeks into the experiment). Age at which each rabbit attained puberty/sexual maturity was recorded based on their responses, this was at 22-weeks of age.

Fertility performance of rabbits fed *Kigelia africana* fruit and leaf meals

At twenty-six weeks of age, bucks and does of same treatment were crossed using natural mating in a ratio 1:2. The dates of mating were recorded for each does for determination of gestation periods. Conception was observed in does after ten days and up to fourteen days after mating through palpation. Parturition date, litter size, birth weight of kids, abnormalities in kids, mortality rate and gestation period were recorded for each doe. The kid birth weights were taken using a sensitive digital scale (Electronic scale, Model EHA251) and were recorded in grams.

Statistical analysis

All data obtained from buck mounting reaction time, doe receptivity, semen characteristics and fertility performance were subjected to a two-way analysis of variance procedure following a model for 2×4 factorial design (Steel and Torrie, 1980) to evaluate the effect of KA parts and dietary inclusion when compared with the control, all data from each group were analyzed using General Linear Model procedure SAS Institute (2002), and significant differences between treatments means were separated using the Duncan's Multiple Range Test.

Table 1. Composition of Experimental Diets Supplemented with *Kigelia africana* Fruit/Leaf Meals

Ingredients	Control	5% Fruit	10% fruit	15% Fruit	20% fruit	5% Leaf	10% Leaf	15% Leaf	20% leaf

3. RESULTS

Table 2 shows the results of mounting reactions time exhibited by rabbit bucks fed *Kigelia africana* fruit and leaf meals. The rabbit bucks on the leaf exhibited a significantly ($p<0.05$) longer reaction time than those fed fruit at both 18 and 22 weeks of age. At graded levels, the longest reaction time was recorded in the control groups while the shortest time was recorded in the groups fed 20% inclusion. This was a case of reduction of reaction time with increasing levels of KA meals. The period between mounting and fall-off (thrusting) was longest in control and 20% ($p<0.05$) compared with other groups. The detail of interaction for the significant parameters are presented in the interaction table.

Table 2. Effects of *Kigelia africana* Fruit and Leaf Meals on Mounting Reaction Time of Rabbit Bucks

KA parts	BRT at 18weeks (seconds)	BRT at 22weeks (seconds)	Thrusting period (seconds)
Fruit	21.65^{b}	14.60^{b}	4.95
Leaf	25.65^{a}	16.10^{a}	5.10
P value	0.002	0.05	0.46

Table 2a presents the details of interaction between *Kigelia africana* parts (fruit or leaf) and inclusion levels for bucks' reaction time at 18 weeks of age. The control group was significantly different ($p<0.05$) from all other groups presenting the highest reaction time to does presence. The shortest reaction time was noted in bucks fed 20% *Kigelia africana* fruit meal.

Table 2a. Interactions between KA Parts and Inclusion Levels of *Kigelia africana* Fruit and Leaf Meals on Rabbit Buck Reaction Time

Inclusion Level (%)						
KA Parts	**0%**	**5%**	**10%**	**15%**	**20%**	**SEM**
Fruit	37.25[a]	23.25[b]	18.50[b]	17.50[bc]	11.75[c]	1.86
Leaf	37.25[a]	22.75[b]	21.25[b]	23.75[b]	23.25[b]	1.86

KA= *Kigelia africana*, a, b, c – means with different superscript are significant along the row, SEM=Standard Error of Mean

Table 3 shows the result of receptivity of rabbit does to bucks. There was a significant difference ($p<0.05$) in the acceptability of bucks by the does. Comparing the interval of examination, KA leaf meal inclusion significantly increased ($p<0.05$) receptivity of rabbit does. However, does on fruit meal had the shortest time of reaction/receptiveness to bucks. Acceptance of rabbit does at 24 weeks of age was significantly the same irrespective of either fruit or leaf inclusion. More so, there was no significant difference in their receptivity time. At treatment levels however, the receptiveness of rabbit does significantly increase ($p<0.05$) as level of KA inclusion increased with 20% inclusion presenting the highest percentage of receptive does. No significant difference was observed in the receptivity time at 22 weeks of age. Conception of the does was significantly ($p<0.05$) increased with fruit meal inclusion. Similarly, the level of inclusion of the treatments significantly ($p<0.05$) influenced the conception percentage. It increased with an increase in treatment levels.

Table 3. Receptivity of Rabbit Does Fed *Kigelia africana* Fruit and Leaf meals

The results of reproductive responses of rabbit does fed *Kigelia africana* fruit and leaf meal are presented in table 4.14. The inclusion of the treatment had no significantly (P>0.05) influence on the gestation periods, birth weights of the kids, mortality and kits' abnormality. However, litter size showed a significant (P<0.05) difference among the varied levels of the treatments with means ranging from 4.88 to 7.94. The mean of litter size increase with increase in the treatment inclusion levels and was significantly highest at 20% inclusion while the lowest was recorded in the control group.

4. DISCUSSION

Onset of puberty and the level of sexual drive (libido) are vital physiological trait in a successful rabbit production. Fighting, mounting of objects, spraying of urine, growling, circling, territorial biting, destructive chewing and digging (in females) are major characteristic signs of puberty attainment in rabbit. In this present study, mounting and thrusting were used for the evaluation. Rabbit bucks on *Kigelia africana* (KA) fruit and leaf presented higher sex drive compared with the control group. The reaction time of rabbit bucks fed KA meals were significantly reduced at earlier age and with minimum time duration compared with the control. However, the reaction times at various weeks of evaluation were lowest at 15% and 20% fruit inclusion, suggesting that KA part was a significant factor for libido performance. Various factors have been identified as key responsible for libido, fertility and overall reproductive performance, among which is testosterone concentration. Coincidentally, serum testosterone levels of rabbits in these groups were also higher (Aliyu *et al*., 2024). The reaction time reported from this study was longer but close to 4.2s reported by Ogbuewu *et al*. (2009) and shorter than 14 – 21s reported by Saafa *et al*. (2008), and 22.31s reported by Gado, (2015). This could be due to the high concentration of testosterone which has been associated with male maturity and pubertal characteristics. This increased concentration could be linked to presence of bioactive compounds and phytochemicals in KA which possesses antioxidant properties. Antioxidants have been reportedly influencing sexual drive and overall reproductive health (Ranjith *et al.* 2025).

Good sex drive (libido) of rabbit bucks is essential to achieve maximum productivity in breeding especially through natural mating (Saleh *et al*., 2010).

The reproductive performance of rabbit does in this study showed that the inclusion of *Kigelia africana* fruit and leaf meals had a significant positive influence on the litter size. This was observed with a correspondent increased level of KA meals. Physiologically, higher number in litter size implies that multiple eggs have been released by the does, this suggest that KA might have some super ovulatory effects on the rabbit does and this may be corroborated with their usage by the traditional healers to treat infertility in man and woman of child bearing age, (Ogbeche *et al*., 2002, Oyeku *et al*., 2011). It could also be associated with antioxidant potential possessed by plant. According to Shan Wang *et al*. (2017), the reactive oxygen species (ROS) produced during ovarian physiological metabolism is maintained with the help of antioxidant thereby ensuring oocyte maturation, ovulation, fertilization, implantation and embryo development without damage by these free radicals.

5. CONCLUSION AND RECOMMENDATION

Kigelia africana fruit and leaf meals inclusions up to 20% improved the libido and reproductive performance of rabbit. KA meals can be included in rabbit diets up to 20% for a improved reproductive performance.

ABSTRACT

Food insecurity is a major problem in Nigeria. The Food and Agriculture Organization (FAO) estimates that Nigeria's food security has worsened in the past 15 years. This paper examines the impacts of different factors that jeopardize the Nigerian food security situation. According to previous literature, there are mostly three factors that affect food security; climate change, economic development and violent conflict. Nigeria is the chosen case study because all the above mentioned factors play a key role in the country; it is affected by climate change, the economy is fluctuating and there has been the Boko Haram insurgency going on since 2009. This paper aims, with the help of the concept of food security, to analyze these factors to see whether and to what extent they influence food insecurity in Nigeria. This paper uses a mixed-methods approach. Quantitative data are retrieved from several data-bases that give measurements on food security, climate change, economy, and conflict. Qualitative data are reports and interviews that were conducted with Nigerian NGOs. Cautious findings show that all three factors can lead to food insecurity and, therefore, can explain why there is food insecurity in Nigeria. Finally, this paper concludes and confirms the results of existing research in the case of Nigeria.

Key Words: Food Security and Insecurity, Climate change, Economic development, Violent conflict, Nigeria

1. INTRODUCTION

When food security issues were first highlighted in the 1970s, the question was whether a nation or a region could command enough food to meet the aggregate requirements of its people. Special attention was paid to fluctuations in aggregate food supply and food security interventions were primarily concerned with providing effective buffer mechanisms against such fluctuations. In this context, food security measures came to be identified with macro-level instruments such as national and international storage of food and balance-of-payments support for countries facing temporary food shortages (see Waldes, 2011).

Food security is a basic human need and fighting hunger is one of the greatest challenges of this country (Ojo and Adebayo, 2012: 204). Although the number of people living in hunger has declined for many years, in 2015 it has started to increase again (FAO et al. 2019). Today, two billion people in the world are still living in moderate or severe food insecurity, because they do not have regular access to food, not a necessary variety of nutritional value, or there is not enough food for the whole population available. 820 million of these two billion facing insecurity are living in hunger (FAO et al., 2019: 22). Particularly in developing countries, people cannot meet their nutritional needs (Oyinloye et al., 2018: 69).

It is an immensely discussed issue in our society and many scholars have studied the factors leading to food security with their direct and indirect impacts on food security (e.g. Berhanu and Wolde, 2019; Martin-Shields and Stojetz, 2019; Musenwa et al., 2015). Amongst others, Misselhorn (2005) has compared different drivers and three key factors causing food insecurity: conflict, climate change, and economic development. As many scholars analyzed, these drivers often co-exist and influence each other. Only assessing a single factor influencing food insecurity is almost impossible and it is important to take confounding drivers into account.

The decline in the production of some of Nigeria's leading agricultural export commodities was most worrisome. For instance, Nigeria that was ranked as the world's leading producer and exporter of palm oil in the 1960s had become a net importer of this commodity in the mid-1970s. Similarly, Nigeria's cocoa production which ranked a peak of 305,000 tons in 1970 fell drastically to 160,000 tons in 1985 (CBN, 2004). The sharp down-turn in the gross value terms of trade in agriculture was equally serious. The ratio of agricultural exports to food imports which stood at 147 per cent in 1970-1975 suffered significant deterioration and reached the lowest trough at 38 per cent by 1976-1982.

Today, Food security ranks the top most among the development problem facing Nigeria. The level of food insecurity has continued to rise steadily since 1986 to about 41% in 2004 (Sanusi, et al 2006). According to Barrett (2002), the lack of food excludes people to practice what other people are doing every time. However, large amount of food production in the world does not ensure any country's food security. Moreover, huge production in food at national level does not guarantee for the household food security. This may be due to unfair distribution of resources, variation in production functions, and motives for productivity. That is why even if the production increases through time, food insecurity, malnutrition and hunger remain the main agenda and much more serious problems in the world (Akume and Bakporhe, 2013).

1.1 Research Problem

A strong argument that encourages analyzing food security issues is the importance of food in our lives. There is evidence that climate change, economic development, and conflict affect food security negatively. For example, the Food and Agriculture Organization (FAO), International Fund for Agricultural Development, United Nations Children's Emergency Fund (UNICEF), World Food Program, and the World Health Organization have for the last three

years published the report 'The State of Food Security and Nutrition in the World' that focused on conflict (FAO et al., 2017), climate change (FAO et al., 2018), and the economy as a driver of food insecurity (FAO et al., 2019). This shows that these factors are a global concern in today's world.

Nigeria is one of the most food insecure countries and highly affected by all three drivers. For one, the country is vulnerable to climate change and successively hit by environmental disasters, that impact people's livelihoods (Nkechi et al., 2017: 301). Furthermore, its economy is thriving, but around 48% of its population lives below the poverty line (World Bank, 2020; World Poverty Clock, 2020). In addition to that, since 2009 north-eastern Nigeria is struck by conflict, with the terrorist group Boko Haram involved. Due to that, Nigeria is suitable to use as a case study.

1.2 Aim and Research Question

Research that has been done on food security, has mostly focused on one driver, acknowledging others as compounding variables. Furthermore, many scholars have done a quantitative analysis. This paper analyzes different drivers for food insecurity in a single country analysis. It focuses on Nigeria, because as mentioned above, it is a food-deficit country and all three key drivers exists in the said country and can be analyzed. This leads to the following research questions:

- What factors impact food insecurity and jeopardize the food security situation in Nigeria?

The impact these drivers have on the food security situation in Nigeria is assessed in the paper. The analysis can be examined with the help of deductive research and a case study research design. To answer the research question, there are three sub-questions to be answered:

- What impact does climate change have on food security in Nigeria?
- What impact does Nigeria's economy have on its food security situation?
- What impact does the Boko Haram Insurgency have on food security in Nigeria?

1.3 Organization of the Study

After this introductory section, the next section elaborates on the literature review comprising of background information on climate change in Nigeria, Nigeria's economy, and Boko Haram terrorist group ant a review of previous literature which shows what scholars found on the different drivers impacting food security. This section also illustrates the concept of food security as used in this paper. The next section describes the research design and also analyzed the data collected from the field. Finally, a conclusion, recommendations and a roadmap for further research in related area were highlighted.

2.0 LITERATURE REVIEW

2.1 Background

The Federal Government of Nigeria is a culturally and religiously multifaceted country located in West Africa. It consists of 36 states and a capital territory. With approximately 201 Million, it is the most populated country in Africa, and its population is growing rapidly (World Poverty Clock, 2019). Nigeria declared its independence from Great Britain in 1960. After going through years of military junta, the country held its first democratic elections in 1999. Since then it has been on stable democracy with a lot of corruption and struggles to fight terrorism (Kah, 2017; World Bank, 2016). This section gives a background on Nigeria's economic sector, climate change in Nigeria, and the Boko Haram insurgency.

2.1.1 Economic Development

Today, Nigeria has a key role in Africa's economy with a large natural resource reservoir. It is a founding member of the African Union and an important, influential member of the Economic Community of West African States (ECOWAS).

Nigeria's biggest economic sector is the oil industry. With exporting, these natural resources, its economic growth depends largely on the world market and world oil prices (World Bank, 2020). Another important, but smaller sector, that has been contributing to Nigeria's economic growth is agriculture. Agriculture is the income for many Nigerians. The Nigerian Government operates on an agriculture strategy to achieve the first two goals of the sustainable development goals, reducing hunger and poverty, by for example bringing private sectors to invest in agriculture, building institutions in rural areas and developing the infrastructure all over the country (Obi et al., 2020: 208; World Bank, 2020). The Nigerian government has started with its intense oil trade under British rule and as a result, neglected agriculture as an important economic sector when the oil industry got bigger and they invested more in oil exploration, however at the moment they are working on reinvesting in this sector (Ojo & Adebayo, 2012: 205; Babu, 2018: 113-114).

Despite being an overall rich country with oil assets, Nigeria's economy has not created many more job opportunities and only a few people benefit from the GDP growth (World Bank, 2019: 20). About 96 million people, 48% of the population suffered from extreme poverty (Otekunrin et al., 2019: 4-5; World Poverty Clock, 2020). Since the population is growing rapidly and the percentage of people living in poverty is only slightly changing, the absolute number of people living in poverty is increasing as well, which causes even more people to suffer from food insecurity (Ugwoke et al., 2020: 1).

While poverty in the South has been decreasing over the years, it has been increasing in the North, especially the North East, because the region is developing less than the South (Ugwoke et al., 2020: 1). The poverty level is more than 50% higher in the North than in the South. Oil reserves are in the South and the economy in the Northeast and the cultivation of land is mostly done in rural areas in the North (Otekunrin et al., 2019: 6).

2.1.2 Climate Change in Nigeria

Climate change is a global issue that affects every country. Nigeria is amongst most sub-Saharan states vulnerable to the impacts of environmental problems. Throughout the years, environmental disasters have become more frequent. In 2012, for example, there was one of the worst floods in Nigeria in 40 years. This led to the loss of many lives, displacement of people, and farmlands being washed away (Nkechi et al., 2017: 301). Nevertheless, climate change does not affect all states the same. Nigeria has four semi-arid savannah climate in the middle belt and parts of the southwest' (Akande et al., 2017).

Desertification as well as too much rainfall can lead to changes in cultivation and displacement of people. Therefore, the whole country is hit by climatic change. All in all, there is evidence that climate change will worsen Nigeria's environment in the future (World Bank, 2016: 49; Abdulkadir, 2017; FAO, 2017).

2.1.3 Development of the Boko Haram terrorist organization

Jama' atu Ahlis Suma Lidda 'awati Wal,Jihad, commonly known as Boko Haram and in this study referred to as Boko Haram is an Islamic territorial terrorist organization in Nigeria. They do not only aim for territories but also want to destroy the current Nigerian political system in said area to establish their political and religious ideology. They do this through attacks on

humans and public facilities as well as the destruction of infrastructure and economic development (ICC, 2014: 4; Adelaja and George, 2019: 185-186).

The group was established between 2002 and 2003 in northeastern Nigeria, where contrary to the south, most of the population is Muslim. Boko Haram has surfaced in 2003 when they attacked police stations and public buildings in the northeastern Yobe State. The buildings were occupied for some days and the group demonstrated its sympathy with Afghanistan's Taliban (Pham, 2016: 3).

Until Nigerian authorities captured and killed their leader Mohammed Yusuf in 2009 they were quite unknown, their attacks were small and simple. Yusuf wanted an Islamic government but achieving that politically in a nonviolent way (ICC, 2014: 9). They turned to the Al-Qaeda in the Islamic Maghreb (AQUIM) terrorist group, got support mainly with financial aid, by AQUIM'S leader and became a jihadist terrorist group. One attack, that gave Boko Haram international attention, was suicide attack on a United Nations (UN) compound in Abuja in 2011 (Pham, 2016: 6).

Since the summer of 2009, northeastern Nigeria has struggled with numerous terrorist attacks, many of them suicide attacks, regularly, aiming against the Nigerian government and its democracy. The three northeastern states, Adamawa, Borno, and Yobe have a majority of Muslims and were targeted most. Other states were also hit, but they also dealt with people fleeing from the conflict, that they took local government resources and budgets away (Adelaja and George, 2019: 3).

Boko Haram aims to destruct selectively. They destroy assets, infrastructure, and agriculture. At the same time, they attack government storage facilities, fertilizer factories, agricultural input, transport systems and farms' (Adelaja and George, 2019: 185), which they attack for their use and survival.

In 2012 the group got more power and became internationally recognized as a militant group that can build and use bombs. Boko Haram built an international network with other African Islamic groups and was able to expand to the neighboring countries, Niger and Cameroon. The militants attacked prisons to release the prisoners, destroyed government buildings, hospitals, and burned down schools, forcing students out of education. By mid-2013 Boko Haram has controlled several local governments, having de facto authorities in these regions. In 2014 the Boko Haram insurgency hit its height. In the first half of the year, they killed at least 2053 civilians in numerous locations, almost daily attacks on marketplaces, churches, and residential areas. One of the most infamous attack was the kidnapping of 2776 girls (Chibok girls) in a school in Borno state (Human Rights Watch, 2014). In mid-2014, the fighters had enough money and resources to go into offense, executing people in public and expand successively. By then they were able to occupy approximately 26-27 local governments. Most of the occupied regions were in a rural area, where agriculture is the livelihood of the population, hereby agricultural land was destroyed (Pham, 2016: 9-10; Adelaja and George, 2019: 186).

In 2015 Boko Haram showed weakness and the Nigerian army and government reclaimed the zones that were taken over. Nigeria declared victory over Boko Haram quickly. The group has had internal struggles and spilt into two factions. One faction pledged allegiance to the Islamic State (IS), turning into the Islamic West Africa Province (BBC, 2015; Anao, 2020). The number of attacks and fatalities has dropped, but in 2017, now being two groups, attacks have gone up again and the Nigerian government is continuously challenged (ACLED, 2019a; Anao, 2020: 7).

2.2 Conceptual and Empirical Framework

2.2.1 Climate change as a driver of food insecurity

Climate change is defined as any change in climate over time, whether due to natural variability or as a result of human activity' (IPCC 2001: 2). Climate change has turned into a global issue and has worsened in recent times. It is now considered a climate crisis and threatens the agricultural production due to higher and more inconsistent temperatures as well as the variation in rainfall patterns and extreme events, such as droughts and floods, occurring more often (Ojo and Adebayo, 2012: 211; Ogbo et al., 2013: 221). With this change, researchers decided to study the relationship between climate change and food security. Studies were done concerning one single country, several countries, or simply regions. Most of the research has been conducted through surveys, direct observation, and weather data. They often use a modeling approach, because they often predicted future scenarios (Zewdie, 2014; Berhanu and Wolde, 2019; Wossen et al., 2018; Fadjumdjum et al. 2019). Researchers agree upon several impacts that climate change already has or will have on food security: on the cultivation and crop yields, as well as on biodiversity.

Climate change affects the first aspect of the food supply chain most. Food production starts with crop growth and cultivation. These are strongly affected by climate variability and therefore especially the agricultural sector is hit by climate change (Jung and Kunstmann, 2007; Wossen and Berger, 2015). In Iran for example impacts, the decline of water resources and precipitation, warmer temperature, and higher CO2 emissions will have on crop growth and food production. Their findings were similar to the majority of research on food security that: food production depends on a steady climate and enough clean water resources.

Aside from food production, climate change also restrains people from having food available and access to it. Extreme weather events can damage food storage. When it gets warmer, air conditioning and refrigeration is needed, which can get expensive, and sometimes there are problems with electricity. If it does not work, the harvested food get expensive, and sometimes there get ruined or no longer be healthy to eat (FAO, 2008; James, 2010). Even though most researchers argue that climate change negatively affects agriculture, some studies have found a positive correlation between global warming and agriculture. This research focused on industrial countries and less on developing countries.

Climate change also forces people to leave their homes, which makes them vulnerable to food insecurity. Internally displaced persons (IDPs) are often forced to leave because of climate change and conflict, two of the three drivers reviewed here. McGregor (1994) addressed the nexus of climate change, forced migration, and food insecurity because already in 1994 there have been many involuntary population displacements due to climate change. Food is one of the most vital needs in displacement camps, where a lot of the IDPs have to live in for many years. They have limited access to it and because they mostly depend on aid that is not always given and most likely they are not able to consume the amount and diversity needed. Thus, they increase food insecurity in a country (McGregor, 1994; Mooney, 2015).

As this section shows, climate change affects food security in various ways. It mostly affects people's livelihoods through food production, people live food insecure because there is less food available or the available food does not have enough nutrients. This leads to people not being able to access food. Most researchers asserted that climate change led to food insecurity. Therefore, it is worth it to explore how climate change has led to food insecurity in Nigeria.

2.2.2 Economic development as a driver of food insecurity

Previous literature suggests that the economy influences food security. Economic growth is one of the highest variables to measure the economy and can be closely connected to food security. Studies by several scholars provide proof that the better the economic growth is, the more people are likely to be food secure (Warr, 2014). Hence a weak economy or an economic crisis can lead to food insecurity in a country (Tawodzera, 2011; Musenwa, 2015; FAO et al., 2019). Most research has been conducted in developing countries in Africa because especially developing countries might have thriving economic growth, but at the same time are vulnerable to an economic crisis, because they are often low-income countries, countries in conflict and the countries that are hit most by climate change. All this increases the vulnerability of a population (FAO, 2019: 59).

For the food security status of a household, the economic situation of the individual is significant as well. Many researchers analyzed factors in the field of economic development and food security. Being unemployed puts people into poverty and poor people usually depend on the market to obtain food. They spend a higher percentage of their income on food and consequently suffer more likely from food insecurity (Etana and Tolossa, 2017: 64). A lot of other literature argues that unemployment, in particular long-term unemployment, does not only result in people spending less money on food but also causes people to change their diet. Evidence showed that they bought cheaper and less healthy food, which in turn impacted the quality of the daily calorie intake. Other studies also found that consumption pattern change when one gets unemployed (Leichchenko and Silva, 2014: 540). Therefore, unemployment can lead to food insecurity on the individual level.

Food prices are another indicator leading to insecurity (Herte et al., 2010; Smith et al, 2017). Global food price drops or rises hit especially countries with an uneven trade balance. When a country depends on exporting agricultural goods or minerals, they are more vulnerable to global price volatility (FAO, 2019: 66).

As mentioned above, most scholars argue that often developing countries are affected by economic crisis. However, all countries can be affected by a sudden global economic shock. Especially the 2008 financial crisis and the recession that followed negatively impacted several countries in the Global North. Davis and Geiger (2017) analyzed the demand for food aid in Europe after 2008. They argue that the need for more food aid represents higher food insecurity. They found that a rise in food aid and led to a more food insecurity after 2008. Griffith et al. (2013) have, on the other hand, examined the food expenditure of people in the UK and concluded that after 2008 there was a significant change in what people bought. Further studies have also shown identical results in studies covering developing countries (Browning and Crossley, 2009; Huang et al. 2016). The economic situation of people affects their state of food security. Hence it does not matter whether a country is in the Global North or Global South, an economic crisis can hit every country.

2.2.3 Violent conflict as a driver of food insecurity

The FAO (2017) has asserted that conflict-affected countries have on average higher rates of food insecure people than countries not affected by conflicts. Violent conflicts can have short-livelihoods. There are several ways where violent conflicts affects food security. However at first, it has to be mentioned that the effect conflict has on food security depends on what kind of conflict it is, considering that ‘measuring and categorizing conflict is not straightforward’ (Martin-Shields and Stojetz, 2019: 151). Studies showed that the outcome depends on the type of conflict.

Literature shows that conflict often occurs in rural areas, areas that have a lot of agriculture (FAO, 2017: 44). Consequently, violent conflict can especially impact agricultural production. On the other hand, food production can decrease. Cultivation is interrupted, where people depend on agriculture. Often fields were ruined by bombs, or it was simply unsafe to work on them (Baumann and Kuemmerle, 2016). Other times farmers abandoned their lands because farmers or workers were killed, people were forced to leave, fled voluntarily, or were involved in the fighting. This can lead to a labor shortage and therefore fewer people harvesting which then can lead to crop yield loss and food insecurity (Suthakar and Bur, 2008; Eklund, et al., 2016; Adelaja et al., 2019: 184). On the other hand, agricultural productivity can increase and have a positive impact on the food security situation in conflict areas. Agriculture can be an important income source for the militants. Jaafar and Woerz (2016) analyzed the agricultural productivity of the Islamic State in their controlled area until 2016. Their findings were that it is an important source of domestic food security.

Whereas the scholars above agreed that conflict impacts food security, Adelaja and George (2019) came to different findings. Their focus was also not on food security at all. They collected data from household surveys and the Armed Conflict Location & Event Data Project (ACLED). When analyzing the data, they found that the amount of land that can be harvested does not decrease when the number of attacks goes up. Although at the same time they did find that a higher intensity of the conflict harms the output of agriculture (Adelaja and George, 2019).

Food access to households and individual food consumption has also been researched by people. A reduced production can lead to a decline in food availability which can cause a reduction in market access to buyers. An example of long-term impacts of food insecurity due to a conflict are studies that focused on the long-term effect of children that were exposed to conflict at an early age (Martin-Shields and Stojetz, 2019; George et al., 2020). The researchers often used the differences-in-differences approach. They analyzed one region where conflict occurred and one where there was no conflict and compared the results. Bundervoet et al. (2007), for example, studied the impact of the civil war in Burundi on children's nutritional status over time. They used data from household surveys in civil war affected and non-affected areas. According to their study, children that were born in regions that at the time of birth experienced violence and had no access to food, due to the disruption of the agricultural production, had lower height-for-age z-score (HAZ) and were therefore not developing the same way as other children. Minoiu and Shemyakina (2014), as well as Arcand et al. (2015), based their research on Bundervoet et al. and did similar studies in Cote d' Ivoire and Angola. With the same approach, their findings are similar: Children who were exposed to these conflicts while born or in their early childhood had a lower HAZ than others.

Lastly, other scholars focused on the impact on IDPs. As above mentioned, conflict can lead to people fleeing and as noted, they are especially vulnerable to food insecurity. The outcomes are the same as when there are IDPs due to climate change. However, these scholars show that not only climate change can lead to internal displacements, also conflict can be a reaon (Tasime et al., 2013).

As this section demonstrates, violent conflict can impact food security directly and indirectly. Direct impacts are mostly on the national level and indirect impacts mainly on the individual level. For example, as the prior section of economic development on food security shows, unemployment, and reduced household expenditure can impact the household at individual level, although not every scholar supports this, it can be said that conflict can have an impact on all different levels of food security.

The literature review shows that these different drivers can lead to food insecurity but are also intertwined. Despite the wealth of literature and the diversity of studies, there is rarely literature disagreeing with the fact that these drivers impact food security in some way. Most scholars argue that the drivers they analyzed lead to food insecurity, but they also state that other drivers have to be acknowledged as interfering variables. They overall agree that each of the drivers can lead to food insecurity, in different parts more than in others. Therefore, when all the drivers are occurring in one country, this country's population is more likely to be severely food insecure.

3. Methodology

This study adopted a mixed-methods approach, that is qualitative and quantitative methods approach. Quantitative data were retrieved from several data-bases that give measurements on food security, climate change, economy and conflict. Qualitative data were drawn from reports and interviews that were conducted with Nigerian NGOs.

The statistical data on the climate is retrieved from the Climate Change Knowledge Portal, which is part of the World Bank Group. Even though they do offer metadata information, it is not exactly clear where data come from. As per economic development, the secondary data is taken from two different sources: The World Bank and UN Contrade Database. The World Bank shows a pool of statistics covering several areas from many different sources. This database is publicly accessible and is updated regularly. The indicators itself do not only come from the World Bank. The metadata with its source for every single indicator can be downloaded on their website. Concerning violent conflict, the primary data utilized is interview method. Other methods of data analysis include the ACLED database, and IDMC sources.

4. Analysis

The following chapter shows the analysis of the study. With the help of all the data described in the previous sections, this section analyzes the said data. Previous scholars mostly approached their articles by first conceptualizing and analyzing food security (e.g. Martin-Shields and Stojetz, 2019). Here it also seems appropriate to analyze the food security situation using the three drivers as already stated.

4.1 Food security situation in Nigeria

As shown and explained in previous sections, food security in Nigeria is analyzed through data from FAO database, the Nigerian GHS as well as interviews. This section shows evidence that there is a significant amount of people facing food insecurity in Nigeria. All conducted interviews with the NGOs have agreed that food insecurity is visible all over the country. According to all of them, the food security situation worsened over the past years. They mentioned that since the Covid-19 outbreak it has gotten even worse and it will not get better in the next few years, but there are no evidential facts about it yet.

Using both figure 1.1 1.2 and a graph, figure 1.1 shows how food security has changed over time. Each measuring period has been conducting its data in the same way and can therefore, be compared. It indicates that there has been quite a change since around 2008. As shown in the figure from 2008-2010 the percentage of undernourishment has been constantly on the rise. At first, it is slowly rising, but looking at the years from 2014-2016 and 2015-2017, there was a drastic rise, with an increase of almost two percent from 9.6% in 2014-2016 to 11.5% in 2015-2017 and after this again another two percent to 13.4% in 2016-2018. Due to the fact that these numbers are always only a three-year average, it can be said that 2014-2016 was another significant turning point in the Nigerian food security situation.

4.1.1 Climate Change data

As much of the literature shows, climate change is one of the causes of food insecurity, and is therefore an independent variable to analyze. To answer the sub-question on what impact climate change has on food security in Nigeria, data that shows the trend in climate variability seems appropriate. This can be the trend of rainfall, the occurrence of rain and drought days, or mean temperatures. Descriptive data that is available on trends in climate variability is the trend of yearly mean temperature and rainfall pattern. Further data that can help get to the connection to food insecurity is data on internal displacement which shows how many people fled due to climate change. Further indicators used in the analysis are the interviews. Interviewees were asked about the experience of monthly rainfall change and droughts affecting cultivation. Secondly, the United Nations Office for the Coordination of Humanitarian Affairs (OCHA) publishes situation reports that give information about certain strong floods and its impact on people's livelihoods in the areas hit.

4.1.2 Economic Development Data

Previous literature argues that whether somebody lives in food security is often also influenced by the countries' current economic performance. Thus, economic development can be a catalyzer for food insecurity and is one of the three independent variables in this study. To analyze the economic development as a cause for food security situation, data has to provide information about the economy in Nigeria and must be compatible with the given food security data.

The economy can be measured through multiple indicators. In general, the GDP can be a relevant summary of the overall economic performance (FAO, 2019). Therefore, GDP and economic growth are the first indicators to use in the analysis . Further indicators to understand the economic situation in Nigeria and how it has evolved across time are the trade balance and products that are predominantly exported. Moreover, food inflation and the unemployment rate are used as secondary data, qualitative data and primary source, that contributes to the analysis are the interviews.

4.1.3 Violent Conflict Data

According to existing literature, the presence of conflict plays an important role in how food insecure somebody is. Thus, a third independent variable chosen to analyze in this study is the Boko Haram conflict in Northeast Nigeria. To measure the food security situation in Nigeria and its relation to the northeastern conflict, especially interviews are good as a primary source. To get statistical data that can be compared to the FAO and Nigerian GHS data is data about the number of conflict and the fatalities that happened over the years since the Boko Haram insurgency began. As Adelaja and George (2019) state in their study that longitudinal data for comparison is limited. I found that this is true and it was difficult to get the right data for this analysis.

However, there are several databases available that measure conflicts. Previous literature that used quantitative data usually either worked with the UCDP or ACLED. After consideration of what database is best to the Boko Haram Insurgency, ACLED was chosen. This database offers information on different kinds of violence in real time, broken down into the date and place of the event, the type of violence and the actors involved (ACLED, 2019). Including the exact source for each for each event and even quotes the source to show that it was precisely taken from there.

According to ACLED, their data is collected by experienced researchers. However, it is primarily taken from secondary sources, but to make sure that the data is accurate and not biased, ACLED uses a variety of sources and does not only trust one source.

5. Conclusion

The study aimed to answer the question: What factors impact food insecurity and jeopardize the food security situation in Nigeria? To answer this, the whole study was focusing on the three factors that, according to previous literature, seemed to influence food security the most: climate change, economic development, and violent conflict. The concept of food security with its four dimensions was the concept often used in the existing literature and previous research showed that each of the drivers influences the different dimensions in some way. The findings demonstrated that these factors can in fact, lead to food insecurity.

The analysis of this study examined these determinants to see how they influence food security and whether they lead to food insecurity in Nigeria. Data was taken from several sources, statistical databases as secondary sources and interviews with NGOs as primary sources. Since the data was rare, the conclusions had to be drawn cautiously. The results of this analysis, however, do confirm the findings in previous research.

According to previous literature, the drivers are intertwined and do not only affect food security, but also impact each other. This study has also found that it cannot be said that either of the drivers alone could have led to food insecurity in Nigeria. In this case It is also more likely that they all influence each other. Climate change and the Boko Haram conflict for example can lead to a lack of food production, which can lead to fewer labor needs, that on the one hand leads to unemployment, then again makes it hard for people to buy food, then facing a food shortage. On the other hand, less food production can lead to more dependence on food imports. A bad economy again can lead to more conflict and so on. It can be said that Nigeria is currently in a vicious circle and it is hard to achieve stable food security. Because Nigeria is affected by all three drivers, it is likely that food insecurity occurs, with what the literature review agrees.

Therefore, the research question can be answered by saying that all three different determinants can jeopardize the food security situation in Nigeria. Furthermore, they all impact people's livelihoods in different years, keeping some people continuously in a state of food insecurity. Moreover, the study found that even though all drivers impact all dimensions of the food security concept, they do influence each of them in other ways. While, according to this study's findings, climate change and the Boko Haram insurgency primarily impact food availability, the economy affects the food access dimension foremost. Especially the interviews have brought the focus on food production in general, meaning that the food availability dimension is often the first dimension that is hit. When there is less food available, and a country depends on food imports, it can lead to a lack of the other dimensions, meaning to many people not having access to food or not having enough food diversity. Because all drivers impact the different dimensions, the last dimension of food security is not met. There is no food stability, and it takes time to achieve the dimensions.

This study also shows that food security depends not only on how a country, specifically Nigeria performs, but also how other countries deal with issues that can reflect back to a country like Nigeria. Globalization has made it hard for such a country to achieve food security by itself.

CLIMATE CHANGE AND ITS EFFECTS ON THE SOCIO-ECONOMIC DEVELOPMENT OF NIGERIA

Dr. Chukwuemeka Godson Eme (Ph. D)

Lecturer, Department of Business Administration, Faculty of Management Sciences,

National Open University of Nigeria, Jabi- Abuja, Nigeria

E-Mail: kaluchukwuemeka26@yahoo.co.uk; ceme@noun.edu.ng

ABSTRACT

Climate change has become a great challenge to our generation and its impact is felt in almost every society in the world. Nigeria is likely to be the one of the most negatively impacted countries in the world as a result of climate change. Nigeria is plagued with many ecological problems of various dimensions. Whilst the people living in the southern part of the country are being ravaged by flood and gully erosion, their counterparts in the north are contending with the menace of desertification, deforestation and drought, among others. These environmental challenges have direct and indirect effects on the social and economic activities of the societies. The paper reviews the potential impact of climate change on Nigeria's economic and socio-cultural developments. Secondary data were used and descriptive research design was adopted. The findings indicates that many sectors of the Nigerian economy appears to be directly vulnerable to the impacts of climate change such as manufacturing, insurance, transportation, offshore oil and gas exploration and thermal and hydro-power generation and transmission. Other vulnerable sectors are those dependent on climate-sensitive resources like agriculture, fishing, forestry, renewable energy and eco-tourism. These cumulative effects will impact the GDP negatively. On the basis of the findings, the following were recommended; there should be policies toward mitigation and toward developing technology that can improve productivity and are environmentally friendly, irrigation should be encouraged, NIMET should be well equip to enable it function effectively, government agencies and NGO should sensitize the people about the danger and had to work towards a sustainable environment.

Key Words: Climate change, Global warming, Economic development, Sustainable development, Nigeria

1. Introduction

Climate change has become a great challenge to our generation and its impact is felt in almost every society in the world. Nigeria as a developing country with a population of about 160 million is likely to be adversely impacted by climate change due to the vulnerability and low coping capability. Evidences have shown that climate change impacts on Nigeria arises from various climate change related causes experienced due to the increase in temperature, rainfall, sea level rise, impact on fresh water resources, extreme weather events, flooding, drought in the north and increased health risk.

Climate change is an interminable environmental threat of the 21st century which the world is currently experiencing and seeking measures to adopt and mitigate its impact. The United Nations Framework Convention on Climate Change (UNFCC) defines climate change as a change which is attributed directly or indirectly to human activity that alters the composition of the global atmosphere over comparable time periods. Climate change is wreaking havoc on the economies of several individuals, societies, and countries, including Nigeria. This has detrimental effect on a huge number of farmlands and the means of sustenance of persons, increasing poverty and leading to food insecurity, migration, conflicts and public health concerns. As poverty becomes severe, the poor become more reliant on unsustainable development strategies. Thus, unsustainable development strategies such as fossil fuels add to global warming. Global warming therefore exacerbates problems in underdeveloped countries, particularly in sub-Saharan Africa, which lacks the capacity to adapt to climate change. As greenhouse gas emissions cover the Earth, they trap the sun's heat, causing it to warm at an unprecedented rate; hence, global warming and climate change occur.

As one of the most pressing environmental challenges and global crisis affecting civilization today, climate change is becoming a significant global concern, particularly in Africa and Nigeria, where rain-fed agriculture is used. One fossil-fuel-based economic system has been altering the world for many years. Sub-Saharan Africa, in general, and Nigeria, in particular, have been recognized as the region most likely to be affected by climate change, including increasing heat, erratic rainfall and natural catastrophes, as a result of global warming. The failure of the international leaders' meeting in Copenhagen to enhance aspirations for a healthy climate saddened the region. The gathering, a worldwide meeting held in December 2009 to assess progress toward the 1997 Kyoto Protocol's aim and design a new direction for addressing climate change challenges, did not yield a satisfactory result (Muller, 2010). Co2 emissions and the building of greenhouse gases in the atmosphere have changed weather and climate patterns; sadly, those responsible for climate change are rarely held accountable. Climate change has been exacerbated by traditional agriculture practices such as deforestation (tree felling for firewood and cooking energy) and bush burning as a farming practice.

Despite the fact that man and nature are closely linked, growing industrialization has accelerated the carbonization of the biosphere, leaving mother Earth with a negative carbon imprint that is redefining our symbolic relationship with nature. The issue of slow accumulation of dangerous gases in the atmosphere is central to the issue of anthropogenic carbonization of the biosphere and the bio-geophysical interests of world powers, which influence the nature and extent of all socioeconomic and political interactions on climate change (Sadiq, 2013).

Nigeria is vulnerable to climate change. Under the A2 Scenario of the Intergovernmental Panel on Climate Change's (IPCC's) Emissions Report (National Adaptation Strategy and Plan of Action on Climate Change for Nigeria (NASPA-CCN, 2011), it is projected that Nigeria will experience a temperature increase of 0.04 Oc per year from 1981/2000 until the 2046/2065 period, rising to 0.08 0c per year after 2060. The scenario also projects wetter conditions in the southern part. The drier conditions are expected to be most severe in the north-eastern part of

the country. For the 2046/2065 period, rainfall is projected to increase by an average of 15 on annually rate of 7.5 cm annually in the north (NASPA-CCN 2011: 10). Increased climatic risks, notably floods and droughts, are typically the result, wreaking havoc on food supplies and the economy. Climate change and global warming would wreak havoc on Nigerian livelihoods, including crop production, livestock production, fisheries, forests, and post-harvest activities, if they go uncontrolled.

The impact of these changes, therefore without adaptation could cost between 6% of Nigeria's GDP by 2050, amounting to between USD 100 billion and USD 200 billion. The government has put in place N460 billion to enable them fight the menace of climate change and global warming (Department for International Development (DFID, 2009: 10).

1.1 Objective of the Study

The main objective of this study is to examine climate change in Nigeria, looking at its impact on the socio-economic and cultural sustainable developments of Nigeria. Others include, examining climate governance and policies as response to climate change in Nigeria.

1.2 Methodology

The research adopted a descriptive research design. It dealt exhaustively on the impact of climate change on Nigeria's socio-economic and cultural development. The research made extensive use of secondary sources of data from textbooks, internets sources and newspapers.

2.0 Conceptual Clarifications

2.1.1 Concept of Climate Change

There are many different ways to measure climate change. The International Panel on Climate Change says that it's a 'change in the state of the climate' that can be found by looking at how its properties change over time, usually for decades or more. Any change in temperature over time, whether caused by natural variability or human activity, is called climate change. ''Climate change is defined as ''a change in the climate that is caused by human activity and that is in addition to natural climate variability that has occurred over the same time periods'' (United Nations Framework Convention on Climate Change UNFCCC, in IPCC, 2007). ''A change in the statistical distribution of weather over long periods of time is called ''climate change''. Wikipedia says that ''climate change'' is a change in the weather over a long period of time (Wikipedia, 2009). Wikipedia (2009) says that global warming is ''the rise in the average temperature of the Earth's surface, air, and oceans since the mid-20th century and its expected continuation''. This makes it clear that what is called climate change is actually the result of global warming. Climate change is a problem or phenomenon that has come about because there has been a high rise in the concentration of greenhouse gases (GHGs) made by humans (Spore, 2008). Natural resource depletion, ozone layer depletion, and global warming are some of the most important things about climate change. These traits are more self-reinforcing than other traits. A big problem in Africa when it comes to climate change is how many different stressors, like HIV/AIDS spreading and the effects of economic globalization and resource privatization, work together with climate change to make things worse.

Climate change has arisen as a new component, contributing to increased underdevelopment. There's a danger that Nigeria's climate change crisis may be exacerbated by the lack of a robust emergency and development policy, further complicating problems and increasing dependency and underdevelopment. Thus, the subject of climate change in Nigeria must be viewed in conjunction with developmental challenges, poverty, and unemployment. Nigeria has been seen as a weak, fragile state that has failed to put in place strong systems to help its citizens who have been affected by global economic woes. Every aspect of development in Nigeria is

vulnerable to climate-related stressors. Nigeria's natural capital, including land, forests, landscapes, water and fisheries) and physical capital, including cities, infrastructure, and other kinds of capital are highly susceptible to the impact of climate change. Climate change affects the ability of natural capital, which is the main source of income and livelihoods for majority of Nigerians, to deliver its wide range of products and services including food, timber, and the regulation of water cycle. It's worth highlighting for instance, that economic fights are inextricably linked to social and environmental aspects of man's interaction with the climate system (Edeh, Eme and Nnoli, 2014).

2.1.2 Concept of Global Warming

The continuous rise in temperature of the planet is really upsetting. The root cause for this is global warming. Global warming begins when sunlight reaches the Earth. The clouds, atmospheric particles, reflective ground surfaces, and surface of oceans then sends back about 30% of sunlight back into the space, whilst the remaining is absorbed by oceans, air and land. This consequently heats up the surface of the planet and atmosphere, making life feasible. As the Earth warms up, this solar energy is radiated by thermal radiation and infrared rays, propagating directly out to space, thereby cooling the Earth. However, some of the outgoing radiation is re-absorbed by carbon dioxide, water vapour, ozone, methane and other gases in the atmosphere and is radiated back to the surface of the Earth. These gases are commonly known as greenhouse gases due to their heat-tripping capacity. It must be noted that re-absorption process is actually good as the Earth's average surface temperature would be very cold if there was no resistance of greenhouse gases. The dilemma began when the concentration of greenhouse gases in the atmosphere was artificially increased by humankind at an alarming rate since the past two centuries. As of 2004, over 8 billion tons of carbon dioxide was pumped, thermal radiation is further hindered by increased levels of greenhouse gases resulting in a phenomenon known as human enhanced global warming effect. Recent observations regarding global warming have sustained the theory that it is indeed a human enhanced greenhouse effect that is causing the planet to heat up. The planet has experienced the largest increase in surface temperature over the last 100 years. Between 1906 and 2006, the Earth's average surface temperature augmented between 0.6 to 0.9 degrees Celsius. Millions of pounds of methane gas are generated in landfills and agricultural decomposition of biomass and animal manure. Nitrous oxide is released into the atmosphere by various nitrogen-based fertilizers including area and diammonium phosphate and other soil management utilizations. Once released, these greenhouse gases stay in the atmosphere for decades or even longer. According to Intergovernmental Panel on Climate Change (ICCC), carbon dioxide and methane levels increased by 35% and 148% since the industrial revolution of 1750.

2.1.3 Impact of Climate Change on the socio-economic development of Nigeria

Climate change has been described as a statistical variation that persists for an extended period, typically for a decade or longer. I includes shift in the frequency and magnitude sporadic weather events as well as the slow but continuous rise in global average surface temperature (Intergovernmental Panel on Climate Change (IPCC, 2001). The German advisory council on climate change noted that climate is a threat already having substantial impact on human beings and the natural eco-system both in developed and developing countries but at varying degrees (German Advisory Council on Global Change (WBGU, 2003). For the developed countries, the impact of climate change has been perceived to be less severe due to natural advantage, high adaptation techniques, high technology, mechanical agricultural system and wealth status. These factors have enabled the developed economies to curtail the adverse effects of climate change. For developing countries like Nigeria, the impact of climate change is of great importance given the high temperature level, poor adaptation capacity and lack of early warning

system. Apart from the above, climate change affects economies whose economic activities are natural resource sensitive such as agricultural activities. Unfortunately, some aspects of the existing literature shows that climate change may lead to significant reductions in agricultural productivity in developing countries (McGungan et al., 2002). Indeed, the effect of climate change on agricultural activities can be viewed from various aspects. Climate change affects the distribution of rainfall and temperature during a year and this determines crop yields especially those crops cultivated under rain-fed conditions (Thurlow et al., 2009). Excessive rainfall leads to destruction of arable land, impairment of cultivated crops, increased growth of weeds and greater post-harvest loss while a significant reduction in rainfall may culminate in drier land, reduction in water level in streams and rivers, increase in famers' search for water for irrigation and consequently resulting in invaluable man hour losses and reductions in crop yield (Ozor, 2009). Climate change also affects livestock production due to reduction in the available pasture land, reduction in surface water resources for animals, increase in salinity of water resources for animals, increase in salinity at watering points due to increased temperature and evaporation in the face of reduced rainfall. This implies that there would be a decline in the production of livestock, resulting in a reduction in the supply and availability of annual protein including meat, egg, milk and other animal produce such as hides and skins (Ozor, 2009).

In Nigeria, climate change also affects forestry due to erosion and excessive wind thereby resulting in decline I forest produce such as wood and cane. Consequently, it leads to reduction in forestry produce and low income, as well as an increase in the costs of building and furniture materials. Onuoha (2009) estimated the cost of deforestation and losses in non-timber forest products in the last 5 years in Nigeria at N120 billion per year which is equivalent of 1.7% of gross domestic product (GDP) in 2003. Obviously, climate change portrays a potential threat to the composition of agricultural output on agricultural output in particular and to aggregate national output in general.

In 2012, Nigeria adopted its Climate Change Policy Response and Strategy (CCPRS) to ensure an effective national response to the multi-faceted impacts of climate change. The main goals of the CCPRS include: Implementation of mitigation measures that will promote low carbon as well as sustainable and high economic growth, enhancement of national capacity to adapt to climate change, raising climate change related science, technology and research and development to a new level that will enable the country to better participate in international scientific and technological cooperation on climate change; significantly increase public awareness and involve private sector participation in addressing the challenges of climate change; strengthen national institutions and mechanisms (policy, legislative and economic) to establish a suitable and functional framework for climate change governance. The National Adaptation Strategy and Plan of Action for Climate Change Nigeria (NASPA-CCN) describes the adaptation priorities for future action. The NASPA-CCN vision is a Nigerian approach in which climate change adaptation is an integrated component of sustainable development, reducing the vulnerability and enhancing the resilience and adaptive capacity of all economic sectors and of all people to the adverse impacts of climate change, while also capturing the opportunities that arise as a result of climate change.

The impact of climate change is numerous. The variations in rainfall, temperature, drought, and humidity associated with the science of climate change in Nigeria affect climate dependent sectors. It affects the socioeconomic and political landscapes of countries as well as the relationship across nations as a trans-boundary phenomenon. As a result of its features which are life threatening; the rising sea levels, flooding, starvation, desertification, it is recognized as a threat to human existence. Certain factors such as HIV/AIDS, failing commodity prices, and in some areas have significantly weakened the ability of poor Nigerians to withstand shocks from extreme climate events.

Climate change puts our food and waste supplies at risk, as well as our health, security, stability, and property. Different countries' economic conditions and institutional infrastructure have an effect on their vulnerability to climate change. Certain countries particularly those with affluent economies, exhibit a high degree of resilience, while others, particularly those in sub-Saharan Africa with less favourable economic and institutional conditions, are more fragile. Indeed, because developing countries are frequently exposed to a variety of climatic and non-climatic stresses, their failure to collect reliable data on the resulting consequences exacerbates the consequences.

With climate change affecting highly populated locations in Nigeria like Lagos state, the number of environmental refugees displaced by natural disaster will increase. Forced migration therefore becomes one of the effects of climate change in human settlements, industries and businesses. Flood catastrophes in 2010 affected almost 250,000 people in Nigeria (BRNCCC 2011). In 2012, the situation became worse as the country was hit by high incidence of flooding; 1.3 million people were affected and over 400 people killed and in Makurdi, the flood was much that crocodiles were found in the streets of the town. These incidence were blamed on climate change thus making the Director General of the National Emergency Management Agency (NEMA), Muhammad Sani-Sidi, to say that, 'We are now living witnesses to the reality of climate change and global warming where areas considered dry land in the Northern part of the country witnessed excessive and torrential rainfall while some communities in the South were also submerged'' (Ezigbo, 2012). Rainfall patterns across the country have changed dramatically over the years, with most regions now seeing late onset rainfall as opposed to only a few areas in the northeast, northwest, and southeast (BNRCC, 2001).

Climate change affects human health and survival creating a major concern as well as the health and survival of other species of flora and fauna, and the environment. The World Health Organization (WHO) estimated that at least 150,000 deaths each year could be traced to the outcome of climate change. Moreover, the figure is expected to double by 2030 with connections to flooding and water-related diseases (WHO, 2021). Studies have claimed that climate change-related torrential flooding has led to disease outbreaks in various regions of the globe (Lislie, 1995; Rose et al., 2000). Consequently, the Nigerian population could be exposed to such threats.

Another area affected by climate change is source of livelihood. Livelihood is a means of securing the necessities of life. The effect of climate change threatens the means of sustenance of people. With the increased threats to productivity, farmers' income will diminish and their ability to meet household needs (food, income, etc) will be difficult (Ozor, 2009). Oceanic acidification and increase in surface water temperature especially around the coast affects fish stocks and as a result threaten the livelihood of small-scale fishing communities in the area (IPCC 2007). This eventually will further deepen the vulnerability of the poor.

Climate change could also engender resource conflicts. In Nigeria, resource conflicts worsen given climate change as a result of the scarcity of resources. Population growth and the resulting increases in supply and demand for resources increase competition for scarce food, water, oil, and other resources. For instance, the Fulani herdsmen and farmers in Nigeria compete for grassland and water resources thereby engaging in violent conflicts.

Aside from the effects of climate change visible in the nature of glaciers, vegetation, the core, and other exotic indicators, sea level variations are especially important in our assessments of Nigeria's socio-economic development. Some Nigerian observers have pointed out with some justifications that Nigeria is doubly vulnerable to climate change: heavy rainfall, flooding, soil erosion, and submergence of land in coastal areas as well as loss of wetlands (Ekott, 2009). Climate change in the South-South zone of Nigeria manifests primarily in increased

precipitation, widespread flooding risk, ocean encroachment, increased deforestation, psychosomatic illnesses caused by the excessive heat of gas flaring and sea-level rise. However, it should be pointed out that while developing countries are concerned about the effects of climate change on their population, developed countries are concerned that climate change will limit their unique habits and lifestyle. This is the irony of life.

Climate change impacts are moderated by the level of socioeconomic development of a given community and Nigeria's rather weak socioeconomic development is heightening the severity of the impact; further limiting the country's capacity to respond to emerging challenges (Adesina & Odekunle, 2011). Without serous interventions, including, adaptation, the impact of climate change could be greater as the century progresses. This makes it crucial for Nigeria to focus on those activities and programs that would strengthen its resilience and adaptive capacity in terms of socioeconomic development and effective management of ecosystems (Raffaello et al., 2013; United States Agency for International Development (USAID, 2018).

2.1.4 Climate Governance and Policies as Response to Climate Change in Nigeria

Awareness creation on the impact of climate change involves the effort of everyone; thus, climate change governance involves broad public participation in decision-making which is a critical condition for achieving climate-resilient development. In Nigeria, various stakeholders, (government, non-governmental organizations, the academia and private organizations) collaborate to achieve positive results in climate change management and governance, disseminating information to every local community, stating the impact of climate change on the people especially those into agriculture. With the recognition of the impact of climate change on the socio-economic development of the country and the well-being of the populace by the federal government and other non-governmental organizations, efforts are made to manage climate-related development challenges with appropriate policy and institutional arrangements that will encourage the implementation of mitigation and adaptation actions at all levels of governance for climate compatible sustainable development. Such efforts include in 2012, the Federal Executive Council approved a comprehensive strategy policy on climate change: the Nigeria Climate Change Policy Response and Strategy (NCCPRS), a document which is an output of a national participatory and stakeholders consultative approach to put in place a well-defined national climate change response framework and implementation plan that incorporates critical elements of mitigation and adaptation, contains policy elements and short, medium and long-term national strategies that will enable the country to mainstream mitigation and adaptation into its national development efforts. This is to enable Nigeria respond effectively to the impact of climate change to reduce its vulnerability and enhance its resilience so that the national priorities of rapid economic growth, energy sufficiency, job creation, food security, transparent and accountable climate change governance will be properly addressed.

The Policy has been guiding policy decisions and led to actions in responding to climate change in the country. With the development of the NCCPRS, the global discourse on climate change has led to the adoption of new initiatives that have been domesticated to guide national response to reducing the impact and adapting to the challenge. In particular, a major basis for Nigeria's effective response to the challenge of climate change is the implementation of the 2015 Paris Agreement constitutes an important milestone in promoting the transition to a low carbon economy. Thus, the purpose of this National Policy on Climate Change is to define a new holistic framework to guide the country's response to the development challenge of climate change. As a framework document, it prescribes sector and cross-sectoral strategic policy statements and actions for the management of climate change within the country's pursuit for climate resilient sustainable development (Federal Ministry of Environment, 2021).

Also, the government of Nigeria mapped out other steps to address the challenges of climate change and they include the establishment of the Department of Climate Change (DCC) in the Federal Ministry of Environment which is the focal point to the United Nations Framework Convention on Climate Change (UNFCCC) and also the Designated National Authority (DNA) for the Clean Development Mechanism. The DCC works with other Ministries through the Inter-Ministerial Committee on Climate Change. Also taken as a measure are some development policies with clear implications for climate change adaptation: (i) Vision 20:2020; (ii) the Transformation Agenda (2011 – 2015); and (iii) Economic Recovery and Growth Programme (ERGP) (2017 – 2020). There is also the Nationally Determined Contribution (NDC) which was developed in 2015 towards the ratification of the Paris Agreement on Climate Change. Its aim is to reduce greenhouse gas (GHG) emissions intensity of GDP by 20% by 2030 relative to the emissions intensity of GDP in the base period 2010 to 2014 on an unconditional basis as well as a further 45% on a conditional basis consequent upon receiving climate finance, technology transfer and capacity building from the developed countries.

2.2 Theoretical Review

Two theoretical perspectives are particularly relevant towards our understanding of the phenomenon of climate change; namely the Anthropogenic Global Warming (AGW) hypothesis and the standard theory of externalities. The UK Met Office (1998) describes the AGW hypothesis as the first theory of climate change, which contends that human emissions of greenhouse gases principally carbon dioxide (CO2), methane, and nitrous oxide, are causing a catastrophic rise in global temperatures. The mechanism whereby this happens is called the enhanced greenhouse effect. Energy from the sun travels through space and reaches the earth. The earth's atmosphere is mostly transparent to the incoming sunlight, allowing it to reach the planet's surface where some of it is absorbed and some is reflected back as heat into the atmosphere. Certain gases in the atmosphere, called ''green-house gases'' absorb the outgoing reflected or internal thermal radiation, resulting in earth's atmosphere becoming warmer than it otherwise might be. Water vapour is the major greenhouse gas, responsible for about 36-90% of the greenhouse effect, followed by CO2, methane, and ozone. During the past century, human activities such as burning of wood and fossil-fuel as well as burning of forests are thought to have increased the concentration of CO2 in the atmosphere by approximately 50%. Proponents of the AGW theory believe that man-made crop failures, species extractions, spread of diseases, ocean coral bleaching, famines and literally hundreds of other catastrophes are fall-outs of climate change. According to them, all these disasters will become more frequent and more severe as temperatures continue to rise so that only large and rapid reductions in human emissions will save the planet from these catastrophic events.

Like other environmental problems, climate change involves externality, for instance, the emission of greenhouse gases causes damages to other economic agents for which they are not compensated by the agent responsible for the emission. The standard theory of externalities points to one of taxation of the emitter equivalent to marginal social cost of the externalities generated by it. But where there is weak representation of those most affected, coupled with long-term horizons, a global scale major externalities, and important interactions with other market failures, then resolving the externality problem can be quite complex. Hence, while the standard theory can provide useful initial insights, there is a much deeper and more complex economic policy problem. There is a problem of intertemporal international collective action with major uncertainty and linked market failures.

2.3 Empirical Review

Empirical studies have also confirmed that climate change can have substantial impacts on the overall economy. In Ethiopia, Gebreegziabher et al. (2011) examined the economic effect of

climate on agriculture productivity (GGE) model. The study observed that the impact of overall climate change will be relatively benign until approximately 2050, and thereafter worsen considerably. Further, the simulation results showed that, over a 50-year period, the projected reduction in agricultural productivity may lead to about 30% less average of climate change. Using descriptive analysis, Ozor (2009) demonstrated the processes that lead to climate change so as to enable a better understanding of the concept. The study described in details the impacts of climate change on various issues of national development such as low agricultural productivity, food insecurity, resource conflicts, unemployment, environmentally-induced migration, livelihood problems and health issues. The study also noted that these impacts are as a result of devastating effects of flooding, drought, erosion, desertification, sea level rise, heat stress, pests and diseases, and erratic rainfall patterns, arising from climate change. The study further suggested the need for climate policy in Nigeria, the establishment of NCCC, the development of a national framework for climate change adaptation, and the embracing of emerging technologies.

Onuoha (2009) examined the threats posed by climate change across the globe with particular reference to developing countries, where agriculture is a dominant sector and in turn depends on weather and climate. The study utilized the sustainable development model in the form of the Green Wall Sahara Nigeria Program as a strategy for greening the drought-prone and desert infested areas of Northern Nigeria. The study concluded that the challenges of climate change to economic growth and sustainable development in Nigeria require creative thinking, holistic ideas, innovative solutions and the involvement of all stakeholders. Agwu and Okhimamhe (2009) conducted two studies on the gender dimensions of climate change in North-Central and South-Eastern Nigeria. The North-Central study assessed the impact of climate change on the Zumba and Augie Communities in Niger and Kebbi states respectively. It highlighted the challenges and adaptation strategies of the selected communities. The study observed that communities had noticed climate change but failed to identify its causes. Some of the women in these communities attributed the climate change such as environmental degradation to the construction of the Shiroro dam and the resulting massive deforestation. Less scientifically, Augie women believed that the flood waters from Bakoleri and Goronyo dams which destroyed their farms and affected the health of their people were calamities inflicted by the gods. Again, the women accepted that they had contributed to deforestation in their search of the wood which led to the disappearance of many plant and animal species. Although these resilient communities have put various adaptation measures in place, they were not primarily targeted at reducing the impact of climate change. The study finds that Augie community is already practising a number of coping strategies and requesting for assistance to strengthen them. Specifically, the stakeholders of the community requested for funding, awareness campaigns and capacity building. In Zumba, awareness campaigns are also needed to address traditional beliefs. The second aspect of the study focused on two South-eastern communities, namely Enugwu Nanka in Anambra State and Akama Amankwo Ngwo in Enugu State. The study revealed that the impacts of climate change in South-Eastern Nigeria include the destruction of roads and economic trees by landslides and tornadoes. Climate change is also responsible for excessive heat, heightened insect activity and the drying up of streams. The study concluded that while ingenious adaptive and mitigation strategies developed by women were found in the sample states, better policy making to combat climate change is urgently needed.

Nwafor (2007) notes that a common theme in the climate change vulnerability literature is the idea that countries, regions, economic actors and social groups differ in their degree of vulnerability to climate change. This is partly due to the fact that changes in temperature and precipitation occur unevenly and that climate change effects on resources and wealth are distributed unevenly across the globe. Onuoha (2008) examined these observations by adding

that unless appropriate mitigation measures are adopted to reduce vulnerability in Nigerian and other developing countries of sub-Saharan Africa, climate change portends grave danger not only to the people but also to the biotic and abiotic environments. The study expressed concern that all the developmental advances witnessed in sub-Saharan Africa may be destroyed or reversed over a short period of time unless the effects of climate change are urgently tackled.

3.0 Results and Discussion

The empirical analysis began with the examination of the data for its time series properties. The results of the unit root tests are shown in Table 1. The results indicate that all the series are i/1 except annual rainfall. This suggests that the variables may be co-integrated, since the dependent variable (GDP) has the same order of integration with majority of the regressors. Indeed, we conducted the co-integration test using the residual approach. The result which is shown in Table 2, indicates that the residual is stationary at all level, thereby confirming the existence of an equilibrium relationship between the variables.

Table 1: Unit root test results

Variable	ADF	Phillips-Perron	Result
GDP	1(1)	1(1)	1(1)
ARF	1(0)	1(0)	1(0)
GEM	1(1)	1(1)	1(1)
FDI	1(1)	1(1)	1(1)
GEXP	1(1)	1(1)	1(1)
PINV	1(1)	1(1)	1(1)
REXR	1(1)	1(1)	1(1)

1(0) and 1(1) denote stationary at level and after first difference, respectively. The unit root tests were performed at 5% level controlling for trend and intercept for GDP, GEXP and REXR and controlling for only intercept in other cases. All variables are in their natural log transformation, GDP (Gross Domestic Product); ADF, Augmented Dickey Fuller

As a robustness check, we also conducted the Johansen co-integration test and the results are shown in Table 3. While the Trace test indicates the existence of at least 4 co-integrating equations.

Table 2: Testing the residual for unit root

Variable	Augmented Dickey Fuller Test Statistics	1% Critical Value	5% Critical Value	Probability Value
Residual	-6.339649	-3.646342	-2.954021	0.0000

The residual is stationary at 1% level of significance

Table 3: Johansen co-integration test results

Hypothesized number of CE (s)	Trace Statistics	5% critical value	P value	Hypothesized number of CE (s)	Max-Eigen statistics	5% critical value	P value

None (x)	218.0508	150.5585	0.0000	None	56.8722	50.5999	0.0099
At most 1 (x)	161.1786	117.7082	0.0000	At most 1	51.3355	44.4972	0.0078
At most 2 (x)	109.8431	88.8038	0.0007	At most 2	43.1871	38.3310	0.0128
At most 3 (x)	66.6560	63.8761	0.0286	At most 3	30.1416	32.1183	0.0855

At most 5	18.0380	25.8721	0.3414	At most 5	11.7789	19.3870	0.4360
At most 6	6.2592	12.5180	0.4281	At most 6	6.2592	12.5180	0.4281

Note: The xx indicates that the Trace statistics or the Max-Eigen statistics is greater than the corresponding 5% critical value

Table 4: Robust long-run estimation results (dependent variable = GDP)

Variable	Coefficient	Diagnostic checks	Remarks
Constant	3.71 (xxx)	Adjusted R	Good
ARF	0.17 (xx)	P-statistic	‘’
CEM	0.22 (xxxx)	Valid F-statistic	‘’
FDL	0.01	Durbin-Watson Statistic	
GEXP	0.84 (xxxx)	Breusch-Godfrey Test (observed Chi-square)	
PINV	-0.35 (xxxx)	Breusch-Pagan-Godfrey Test (observed Chi-square)	
REXR	-0.14 (xx)	Jarque-Bera statistic	

Table 5: ECM estimation results (dependent variable = D(GDP)

Variable	Coefficient	Diagnostic checks	
Constant	0.05	R Square	0.59
D(ARF)	0.10 (x)	Adjusted R square	0.48
D(CEM)	-0.21 (x)	F-statistic	Remarks

D(FDL)	-0.05	Durbin-Watson statistic	
D(GEXP)	0.76 (xxx)	Breusch-Godfrey test (observed Chi-square)	
D(PENV)	-0.30 (xxxx)	Breusch-Pagan-Godfrey test (observed Chi-square)	
D(REXR)	-0.29 (xxx)	Breusch-Pagan-Godfrey (observed Chi-square)	
BCM(-1)	-1.09 (xxx)	Jarque-Bera statistic	

Following the establishment of an equilibrium relationship between the variables, we estimated the long-run relationship of equation 1. The results are shown in Table 4. We summarize the main findings as follows. First, out of the three climate change variables in this study, only carbon emission impacts negatively on the overall output growth of the Nigerian economy. This suggests that Nigerian government must resolve and implement policies that will reduce the amount of carbon emission in the country, especially those coming from the consumption of fossil fuel and gas flaring. Second, the impacts of rainfall and carbon emission are statistically significant at the 5% level. This shows that these climate change variables are important in Nigeria. Third, contrary to expectation, the impact of forest depletion is positive, though it is not statistically significant. This may be due to inadequacies in documenting forest depletion activities in Nigeria. Consequently, the study will favour the continuation of efforts towards forest conservation in Nigeria. Fourth, all the control variables conformed to theoretical expectations, except for domestic private investment. While government expenditures impacts positively and significantly on output at the 1% level, both private investment and exchange rate impact negatively.

The diagnostic checks indicate that the underlying assumptions of the model have been substantially satisfied. The adjusted R square shows that the regressors have adequately accounted for the variations in the dependent variable. The F-statistics, which is strongly significant at the 1% level, shows that the model as a whole is meaningful. The Durbin-Watson Statistic which is approximately 2 is in line with theoretical expectation. Even though the Breusch-Godfrey Test indicates the presence of residual serial correlation problem at the 5% level, we corrected the problem using the Newey-West FAC method. The Breusch-Pagan-Godfrey test shows that there is no problem of Heteroscedasticity in the results. The Jarque-Bera statistic shows that the residual is normally distributed in line with theoretical expectations. Overall, the model assumptions are adequately fulfilled.

5. Conclusion and Recommendations

This paper examined the impact of climate change on socio-economic growth and development in Nigeria. The paper used OLS estimation technique and data for the period 1981-2014. Changes in annual rainfall, carbon emission and forest depletion were used to capture climate change, while government expenditure, domestic private investment and exchange rate were used as control variables in order to obtain robust estimates. The paper estimated an error correlation model in order to account for both long-run and short-run relationships. The results indicate that both in the long-run and short-run, carbon emission affect output growth in Nigeria adversely. In addition, forest depletion impacts negatively on national output growth in Nigeria

in the short-run. These results imply that Nigerian government should evolve and implement policies to curb carbon emissions and forest depletion. In other words, government intervention is required to reduce carbon burning, deforestation and fossil fuel consumption. Government should evolve policies to encourage the use of environmental-friendly equipment, machines, infrastructure, and technologies that generate minimal greenhouse gases, such as improved road and rail transport as well as use of bio-fuels and energy saving devices. A NCCC is obviously required in Nigeria to deal with all climate change issues. Furthermore, the finding that domestic private investment and naira-to-dollar exchange rate impede output growth in Nigeria implies that policymakers and governments at all levels in Nigeria should evolve and implement policies to reverse these undesirable outcomes.

ÖZET

Bu çalışma, YOLOv11s nesne algılama modeli tabanlı otomatik bir buğday tanesi kalite değerlendirme çerçevesi sunmaktadır. Gerçekçi denetim senaryolarını simüle etmek amacıyla, yazarlar tarafından 219 görüntü ve 46.689 elle etiketlenmiş buğday tanesinden oluşan özel bir veri kümesi oluşturulmuştur. Veri kümesinde, farklı aydınlatma ve arka plan koşulları altında çekilmiş üç buğday türü (açık, tam ve makarna buğdayı) yer almaktadır. Model, yoğun ve görsel olarak karmaşık sahnelerde sağlamlığı artırmak için hiperparametre optimizasyonu ve veri artırma teknikleri (Mosaic karıştırma, bounding box kayıp ağırlıklarının artırılması vb.) kullanılarak ince ayar yapılmıştır. Deneysel sonuçlar, önerilen YOLOv11s modelinin ortalama doğruluk (mAP@50) değerinin 0.90 olduğunu ve tüm sınıflarda (Sağlıklı, Sağlıksız ve Yabancı Madde) yüksek doğruluk ve geri çağırma oranlarına ulaştığını göstermektedir. Bu sonuçlar, YOLOv11s mimarisinin hem yüksek tespit doğruluğu hem de gerçek zamanlı işleme hızını koruyarak, tarım endüstrisinde pratik kalite kontrol uygulamaları için uygun bir çözüm sunduğunu ortaya koymaktadır. Ayrıca, çalışmada oluşturulan özel veri kümesi, gelecekteki araştırmalar için buğday tanesi kalite sınıflandırmasında değerli bir referans niteliği taşımaktadır.

AUTOMATIC CLASSIFICATION OF WHEAT GRAINS USING YOLO11 ARCHITECTURE FOR SMART AGRICULTURE APPLICATIONS

ABSTRACT

This study presents an automated wheat-grain quality assessment framework based on the YOLOv11s object detection model. A custom dataset comprising 219 images and 46,689 manually annotated grains was constructed by the authors to simulate realistic inspection scenarios, including three wheat types (light, whole, and durum) under diverse lighting and background conditions. The model was fine-tuned using hyperparameter optimization and data augmentation techniques such as Mosaic blending and increased bounding-box loss weighting to improve robustness in dense and visually complex scenes. Experimental results demonstrate that the proposed YOLOv11s model achieves a mean Average Precision (mAP@50) of 0.90, with high precision and recall across all classes (Healthy, Unhealthy, and Foreign-material). These results highlight that the YOLOv11s architecture maintains both high detection accuracy and real-time processing speed, making it suitable for practical agricultural quality control applications. Moreover, the constructed dataset provides a valuable benchmark for future research in wheat-grain quality classification.

Keywords: Wheat Quality Detection, YOLOv11, Object Detection, Deep Learning, Agricultural Automation, Dataset Annotation

1. INTRODUCTION

Wheat stands as a cornerstone of global agriculture, making the assessment of its grain quality and yield paramount for maintaining food security and economic stability. According to the U.S. Department of Agriculture (USDA, 2024), global wheat production in the 2024–2025 marketing year is estimated to exceed 790 million metric tons (MT), reaffirming its position among the top three staple cereal crops worldwide, alongside rice and maize [1].

Traditional human inspection for grain quality remains labor-intensive, costly, and fundamentally unscalable for the vast quantities processed in modern industry. Moreover, such manual evaluations are subjective and prone to inconsistency and human error. Earlier computer-vision systems, while partially automating the process, were constrained by handcrafted, non-adaptive features, which limited their robustness and generalization under diverse real-world lighting and background conditions [2].

Consequently, reliance on human judgment and outdated vision pipelines creates a critical bottleneck in large-scale agricultural quality control. This challenge underscores the need for automated, objective, and data-driven solutions leveraging modern deep-learning architectures.

Deep-learning-based object-detection models are generally categorized into two main paradigms: two-stage detectors (e.g., Faster R-CNN) and one-stage detectors (e.g., SSD, YOLO). While the former achieve high accuracy, they suffer from slower inference speeds that limit real-time deployment. In contrast, YOLO is widely used because it prioritizes processing speed over detection accuracy, offering the efficiency required for industrial automation [3].

Recent studies have investigated YOLO-based and deep learning approaches for wheat grain inspection.

For example, Zhao et al. (2022) proposed an improved YOLOv5 model for wheat grain quality detection [4], while Ma et al. (2024) introduced YOLOv8-HD for seed detection and counting under challenging conditions of adhesion and impurity [5].

Similarly, Qiu et al. (2024) developed YOLO-SDL, a lightweight YOLOv8n variant for classifying perfect, germinated, diseased, and damaged grains [6].

In addition, Liu et al. (2022) employed terahertz spectral imaging with deep learning techniques to identify unsound wheat grains [7].

However, these studies primarily relied on earlier YOLO versions (v5–v8) or non-RGB modalities, and most focused on detection or counting tasks in controlled laboratory environments.

In contrast, the present study introduces a manually annotated dataset containing over 46 000 labeled objects captured under realistic conditions involving multiple wheat varieties and imaging angles. A fine-tuned YOLOv11 model is proposed to balance accuracy and speed, achieving efficient multi-class wheat grain quality detection suitable for practical, real-world deployment in industrial processing environments.

2. MATERIALS AND METHODS

A.DATASET CONSTRUCTİON AND ANNOTATİON

The dataset was originally created and annotated by the authors to support the development of a realistic wheat-grain quality detection model. Wheat grains were manually arranged on A4 sheets and photographed using a mobile-phone camera at multiple viewing angles. To better mimic real inspection conditions, three different wheat types were included light wheat, whole wheat, and durum (pasta) wheat representing the common varieties encountered in food-processing and grain-storage environments. The grains were distributed with varying densities,

from sparse to closely packed, and imaged under different lighting conditions and perspectives. This setup, though simple, effectively reproduced the visual diversity found in real inspection scenarios.

Figure 1 shows representative sample images from the constructed dataset, illustrating the diversity in lighting, angle, and grain arrangement across the three wheat varieties.

All annotations were performed manually using the Roboflow Annotate platform. The dataset consists of 219 images with a total of 46,689 manually labeled bounding boxes, distributed as follows: Healthy-wheat (14,750), Unhealthy-wheat (21,100), and Foreign-material (10,839). Images were exported in YOLO v11 format, each resized to 1024 × 1024 pixels to ensure uniform input dimensions prior to training.

The dataset was divided into 75 % for training and 25 % for testing. Although the total image count was moderate, the high number of labeled instances per image provided sufficient diversity and effectively compensated for the limited number of source images. All annotations were converted to YOLO format to ensure compatibility with the YOLOv11 fine-tuning pipeline, allowing the model to achieve an optimal balance between speed and detection accuracy for multi-class wheat-grain quality assessment.

Figure 1. Sample Images

To illustrate the visual diversity and labeling quality, Figure 1 presents sample images from the constructed dataset, each representing different classes and acquisition conditions. Figure 1. Sample images from the constructed wheat grain dataset, showing examples of healthy, unhealthy, and foreign-material grains.

B. MODEL SELECTİON AND ARCHİTECTURE

In The YOLOv11s model was adopted in this study due to its efficient architectural design and balanced trade-off between speed and detection accuracy [8].

1) YOLOv11 Architecture

The model architecture is organized into three main components [9]:

- Backbone: The backbone employs the R-ELAN (Residual-Enhanced Efficient Layer Aggregation Network) structure, which facilitates better feature reuse and gradient flow through residual aggregation. It also integrates C2f-PSA (Cross-Stage Partial with Parallel Spatial Attention) and SPPF (Spatial Pyramid Pooling – Fast) modules to capture multi-scale spatial information while maintaining computational efficiency.
- Neck: The neck combines Feature Pyramid Network (FPN) and Path Aggregation Network (PAN) layers, enabling multi-level fusion of low- and high-level semantic features. This design improves the model's capability to detect targets of varying scales and aspect ratios.
- Head: The decoupled detection head separates the classification and regression branches, allowing independent optimization of localization and confidence prediction. This modification stabilizes training and increases detection precision in cluttered scenes.

Overall, YOLOv11 achieves enhanced inference stability and accuracy across multiple benchmark datasets while preserving lightweight efficiency, making it suitable for deployment in real-time detection pipelines.

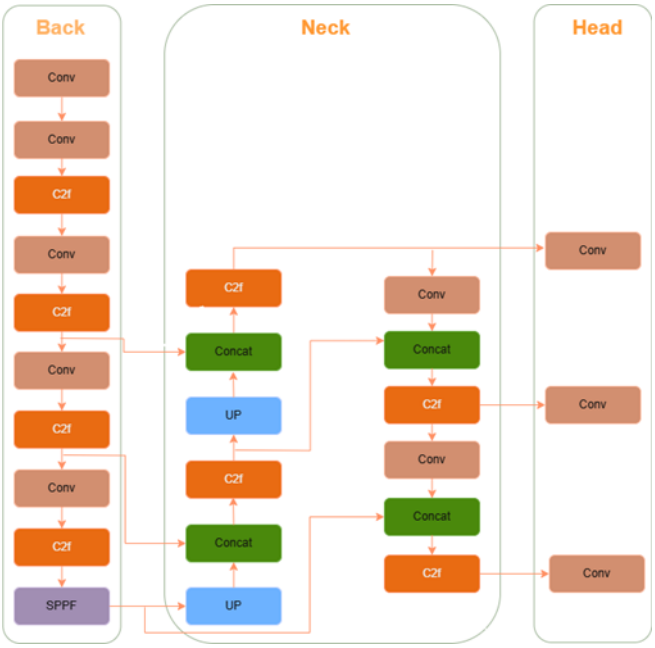

Figure 2. YOLOv11 Architecture

C. MODEL FİNE-TUNİNG AND OPTİMİZATİON

To tailor the model for the wheat-grain quality detection task, a fine-tuning strategy was applied using the custom dataset described earlier. Several hyperparameters and data-augmentation techniques were carefully configured to enhance robustness and generalization:

• Input Resolution: All images were resized to 1024 × 1024 pixels prior to training to preserve the fine-grained details required for accurate detection. Studies have shown that higher input resolution improves localization accuracy, especially for small or densely packed objects [10].

• Data Augmentation: The Mosaic augmentation technique was adopted to enrich the dataset by blending four images into one, effectively increasing diversity in object positions, scales, and backgrounds. Mosaic has been proven effective in agricultural and dense-scene applications by improving contextual learning [11].

• Loss-Weight Adjustment: The bounding-box loss weight (box = 7.5) was increased to encourage the model to prioritize spatial localization over classification probability. This hyperparameter tuning improves the detection of overlapping and adjacent objects by reducing false negatives [12]. Training Environment: All experiments were conducted on Google Colab using an NVIDIA T4 GPU (16 GB VRAM), batch size = 8, and 155 epochs. The default Stochastic Gradient Descent (SGD) optimizer and a cosine-annealing learning-rate scheduler (cos_lr = True) were employed, with early stopping (patience = 40) to prevent overfitting. This fine-tuned configuration allowed the YOLOv11s model to achieve a stable balance between accuracy and real-time inference, ensuring its suitability for practical agricultural inspection tasks. The overall workflow of the proposed wheat grain quality detection system is illustrated in Figure 3.

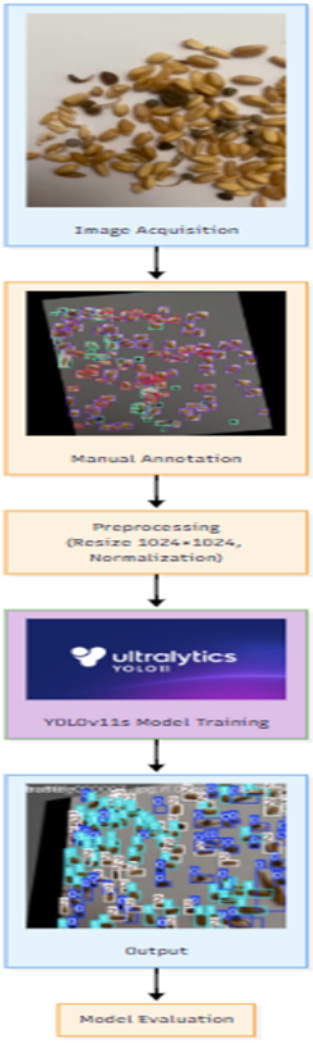

Figure 3. Overall workflow of the proposed system

D. EVALUATİON METRİCS

To evaluate the performance of the object detection models on the wheat classification task, this study employed several well-established evaluation metrics, including Precision (P), Recall (R), F1-score, mean Average Precision at IoU threshold 0.5 (mAP@50), mean Average Precision over multiple IoU thresholds (mAP@50–95), Giga Floating Point Operations per Second (GFLOPs), and Frames Per Second (FPS).

These metrics are widely adopted in modern object detection benchmarks and follow the COCO evaluation standards [13].

Precision (P): Quantifies the percentage of predicted positive instances that are actually correct, measuring the model's ability to avoid false positives:

$$P = \frac{TP}{TP+FP} \qquad (1)$$

Recall (R): Measures the proportion of actual positive instances that are correctly predicted, reflecting the model's ability to detect all relevant objects:

$$R = \frac{TP}{TP+FN} \qquad (2)$$

F1-score: The harmonic mean of precision and recall, offering a balanced metric especially

valuable in imbalanced datasets:

$$F1 = 2 * \frac{P*R}{P+R} \quad (3)$$

mAP@50: Mean Average Precision calculated when the Intersection over Union (IoU) threshold is set at 0.5. This metric provides an overall view of the model's ability to correctly detect and localize objects:

$$mAP_{50} = \frac{1}{m}\sum_{i=1}^{m} AP_i \quad (4)$$

mAP@50–95: As introduced in the COCO evaluation protocol (Lin et al., 2014), this metric averages AP across 10 different IoU thresholds (from 0.50 to 0.95 in steps of 0.05), providing a more comprehensive assessment of detection performance:

$$mAP_{50-95} = \frac{1}{m}\sum_{i=1}^{m}\left(\frac{1}{10}\sum_{j=1}^{10} AP_{i,j}\right) \quad (5)$$

3. RESULTS

A. Quantitative Performance

The model achieved strong detection performance, with Precision = 0.91, Recall = 0.88, F1-score = 0.895, mAP@50 = 93.8 %, and mAP@50-95 = 80.5 %. The high mAP@50–95$ value validates the success of the customized Bounding Box Loss Weight tuning in achieving precise localization, which is vital for distinguishing small, clustered grains.

B. Performance Evaluation Based on Precision–Recall Curves

As illustrated in Figure 4, the Precision–Recall (PR) curve demonstrates strong overall detection performance across all three classes, achieving a mean Average Precision (mAP@50) of 0.90.

The Healthy-wheat class exhibits the highest precision and recall values, reflecting the model's strong ability to both correctly identify and avoid false detections for regular grains.

The Unhealthy-wheat class shows slightly lower recall, suggesting that a small proportion of damaged kernels were missed likely due to partial or subtle discolorations blending with normal grains.

The Foreign-material class displays the lowest precision among the three, indicating occasional false positives where background artifacts or light reflections were misinterpreted as foreign objects.

Nonetheless, all curves remain consistently above 0.85, confirming the YOLOv11s model's robust discrimination capacity and balanced trade-off between sensitivity (recall) and precision under real-world imaging conditions.

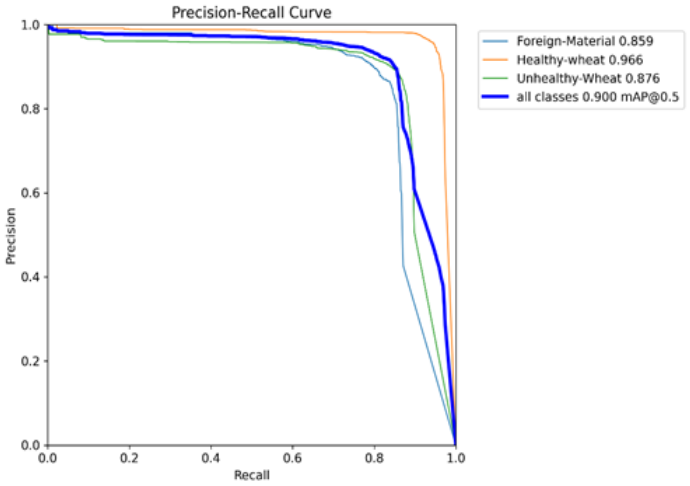

Figure 4. Precision–Recall (PR) curve

C. Confusion Matrix Analysis

As shown in Figure 5, the confusion matrix demonstrates that the YOLOv11s model achieved consistently high per-class accuracy, with most predictions correctly located along the diagonal.

Minor misclassifications were mainly observed between the Foreign-material and Unhealthy-wheat classes. This confusion likely arises from visual overlap in texture and tone, as certain foreign particles such as straw fragments or pasta residues share surface characteristics with damaged grains.

Additionally, a small portion of Foreign-material instances were misinterpreted as background, reflecting the difficulty of detecting low-contrast or partially occluded objects under complex lighting.

Nevertheless, the overall confusion remained limited, confirming the model's strong discriminative capacity and robustness in multi-class wheat-grain quality detection.ecision under real-world imaging conditions.

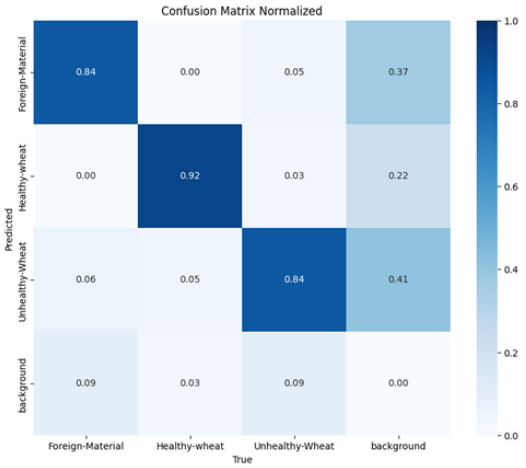

Figure 5. Confusion Matrix

4. CONCLUSION

This study presented a deep learning–based framework for automated multi-class wheat grain quality assessment using the YOLOv11s model. The model achieved a strong overall performance, with a mean Average Precision (mAP@50) of 0.90 and high per-class accuracy

across Healthy-wheat, Unhealthy-wheat, and Foreign-material categories. These results demonstrate the potential of modern one-stage detectors, such as YOLOv11, to provide reliable, real-time quality inspection suitable for industrial deployment.

Despite its promising accuracy, the analysis revealed that foreign-material detection remains the most challenging task due to the high visual similarity between impurities and damaged kernels, as well as background interference.

Future work will therefore focus on expanding and refining the dataset, particularly by increasing the representation and diversity of foreign-material samples under varying lighting and background conditions.

Additionally, future experiments will investigate the integration of attention-based modules and data-driven fine-tuning strategies to enhance small-object discrimination.

Finally, real-time deployment tests will be conducted to evaluate hardware feasibility, ensuring that the system can operate efficiently on embedded devices or industrial inspection units, bridging the gap between research and practical application.

ÖZET

Bu çalışma, dişi kedilerde siklik dönemlerde sıkça karşılaşılan, neoplastik olmayan ve memelerde büyümeyle karakterize olan meme hiperplazisi hakkında bilgi vermek amacıyla hazırlanmıştır. Meme hiperplazisi; fibroadenoma kompleks, meme displazisi, fibroglandular meme hipertrofisi, meme fibroadenomatozisi gibi isimlerle anılmakta olup meme stroması ile meme kanal epitelinin proliferesyonuyla karakterizedir. Meme hiperplazisi genellikle birden fazla meme lobunu etkiler ve genç siklik kedilerde daha çok rastlanılmaktadır. Meme hiperplazisi bening karakterdedir ve uzun süre progesteron kullanımı hastalık insidensini arttırmaktadır. Meme bezlerinin hiperplazisi, östrus döneminden 1-2 hafta sonra veya progesteron tedavisinden 2-5 hafta sonra meme bezlerinin hızla büyümesi ile karakterizedir. Bazen kısırlaştırılmış dişi veya erkek kedilerde de görülebilir. Meme hiperplazilerinde meme bezlerinin büyümesinin geri dönüşümü mümkünkür. Etkilenen meme bezlerinde diffuz genişleme şekillenmesi ve çeşitli boyutlarda kitlelere de rastlanması sebebiyle meme tümörü ile karıştırılabilmektedir. Ancak meme neoplazileri genellikle hızlı büyür, katı ve düzensiz şekillidir ayrıca erken dönemde lenf nodüllerine metastaz yapabilir. Hiperplazi ise ısı artışı ve yangı belirtisi gibi klinik bulgular görülmeden birden çok memede şekillenen şişme olgusudur. Bu durum hiperplazinin teşhisini nispeten kolaylaştırmaktadır. Kesin teşhis biyopsi örneklerinin histopatolojik olarak değerlendirilmesiyle yapılmaktadır. Meme bezlerinin gelişimi ve büyümesi, stroma ve epitel hücrelerindeki progesteron reseptörlerinin etkisinden kaynaklanır. Progesteron, meme bezlerini proliferasyonu tetikler. Dolayısıyla progesteron salınımında yaşanan aksaklıklar yada eksternal progesteron uygulamaları meme bezi hiperplazisinin yanı sıra ilerleyen dönemlerde neoplastik aktivitenin gelişimine de neden olabilir. Hiperplazi şekillenen meme bezlerinin yumuşak ve fluktuan olduğu sınırlarının belirginleştiği, görülmektedir. Bazı hiperplazi olgularında meme derisinin gerildiği ve olgunun üzerinden geçen zamana bağlı olarak nekrotik odaklar şekillendiği de gözlemlenmektedir. Hiperplazilerde nadir olarak ateş, anemi, letarji ve anoreksi gibi sistemik belirtiler ortaya çıkabilmektedir. Tedavi amacıyla ovariohisterektomi uygulanabilir fakat hiperplazinin regrese olması için 5-6 ay süreye ihtiyaç vardır. Hiperplazinin sentetik progesteron uygulamasına bağlı olduğu durumlarda progesteron uygulaması acilen sonlandırılmalıdır. Meme bezlerinin kitle hacmi, luteoliz veya eksojen progesteron hormonu aktivitesinin sona ermesinden sonra yavaş yavaş azalabilmekte ve genellikle birkaç hafta içinde normale dönmektedir. Tedavide sekonder enfeksiyonların önüne geçebilmek için geniş spektrumlu bir antibiyotik ile yangı belirtileri mevcut ise kısa süreli antienflamatuar ilaçlar kullanılabilir. Aglepristone veya progesteron

reseptör blokerleri kullanılmaktadır. Bu ilaçlar hedef dokuda progesteron reseptörüne 9 kat afinite ile bağlanan rekabetçi bir moleküldür. Bu ilaçlar 20 mg/kg dozunda günde bir kez veya 10 mg/kg dozunda günde iki kez verildiğinde hiperplazi yaklaşık bir haftada gerileyebilmektedir. Sonuç olarak, kedilerde meme hiperplazisi siklik kedilerde hormonal değişimden etkilenen ve memelerde büyümeyle karakterize geri dönüşümlü bir hastalıktır.

Anahtar Kelimeler: Kedi, benign, hiperplazi, hipertrofi, meme

MAMMARY HYPERPLASIA IN FELINE

ABSTRACT

This study was prepared to provide information about mammary hyperplasias, which are non-neoplastic and characterized by growth in the mammary glands, frequently encountered in female cats during their estrous cycles. Mammary hypertrophy, fibroadenoma complex, mammary dysplasia, fibroglandular mammary hypertrophy, and mammary fibroadenomatosis are terms used to describe a condition characterized by rapid proliferation of the mammary stroma and mammary duct epithelium. Mammary hyperplasia is generally a disease pattern that can affect multiple mammary lobes. It is more commonly seen in young cyclic cats. Mammary hyperplasia is benign in nature, and long-term progesterone use increases the incidence of the disease. Mammary gland hyperplasia is characterized by rapid growth of the mammary glands 1-2 weeks after the estrus period or 2-5 weeks after progesterone treatment. It can sometimes be seen in spayed female or neutered male cats. In mammary hyperplasia, the enlargement of the mammary glands is a reversible disorder.

Due to the diffuse enlargement of the affected mammary glands and the presence of masses of various sizes, it can be confused with mammary tumors. However, in differential diagnosis, mammary neoplasms generally grow rapidly, are solid and irregular in shape, and can metastasize to lymph nodes in the early stages. Hyperplasia, on the other hand, is swelling that occurs in multiple breasts without clinical findings such as increased heat and inflammation. This makes the diagnosis of hyperplasia relatively easy. The definitive diagnosis is made by histopathological evaluation of biopsy samples. The development and growth of mammary glands are shaped by the effects of progesterone receptors in stromal and epithelial cells. The local action of progesterone also triggers a specific increase in progesterone that promotes mammary gland proliferation. Disruptions in progesterone stimulation or external progesterone administration can cause mammary gland hyperplasia as well as the development of neoplastic activity in later stages. Hyperplasia is characterized by clearly defined borders of the mammary glands, which are soft and fluctuant. In some cases of hyperplasia, stretching of the breast skin and the formation of necrotic foci over time have also been observed. Systemic symptoms such as fever, anemia, lethargy, and anorexia may rarely occur in hyperplasia.

Ovariohysterectomy may be performed for treatment purposes, but regression of hyperplasia requires 5-6 months. This option is not mandatory if the cat is intended for breeding. In cases where hyperplasia is associated with synthetic progesterone administration, progesterone administration should be discontinued immediately. The mass volume of the mammary glands may gradually decrease after luteolysis or the cessation of exogenous progesterone hormone activity and usually returns to normal within a few weeks. To prevent secondary infections during treatment, a broad-spectrum antibiotic may be used, and if there are signs of inflammation, short-term anti-inflammatory drugs may be used. Aglepristone or progesterone receptor blockers are used. These drugs are competitive molecules that bind to the progesterone receptor in the target tissue with 9-fold affinity. When administered at a dose of 20 mg/kg once daily or 10 mg/kg twice daily, these drugs can regress hyperplasia in about a week. In conclusion, mammary hyperplasia in cats is a reversible disease characterized by growth in the mammary glands, affected by hormonal changes in cyclic cats.

1. GİRİŞ

Kedilerde meme hiperplazisi, genellikle genç, dişi ve hormonal olarak aktif kedilerde görülen, memede hızlı ve proliferatif büyüme ile karakterize benign bir hastalıktır (Görlinger et al., 2002). Kedi meme hiperplazisi, meme dokularında görülen, duktal epitel ve meme stromasının yaygın proliferasyonu ile karakterize bir değişikliktir (Uçmak et al., 2011). Dişi kedi meme bezlerindeki kitlelerin yaklaşık %80'i neoplastiktir (Görlinger et al., 2002). Meme hiperplazisi ise meme kitlelerinin %13-20'sini oluşturmaktadır (Payan-Carreira, 2013). Bu durum genellikle progesteron hormonuna bağlı olarak gelişir ve özellikle progestin içeren ilaçların kullanımıyla tetiklenebilir. Bu çalışmada, meme hiperplazisinin etyopatogenezi, klinik özellikleri, tanı yöntemleri ve tedavi yaklaşımları derlenmiştir.

Meme bezleri, embriyonun ventrolateral yüzeyindeki bilateral meme çizgileri veya sırtlarından gelişen ve torakstan inguinal bölgeye kadar uzanan bezlerdir. Kedilerde tipik olarak ventral göğüs kafesinden karına doğru uzanan iki sıra halinde simetrik olarak düzenlenmiş dört çift meme bezi bulunur. (Könıg & Liebich, 2021). İlk meme çifti kranial torasik, ikincisi kaudal torasik, üçüncüsü kranial abdominal ve dördüncüsü kaudal abdominal olarak adlandırılır. Temel olarak bağ dokusuyla kaplı loblardan oluşurlar (Dyce et al., 1997; Pantoja et al., 2017).

Doğumdan pubertasa kadarki sürede normal meme büyümesi vücudun genel büyüme hızının aksine daha yavaştır. Memelerdeki hacimsel gelişim, yağ ve bağ dokularının büyümesiyle şekillenir. İlk östrus siklusundan önce, meme bezinin parankimal dokusu vücutta dışa doğru büyümeye başlar. Her östrus siklusu sırasında meme bezleri ovaryum östrojeni, prolaktin ve hipofiz somatotropini tarafından uyarılmaktadır. Ovaryumda bulunan korpus luteum (KL), tübüloalveolar sistemdeki duktal büyüme ve farklılaşmayı uyarmak için diğer hormonlarla sinerjik olarak progesteron üretmektedir. Kedilerin meme bezinin fibroadenomatöz dokusunda hem progesteron hem de östrojen reseptörlerinin varlığı bildirilmiş, bu da her iki hormonun da patogenezde rol oynayabileceği ifade edilmektedir (Jurka & Max, 2009).

MEME HİPERPLAZİSİ

Kedilerde meme hiperplazisi, meme kanalları ile bağ dokusunun hızla büyümesi (proliferasyonu) ile ilişkili iyi huylu ve genellikle birden fazla meme lobunda şekillenen meme büyümesidir (Loretti et al., 2005; Gaviria et al., 2010). Evcil türler arasında kedilere özgü bir patolojidir. (Vasconcellos, 2003). Kedilerde Meme Hiperplazisi; Fibroadenomosis; Adenofibroma ve Fibroadenom gibi isimlerle de anılmaktadır. Etiyoloji tam olarak belirlenmemiş olsa da lezyonların oluşumuna yol açan endojen ve ekzojen progestinlerin etkisi altında ortaya çıkmaktadır. Bu hastalık, meme kanallarının ve bitişik bağ dokusunun anormal büyümesi ile karakterizedir ve bu anormal büyümesinin progesterondan kaynaklandığı veya progesterona verilen yanıt sebebiyle şekillendiği düşünülmektedir (Simas et al., 2011).

Etiyoloji

Kedilerde meme bezi hiperplazisinde ırksal bir yatkınlık saptanmamış olup, kontrolsüz üreme alanlarındaki evcil ve melez kedilerde çevresel ve iklimsel koşullar dikkate alındığında görülme sıklığının daha yüksek olduğu görülmektedir (Allen, 1973). Esas olarak progesteron veya analogları (medroksiprogesteron asetat ve megestrol asetat vb.) ile tedavi edilen tüm dişi ve erkek kedilerde yaştan bağımsız olarak ortaya çıkabilir (Hayden et al., 1981; Bethlehem & Souza et al., 2002; MacDougall, 2003; Romagnoli, 2015). Hayvanın kendi vücudu tarafından üretilen progesteron (endojen) ve kontraseptif amacıyla uygulanan progesteron (eksojen) meme hiperplazisinin şekillenmesine yol açmaktadır (Filgueira et al., 2015). Progesteron malign tümör oluşumunun yanı sıra meme hiperplazisinin oluşma riskini üç kata kadar artırabileceği ifade edilmektedir. Tek bir sentetik progestin uygulanması yapılan kedilerde dahi meme hiperplazisi gelişebileceği ifade edilmektedir (Loretti et al., 2005).

Meme bezindeki bu değişikliklerin oluşumunda rol oynayan diğer faktörler genetik yatkınlık ile hayvanın beslenme şekli ve rasyonudur (Oliveira, 2015). Obez hayvanlarda mevcut yağ dokunun dolaşımdaki östrojen seviyelerini artırabileceği bilinmektedir (De Nardi et al., 2016). Meme gelişimi üzerinde; östrojen, progesteronun yanı sıra büyüme hormonu (GH), prolaktin, adrenal kortikosteroidler ve muhtemelen tiroid hormonunun etkisi vardır. Hipofiz ve ovaryum hormonları arasındaki sinerji, maksimum meme büyümesine ulaşmak için gereklidir (Vasconcellos, 2003).

Meme hiperplazisi kısırlaştırılmamış dişi kedilerde, gebelik ve yalancı gebelik sırasında ve ekzojen veya sentetik progesteron tedavisi sonrası dişi kedilerde ve kısırlaştırılmamış erkek kedilerde görülebilmektedir (Mayayo et al., 2018; Vitasek & Dendisova, 2006; Marino et al., 2021). Meme hiperplazisi için 6 ay ila 13 yaş arasında en sık ise 13 hafta ve 2 yaş aralığında görülebilmektedir (Uçmak et al., 2011; Hayden et al., 1989; Wehrend et al., 2001; Payan-Carreira, 2013).

Klinik Bulgular

Meme hiperplazisi bir, birden fazla veya tüm meme loblarında simetrik veya rastgele şekillenebilir. Hiperplazi genellikle sağ ve sol bezlerde aynı yerde ve aynı büyüme derecesinde görülür. Genç kedilerde birden çok memede inflamasyon şekillenmesi yaygındır (Silva et al., 2002). Klinik görünüm genellikle oldukça endişe vericidir. Memelerdeki şişme ve renk değişimine bağlı olarak mastitis veya malign neoplazi ile karıştırılabilmektedir (Vasconcellos, 2003).

Klinik belirtiler, bir veya daha fazla bezde lokalize eritem, inflamasyon, kanamalar, ülserasyon ve nekroz ile birlikte meme dokusunun hızlı büyümesi ile karakterizedir. Etkilenen meme bezi, belirtilerin başlamasından birkaç hafta içinde hızlı bir şekilde büyür ve şişer (Görlinger et al., 2002; de Melo et al., 2021; Vasiu et al., 2023).

Gebe olmayan kedilerde genellikle asimetrik şişlikler bulunurken, gebe kedilerde lezyonlar daha homojendir (Payan-Carreira, 2013). İleri vakalarda lezyonlarda şekillenen ödem, iltihap ve anatomik yerleşimi nedeniyle meme dokularının rengi giderek koyulaşır. Bu bölgelerde alopesi de şekillenebilir. Travmanın artmasıyla birlikte şiddetli iltihap, kanama alanları ve nekroz görülebilir. Nekrotik alanlar en sık aksiller ve inguinal loblarda görülür. Meme hiperplazisi gebe kedilerde hangi boyutta olursa olsun meme bezlerinde süt üretimi olmaz (Görlinger et al., 2002).

Memelerin palpasyonunda lezyonlar yumuşak jelatinimsi yada sert kitlelere kadar değişebilmekte, 2,5 cm'den18 cm'e kadar ulaşabilmektedir. Kediler nodüller ülserleşmedikçe veya enfeksiyon şekillenmedikçe genelde ağrı hissetmezler (Amorim et al., 2006). Ancak olgularda ödem, hipertermi ve hiperemi gibi klinik belirtiler ile sıklıkla karşılaşılır (Filgueira et al., 2008). Lezyonların çok yaygın olması halinde kediler yürümekte isteksiz olabilir (Payan-Carreira, 2013) ayrıca travma, yalama, apse, (Vasconcellos, 2003) veya lokal perfüzyonun bozulmasına bağlı olarak ülserler şekillenebilir. İlerleyen kronik vakalarda iskemi şekillenebilir ve sekonder bakteriyel enfeksiyonlara neden olabilir (Araújo et al., 2017; Burstyn, 2010).

Kan analizlerinde hiperplaziye özgü bir değişiklik gözlenmez (Leidinger et al., 2011). Mastitis ve ülserasyon şekillenmesi halinde lökosit sayısında artış ve anemi görülebilir. Kan biyokimyasında üre, kreatinin ve karaciğer enzimleri ileri olgularda sistemik enfeksiyona bağlı olarak yükselebilir (Payan-Carreira, 2013).

Tanı

Meme hiperplazisinin klinik tanısı, hayvanın yaşı, ekzojen progesteron uygulama öyküsü veya meme bezlerinin klinik görüntüsü ve palpasyonu ile konmaktadır (Oliveira, 2015). Kedilerin

anamnezi alınırken östrusun baskılanması veya bazı deri hastalıklarının tedavisi amacıyla progesteron kullanıp kullanılmadığının (Payan-CarreİIra, 2013) yanı sıra ovariohisterektomi operasyonunun bir komplikasyonu olan ovarian remnant sendrom (ORS) şekillenip şekillenmediği bilgisi alınmalıdır. ORS teşhisi, vajinal sitoloji ve davranışsal gözlem yolu ile konulmalıdır (Giménez et al., 2010).

Hayvanın meme bezinde şekilsel bir bozukluk oluştuğunda ayırıcı tanı son derece önem kazanmaktadır. Öncelikle birden fazla meme lobunda şişlik şekillenen meme hiperplazisine benzer klinik belirtilere neden olan kistik meme displazisinden ayırt edilmelidir (Filgueira et al., 2012; Dalanezi et al., 2014). Ayrıca meme karsinomundan ayırt edilmesi, özellikle tedavi yöntemi ve prognozda belirgin bir fark olması sebebiyle çok önemlidir (Filgueira et al., 2015). Meme karsinomarından ayırmak amacıyla histopatolojik incelemeler yapılması gerekmektedir (Davidson, 2015).

Neden endojen olduğunda, meme bezi hiperplazisi ile uyumlu olarak hayvanlarda yüksek hormon seviyelerini kontrol etmek için serum progesteron ölçümleri yapılabilir (Giménez et al., 2010). Ancak, meme hiperplazisinin nedeni ekzojen hormon kullanımı sonucunda şekillendiğinde, bu tanı yönteminin sensivitesinin düşük olması nedeniyle serum progesteron seviyeleri düşük çıkabilmektedir (Payan-Carreıra, 2013). Meme dokusunun ultrasonografik muayenesinde fibroepitelyal doku normal dokuya göre daha fazla ekojenite vermektedir. Radyografik muayene meme hiperplazisinde kullanılmaz ancak ayırıcı tanıda neoplazilere bağlı şekillenebilecek metastaz olasılığını değerlendirmek için uygulanabilir (Payan-Carreıra, 2013). Meme hiperplazilerinde hayvanın öyküsünün ve klinik bulgularının tamamlamasının ardından kesin tanı koymak amacıyla biyopsi alınarak sitolojik muayene yapılabilir (Amorim et al., 2006). Histolojik muayenede normal meme bezine benzer ancak meme kanalları normal dokudan daha geniş ve stroma daha vaskülarize olarak görüntülenir (Hayden et al., 1983). Ayırıcı tanı, mastitis ve sıvı dolu büyük kistler içeren diğer meme displazisi formlarını; adenozis; erkeklerde jinekomasti; duktal ektazi ve lobüler hiperplaziyi de içermelidir (Vasconcellos, 2003).

Tedavi

Meme hiperplazisi tedavisi, altta yatan nedene bağlı olarak değişiklik göstermektedir. Dişi kedilerde siklusun tekrarlamaması ve progesteron etkisinin görülmemesi için ovariohisterektomi (OHE) yapılması gerekir. Bu operasyon median hattaki kan akışının artması nedeniyle sol lateral bölgeden yapılması önerilmektedir (Viana et al., 2012). Hasta kedi progesteron tedavisi görüyorsa ilk olarak hormon uygulamasına son verilmelidir.

Meme hiperplazisinin medikal tedavisinde, bir progesteron reseptör blokeri olan aglepristone kullanılmaktadır (Johnston et al., 2001; Nak et al., 2004; Keskin et al., 2008). Aglepristone progesteron reseptörlerine bağlanarak hormonun etkilerini bloke eden bir antiprogesteron ajanıdır. Bu ilaç aynı zamanda kedi ve köpeklerde gebeliğin sonlandırılmasının yanı sıra pyometra tedavisinde de başarılı şekilde kullanılmaktadır (Sontas et al., 2008; Enginler & Senünver, 2011; Gogny & Fieni, 2016). Çalışmalarda antiprogestinin beş ardışık gün boyunca 24 saatte aralıkla kullanıldığında herhangi bir yan etki şekillenmediği ayrıca ilk uygulamadan bir ay sonra meme bezlerinde involüsyon gözlendiği bildirilmektedir (Jurka & Max, 2009). Ayrıca, 1, 2, 7 ve 21. günlerde (10 ila 15 mg/kg/gün SC) uygulama seçeneği de mevcuttur ve bu prosedür ile altı hafta sonra tamamen gerileme görüldüğü ifade edilmektedir (Vitasek et al., 2006). Antiprogestinler oldukça pahalı ilcalar olması sebebiyle tedavi maliyetlerini yükseltmektedir.

Şiddetli eksojen progesteron kaynaklı hiperplazi vakalarında nüksün önlenmesi amacıyla memelerde tam involüsyonunu takiben OHE uygulanması sayesinde endojen progesteron kaynağı ortadan kaldırılmış olmakta ve hasta sahiplerinin östrus baskılamak amacıyla ekzojen

progesteron kullanımının da önüne geçilmiş olur (Wehrend et al., 2001; Munson, 2006). Endojen hiperplazi olgularında, birincil hormonal kaynağı ortadan kaldırmak için OHE endikedir. Hormonal uyarı kesildikten sonra bile meme involüsyonunun tam olarak gerçekleşmediği veya nüks şekillenen vakalarda mastektomi endikedir (Amorim et al., 2006).

Meme hiperplazisi tanısı konulan kedilerde, meme bezlerinin şişmesi, enfeksiyon ve nekroz şekillenmesi haline tedavi gerekebilir (Görlinger et al., 2002). Prognoz genellikle iyi olsa da kendiliğinden iyileşme görülme ihtimali düşüktür ve bu süreç haftalar hatta aylar sürebilmektedir (Loretti et al., 2004).

Tedavi protokolünün belirlenmesinin ardından, tedavinin maliyeti, iyileşme süresi ve hastalığın nüks oranları kedi sahiplerine iletilmelidir. Meme hiperplazisi şekillenen kedide mastitis, ülser, apse veya sistemik enfeksiyon şekillenmesi halinde hasta sahibi prognoz hakkında bilgilendirilmeli ve ardından tedaviye başlanmalıdır. Seçilen tedavi protokolüne ek olarak geniş spektrumlu antibiyotiler ve sıvı tedavisi uygulanabilir (Burstyn, 2010; Araújo et al., 2017). Kedilere ağrı semptomlarını hafifletmek için non-steroid antienflamatuar ilaçlar (NSAID) (meloksikam, ketoprofen veya karprofen gibi) kullanılabilir (Payan-Carreira, 2013).

Korunma

Kedilerde pubertas öncesi (ilk östrus siklusu şekillenmeden) OHE uygulanması durumunda meme hiperplazisi ve meme tümörleri gelişme riski %5 oranında azalmakta ve OHE korunmada başlıca alternatif olarak değerlendirilmektedir (De Nardı et al., 2016). Ayrıca, kedilerde östrusun baskılanması için ekzojen progestinlerin kullanımının engellenmesi korunmada önemli bir diğer adımdır (Oliveira, 2015; De Nardı et al., 2016).

Prognoz

Kedilerde meme bezi hiperplazisinin prognozu genellikle iyidir. Meme dokusunda ülserler, erozyonlar, apseler ve sistemik bulgular varsa prognoz temkinlidir. Mortalite oranları değişkendir ve sekonder komplikasyonlar ortaya çıkarsa ölüm meydana gelebilir. Ancak, sahibi hastayı ötenazi ile öldürmeyi tercih edebilir (Loretti, et al., 2004; Payan-Carrera, 2013; Pantoja et al., 2017). Ovariohisterektomiye yanıt vermeyen hastaların prognozu da temkinlidir, çünkü gerilememiş tümörleri çıkarmak için kullanılacak son protokol radikal bilateral mastektomidir (Macdougall, 2003; Loretti et al., 2005; Filgueira et al., 2008).

ÖZET

Bu çalışma, dişi köpeklerin tüm neoplazilerinin yaklaşık %50'sini oluşturan meme bezi tümörlerinin tedavi seçenekleri arasında yer alan kemoterapi uygulamaları hakkında bilgi vermek amacıyla hazırlanmıştır. Meme tümörlerinin görülme sıklığı 6-7 yaşından itibaren artmakla beraber en sık 10-11 yaş arasında karşılaşılmaktadır. German Shepherds, Dachshunds, Poodles, Cocker Spaniels, Terrier, Setter gibi bazı ırklarda predispozisyon bulunur. Meme tümörlerinin gelişimi yaş, ırk, hormonal etki, kısırlaştırma zamanı, obezite ve besleme gibi çeşitli faktörlerden etkilenmektedir. Meme bezi, alveoller ve kanallardan oluşan, bağ dokusu, damarlar ve sinirlerle çevrili, modifiye bir apokrin ter bezidir. Köpeklerin meme bezi, iyi huylu ve kötü huylu tümörlerin en yaygın görüldüğü dokudur. İyi huylu tümörler genellikle küçük, iyi sınırlı, palpasyonda serttir ve yavaş büyürler; kötü huylu tümörler ise lokal olarak invaziv, üstteki deriye veya derin dokulara sabitlenmiş, ülserleşmiş veya hemorajik olabilir ve genellikle hızlı büyürler. Yaygın metastaz yerleri bölgesel lenf düğümleri ve akciğerlerdir; ancak abdominal organlar, kemikler ve beyin de etkilenebilir. Köpeklerde görülen tümörlerin yaklaşık %40-50'si kötü huyludur. Genel olarak, meme bezi tümörlü tüm köpeklerde, gerektiğinde lenfadenektomi ile birlikte tümörün ve bitişik meme bezlerinin cerrahi eksizyonu endikedir. Bu teknik, lenfatik tutulum ve uzak metastaz olmayan veya daha az agresif histolojik tiplere sahip köpeklerde küratif olabilir. Ancak bölgesel lenf nodu metastazı, agresif histopatolojik tanı ile karakterize, metastaz veya nüks riski yüksek olan invaziv meme tümörlü dişi köpekler için adjuvan tedaviler açısından kemoterapi önerilmektedir. Kemoterapide kullanılan sitotoksik ilaçlar, etki biçimlerine göre genellikle altı sınıfa ayrılmaktadırlar (Alkali ajanlar, Antimetabolitler, Antitümör antibiyotikler, Mitotik İğ İnhibitörler, Glukokortikoidler, Çeşitli ajanlar). Alkali ajanlar, antitümör antibiyotikleri ve diğer ajanların bazıları DNA replikasyonuna bir noktada engel olur. Antimetabolitler enzim inhibitörleri ya da non fonksiyonel moleküllerin sentezi sayesinde DNA ya da RNA sentezini engellerler. Vinca alkoloidler antimitotiktir, mitotik eksende metafazı durdurarak etkiler. Kemoterapötikler çoğunlukla vücut yüzey alanına göre dozlanır. Anafilaksi, kusma ve ishal, anoreksi, miyelosupresyon, alopesi, kaşıntı ve kutanöz hiperpigmentasyon, nefrotoksisite, hematüri, nötropeni, anemi, lenfositopeni, immunsupresyon en sık karşılaşılan komplikasyonlar arasında yer almaktadır. Karboplatin, doksorubisin, dosetaksel, mitoksantron ve gemsitabin içeren kemoterapi protokolleri, meme neoplazmaları olan dişi köpekler için endikedir ve tek başına

veya siklofosfamid ve COX-2 inhibitörleri ile kombinasyon halinde kullanılabilir. Köpeklerde meme tümörlerinin tedavisinde etkili olduğu bildirilen kemoterapi protokolleri vardır. Fakat bu protokoller her hayvanda ya da her meme tümörü vakasında aynı başarıyı göstermemektedir. Kemoterapötik ilaçlar ciddi toksisiteye sahiptir bu nedenle kemoterapötik ilaçları, doğru dozu ve etkili kombinasyonları belirlemek tedavide kritik öneme sahiptir. Kemoterapötiklerin ortalama yaşam süresini ve hastalığın prognozunu nasıl etkilediği hala tartışmalıdır. Sonuç olarak; meme bezi tümörlü köpeklerde kemoterapinin etkinliği hakkındaki bilgiler sınırlı olduğundan kullanımına ilişkin kılavuzlar oluşturmak için daha derinlemesine çalışmalara ihtiyaç vardır.

Anahtar Kelimeler: Meme tümörü, Kemoterapi, Dişi köpek

CHEMOTHERAPEUTIC TREATMENT OF MAMMARY TUMORS IN BITCH

ABSTRACT

This study was prepared to provide information about chemotherapy applications among the treatment options for mammary gland tumors, which constitute approximately 50% of all neoplasms in female dogs. The incidence of mammary tumors increases from age 6-7, but they are most common between ages 10-11. Some breeds, such as German Shepherds, Dachshunds, Poodles, Cocker Spaniels, Terriers, and Setters, are predisposed. The development of mammary tumors is influenced by various factors, including age, breed, hormonal influences, spaying timing, obesity, and nutrition. The mammary gland is a modified apocrine sweat gland composed of alveoli and ducts, surrounded by connective tissue, vessels, and nerves. The canine mammary gland is the most common site of benign and malignant tumors. Benign tumors are generally small, well-defined, firm on palpation, and grow slowly; malignant tumors, on the other hand, are locally invasive, fixed to the overlying skin or deep tissues, may be ulcerated or hemorrhagic, and generally grow rapidly. Common sites of metastasis are regional lymph nodes and the lungs; however, abdominal organs, bones, and the brain may also be affected. Approximately 40-50% of tumors seen in dogs are malignant. In general, surgical excision of the tumor and adjacent mammary glands, with lymphadenectomy if necessary, is indicated for all dogs with mammary gland tumors. This technique can be curative in dogs without lymphatic involvement and distant metastases, or with less aggressive histological types. However, chemotherapy is recommended as adjuvant treatment for bitches with invasive mammary tumors characterized by regional lymph node metastasis, aggressive histopathological diagnosis, and a high risk of metastasis or recurrence. Cytotoxic drugs used in chemotherapy are generally classified into six classes based on their mode of action (alkaline agents, antimetabolites, antitumor antibiotics, mitotic spindle inhibitors, glucocorticoids, and miscellaneous agents). Alkali agents, antitumor antibiotics, and some other agents inhibit DNA replication at some point. Antimetabolites inhibit DNA or RNA synthesis by inhibiting enzymes or by synthesizing nonfunctional molecules. Vinca alkaloids are antimitotic, acting by arresting metaphase in the mitotic cycle. Chemotherapy drugs are mostly dosed according to body surface area. Anaphylaxis, vomiting and diarrhea, anorexia, myelosuppression, alopecia, pruritus and cutaneous hyperpigmentation, nephrotoxicity, hematuria, neutropenia, anemia, lymphocytopenia, and immunosuppression are among the most common complications. Chemotherapy protocols containing carboplatin, doxorubicin, docetaxel, mitoxantrone, and gemcitabine are indicated for bitches with mammary neoplasms and may be used alone or in combination with cyclophosphamide and COX-2 inhibitors. There are chemotherapy protocols reported to be effective in the treatment of mammary tumors in dogs. However, these protocols do not provide the same success in every animal or every case of mammary tumor. Chemotherapy drugs have serious toxicity; therefore, determining the correct dosage and effective combinations of chemotherapy drugs is critical in treatment. How chemotherapeutics affects average life expectancy and disease prognosis is still debated. In conclusion, since information on the effectiveness of chemotherapy in dogs with mammary gland tumors is limited, more in-depth studies are needed to develop guidelines for its use.

1. GİRİŞ

Meme bezi, alveolar dokular ve kan damarları, bağ dokusu ve sinirlerle çevrili süt kanallarıyla karakterize, modifiye bir apokrin ter bezidir. Köpeklerdeki meme bezleri torasik bölgelerden abdominal ve inguinal bölgelere kadar uzanan beş çift halinde ve on adettir (Rath ve ark. 2024). Üreme açısından aktif dişi köpeklerin yaşamları boyunca yeniden şekillenme ve farklılaşma geçiren benzersiz bir organdır. Her östrus döngüsünde, epitel ve mezenkimal proliferasyon, duktal dallanma ve alveoligenez dalgaları yoğun regresif değişikliklerle birlikte görülür. Meme bezlerindeki bu fizyolojik ve morfolojik değişiklikler, neoplaztik değişikliklere karşı oldukça hassastır (Sewoyo ve ark. 2023). Bu nedenle köpeklerin meme bezi, iyi huylu ve kötü huylu tümörlerin gelişiminin en yaygın görüldüğü dokudur (Benavente ve ark. 2016). Tümör gelişimi ve ilerlemesi, yaş, cinsiyet, beslenme durumu, üreme durumu ve çevresel uyaranlara maruz kalma gibi çeşitli faktörlerden etkilenir (Kaszak ve ark. 2022). Meme tümörleri, seksüel yönden aktif dişi köpeklerde yaygındır. Bazı ırklar; örn. German Shepherds, Dachshunds, Poodles, Cocker Spaniels, Terrier, Setter, bu tip meme tümörüne yakalanmaya diğerlerinden daha yatkındır. Bu da meme tümörlerinde genetik nedenlerin rol oynayabileceği anlamına gelmektedir (Torres ve ark. 2021, Sewoyo ve ark. 2023). Ayrıca meme tümörleri safkan köpeklerde (%62), karma ırklara (%38) göre daha sık görülmektedir (Vascellari ve ark., 2016). Dünya genelinde meme tümörleri, dişi köpekleri etkileyen toplam tümör tiplerinin yaklaşık %25-70' ini oluşturmaktadır ve bunların da yaklaşık %50'si kötü huyludur (Torres ve ark. 2021, Sewoyo ve ark. 2023). Beş yaşından küçük köpeklerde meme tümörü gelişimi nadirdir. Meme tümörlerinin görülme sıklığı 6-7 yaşından itibaren artmakla beraber en sık 10-11 yaş arasında karşılaşılmaktadır (Benavente ve ark. 2016). Makroskopik anormallikler fark edilene veya klinikte rutin bir klinik muayene sırasında tümör tespit edilene kadar, köpek sahipleri genellikle evcil hayvanlarında tümör olduğunun farkında değildir (Sewoyo ve ark. 2023).

2. ETİYOLOJİ

Meme tümörlerinin gelişimi yaş, ırk, hormonal etki, kısırlaştırma zamanı, obezite ve besleme gibi çeşitli faktörlerden etkilenmektedir (Franco ve ark. 2024).

Meme tümörlerinin çoğu orta yaşlı ve yaşlı köpeklerde görülürken, genç köpeklerde görülme sıklığı çok düşüktür. En yüksek görülme sıklığı 7-13 yaş arasındadır (Goldschmidt ve ark. 2016). Sorenmo ve ark. (2009) iyi huylu tümörlerin genç köpeklerde (ortalama 7-9 yaşta) görülürken, kötü huylu tümörlerin yaşlı köpeklerde (ortalama 9-11 yaşta) görüldüğünü belirtmektedir. Ancak, tümörlerin gelişeceği yaş, köpeğin cinsine ve boyutuna bağlı olmaktadır; çünkü büyük ırklarda meme tümörleri küçük ırklara göre daha genç yaşta gelişir. Hem progestin hem de östrojen gibi ekzojen hormonların kullanımı da meme tümörlerinin geliştiği yaşı azaltmaktadır (Goldschmidt ve ark. 2016).

Hem normal hem de neoplazik memelerde doku büyümesi östrojen, progesteron ve prolaktin hormonları ve büyüme faktörleri tarafından uyarılır (Cassali ve ark. 2014, de Araujo ve ark. 2015). Östrojen, meme epitelinin mitotik aktivitesini uyararak bu organda neoplazma riskini artırdığı için onkogenezde önemli bir rol oynar. Progesteron, miyometriyumun aktivitesini baskılayarak, endometriyal bezlerin büyümesini uyararak ve meme alveolar dokusunun gelişimini destekler (Rueda ve ark. 2024). Östrojenle birlikte olduğunda, proliferatif faktör nedeniyle meme neoplazmlarının gelişiminde önemli bir rol oynar. Prolaktinle birlikte olduğunda, östrojen reseptörlerinin sayısını artırarak bu hormonun mitotik etkisini kolaylaştırır (Misdorp 2002, Rueda ve ark. 2024). Köpeklere veya kedilere ekzojen progesteron uygulandığında, meme bezinde büyüme hormonu sentezi uyarılır, lobulo alveolar proliferasyon ve buna bağlı olarak miyoepitelyal ve salgı elemanlarının hiperplazisi meydana gelir ve bu da genç hayvanlarda iyi huylu nodüllerin oluşumuna neden olur. Meme dokuları, sürekli olarak progesterona maruz kaldığında kötü huylu metaplaziye uğrayabilir (Misdorp 2002, Rueda ve

ark. 2024). Çok sayıda çalışma, erken yaşta yapılan ovariektominin daha sonraki meme neoplazisi gelişimini önlemede koruyucu olduğu gösterilmiştir. İlk kızgınlık döngülerinden önce ovariektomi yapılan köpeklerde, meme neoplazmı geliştirme riski %99,5 oranında azalırken, ikinci ve üçüncü kızgınlık döngülerinden önce ovariektomi yapılırsa risk sırasıyla %92 ve %74 oranında azalmıştır; üçüncü döngüden sonra ovariektomi yapılırsa istatistiksel olarak anlamlı bir fayda sağlamamıştır (McNeill ve Vienna 2015, Goldschmidt ve ark. 2016). Progestinler ve östrojenler gibi ekzojen hormonlar köpeklerde meme tümörü geliştirme riskini artırır. Düşük doz progestinler iyi huylu neoplazmların gelişimini tetiklerken, progestin ve östrojen kombinasyonunun kötü huylu neoplazmların gelişimini tetiklediği görülmektedir (Goldschmidt ve ark. 2016).

Bazı çalışmalar, dişi köpeklerde obezite ile meme neoplazmlarının gelişimi arasında olası bir ilişki olduğunu göstermektedir (Cleary vd. 2010; Lim vd. 2015; Chandler vd. 2017). Bu neoplazmların gelişimindeki obezite, leptin ve adiponektin proteinlerinin etkileriyle ilişkili olabilir (Cleary vd. 2010). Leptin apoptozu inhibe eder ve hücre çoğalmasını uyarırken, adiponektin hücre çoğalmasını azaltır ve apoptozu destekler. Yağ dokusu tarafından üretilen bu maddelerin konsantrasyonları vücut ağırlığına göre değişir, bu nedenle kilo ve vücut kitle indeksi arttığında, serum leptin konsantrasyonları artar ve adiponektin azalır (Cleary vd. 2010; Lim vd. 2015). Obezite ayrıca, globuline bağlı seks hormonlarının serum konsantrasyonunda bir azalmayla da ilişkili olabilir ve bu da serum serbest östrojen konsantrasyonlarında bir artışa neden olabilir. Ayrıca, yağ dokusu, aromataz aracılı androjen dönüşümü yoluyla artan östrojen üretiminin bir kaynağı olabilir (De Nardi ve ark. 2016).

Birkaç gözlemsel çalışma, diyet ile meme neoplazisi geliştirme riski arasında bir korelasyon bulmuştur. Kırmızı et oranı yüksek bir diyetle beslenen ve 1 yaşında obez olan köpeklerin meme neoplazmı geliştirme riski artmıştır. Başka bir çalışma, 9-12 aylıkken zayıf olan köpeklerin meme neoplazmı geliştirme riskinin azaldığını bildirmiştir. Düşük yağlı, yüksek proteinli bir diyetle beslenen köpeklerde kötü huylu meme tümörlerinin çıkarılmasından sonra daha uzun hayatta kalma süreleri ile ilgili bir ilişki olduğu öne sürülmüştür (Goldschmidt ve ark. 2016).

3. TANI

Meme tümörü olan dişi köpeklerin çoğu, tanı anında klinik olarak sağlıklıdır ve nodüller rutin klinik muayene sırasında sahipleri veya veteriner hekimler tarafından tanımlanabilir (Cassali ve ark. 2011). Oliveira ve ark. (2021), kötü huylu meme tümörlü köpeklerin yaklaşık %25 ila %50'sinde tanı anında metastazlar bulunduğunu ifade etmiştir. Lezyonun başlangıç ve ilerleme zamanı, önceki tedavi ve üreme geçmişi ile ilgili bilgileri içeren anamnez alındıktan ve genel durumu belirlemek için tam bir fizik muayene yapıldıktan sonra köpek, nodülleri veya boyut, şekil veya kıvamdaki değişiklikleri belirlemek için meme zincirlerinin ve bölgesel lenf düğümlerinin palpasyonunu içeren, lezyonları makroskopik olarak tanımlayan özel bir meme bezi fizik muayenesinden geçmelidir (Cassali ve ark. 2014, Brissot ve Edery 2017). Meme bezi ve lenf düğümlerinin palpasyonundan sonra, nodüllerin ve lenf düğümlerinin ince iğne sitopatolojik incelemesi tanıda yardımcı olarak kullanılmalıdır (De Nardi ve ark. 2016). Beş santimetreden büyük, hızlı büyüyen, yapışık, geniş ülserasyon alanları olan ve lenf düğümlerine metastaz yapan nodüller en kötü prognozla ilişkilidir. Birden fazla nodülü olan memeler hem iyi huylu hem de kötü huylu olmak üzere farklı histolojik tipler gösterebilir, bu yönler prognozu etkilediği için dikkate alınmalıdır (Rueda ve ark. 2024). Köpek meme tümörlerinde en sondaki meme bezleri en sık etkilenir ve daha kranial bezlerde hastalık görülme sıklığı azalır. Küçük neoplazmaların (<1 cm çapında) iyi huylu olma olasılığı daha yüksekken, daha büyük neoplazmaların (>3-5 cm çapında) kötü huylu olma olasılığı daha yüksektir. Ancak tüm meme nodülleri, boyutlarına bakılmaksızın, iyi huylu ve kötü huylu tümörleri ayırt etmek için histolojik olarak değerlendirilmelidir. Meme neoplazmı olan çoğu köpek, herhangi bir sistemik

hastalık belirtisi göstermez. Tümörler metastaz yaparsa, köpek son aşamada kaşeksi ve solunum güçlüğü belirtileri gösterebilir. Meme bezlerinde elle hissedilebilen bir veya daha fazla kitle dışında, çoğu köpek genellikle sağlıklıdır (Goldschmidt ve ark. 2016).

Meme neoplazmı olan dişi köpeklerin klinik derecelendirilmesi, tedavi seçenekleri konusunda planlama yapılabilmesi ve prognozun belirlenebilmesi için yapılmalıdır (Rueda ve ark. 2024). Dünya Sağlık Örgütü (WHO), birincil tümörün (T) değerlendirilmesi, bölgesel lenf düğümlerinin (N) (aksiller ve yüzeyel inguinal) tutulumu ve uzak metastazların (M) belirlenmesi gibi değişkenleri içeren TNM sistemini önermektedir (Batschinski ve Tedardi 2016; De Nardi ve ark. 2016; Cassali ve ark. 2020). Bu sınıflandırma sisteminde, tümör ilerlemesine göre beş klinik evre tanımlar: Klinik evre I: T1, N0, M0; II: T2, N0, M0; III: T3, N0, M0; IV: Herhangi T, N1, M0; V: Herhangi T ve N, M1.

4. TEDAVİ

Köpek meme tümörlerinin (CMT) tedavisi cerrahi, radyoterapi, hormonal tedavi, kemoterapi, hedefe yönelik tedavi ve viroterapiyi içerir. Cerrahi, birçok CMT türü için ilk tedavi seçeneği olmaya devam etmektedir. Cerrahi eksizyon, bölgesel tümör kontrolü için en etkili yöntemdir ve genel sağkalımı artıran histolojik değerlendirmeye olanak sağlamaktadır. Lumpektomi, bölgesel mastektomi, basit mastektomi ve tek taraflı ve iki taraflı mastektomi kullanılan cerrahi teknikler arasındadır (Sleeckx ve ark. 2011).

Cerrahi türü, tümör boyutu ve konumu, bölgesel lenf düğümlerine olası yayılım, tümörün dokuya yapışması ve fiksasyonu ve toplam lezyon sayısı gibi belirli kriterlere göre seçilir. Lumpektomi veya nodülektomi, küçük (<0,5-1 cm), sert ve fiksasyona uğramamış iyi huylu nodüllerin çıkarılması için endikedir. Basit (tek) mastektomi, tek bir meme bezinin çıkarılması anlamına gelir ve meme bezinde merkezi bir konuma sahip ve alttaki dokulara veya üstteki deriye fiksasyon gösteren büyük lezyonlar için endikedir. Bölgesel mastektomi, ardışık bezlerde veya iki bez arasında lokalize olan büyük meme tümörlerinin çıkarılmasıdır. 1'den 5'e kadar meme bezlerinin bir ünite olarak çıkarılması, tek bir zincirdeki bezlerdeki birden fazla tümör için endike olan tek taraflı mastektomi ile gerçekleştirilir. Her iki zincirde de lokalize olan birden fazla tümörde iki taraflı mastektomi yapılır. Hastalığın daha düşük klinik evrelerine sahip, küçük, invaziv olmayan ve iyi yerleşmiş tümörleri olan köpekler ameliyatla tedavi edilir. Metastatik gelişime yatkınlığı olan daha yüksek dereceli tümörlere sahip dişi köpeklerde ek tedavi seçenekleri kullanılmalıdır (Nosalova ve ark. 2024).

Ameliyattan önce uzak metastazları tespit edilen köpeklerde ameliyat, köpeğin sağkalım süresini uzatmaz, ancak ülserli ve/veya ağrılı lezyonları olan hastaların yaşam kalitesini artırabilir (Cassali vd. 2020). Cerrahi tedavi tercih edilen tedavi yöntemi olsa da kemoterapi, nüksü ve metastaz oluşumunu önlemeye yardımcı olabilir ve ayrıca ameliyat edilemeyen tümörlerde ve hastanın uzak metastazları varsa da endikedir (Rueda ve ark. 2024). Mikropapiller karsinom, solid karsinom, karsinosarkom ve pleomorfik lobüler karsinom teşhisi konan dişi köpeklerde metastaz riski artmıştır ve bu vakalarda klinik evreden bağımsız olarak adjuvan kemoterapi önerilir. Lenf düğümlerinde veya akciğerlerde metastazı olan, klinik evre IV ve V olan hastalar her zaman kemoterapiden fayda görecektir (Cassali ve ark. 2011, Cassali ve ark. 2020).

KEMOTERAPİ

Kanser tedavisinde farmakolojik ajanların modern kullanımı ilk olarak 1940'ların ortalarında gerçekleştirilmiştir. Günümüzde klinik kullanımda 1955'te Ulusal Kanser Enstitüsü'nde kanser kemoterapisi için oluşturulan çerçeveden faydalanılmaktadır (Chabher ve Roberts 2005, DeVita 2008). Kemoterapi cerrahi müdahaleye ek olarak neoplaztik oluşumların tedavisinde

yaygın olarak kullanılmaktadır. Antikanser ilaç uygulamasının temel amacı hücre bölünmesi aşamalarına etki etmektir (Chun ve ark. 2007, Kıvrak ve Aydın 2017).

Kemoterapötiklerin anafilaksi, kusma ve ishal, anoreksi, miyelosupresyon, alopesi, kaşıntı ve kutanöz hiperpigmentasyon, nefrotoksisite, hematüri, nötropeni, anemi, lenfositopeni, immunsupresyon gibi ciddi yan etkileri vardır. Hastaları, kemoterapötik ajanları ve doğru dozu belirlemek bu yüzden kritik öneme sahiptir. Kemoterapötikler çoğunlukla vücut yüzey alanına göre dozlanır. Vücut yüzey alanı, vücut ağırlığına göre hazırlanan bir formülle hesaplanır (Chun ve ark. 2007, Kıvrak ve Aydın 2017). Vücut ağırlığının kilogram cinsinden değerini, vücut yüzey alanının metre kare cinsinden değerine göre hesaplanmış değerleri Tablo 1 de verilmiştir.

Tablo 1. Köpeklerde vücut yüzey alanı ile ağırlık arasındaki ilişki (Gustafson ve Page 2013).

Köpeklerde Kilo ile Vücut Yüzey Alanı Arasındaki İlişki					
kg	**m²**	**kg**	**m²**	**kg**	**m²**
3.0	0.210	20.0	0.744	48.0	1.334

19.0	0.719	46.0	1.297	80.0	1.882

Kemoterapide kullanılan sitotoksik ilaçlar, etki biçimlerine göre genellikle altı sınıfa ayrılmaktadırlar (Chun ve ark. 2007, Gustafson ve Page 2013):

1. Alkilleyici ajanlar; etkilerini DNA'ya kovalent bağlanarak gösterir ve sonuçta hücre bölünmesini durdurur ve programlı hücre ölümüne (apoptoz) yol açar.

Cyclophosphamide, Köpeklerde oral (PO) veya IV yolla bolus doz (250 mg/m²) olarak etkili bir şekilde uygulanır. Bazı protokollerde fraksiyonlu bir dozlama programı da kullanılır (doksorubisinden sonra 3 ila 4 ardışık gün boyunca 50 mg/m²)

Chlorambucil, Köpeklerde kronik oral doz, 1-2 hafta boyunca günde 3-6 mg/m² PO ile başlamalı ve rutin hematolojik tarama ve kanser kontrolüne göre gün aşırı 3-6 mg/m² PO'ya düşürülmelidir.

Lomustine, 3 haftada bir 70-80 mg/m² PO çoğunlukla tek başına veya çoklu ajan protokollerinde kullanılır.

Dacarbazine, tek başına bir ajan olarak, 3 haftada bir 800-1000 mg/m² IV infüzyon dozu olarak, diğer sitotoksiklerle birlikte kullanıldığında, 600 mg/m² IV dozu bildirilmektedir.

Melphalan, 10 ila 14 gün boyunca günlük 0,1 mg/kg PO başlangıç dozu, paraproteinemi kontrolü ve hematolojik taramaya göre günlük 0,05 mg/kg PO'ya düşürülmelidir. Köpekler için alternatif doz rejimleri de kullanılmıştır: 3 haftada bir 5 gün boyunca günlük 7 mg/m² PO veya 10 gün ara ile 10 gün boyunca günlük 2 mg/m² PO ve gerektiğinde tekrarlama şeklinde kullanılmaktadır.

2. Antitümör Antibiyotikler; çeşitli etki mekanizmalarına sahip klinik olarak yararlı bileşikler üreten antrasiklinler, mitomisinler ve aktinomisinler dahil olmak üzere mikrobiyal fermantasyondan elde edilen doğal ürünlerden oluşur. DNA ve RNA sentezini önleyerek etki göstermektedirler. Hücre bölünmesini önler ve bölünen hücrelerde apoptozu indükler.

Doxorubicin, geleneksel doz rejimleri, 15 kg'dan büyük köpeklerde 3 haftada bir 30 mg/m² yavaş IV bolus veya infüzyon (10 ila 30 dakika), 15 kg'dan küçük köpeklerde 1 mg/kg'dır.

Mitoxantrone, 3 haftada bir 5 ila 6 mg/m² IV yavaş bolus, DOX'un kümülatif seviyesine ulaşmış veya kardiyomiyopati belirtileri gösteren ve doksorubisin uygulamasıyla daha fazla hasar riski altında olan köpeklerde kalp koruyucu antrasiklin olarak kullanılır.

Aktinomisin D, köpeklerde çoklu ajan protokollerinde veya kalp anomalileri olan köpeklerde doksorubisin yerine kullanılır. Her 3 haftada bir 0,5 ila 0,75 mg/m² dozunda intravenöz olarak uygulanır.

3. Antimetabolitler; hücre büyümesi ve bölünmesi sırasında hücresel metabolitlerin kullanımını engelleyen maddelerden oluşur. Bu nedenle, bu maddeler genellikle normal metabolizma sürecinde ve kanser kemoterapötiklerinde, özellikle DNA replikasyonu ile ilişkili anabolik süreçlerde kullanılan bileşiklerin analoglarıdır.

Gemcitabine, Köpeklerde kullanılan doz rejimleri, protokoldeki diğer sitotoksik ilaçların kullanımına bağlı olarak, yüksek doz (4 hafta boyunca her hafta 20 ila 30 dakika boyunca 800 mg/m² IV) veya düşük doz (protokol başına haftada bir veya iki kez 25 ila 50 mg/m² IV) seçeneklerini içermektedir.

Methotrexate, 0,1 mg/kg dozunda PO, gün aşırı şeklinde uygulanabilmektedir. Daha az toksik ve daha güçlü diğer ajanların geliştirilmesiyle birlikte, geleneksel tedavi rejimlerinden çıkarılmış ve veteriner onkolojisinde nadiren kullanılmaktadır.

5-Fluorouracil, bildirilen doz haftada 150 mg/m² IV' dir. Köpeklere topikal ve lezyon içi olarak da uygulanabilir ancak etkinliği net değildir.

4. Antimikrotübül Ajanlar; veteriner hekimliğinde şu anda kullanılan antimikrotübül ajanlar, taksan veya vinka alkaloid sınıfına ait bileşiklerin yapısal olarak karmaşık ajanlarıdır. Bu ajanların etki mekanizması, hücre fonksiyonu ve bölünmesinde kritik rol oynayan mikrotübüllerin polimerizasyonu veya depolimerizasyonunu engellemeye dayanır.

Paklitaksel, köpeklerde veya kedilerde kullanımı sıklıkla tanımlanmamıştır. Bunun nedeni, antihistaminikler ve steroidlerle önemli bir ön tedavi gerekliliği ve ardından akut aşırı duyarlılık için sürekli izleme ile uzun süreli infüzyon gerekliliği olabilir. Yapılan çalışmalarda ön tedaviye rağmen aşırı duyarlılık sık görülmüş ve önemli kemik iliği toksisitesi gözlemlenmiştir, bu da köpeklerde daha ileri değerlendirme için önerilen dozun her 3 haftada bir 132 mg/m² dozunda yavaş IV infüzyon olduğu bildirilmektedir.

Docetaxel, köpekler ve kediler üzerinde araştırılmıştır. Aşırı duyarlılık reaksiyonlarını önlemek için, emilimi kolaylaştırıcı olarak siklosporin ile birlikte oral docetaxel uygulamak üzere bir strateji geliştirilmiştir. Doketakselin maksimum tolere edilen dozu, siklosporin (5 mg/kg PO) ile kombine edildiğinde, sırasıyla 2 ila 3 haftada bir 1,63 mg/kg ve 1,75 mg/kg PO (gavage ile) olarak belirtilmektedir.

Vinka alkaloidler, doğal olarak bulunan vinkristin (VCR) ve vinblastin (VBL) ile VBL'nin yarı sentetik türevi ve metaboliti olan vindesin (VDS) ve VBL'nin yarı sentetik türevi olan vinorelbin (VRL) içerir. *Vinkristin* dozu, köpekler ve kedilerde haftada 0,5 ila 0,75 mg/m² IV bolus olarak veya protokolde tanımlandığı şekilde uygulanır. Tüm vinka alkaloidler, doku dışı verildiklerinde doku tahriş edicidir, ancak doksorubisin kadar ciddi değildir. Enjeksiyon sırasında son derece dikkatli olunmalıdır. *Vinblastin*, tek başına veya diğer ajanlarla kombinasyon halinde, 1 ila 2 haftada bir 2,5 mg/m² IV veya 2 ila 3 haftada bir 3,0 ila 3,5 mg/m² IV olarak uygulanabilir.

5. Steroidler; Prednizon veya prednizolon, glukokortikoid reseptörü ile etkileşime girerek ve apoptozu indükleyerek hematopoietik kanser hücrelerinin ölümünü tetiklediği düşünülen bir kortikosteroiddir.

Prednizon, köpek ve kedilerde lenfoid maligniteler, mast hücreli tümörler ve beyin tümörlerinin tedavisinde yaygın olarak kullanılır. Köpeklere, lenfoma için çoklu ajan protokollerinin başlangıcında genellikle günde 2 mg/kg (veya 40 mg/m²) PO dozunda verilir ve 3 ila 4 hafta içinde ilacın kullanımı kesilir.

6. Çeşitli ajanlar; Platin içeren antitümör ajanların aktivitesi, bifonksiyonel lezyonlara ve iplikler arası veya iplik içi çapraz bağlara neden olan yer değiştirme reaksiyonları yoluyla DNA'ya kovalent bağlanma yoluyla gerçekleşir.

Cisplatin, 3 haftada bir diüretik ve antiemetiklerle birlikte 50 ila 70 mg/m² IV infüzyon şeklinde kullanılır.

Carboplatin, 3 haftada bir 10 ila 15 dakika boyunca 300 mg/m² IV, mide bulantısı/kusma insidansının azalması, nefrotoksisite olmaması ve uygulama kolaylığı nedeniyle sisplatine göre daha çok tercih edilir. Miyelosüpresyon, dozu sınırlayan toksisitedir. Köpeklerde osteosarkomun yanı sıra çeşitli sarkom ve karsinomların tedavisinde kullanılır (Chun ve ark. 2007, Gustafson ve Page 2013).

Köpek meme tümörlerinde farklı kemoterapötik ilaçlar ile yapılmış çalışmalar aşağıdaki tablolarda sunulmuştur.

Tablo 2. Köpeklerde meme bezi tümörlerinde kullanılan farklı adjuvan temelli hedefe yönelik tedavi türleri (Rath ve ark. 2024)

İlaçlar	**Hedef molekül tanımı / klinik sonuçlar / olası yan etkiler**	**Tür**	**Kaynak**
Doksorubisin (30 mg m^{-2} i.v. 3 haftada bir) + Dosetaksel (30 mg m^{-2} i.v.)	Evre II–III malign meme tümörlü 31 köpekte uygulanmıştır. Tedavi edilen grupta ortalama sağkalım süresi kontrol grubuna göre daha yüksektir.	Köpek	Simon, D., Schoenrock, D., Nolte, I., Baumgärtner, W., Barron, R., & Mischke, R. (2009). Cytologic examination of fine-needle aspirates from mammary gland tumors in the dog: diagnostic accuracy with comparison to

			histopathology and association with postoperative outcome. Veterinary Clinical Pathology, 38(4), 521-528.
Gemcitabin (800 mg m^{-2} i.v.)	Rekürrens, metastaz ve genel sağkalım üzerinde olumlu etki göstermiştir; hematolojik veya gastrointestinal toksisite gözlenmemiştir.	Köpek	Marconato, L., Lorenzo, R. M., Abramo, F., Ratto, A., & Zini, E. (2008). Adjuvant gemcitabine after surgical removal of aggressive malignant mammary tumours in dogs. Veterinary and Comparative Oncology, 6(2), 90-101.
5-Florourasil (150 mg m^{-2}) + Siklofosfamid (100 mg m^{-2} i.v.), haftada bir × 4 kür	Kombine adjuvan kemoterapi hastalıksız sağkalım ve sağkalımı anlamlı ölçüde uzatmıştır.	Köpek	Karayannopoulou, M., & Lafioniatis, S. (2016). Recent advances on canine mammary cancer chemotherapy: a review of studies from 2000 to date.Rev. Méd. Vét. 167, 192.
Gemcitabin (3 mg kg^{-1} 60 dk i.v.) + Karboplatin (10 mg kg^{-1} 20 dk i.v.), 21 gün aralıkla 3 kür	Güvenli ve iyi tolere edilmiştir; yalnızca geçici hematolojik / gastrointestinal yan etkiler görülmüştür.	Köpek	Israel, C. B., Maués, T., Ferreira, A. M. R., & Ferreira, M. D. L. G. (2021). Clinical and Laboratory Findings in Dogs Undergoing Adjuvant Chemotherapy with Gemcitabine/Carboplatin Combination for Mammary Neoplasia. World's Veterinary Journal, 11(2), 289-299.
Paklitaksel (132 mg m^{-2} i.v. 3 haftada bir)	Vakaların %25'inde kısmi yanıt alınmıştır; ciddi aşırı duyarlılık ve nötropeni bildirilmiştir.	Köpek	Poirier, V. J., Hershey, A. E., Burgess, K. E., Phillips, B., Turek, M. M., Forrest, L. J., ... & Vail, D. M. (2004). Efficacy and toxicity of paclitaxel (Taxol) for the treatment of canine malignant tumors. Journal of veterinary internal medicine, 18(2), 219-222.
Karboplatin (300 mg m^{-2} i.v.) + Siklofosfamid (12.5	Anemi, trombositopeni ve nötropeni gözlenmiştir.	Köpek	Machado, M. C., Yamamoto, P. A., Pippa, L. F., de Moraes, N. V., Neves,

mg m^{-2}/gün oral) 8 ay			F. M. F., Portela, R. D., ... & Estrela-Lima, A. (2022). Pharmacokinetics of carboplatin in combination with low-dose cyclophosphamide in female dogs with mammary carcinoma. Animals, 12(22), 3109.

İlaçlar	**Doz**	**Hasta Sayısı**	**Sonuçlar**	**Kaynak**
5-Fluorourasil ve siklofosfamid	150 mg/m² ve 100 mg/m²	16	Grup 1 (8 cerrahi): İlk 2 yıl içinde %71,4'ü metastazdan öldü. Grup 2 (8 cerrahi + kemoterapi): %100'ü 2 yıldan uzun yaşadı. Genel sağkalım süresinde anlamlı fark: 24 ay (Grup 2), 6 ay (Grup 1). Toksisite: Grup 2'de kemoterapiye bağlı geçici lökopeni.	Karayannopoulou, M.; Kaldrymidou, E.; Constantinidis, T.C.; Dessiris, A. Adjuvant Post-operative Chemotherapy in Bitches with Mammary Cancer. J. Vet. Med. Ser. A 2001, 48, 85–96.
Doksorubisin veya dosetaksel	30 mg/m² veya 30 mg/m²	31	Grup 1 (19 cerrahi): Sadece cerrahi yapılan hastalarda ortalama sağkalım 390 gün. Grup 2 (12 cerrahi + kemoterapi): Cerrahi + kemoterapi uygulananlarda 231 gün. Nüksüz interval, metastaz süresi ve genel sağkalım arasında anlamlı fark yok. Toksisite: Dosetakselde hafif alerjik deri reaksiyonları.	Simon, D.; Schoenrock, D.; Baumgärtner,W.; Nolte, I. Postoperative adjuvant treatment of invasive malignant mammary gland tumors in dogs with doxorubicin and docetaxel. J. Vet. Intern. Med. 2006, 20, 1184–1190.
Karboplatin ve piroksikam/firokoksib	300 mg/m², 0,3 mg/kg/gün veya 5 mg/kg/gün	29	Grup 1 (7 cerrahi): Yalnızca cerrahi yapılanlarda sağkalım 63 gün. Grup 2 (8 cerrahi + karboplatin): Cerrahi + kemoterapi yapılanlarda medyan sağkalıma ulaşılmadı. Grup 3 (5 cerrahi + karboplatin + piroksikam): Sağkalım 390 gün.	LaValle, G.E.; De Campos, C.B.; Bertagnolli, A.; Cassali, G.D. Canine malignant mammary gland neoplasms with advanced clinical staging treated with

			Grup 4 (9 cerrahi + karboplatin + firokoksib): Sağkalım 570 gün. Piroksikam ve firokoksib gruplarında medyan sağkalım artışı (390 ve 570 gün; yalnız cerrahi grubunda 63 gün). Toksisite: Grup 3'te piroksikama bağlı advers etki nedeniyle 1 ölüm.	carboplatin and cyclooxygenase inhibitors. In Vivo 2012, 26, 375–379.
Mitoksantron ve firokoksib	5,5 mg/m² ve 5 mg/kg/ gün	28	Grup 1 (13 cerrahi): Sadece cerrahi yapılanlarda sağkalım 12,7 ± 0,8 ay. Grup 2 (8 cerrahi + mitoksantron): Cerrahi + kemoterapi yapılanlarda sağkalım 16,5 ± 2,6 ay. Grup 3 (7 cerrahi + firokoksib): Cerrahi + kemoterapi + firokoksib yapılanlarda sağkalım 19,4 ± 2,1 ay.	Arenas, C.; Peña, L.; Granados-Soler, J.L.; Pérez-Alenza, M.D.; DVM, C.A.P.; Peña, D.E.L.; Dvm, J.L.G.-S.; Pérez-Alenza, D.M.D. Adjuvant therapy for highly malignant canine mammary tumours: Cox-2 inhibitor versus chemotherapy: A case–control prospective study. Vet. Rec. 2016, 179, 125.

Siklofosfamid ile 5-florourasil veya siklofosfamid ile mitoksantron ve vinkristin gibi çeşitli kemoterapötik ilaçların kombinasyonu, sağkalım süresini önemli ölçüde artırmıştır (Karayannopoulou ve ark. 2001, Clementeve ark. 2009). Karboplatin ve gemsitabin kombinasyonu ile tedavi edilen hastalarda %13'lük bir genel yanıt oranı bulunmuştur (Dominguez ve ark. 2009). Bu sitotoksik ilaç kombinasyonları yalnızca hafif yan etkilere (gastrointestinal veya hematolojik toksisite) neden olmuştur (Karayannopoulou ve ark. 2001, Clementeve ark. 2009, Dominguez ve ark. 2009). Gemcitabine tek başına, docetaxel ile doksorubisin kombinasyonu veya doksorubisin, siklofosfamid ve 5-florourasil kombinasyonunun tedavisi, genel sağkalım süresi ve metastaz süresinde anlamlı bir fark göstermemiştir (Simon ve ark. 2006, Marconato ve ark. 2008, Souza ve ark. 2009). Karboplatin, doksorubisin ve gemcitabine kullanan kemoterapi protokolleri, meme neoplazmaları olan dişi köpekler için endikedir ve tek başına veya siklofosfamid ve COX-2 inhibitörleri ile kombinasyon halinde kullanılabilir. Hem insan hem de veteriner hekimliğinde, selektif COX-2 inhibitörleri, diğer antitümör ilaçlarla ilişkili meme karsinomlarının tedavisinde kullanılmaktadır (Rueda ve ark. 2024).

CMT'lerin, özellikle de kötü huylu formlarının risk faktörlerinden biri, Siklooksijenaz-2 (COX-2) ekspresyonunun artmasıdır (Dore ve ark. 2003). Siklooksijenaz-2; büyüme faktörleri, inflamatuar uyarıcılar ve çeşitli onkogenler tarafından indüklenebilir. Cox-2, tümör anjiyogenezinin uyarılması, tümör apoptozunun azaltılması, invazyon ve metastazın ve tümörle ilişkili inflamasyonun artırılması da dahil olmak üzere karsinogenetik sürecin farklı adımlarında rol oynar (Souza ve ark. 2009). COX-2 inhibitörlerinin farklı köpek tümörlerinde

potansiyel bir tedavi olarak kullanımı tanımlanmıştır (Nosalova ve ark. 2024). COX-2'yi inhibe eden anti-inflamatuar ilaçlar iki gruba ayrılabilir: seçici olmayan ve seçici COX-2 inhibitörleri (Valdivia ve ark. 2021). Steroid olmayan anti-inflamatuar ilaçlar (NSAID'ler), etki mekanizmaları her iki COX izoenziminin blokajını içerdiğinden seçici olmayan gruba aittir. COX-1 inhibisyonundan kaynaklanan olumsuz etkilerden, özellikle gastrointestinal kanamadan kaçınmak için, "koksibler" adı verilen seçici COX-2 inhibitörleri tasarlanmıştır (Derry ve Loke 2000). Deneysel olarak hem seçici olmayan NSAID'lerin hem de seçici koksiblerin, apoptozu düzenleyerek, kanser hücresi büyümesini baskılayarak, proliferasyonu inhibe ederek ve hücrelerin metastatik potansiyelini azaltarak tümör oluşumunu engellediği bulunmuştur. NSAID'ler piroksikam ve meloksikam, CMT hücrelerinde in vitro hücre döngüsü durması, apoptoz ve göç baskılanmasını indükleyebilmiştir (Nosalova ve ark. 2024). İn vitro çalışmalar, bazı COX-2 inhibitörlerinin (piroksikam ve meloksikam) meme karsinomu da dahil olmak üzere farklı köpek kanseri hücre hatlarında hücre çoğalmasını engelleyebildiğini göstermiştir (Knottenbelt ve ark. 2006). Ek olarak, in vivo bir çalışma, piroksikam ile tedavi edilen inflamatuar meme karsinomu olan dişi köpeklerin, geleneksel kemoterapi ile tedavi edilenlere göre hastalık stabilitesinde iyileşme ve daha iyi sonuçlar elde ettiğini göstermiştir (De Mello Souza ve ark. 2009). Bir vaka-kontrol prospektif çalışma, firokoksibin kötü huylu CMT'li köpeklerde hastalıksız sağkalımı ve genel sağkalımı artırma yeteneğini göstermiştir (Arenas ve ark. 2016). Son zamanlarda, Brandi ve ark. (2023), firokoksibin CMT hücre hatlarında in vitro ve in vivo proapoptotik etkisini göstermişlerdir; bu nedenle, CMT'li köpekler için potansiyel bir neoadjuvan tedavi olarak kabul edilebileceğini ifade etmektedirler. İn vitro çalışmalar, bazı COX-2 inhibitörlerinin (piroksikam ve meloksikam) meme karsinomu da dahil olmak üzere farklı köpek kanseri hücre hatlarında hücre çoğalmasını engelleyebildiğini göstermiştir (Knottenbelt ve ark. 2006). Ek olarak, in vivo bir çalışma, piroksikam ile tedavi edilen inflamatuar meme karsinomu olan dişi köpeklerin, geleneksel kemoterapi ile tedavi edilenlere göre hastalık stabilitesinde iyileşme ve daha iyi sonuçlar elde ettiğini göstermiştir (De Mello Souza ve ark. 2009). Daha ileri çalışmalara ihtiyaç duyulmasına rağmen, COX-2 seçici inhibitörlerinin meme kanseri olan köpeklerde adjuvan tedavinin bir parçası olarak düşünülmesi gerektiği vurgulanmaktadır. Ayrıca son zamanlarda, dişi köpeklerde meme karsinomuna karşı terapötik etkinliklerini artırmak için konvansiyonel kemoterapi ile birlikte anti-anjiyogenetik stratejiler geliştirilmiştir. Bu antianjiyogenetik ilaçların temel amacı, karsinogenez sürecinde önemli bir rol oynayan vasküler endotelyal büyüme faktörlerini (VEGF) ve reseptörlerini hedeflemektir. Lee ve ark. (2019) tam kan hücrelerindeki VEGFR-2 reseptörlerini seçici olarak hedef alarak kanserli hücrelerin göçünü ve çoğalmasını azaltan yeni bir antianjiyojenik ilaç olan Rivoceranib'i geliştirmişlerdir.

5. SONUÇ

Köpeklerde meme tümörlerinin tedavisinde etkili olduğu bildirilen kemoterapi protokolleri vardır. Fakat bu protokoller her hayvanda ya da her meme tümörü vakasında aynı başarıyı göstermemektedir. Kemoterapötik ilaçlar ciddi toksisiteye sahiptir bu nedenle kemoterapötik ilaçları, doğru dozu ve etkili kombinasyonları belirlemek tedavide kritik öneme sahiptir. Kemoterapötiklerin ortalama yaşam süresini ve hastalığın prognozunu nasıl etkilediği hala tartışmalıdır. Köpeklerde kemoterapi protokollerini belirlemek için, meme karsinomu olan daha büyük köpek gruplarında farklı ilaç kombinasyonlarının daha fazla araştırılması gerekmektedir. Sonuç olarak; meme bezi tümörlü köpeklerde kemoterapinin etkinliği hakkındaki bilgiler hala tartışmalı olduğundan kullanımına ilişkin kılavuzlar oluşturmak için daha derinlemesine çalışmalara ihtiyaç vardır.

ORCID: 0000-0002-2657-9263

ÖZET

Halyomorpha halys (Stål, 1855) (Hemiptera: Pentatomidae), Doğu Asya kökenli istilacı bir bitki zararlısıdır (Göktürk, 2020). Türkiye'deki varlığı 2017 yılında İstanbul'da (Çerçi ve Koçak 2017) ve Artvin'de (Göktürk vd., 2018), 2020 yılında Kemalpaşa, Hopa, Arhavi (Artvin), Fındıklı, Ardeşen (Rize) ilçelerinde olmak üzere Trabzon, Giresun ve Ordu illerine kadar yayılmıştır (Göktürk ve Tozlu 2019). 2020 yılında İzmir'de de tespit edilen zararlı 2023 yılında Adana'da belirlenmiştir (Kalkan ve Satar, 2023). Ülkemizde başta fındık, daha sonra kivi, mısır, narenciye, fasulye, armut, biber, böğürtlen, domates, elma, frenk üzümü, süs bitkileri, şeftali, yaban mersini ve yabancı otlarda beslenmektedir (Kalkan ve Satar, 2023). Zararlı ile mücadelede Göktürk (2020), ışık tuzağı ve feromon etkinliğini araştırmıştır. İçerilerinde feromon bulunan tuzaklar ve ışık tuzakları Nisan-Ekim aylarında asılı kalmıştır. Kontrollerde bir ışık tuzağına 30.12 (0-85), feromon tuzağına ise 24.72 (1-69) erginin yakalandığı tespit edilmiştir. Araştırmanın yapıldığı 27 hafta boyunca bir feromon tuzağına toplam 618, bir ışık tuzağına da 753 adet ergin düşmüştür. Altanlar ve Tuncer (2023) ise zararlıya karşı feromon kaynağının saha etkinliğini, 3 farklı tuzak tipinin 3 farklı bitki ekositemindeki yakalama etkinliğini test etmişlerdir. 2021 yılında (Temmuz-Eylül) Artvin ilinde, Fındık, kivi ve mısır alanlarında yürütülen çalışmada funnel, bidon ve yapışkan tuzak olmak üzere 3 farklı tuzak tipi denenmiştir. Feromon kaynağının saha etkinliği kontrol tuzaklarla karşılaştırıldığında, yapışkan ve bidon tip tuzaklarda % 100, funnel tip tuzakta ise % 99,9 olarak belirlenmiştir. Mevsim boyunca en fazla *H. halys* funnel tip tuzakta yakalanmış, yakalanan böcek sayısı funnel, yapışkan ve bidon tip tuzakta 145,65±17,52 a, 99,1±10,82 b ve 96,95±8,18 b böcek/tuzak olarak saptanmıştır. Özdemir (2023), Sakarya'da farklı habitatlarda H. halys'in yerli yumurta parazitoitlerini ve bu türlerin etkinliklerini belirlemiştir. Toplanan yumurtaların genel parazitlenme oranı %7,5 olmasına rağmen, bu yumurtalardan başarılı bir şekilde yalnızca üç parazitoit çıkışı meydana gelmiştir. Parazitoidin Telenomus turesis (Walker) olduğu belirlenmiştir. Aşkın vd. (2022), entomopatojen fungusları içeren ticari preparatlar ile bitkisel ekstraktlı preparatları laboratuar koşullarında *H. halys* 'a karşı biyolojik etkinliklerini belirlemiştir. Ticari entomopatojenler içinde Nibortem 7.gün sonunda %72.2 etki göstererek zararlı üzerinde en etkili preparat olarak belirlenmiştir. Çalışmada kullanılan diğer preparatlardan Bio-Magic %55.6, Nostalgist %38.9 etki göstermiştir. Azadirachtin ise en etkili preparat olmuş olup; 5 ml dozda %94.4 etki sağlamıştır. Sonuç olarak zararlıya karşı mücadelede henüz tam bir entegre mücadele stratejisi oluşturulmamıştır. Bu çalışma ile *H. halys*'in etkinlik durumu ve mücadele yöntemlerini gözden geçirmek amaçlanmıştır.

Anahtar Kelimeler: *Halyomorpha halys*, İstilacı tür, Biyolojik mücadele

AN OVERVIEW OF THE DAMAGE AND CONTROL METHODS OF *Halyomorpha halys* (STÅL, 1855) (HEMIPTERA: PENTATOMIDAE)

ABSTRACT

Halyomorpha halys (Stål, 1855) (Hemiptera: Pentatomidae) is an invasive plant pest that is native to East Asia (Göktürk, 2020). It was first reported in Turkey in Istanbul in 2017 (Çerçi and Koçak, 2017) and in Artvin in 2018 (Göktürk et al., 2018). By 2020, it had spread to Kemalpaşa district in İzmir province, as well as to Hopa, Arhavi (Artvin), Fındıklı and Ardeşen districts in Rize province, reaching as far as Trabzon, Giresun and Ordu provinces (Göktürk and Tozlu, 2019). The pest was also detected in Izmir in 2020 and Adana in 2023 (Kalkan & Satar, 2023). In Turkey, *H. halys* primarily feeds on hazelnuts, followed by kiwis, corn, citrus fruits, beans, pears, peppers, blackberries, tomatoes, apples, currants, ornamental plants, peaches, blueberries and various weeds (Kalkan and Satar, 2023). In studies on its control, Göktürk (2020) investigated the effectiveness of light and pheromone traps. Traps containing pheromone and light traps were hung from April to October. During monitoring, an average of 30.12 (range 0–85) adults were captured in light traps and 24.72 (range 1–69) in pheromone traps. Over the 27-week study period, a total of 618 adults were captured per pheromone trap and 753 per light trap. Altanlar and Tuncer (2023) tested the field efficiency of pheromone sources and the trapping performance of three different trap types across three plant ecosystems. Conducted in Artvin Province between July and September 2021, the study took place in hazelnut, kiwi and corn fields and used funnel, bucket and sticky traps. Compared with control traps, the field efficiency of the pheromone sources was found to be 100% in the sticky and bucket traps and 99.9% in the funnel traps. Throughout the season, funnel traps caught the highest number of *H. halys* individuals, with mean captures per trap recorded as 145.65 ± 17.52 a, 99.1 ± 10.82 b and 96.95 ± 8.18 b for funnel, sticky and bucket traps respectively. Özdemir (2023) identified the native egg parasitoids of *H. halys* and evaluated their activity in various habitats in Sakarya. While the overall parasitism rate of the collected eggs was 7.5%, only three successful parasitoid emergence events were observed, all of which were identified as Telenomus turesis (Walker). Aşkın et al. (2022) evaluated the biological effectiveness of commercial entomopathogenic fungal preparations and plant-extract-based formulations against *H. halys* under laboratory conditions. Among the commercial entomopathogens, Nibortem demonstrated the greatest effectiveness, reaching 72.2% after seven days. The other products, Bio-Magic and Nostalgist, showed effectiveness rates of 55.6% and 38.9%, respectively. Azadirachtin was the most effective overall, providing 94.4% control at a dose of 5 ml. In conclusion, a fully integrated management strategy for *H. halys* has yet to be developed. The aim of this study is to review the current status and control methods of *H. halys*.

Keywords: *Halyomorpha halys*, Invasive species, Biological control

1. INTRODUCTION

With the expansion of global trade and the growing movement of people across regions, the transport of pets, livestock, nursery plants, and agricultural or forestry products has also increased. As a result, many species are now being moved beyond their native habitats (Skendzic et al., 2021). Species that manage to establish stable populations outside their natural distribution range are generally described as alien species (Göktürk, 2019). When these introduced organisms spread rapidly in the new environment and begin to cause noticeable economic damage, they are considered invasive (Dursun and Fent, 2022). Such invasive species can disrupt ecosystems by changing patterns of biological diversity and producing genetic effects that appear at the individual, population, or even community level.

The brown marmorated stink bug, *Halyomorpha halys* (Stål, 1855) (Hemiptera: Pentatomidae), is one of the most well-known invasive pest species. Its native range includes East Asia (China, Japan, Taiwan, and Korea), but since 1998 it has spread to many countries across Asia, Europe, and particularly the United States (Altanlar and Tuncer, 2023).

In Turkey, it was first detected in Istanbul in 2017 (Çerçi and Koçak, 2017) and in Artvin in the same year (Güncan and Gümüş, 2017). It has subsequently spread most intensively to the provinces of Trabzon, Giresun, and Ordu (Göktürk and Tozlu, 2019), and further west to Samsun (Özdemir and Tuncer, 2021), particularly in the distrincts of Kemalpaşa, Hopa, Arhavi (Artvin), and Fındıklı, Ardeşen (Rize). Although *H. halys* is present in the Central Black Sea Region, it has not yet been recorded in the provinces of Sinop and Kastamonu (Özdemir and Tuncer, 2021). The species has also been reported in Bursa in 2018 (Erdoğan, 2019), and in İzmir in the Aegean Region (Çerçi, 2021), as well as in Sakarya-Akyazı and Yalova (Ak et al., 2023). More recently, it was found in Adana in 2023 (Kalkan and Satar, 2023).

As with many other invasive species, this pest has begun to cause serious problems in both agricultural areas and human dwellings due to the absence of natural predators in the regions it has invaded. *H. halys* has become a major pest of both annual and perennial crops in the countries where it has become established. It is a polyphagous species capable of feeding on more than 300 plant species (Altanlar and Tuncer, 2023). Its broad host range, which includes important agricultural products such as kiwis, tomatoes, beans, corn, persimmons, and citrus fruits, poses a significant potential risk to many crops grown in Turkey. In the Black Sea Region, *H. halys* is a well-known major pest of hazelnuts, which are one of the region's key crops (Tuncer, 2019). Both adults and nymphs damage host plants by feeding on their sap. In addition, fruit feeding leads to lesions, depressions, deformities, and discolouration, while secretions released during feeding cause the fruit to develop a bitter taste and a hard texture (Aşkın et al., 2022).

1.2. Control Methods

1.2.1. Chemical Control

Numerous studies have been conducted on chemical control methods against this pest (Nielsen et al., 2008; Leskey et al., 2012; Luo et al., 2025). One of the first insecticide efficacy experiments on *H. halys* in the United States was carried out by Nielsen et al. (2008). In this study, an insecticide-treated glass vial bioassay (scintillation vial) was used, and the most effective insecticide group was identified as bifenthrin, a pyrethroid. Another effective insecticide was dinotefuran, which belongs to the neonicotinoid group. Details of the study and some of the other insecticides tested are presented in Table 1.

Table 1. Some chemical insecticides and their effects

Active Ingredient	Experimental Conditions	Results / Key Findings	Reference
Acetamiprid (neonikotinoid)	Laboratory studies; adults and residual (dry film) bioassays	The initial mortality rate was quite high (approximately 93%), but it decreased to around 10% after seven days. In this case, acetamiprid may be limited in terms of long-term effectiveness for controlling the pest.	Leskey et al. (2012)
Bifenthrin	Direct exposure on eggs, nymphs, and adults	Full mortality was achieved in adults within 24 hours. A rapid neurotoxic effect was observed, with the highest immediate mortality recorded among the pyrethroid group.	Cira et al. (2017)
Sulfoxaflor	Adult and nymph stages, post-exposure monitoring	Mortality was observed in adults 14 days after exposure. A reduction in feeding behavior was noted among the surviving adults.	Cira et al. (2017)
Spinosad	Adult and nymph	Full mortality was not observed.	Cira et al. (2025)
Fenpropathrin (pyrethroid)	Laboratory residue (dry film) tests; early instar nymphs	After 24 hours of exposure, mortality rates were determined as 83% in second instar nymphs, 52.8% in third instars, and 19.4% in fourth instars.	Luo et al. (2025)

1.2.2. Botanical-Based Control

The use of chemical insecticides is becoming less popular due to their accumulation in nature over time and their harmful effects on non-target organisms within ecosystems. For this reason, plant-based insecticides have become increasingly common in ecological agriculture (Popescu et al., 2024). Table 2 presents some of the plant-derived insecticides used to control *H. halys*.

Table 2. Some plant-based insecticides and their effects

Plant-based insecticide / active compound	Application method / environment	Target stage	Key findings	Reference
Azadirachtin (Neem), Pyrethrin, Kaolin, Oil-based organic products	Laboratory; dry film and contact test (4.5 hours)	Adult	Neem oil and some organic products reduced adult mobility and feeding; however, mortality rates were low. In groups treated with pyrethrins and pyrethrins + kaolin, mortality rates were higher	Lee et al.(2014)

			compared to the control group.	
Neem oil, Insecticidal soap, Pyrethrin	Laboratory; direct spray and dry surface test	Nympf, adult	Products containing pyrethrins were more effective (>80% mortality). Nymphs were more susceptible than adults.	Bergmann and Raupp (2014)
Essential oils (clove, lemongrass, turmeric, cinnamon, lavender)	Laboratory; Y-tube olfactometer (repellency test)	adult	Clove and turmeric oils have the strongest repellent effects. They are not directly lethal but act as deterrents.	Bulgarini et al. (2021)
Azadirachtin, orange oil, potassium salts of fatty acids, kaolin, basalt powder, diatomaceous earth (kieselguhr), zeolite, sulfur formulations, calcium polysulfide, and mixtures of sulfur with diatomaceous earth or zeolite.	Laboratory and field trials (conducted in pear orchards)	Nympf, adult	Neem and clove oils demonstrated up to 70% mortality in laboratory tests. Their effectiveness in the field was reduced due to UV exposure and temperature. Diatomaceous earth, when used alone or alternated with sulfur or calcium polysulfide, generally provided pest control levels comparable to field trials based primarily on neonicotinoids (acetamiprid).	Chierici et al. (2025)

According to the results presented in Table 2, products such as neem (azadirachtin), clove, and lemongrass oils primarily act as feeding deterrents. Although mortality rates in groups treated with these products were low to moderate, reductions in mobility and suppressed feeding behavior were clearly observed. Pyrethrins exhibited the highest lethal effect, achieving mortality rates of over 80% in both direct spray and dry film tests. When used in combination with kaolin, mortality rates increased significantly. Neem and clove oils were effective under laboratory conditions, achieving up to 70% mortality; however, their efficacy in the field was weak. This was due to the rapid degradation of the active ingredients by UV light.

1.2.3. Biological Control

Various studies are being conducted as part of a classical biological control program for *H. halys*. As a result of these studies, four species of egg parasitoids in the genus *Trissolcus* (Hymenoptera: Scelionidae) have been identified as potential biological control agents (Santacruz et al., 2017). Among these, *Trissolcus japonicus* (Ashmead) appears particularly promising due to its short development time (10.5 days at 25 °C), multiple generations per year, a female-biased sex ratio, and parasitism rates of 50–80% on *H. halys* within its natural Asian range (Yang et al., 2009). A second candidate species, *Trissolcus cultratus* (Mayr), is also being evaluated; however, its parasitism rates are lower than those of *T. japonicus* (Santacruz et al.,

2017). Mele et al. (2024) studied the life cycles of *T. japonicus* and *T. mitsukurii*. Their study concluded that *T. japonicus* has a longer lifespan than *T. mitsukurii* and exhibits higher net reproductive rates at 26 °C and 31 °C. However, *T. mitsukurii* demonstrates higher fitness at lower temperature ranges compared to *T. japonicus*.

Luo et al. (2025) investigated the residual effects of eight pesticides on *H. halys* and three parasitoid species: *Anastatus japonicus, T. japonicus, and T. cultratus*. The pesticides tested included fenpropathrin, acetamiprid, cyfluthrin, dinotefuran, abamectin, azadirachtin, rotenone and chlorantraniliprole. The study found that *A. japonicus* was the most resistant species, while *T. japonicus* was the most sensitive. Chlorantraniliprole exhibited the lowest overall toxicity. Fenpropathrin caused up to 80% mortality in early-instar nymphs. Azadirachtin and acetamiprid showed low toxicity to the parasitoids and are recommended as compatible options for integration into biological control programs.

Özdemir (2023) identified native parasitoid species from *H. halys* eggs collected in various habitats in Sakarya. The native egg parasitoid *Telenomus turesis* was recorded in Turkey for the first time. The overall parasitism rate of *T. turesis* on the eggs was 7.5%, with live parasitoids emerging from only three egg masses. Despite its low natural effectiveness, this species has the potential to be important in biological control programmes.

Entomopathogenic fungi are microorganisms that can infect, parasitise and kill arthropod pests (Bihal et al., 2023). Aşkın et al. (2022) investigated the biological efficacy of commercial entomopathogenic fungi and plant-based preparations against *H. halys* in a laboratory setting. The study found that Nibortem (Verticillium lecanii) was 72.2% effective on the 7^(th) day, while Bio-Magic (*Metarhizium anisopliae*) was 55.6% effective. Nostalgist BL (*Beauveria bassiana*) demonstrated 38.9% effectiveness. Parth et al. (2024) examined the efficacy of various strains on eggs and nymphs. The *Metarhizium brunneum* GT7 strain caused 100% mortality, while *B. bassiana* XG/2B induced 70–91.9% mortality in nymphs, with no effect on eggs. The lowest mortality was observed in groups treated with *Beauveria pseudobassiana* AWLB. Mortality was primarily detected in first-instar nymphs.

1.2.3.4. Examples of Other Control Methods

In integrated pest management, pheromone and light traps are commonly used. These traps are used for monitoring population density and for capturing large numbers of pests (Göktürk, 2020). Nielsen et al. (2013) reported that pentatomids were captured in black light traps, suggesting that these traps could be used as effective monitoring tools. In recent years, many studies have focused on trap design, colour, pheromone formulation, deployment strategy and capture mechanism. Ak et al. (2019) deployed pheromone traps in 2018 across 49 districts in the provinces of Samsun, Ordu, Giresun, Trabzon, Rize, and Artvin to determine the distribution of *H. halys* in the Eastern Black Sea Region. Göktürk (2020) monitored population density in kiwi orchards in Arhavi, Artvin, in 2019 using both pheromone and light traps. The study lasted 27 weeks, using four pheromone traps containing PHEROCON® pheromone and four light traps. Over the entire season, an average of 618 adults were caught per pheromone trap and 753 per light trap. By the end of the 27-week study, a total of 2,472 adults had been captured in the pheromone traps and 3,012 in the light traps. Altanlar and Tuncer (2023) evaluated the effectiveness of pheromone sources in controlling pests in three different crop areas using three trap types. In a study conducted in Artvin between July and September 2021, funnel, bucket and sticky traps were tested in hazelnut, kiwi and corn fields. Compared to control traps, the field effectiveness of the pheromone source was found to be 100% for sticky and bucket traps and 99.9% for funnel traps. Throughout the season, funnel traps captured the highest number of H. halys adults, with an average of 145.65 ± 17.52, 99.1 ± 10.82 and 96.95 ± 8.18 adults per trap for funnel, sticky and bucket traps, respectively.

Another important control approach focuses on the symbiotic relationship between H. halys and its gut bacteria. Laboratory and field studies have confirmed that this pest is sensitive to disruptions in its obligate symbiosis with gut bacteria, providing a foundation for the development of symbiont-targeted control strategies. In a study by Dho et al. (2025), egg surfaces were treated with a biocomplex containing copper, zinc, and citric acid. This complex effectively inhibited the acquisition of the endosymbiont Candidatus Pantoea carbekii by H. halys nymphs, leading to high nymph mortality under laboratory conditions. Based on these findings, anti-symbiont biocomplex applications were conducted in *H. halys*-infested hazelnut orchards in 2022 and 2023. To evaluate the product's effectiveness, *H. halys* egg masses were attached to cardboard tags and placed in different parts of the plant canopy, and the wetting rates according location were measured prior to application. Nymph mortality was monitored, and symbiont acquisition was quantified using qPCR. As a result, a significant reduction in damaged hazelnuts was observed in treated plots, confirming the efficacy of the symbiont-targeted control method in orchards.

A similar study by Prieto et al. (2025) was conducted in a hazelnut orchard in Northwestern Italy. In three years of field trials, *H. halys* population dynamics, the damage caused to harvested hazelnuts, and the effects of the anti-symbiont biocomplex on local entomofauna were assessed. In plots where the symbiont-targeted approach was applied, the control of *H. halys* populations and the level of damage to hazelnuts varied across years. The study used Dentamet®, a biocomplex containing zinc (Zn) and copper (Cu) salts with citric acid as a companion. The effects of the biocomplex were compared with lambda-cyhalothrin insecticide. While the insecticide consistently reduced non-target insect diversity in the field, the anti-symbiont biocomplex showed no such effect. The biocomplex applied to the eggs reduced symbiont acquisition in *H. hal*ys nymphs, thereby increasing mortality and demonstrating its effectiveness against the target pest. In local pentatomid species, the effect of the treatment varied by species: symbiont acquisition decreased and mortality increased in some species, while no significant effect was observed in others.

In conclusion, research on this pest indicates that a single control method is insufficient and that effective management requires the integration of multiple strategies. To develop an effective and sustainable integrated pest management strategy, chemical, biological, plant-based, and symbiont-targeted approaches need to be evaluated synergistically, supported by long-term field trials and regional adaptation studies. This integrated approach will help ensure environmental sustainability while reducing economic losses in agricultural production.

ÖZET

Tütün (*Nicotiana tabacum* L.) dünyada genel olarak gıda dışı kullanım amacıyla yaygın bir şekilde üretilmektedir. Tüm bitkilerde olduğu gibi tütünde de hibrit çeşitlerin verim ve kalite özellikleri daha üstün olmaktadır. Hibrit çeşitlerin tohumluğunun üretimi için bazı teknikler kullanılabilmektedir. Bu çalışmada sitoplazmik erkek kısır anne bireye, baba bireyden polen hasat yöntemiyle elde edilen ve farklı koşullarda saklanan polenler ile yapılan melezleme sonuçlarının paylaşılması amaçlanmıştır. Araştırma açık arazi şartlarında Tokat-Kazova ekolojisinde 2021-2022 yıllarında yürütülmüştür. Araştırmada KINAY hibrit tütün çeşidinin baba ebeveyni olan TT5 basma tütün hattı polen donörü olarak kullanılmıştır. Bu hattan anterler korollanın uzayıp şişkinleştiği ve antosiyanin birikiminin başladığı aşamada toplanmıştır. Anterler etüvde 35 °C'de 23 saatte kurutulmuştur. İnce bir elekle hafifçe sallanarak alınan polenler depolama sürecine alınmıştır. Elde edilen polenlerin stigma üzerindeki canlılıkları ve tohum oluşturma kabiliyetleri KINAY hibrit tütün çeşididin anne bireyi olan TT2 (BC_6F_1) basma tütün hattı kullanılarak belirlenmiştir. Elde edilen polenler +4 °C ve -20 °C'de ev tipi buzdolabında muhafaza edilmiştir. Polen hasat edildiği anda ve hasat edildikten bir yıl sonra melezleme işlemlerinde kullanılmıştır. Polenler hasat edildiği anda yapılan melezlemelerde kapsül başına elde edilen tohum miktarı 0,2135 g bulunmuştur. Bir yıl sonra yapılan melezlemelerde +4 °C'de depolanan polenden elde edilen kapsül başına tohum miktarı 0,1780 g iken -20 °C'de 0,2000 g olarak belirlenmiştir. Polen hasadı yapıldığı anda yapılan melezleme ile elde edilen tohum miktarına göre +4 °C'de bir yıl depolanan polenle yapılan melezleme sonucu elde edilen tohum miktarında %16,63, -20 °C'de bekletilenle yapılan melezleme sonucunda elde edilen tohum miktarında ise %6,32 azalma olduğu görülmüştür. Bir yıllık depolamada -20 °C'nin +4 °C'ye göre daha uygun bir depolama sıcaklığı olduğu ortaya çıkmıştır. Elde edilen tohumlardan fide üretilmiş ve herhangi bir fizyolojik bozukluk gözlemlenmemiştir. Her ne kadar taze polene göre depolanan polenlerle yapılan melezlemelerde tohum miktarında azalma olsa da polenin depolanarak uzun süreler kullanılabileceği ve hibrit tohumluk üretiminde çok önemli bir avantaj sağlayacağı görülmüştür. Ek olarak tütün ıslahında polenin hasat edilmesi, depolanması ve taşınması konularında yeni araştırmalar yürütülmesi gerekmektedir.

Anahtar Kelimeler: *Nicotiana tabacum* L., polen hasadı, polen depolama, melezleme, tohum miktarı

POLLEN HARVESTING AND STORAGE IN TOBACCO

ABSTRACT

Tobacco (Nicotiana tabacum L.) is widely cultivated worldwide for non-food purposes. As with all crops, hybrid varieties of tobacco exhibit superior yield and quality characteristics. Certain techniques can be used to produce seeds for hybrid varieties. This study aims to share the results of hybridization using pollen obtained from the male parent through pollen harvesting methods and stored under different conditions, applied to the cytoplasmic male sterile female parent. The research was carried out in open field conditions in the Tokat-Kazova ecology in 2021-2022. The TT5 basma tobacco line, which is the paternal parent of the KINAY hybrid tobacco variety, was used as the pollen donor in the study. Anthers were collected from this line at the stage when the corolla elongated and swelled and anthocyanin accumulation began. The anthers were dried in an oven at 35 °C for 23 hours. The pollen was gently shaken through a fine sieve and stored. The viability of the pollen on the stigma and its seed-forming ability were determined using the TT2 (BC_6F_1) basma tobacco line, which is the maternal parent of the KINAY hybrid tobacco variety. The pollen obtained was stored in a household refrigerator at +4 °C and -20 °C. The pollen was used in hybridization procedures immediately after harvest and one year after harvest. The amount of seed obtained per capsule in the hybridizations performed at the time of pollen harvest was found to be 0.2135 g. In the hybridizations performed one year later, the amount of seed obtained per capsule from pollen stored at +4 °C was determined to be 0.1780 g, while that from pollen stored at -20 °C was 0.2000 g. Compared to the seed quantity obtained from the hybridization performed at the time of pollen harvest, a 16.63% decrease in seed quantity was observed in the hybridization performed with pollen stored at +4 °C for one year, and a 6.32% decrease was observed in the hybridization performed with pollen stored at -20 °C. It was found that -20 °C is a more suitable storage temperature than +4 °C for one-year storage. Seedlings were produced from the seeds obtained, and no physiological abnormalities were observed. Although there was a decrease in seed quantity in crossbreeding with stored pollen compared to fresh pollen, it was seen that pollen can be stored and used for long periods and provides a significant advantage in hybrid seed production. Additionally, new research is needed on the harvesting, storage, and transportation of pollen in tobacco breeding.

Keywords: *Nicotiana tabacum* L., pollen harvesting, pollen storage, hybridization, seed quantity

1. INTRODUCTION

Tobacco (*Nicotiana tabacum* L.) is one of the most widely cultivated non-food crops in the world. In 2023, 6.02 million tons of tobacco were produced on 3.2 million hectares worldwide, with a yield of 186 kg per hectare (Anonymous, 2025a). In Turkey, 94,000 tons of tobacco were produced on 96,000 hectares in 2024, with a yield of 97 kg per decare (Anonymous, 2025b). Virginia, Burley, and Maryland varieties account for approximately 89% of global tobacco production (Anonymous, 2024). In contrast, Oriental tobacco varieties represent only 4% of the world market (Filiposki et al., 2010). Turkey dominates the Oriental tobacco market with a 60% global share (Gay, 2020). Oriental tobaccos are considered the most distinct market type because they have undergone over 300 years of evolution and selection (Wolf and Wolf 1948; Moon et al. 2009). Isolation, stressful environments, and specific agricultural conditions have led to the formation of a genetic pool distinct from Virginia and Burley tobaccos (Davalieva et al. 2010; Fricano et al. 2012). Considering all these factors, oriental tobacco occupies a unique position compared to other market types.

The deliberate transfer of pollen from one plant to the stigma of another plant is called hybridization. It is known that the Babylonians and Assyrians did this on date palms. These civilizations did this without knowing the scientific truth underlying pollination and fertilization. These ancient efforts were not aimed at creating variation; they were primarily aimed at fertilization for fruit production. Science-based artificial pollination began after Camerarius discovered sex in plants and Koelreuter's subsequent work (Acquaah, 2012). It is a model plant used in many tobacco plant breeding methods. Variety development studies in tobacco plants began in the United States in 1903 (Shamel and Cobey, 1907). It is known that variety development continued in areas such as yield, quality, aroma, and taste following these studies. In Turkey, various institutions have made efforts to develop disease-resistant tobacco varieties between 1975 and 1997. These efforts resulted in the development of disease-resistant tobacco varieties such as İzmir-Özbaş, Akhisar-97, Ege-97, Otan-97, Usturalı-97, and Trakya-Özbaş for different production regions (Peksüslü, 1998). A series of studies have been conducted in Turkey on hybridization in tobacco and the hybrids obtained (Kara, 1993; Çamaş, 1998; Kinay, 2014; Kinay and Yılmaz, 2016; Kinay et al., 2019; Kinay et al., 2020; Kinay, 2020; Kinay and Kurt, 2022). Most of these studies have not reached the hybrid variety registration stage. However, the hybrid tobacco variety named KINAY was registered in 2021 and is currently the only hybrid tobacco variety among the 42 tobacco registration records in the National Variety List (Anonymous, 2025c).

Virginia and Burley type tobacco was produced in limited quantities in Turkey (TADB, 2025). However, in November 2020, the “LAW ON CERTAIN REGULATIONS IN THE FIELDS OF FOOD, AGRICULTURE, AND FORESTRY” was published in the Official Gazette No. 31294. Article 12 of this law adds the following to Article 6 of Law No. 4733: "Tobacco product manufacturers shall, within a calendar year, for the purpose of supplying the domestic market, produce and import; cigarettes, hookah tobacco products, shredded tobacco products for rolling, and pipe tobacco products must be at least thirty percent domestically produced tobacco per category. The President is authorized to increase this ratio up to forty-five percent" (Anonymous, 2025d). With this regulation, the production of Virginia and Burley type tobacco is increasing in Turkey. This is because the majority of imports in this chapter are these types of tobacco. It is necessary to reduce tobacco imports and produce this raw material with local resources. There is a need for domestic tobacco varieties of similar quality to the types to be produced. The varieties named EGE BRL and EGE VRG were registered in 2023 and included in the National Variety List. However, it is not known how much area these varieties are actually produced in.

For commercial hybrid seed production, the parent plants must be male sterile. Once this precondition is achieved, the other stages of hybrid seed production can be carried out on large fields. In hybrid seed production, in addition to agricultural principles (environmental requirements, land needs, and isolation distance), issues such as stigma receptivity, pollen viability, pollination control, and flowering synchronization must be carefully addressed (Chakrabarty et al., 2023). The aim of this study is to determine the conditions for obtaining and storing pollen to be used in commercial seed production in both Oriental type and Virginia and Burley type tobacco hybrids.

2. MATERIAL and METHOD

The research was carried out in open field conditions in the Tokat-Kazova ecology during 2021-2022. The TT5 basma tobacco line, which is the paternal parent of the KINAY hybrid tobacco variety, was used as the pollen donor, and the TT2 (BC_6F_1) line was used as the maternal parent. Seedlings obtained from these lines and seedlings obtained from seeds obtained from subsequent crossbreeding were grown in a foam viol in a peat environment using a float system. The plants were supplied with a nutrient mixture containing 100 ppm nitrogen (N), phosphorus (P), and potassium (K) and 0.4% microelements at a rate of 35 g/ton via the float system (Karakoç, 2021; Kurt et al., 2023). To obtain healthy and mature seedlings, the seedlings were pruned twice (Ekren and İlker 2017). The flowers of the TT5 line were collected at the stage when the anthers elongated and swelled and anthocyanin accumulation began (Figure 1a).

Figure 1. Pollen harvest from the TT5 tobacco line; **(a)** stage of flower collection, **(b)** opening of the corolla and separation of the anthers, **(c)** anthers placed on the drying tray, **(d)** dried anthers, **(e)** pollen before storage.

The collected flowers were brought to the laboratory. The corolla of the flowers was carefully opened and the anthers were separated from the filament (Figure 1 b). The anthers were collected and spread in a thin layer on a tray lined with drying paper (Figure 1 c). This tray was placed in an MMM Medcenter ECOCELL™ oven. The drying conditions were set at 35 °C for 23 hours. After drying, the tray was removed from the oven (Figure 1 d). The drying paper was carefully collected, placed on a sieve, and sifted (Figure 1 e). The sifted pollen was collected in Eppendorf tubes and labeled with the date of collection. These pollen grains were stored in a household refrigerator at +4 °C and -20 °C. The stored pollen grains were removed from the refrigerator one year later and used in cross-pollination experiments (Figure 2). The tips of the corollas of the flowers of the TT2 tobacco line that reached the hybridization stage were gently

removed (Figure 2a). The pollen stored in Eppendorf tubes was applied to the stigma of these flowers using a hair brush (Figure 2b). Hybridizations were performed in 20 capsules each.

Figure 2. Crossbreeding in the TT2 tobacco line; **(a)** removal of the tip of the corolla from the flowers, **(b)** transferring pollen from the Eppendorf tube to the stigma using a hair brush, **(c)** capsules harvested after crossbreeding, **(d)** hybrid seeds obtained.

After cross-pollination, the corollas were isolated using a pipette of appropriate size with one end closed to prevent possible contamination. Once capsule formation began in the plants and the stigma dried, the pipette was removed from the plant to avoid damaging the development. These capsules were marked at the beginning of formation. The capsules that reached the harvest stage were harvested separately (Figure 2c). These capsules were carefully and manually sorted (Figure 2d). The sorted seeds were placed in paper bags and stored in a seed cabinet.

3. RESULTS and DISCUSSION

This study was conducted to make the hybridization process more practical in hybrid tobacco seed production. The recommended hybridization method for tobacco plants is intended for small-scale seed production for R&D purposes (Wernsman and Matzinger, 1980). This method cannot be applied commercially in hybrid tobacco seed production. If applied, the resulting seed would be very costly. For this reason, pollen must be collected, stored, and used in the hybridization process in a practical manner. This will reduce costs in hybrid seed production.

In this study, the TT5 line was used as a pollen donor, and the pollen obtained was crossed with the TT2 (BC_6F_1) maternal line to produce seeds. Pollen stored in a refrigerator at +4 °C and -20 °C for one year was used in the crossbreeding process. During these processes, crossbreeding was also performed with harvested fresh pollen to serve as a control. The amount of seed per capsule obtained after the crossbreeding process was as follows:

(1) Crossing with fresh pollen; 0.2135 g/capsule

(2) Crossbreeding using pollen stored at +4 °C for one year; 0.1780 g/capsule

(3) Crossbreeding using pollen stored at -20 °C for one year; 0.2000 g/capsule was obtained.

When these seed quantities were examined, it was observed that the seed quantity obtained from cross-pollination using pollen stored at +4 °C for one year decreased by 16.63% compared to the seed quantity obtained from cross-pollination using pollen harvested at the time of pollination, while the seed quantity obtained from cross-pollination using pollen stored at -20 °C decreased by 6.32%. It was found that -20 °C is a more suitable storage temperature than +4 °C for one-year storage. Some previous studies have examined the storage responses of tobacco pollen. Dean (1965) stored pollen at 0°C and below 5% relative humidity for 130 weeks and observed 40% in vitro germination. Jensen (1964) stored tobacco pollen under vacuum at

5°C for 716 days and obtained seeds through hybridization. Gwynn and Main (1967) found that tobacco pollen could withstand the effects of freeze-drying, but its viability was zero after 71 days of storage in a laboratory environment. At the same time, similar pollen stored at -18°C maintained high levels of viability for up to 388 days. A study on the storage of tobacco pollen was initiated in 1969 with the aim of developing a storage method whereby pollen could be (a) easily prepared for storage, (b) kept viable for long periods, and (c) preserved with minimum expense or effort. Two years later, all methods produced viable and functional pollen, but the germination abilities of the pollen differed (Gwynn, 1972). Gwynn presented the results of viability tests conducted after seven and a half years of storage on the remaining original pollen samples from the research he initiated in 1969, which had been stored under original conditions. Gwynn (1978) preserved pollen for 90 months using four different methods. When he used pollen stored at low temperatures for 90 months in hybridizations, he observed seed formation. He produced seedlings from these seeds and observed no abnormalities. In the studies mentioned, only Jensen (1964) and Gwynn (1978) tested the pollen they stored on the stigma and observed seed formation. Other studies have examined pollen viability in vitro. Pollen viability is not always related to in vitro germination, because pollen that has lost its germination ability may retain its ability to metabolize (Engelmann and Takagi 2000). This may be related to the unique environment on the stigma for pollen germination being superior to the in vitro germination environment. For this reason, no pollen viability test was performed in our study, and crossings were only performed to evaluate seed development. We produced seedlings from the seeds we obtained and did not observe any abnormal seedling formation, as mentioned by Gwynn (1978). Consequently, pollen with moisture content reduced to a level that will not cause any adverse effects at the low temperature at which it will be stored can be kept at -20 °C in a household refrigerator.

4. CONCLUSION

Turkey maintains its leading position in the production of oriental tobacco. Furthermore, it is anticipated that the production of Virginia and Burley tobacco will increase due to regulatory changes. It is known that 40 oriental, one Virginia, and one Burley tobacco varieties are registered in the national variety list. Among these varieties, only the KINAY variety is a hybrid. Hybrid varieties are known to be more productive and of higher quality than non-hybrid varieties. Virginia and Burley tobacco are planted less frequently than oriental tobacco. To maintain stable productivity and quality in tobacco production areas and prevent variety confusion, the use of hybrid varieties in all areas may be considered. Using the method we have described, hybrid tobacco seed production can be carried out for both Virginia and Burley as well as oriental type tobacco. Furthermore, by planting only male sterile mothers in seed production areas, time and resources can be saved and costs reduced. Finally, in this type of production, the preservation of the father variety is facilitated, contributing to the rights of breeders.

AI-ENHANCED SOLAR-POWERED WATER PUMPING SYSTEM FOR SUSTAINABLE IRRIGATION IN RURAL WEST BENGAL

Biswarup Mukherjee

Brainware University, Kolkata, West Bengal, India

Email: bsm.cse@brainwareuniversity.ac.in

ABSTRACT

Agriculture in rural India struggles with unreliable irrigation, rising fossil fuel costs, and environmental degradation caused by diesel-dependent pumps. This paper delineates the design, deployment, and anticipated outcomes of an AI-enhanced solar-powered water pumping system implemented in Faldi village, Barasat, Kolkata. The system supplants inefficient diesel pumps with renewable solar energy augmented by artificial intelligence for intelligent control, ensuring optimal water distribution across 50 acres of farmland. Core elements encompass photovoltaic panels (3 kWp capacity), a submersible pump, storage reservoirs, distribution conduits, and an AI-driven controller utilizing machine learning algorithms for predictive irrigation scheduling based on real-time soil moisture, weather forecasts, and crop needs. The methodology encompasses site assessment, bespoke system engineering, community-centric installation, and skill enhancement workshops for 50 local farmers. Foreseen results project a 25% uplift in crop yields, 80% diminution in operational expenditures, and yearly CO_2 emission reductions of 5 tons. Comparative scrutiny with analogous Indian deployments underscores scalability and endurance. This innovation not only amplifies agricultural output but also galvanizes rural stakeholders toward autonomous integration of AI and renewables, aligning with imperatives for ecological and economic resilience.

Keywords: Solar-powered irrigation, AI-based control, renewable energy, rural development, sustainable agriculture, smart water management

INTRODUCTION

Agriculture remains the cornerstone of India's economy, contributing approximately 18% to the gross domestic product (GDP) in FY24 and employing about 46% of the workforce [1]. Despite this pivotal role, the sector is increasingly vulnerable to water scarcity and inefficient irrigation practices, particularly in the eastern Indo-Gangetic plains of West Bengal, where groundwater extraction relies heavily on diesel-powered pumps due to limited access to subsidized electricity [2]. In rural settings like Faldi village, Barasat (Kolkata-700125), smallholder farmers face high operational costs from diesel pumps, compounded by emissions that intensify climate risks and operational unreliability during dry seasons [2].

Such inefficiencies result in substantial crop yield reductions, with groundwater depletion trends projecting up to a 20% nationwide decline in cropping intensity and even higher losses (up to 68%) in stressed regions, exacerbating food insecurity and economic instability [3]. While solar-powered irrigation systems have emerged as a viable alternative to mitigate fossil fuel dependency, their integration with artificial intelligence (AI) for predictive control remains underexplored in resource-constrained rural contexts, representing a critical gap in achieving precision agriculture at scale [4].

Related Work

Prior studies have underscored the economic and environmental burdens of diesel-dependent irrigation in India. For instance, research on pump preferences in West Bengal highlights the high operational costs of diesel sets, which dominate groundwater extraction and contribute to escalating farmer expenses amid volatile fuel prices [2]. Complementary analyses reveal that modifications to diesel pumps can improve fuel efficiency by up to 50%, yet adoption remains low due to upfront costs and maintenance challenges [5]. On the sustainability front, projections from hydrological models indicate that unchecked groundwater depletion could curtail cropping intensity by 20% nationally and up to 68% in overexploited aquifers, necessitating urgent shifts to renewable alternatives [3].

Recent advancements in solar irrigation have shown promise, with deployments in arid regions reducing reliance on fossil fuels and extending cultivable land [6]. However, the infusion of AI for optimization—such as machine learning-driven scheduling based on soil and weather data—is nascent, with systematic reviews emphasizing its potential for water savings (15-30%) but noting sparse field trials in rural India [7]. Emerging works on AI-solar hybrids, including IoT-enabled predictive models, demonstrate yield improvements of 20-25% in pilot settings, yet scalability in low-literacy contexts like West Bengal remains a barrier [8]. This study builds on these foundations by deploying an integrated AI-solar system tailored to local needs, addressing gaps in community-driven implementation and long-term monitoring.

This study addresses these challenges through the design and deployment of an AI-enhanced solar-powered water pumping system in Faldi village, led by a multidisciplinary team from Brainware University. Informed by participatory assessments with local stakeholders, the intervention targets reliable irrigation for 50 acres of farmland, leveraging machine learning for optimized water scheduling based on real-time environmental data. The primary objectives are: (1) to ensure consistent water supply, reducing intermittency; (2) to achieve at least 80% reduction in operational costs; (3) to enhance crop yields by 20-30%; (4) to facilitate adoption of integrated renewable-AI technologies; and (5) to build local capacity for system maintenance and scaling.

The remainder of this paper is organized as follows: Section II details the methodology, including system design and implementation; Section III presents results and analysis with

comparative insights; and Section IV concludes with implications for broader rural sustainability initiatives.

Methodology

The methodology employed a structured, participatory approach to ensure the project's alignment with local needs, technical feasibility, and long-term sustainability. This involved iterative phases encompassing site assessment, system engineering, procurement, installation, capacity building, and ongoing monitoring. The overall project workflow is illustrated in Fig. 1, which outlines the sequential and interdependent stages from initiation to evaluation.

A. Site Selection

Site selection was conducted through a comprehensive technical survey to evaluate key parameters, including average solar insolation (5.5 kWh/m²/day), proximity to groundwater sources (<100 m), and accessibility for maintenance. Priority was given to south-facing, unshaded locations adjacent to agricultural fields to minimize pipeline losses (<5% water dissipation). Community consultations with 30 farmers and the local Gram Panchayat were integral to the process, resulting in the selection of a 500 m² site bordering the village pond for optimal integration.

B. System Design

Water requirements were estimated at 50,000 L/day to irrigate 50 acres, based on crop evapotranspiration rates (4–6 mm/day for predominant crops such as paddy and vegetables). The system architecture, depicted in the class diagram of Fig. 2, integrates hardware and software components for efficient operation and community management. Key elements include:

- Solar photovoltaic (PV) array: 3 kWp polycrystalline modules comprising 12 panels (250 W each).
- Submersible pump: 1 HP AC motor delivering 100 m³/h at a 20 m head.
- Storage reservoirs: 10,000 L elevated tanks equipped with solenoid valves for automated control.
- Distribution network: 2 km of high-density polyethylene (HDPE) pipelines (50 mm diameter) extending to fields.
- AI controller: A Raspberry Pi-based unit implementing a random forest machine learning model, trained on historical datasets from the Indian Council of Agricultural Research (ICAR) repositories. This module enables predictive irrigation scheduling using IoT sensors (e.g., soil moisture probes and anemometers) and API-integrated weather forecasts. The AI achieves 15–20% optimization in water flux, preventing over-irrigation and yielding 10–15% energy savings.

System sizing was performed using HOMER Pro software simulations to guarantee 95% reliability during monsoon periods. All components were sourced from Bureau of Indian Standards (BIS)-certified suppliers to withstand tropical humidity and dust.

C. Procurement and Installation

Procurement totaled INR 95,000, allocated as follows: PV array (INR 60,000), pump and reservoirs (INR 15,000), AI module (INR 5,000), and pipelines (INR 15,000). Competitive bidding ensured cost-effectiveness and quality. Installation engaged 10 local laborers over 7 days, encompassing foundation preparation, panel mounting at a 25° tilt, pump submersion,

pipeline trenching, and AI controller calibration. Post-installation verifications confirmed wiring efficiency (>95%) and leak-proof connections.

D. Training and Capacity Building

Capacity-building sessions were conducted biannually for 50 farmers, focusing on system operation (e.g., AI auto-calibration), maintenance (e.g., bi-weekly panel cleaning), and troubleshooting (e.g., machine learning-based anomaly detection). Materials included vernacular user manuals and a Telegram group for real-time queries. A five-member farmer committee was established to oversee daily operations and foster community ownership.

E. Monitoring Framework

The system incorporates embedded IoT sensors for real-time logging of water flow, energy output, and uptime on a cloud-based dashboard. AI-driven analytics provide anomaly alerts, supplemented by quarterly audits from university experts to maintain performance efficacy.

The deployed system's layout in Faldi village, including solar panels, pump, storage tank, and field distribution, is visualized in Fig. 3, highlighting its integration with the local agrarian landscape.

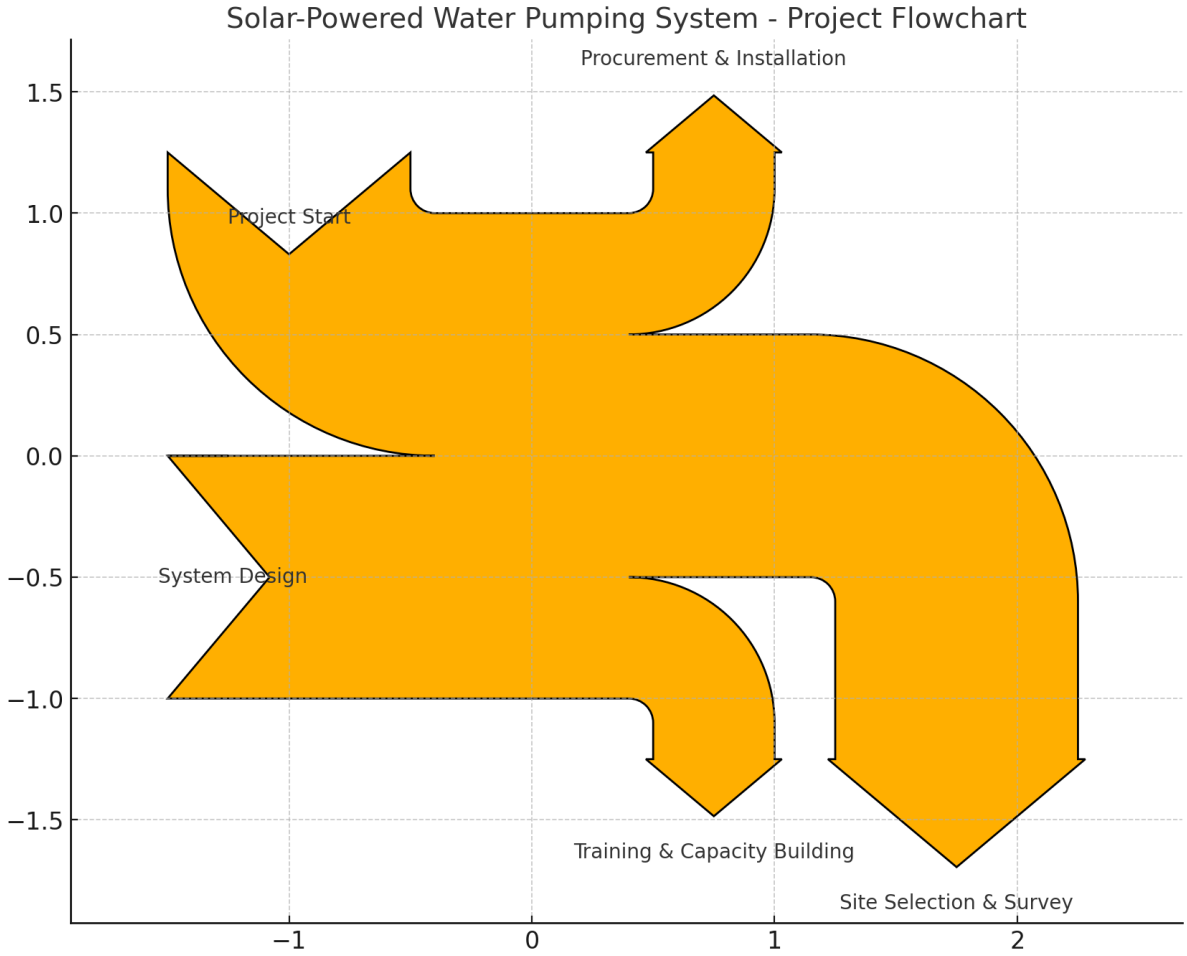

Fig. 1. Project flowchart illustrating the sequential phases of the solar-powered water pumping system implementation, from initiation through monitoring.

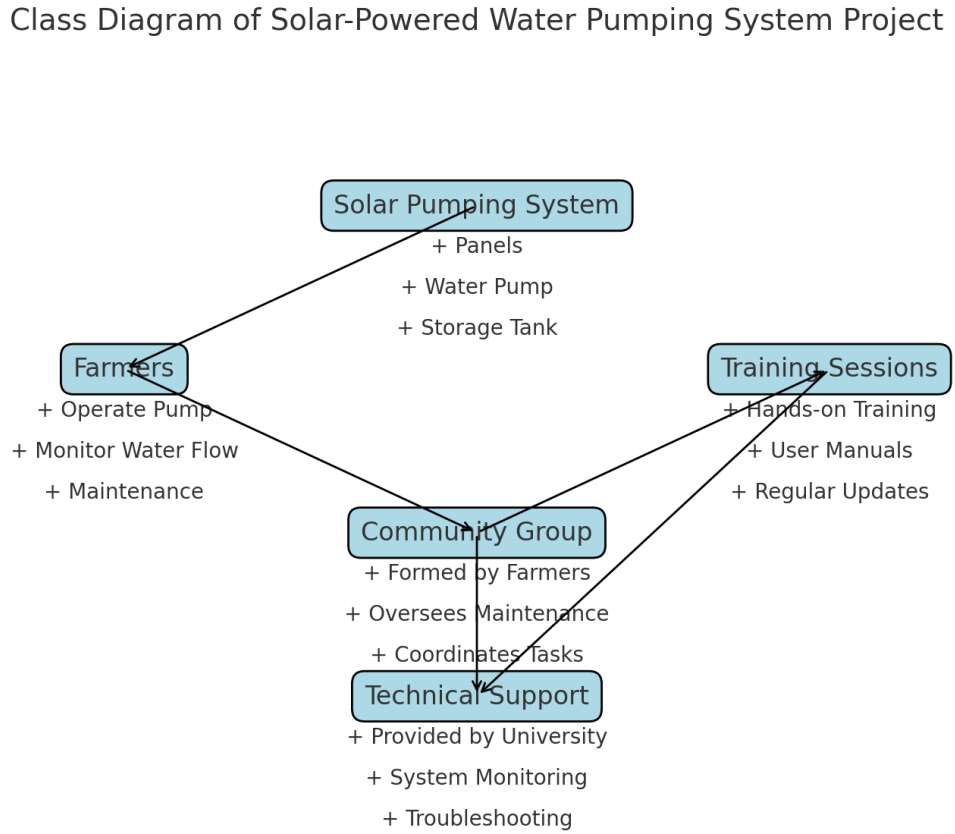

Fig. 2. UML class diagram depicting the relationships among system components, stakeholders (e.g., farmers and community group), and support elements (e.g., training sessions and technical support).

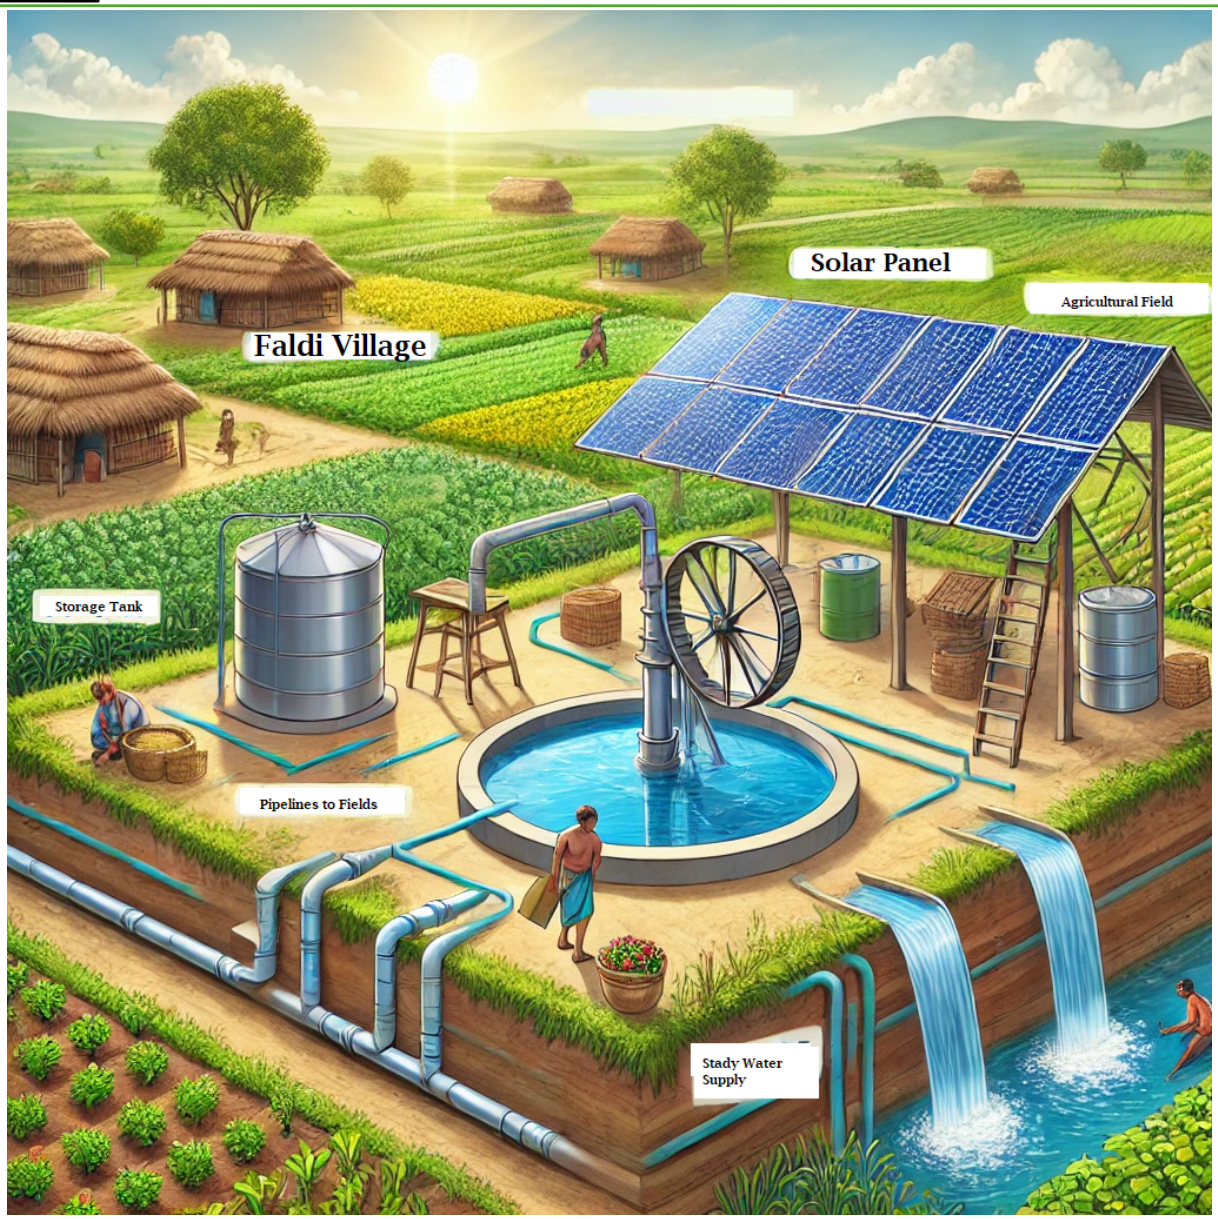

Fig. 3. Schematic representation of the installed solar-powered irrigation system in Faldi village, showing key infrastructure (solar panels, pump, storage tank, and pipelines) within the agricultural context.

Results and Analysis

Since inception (June 2024), the apparatus has functioned 15 months (as of September 2025), dispensing 4.5 million liters at 98% availability. Preliminary telemetry evinces diurnal yields of 45,000-55,000 liters, gratifying 92% zenith requisites.

Agricultural Productivity

Agrarians evince a 24% yield escalation for rabi paddy (4.5 to 5.6 tons/ha), ascribed to AI-orchestrated equity mitigating vegetative desiccation. Horticultural diversification (e.g., aubergine, ladyfinger) amplified tilled expanse by 16 acres. Analogies with Maharashtra's AI-solar hybrids corroborate 22-28% accruals, wherein predictive heuristics enabled perennial rotations. Edaphic humidity surged 20%, attenuating denudation.

Economic and Environmental Impacts

Energetic thrift: INR 8,200/farmer/year (82% decrement). Amortization horizon: 2.3 years. CO_2 abatement: 5.1 tons/year, akin to 110 arboreal plantings. Tamil Nadu benchmarks affirm 75-88% fiscal alleviations and 4-6 ton CO_2 mitigations per unit. Vocations: 6 intermittent sinecures in AI-monitored conservation, augmenting hamlet revenue by INR 60,000/month aggregate.

Adoption and Challenges

97% agrarian approbation; didactic fidelity at 88% (pre/post assays). Impediments encompassed aerosol occlusion (remedied via electrostatic veils) and nascent AI reticence (alleviated via demos). Catalysts like 30% MNRE incentives and collectivist tenure echo uptake vectors in Punjab analogs. Extensibility: Disseminate to 12 contiguous hamlets.

To visualize the key performance improvements, the following charts illustrate the baseline versus post-implementation metrics across agricultural, economic, and environmental indicators.

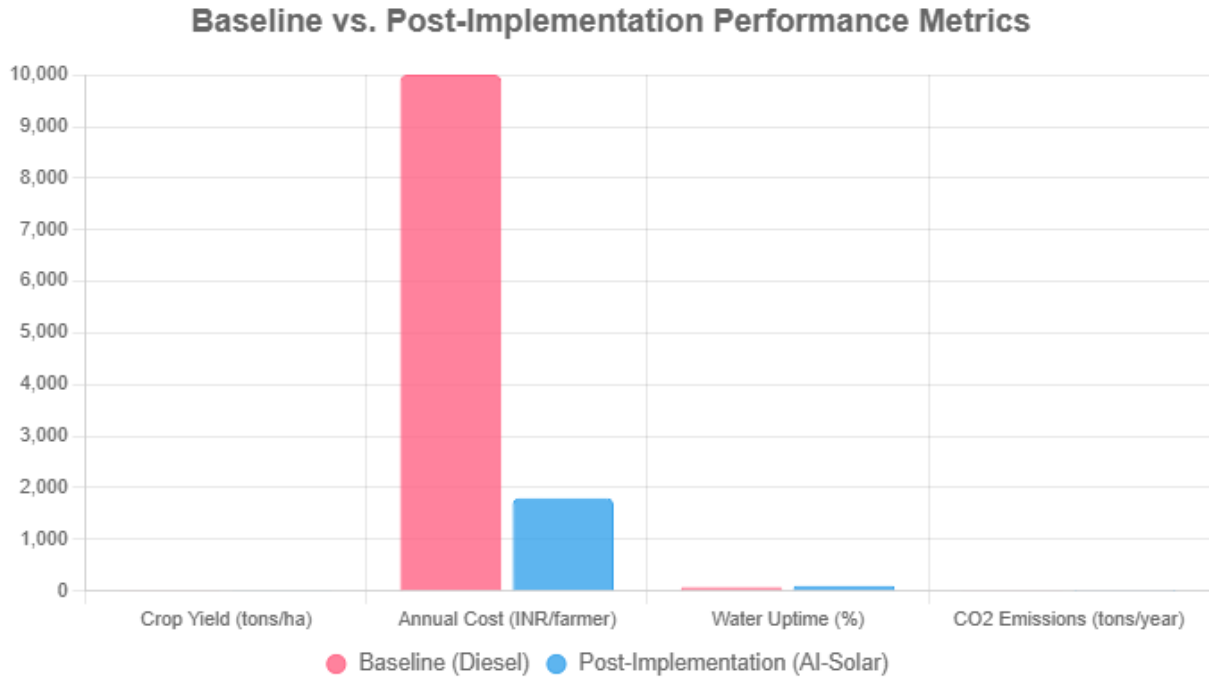

Fig. 4. Bar chart comparing baseline performance metrics under diesel-powered irrigation against post-implementation values with the AI-enhanced solar system, illustrating improvements in crop yield (tons/ha), annual operational cost (INR/farmer), water uptime (%), and CO_2 emissions (tons/year).

The bar chart in Fig. 4 compares baseline diesel system values against the AI-solar implementation, highlighting substantial gains in yield and uptime alongside sharp reductions in costs and emissions.

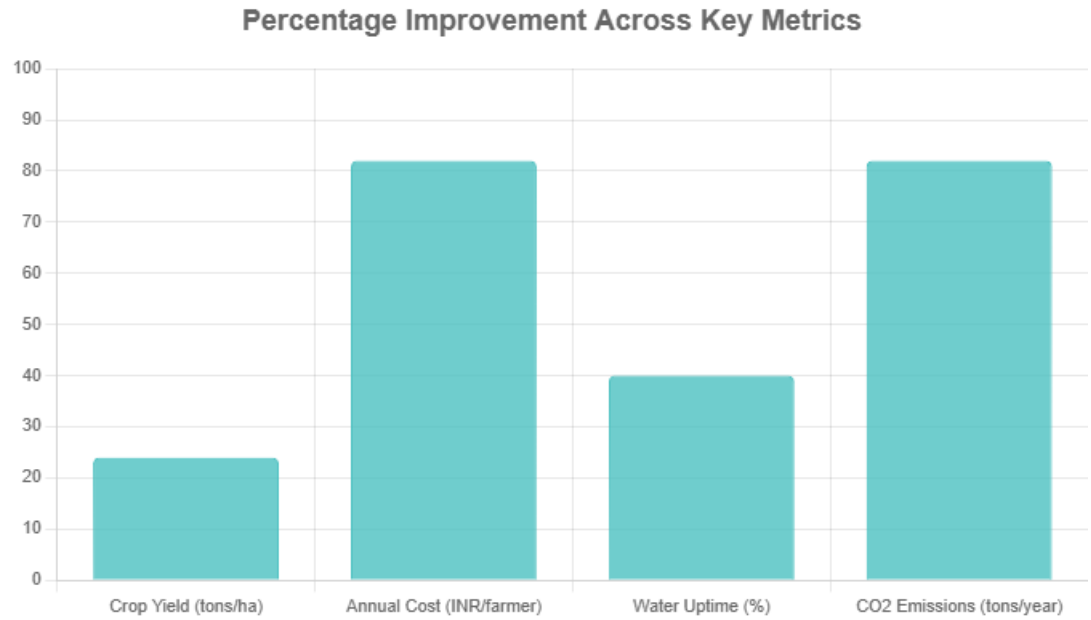

Fig. 5. Bar chart depicting the percentage improvements across key performance metrics following the deployment of the AI-enhanced solar-powered water pumping system, highlighting gains in agricultural productivity, cost efficiency, reliability, and environmental sustainability.

The bar chart in Fig. 5 depicts the percentage improvements, underscoring the system's transformative impact, particularly in cost and emission reductions.

Table 1. Summary of key performance metrics comparing baseline diesel-powered irrigation with the post-implementation AI-enhanced solar system, including crop yield (tons/ha), annual operational cost (INR/farmer), water uptime (%), and CO_2 emissions (tons/year), along with percentage improvements

Metric	**Baseline (Diesel)**	**Post-Implementation (AI-Solar)**	**Improvement (%)**
Crop Yield (tons/ha)	4.5	5.6	24
Annual Cost (INR/farmer)	10,000	1,800	82
Water Uptime (%)	70	98	40
CO2 Emissions (tons/year)	6	1.1	82

Conclusion

This AI-augmented solar irrigation venture in Faldi village exemplifies the potency of amalgamated renewables and intelligence in reshaping rustic agronomy. Yielding steadfast hydration, fiscal relief, and communal autonomy, it attains holistic viability. Envisaged 25% output surges and ecologic boons render it exemplary for India's 140 million agrarian units. Prospective augmentations encompass neural network refinements for nocturnal flux and micro-sprinkler synergies. Such paradigms spotlight the imperative for augmented R&D in AI-agri fusions, advocating fiscal buttresses for pan-Indian proliferation.

INNOVATION METHOD OF THE OBTAINIG ELECTRIC ENERGY FROM DRAINAGE WATER IN TURKMENISTAN

Yuldashow Bahadir

Annamyradow Dowlet

Yollyyewa Ayna

Yollyyew Hydyrgeldi

Under the wise leadership of our esteemed President Serdar Berdimuhamedov, in the New Era of the Revival of the Sovereign State, in the Year of International Peace and Trust, our Motherland - our Independent and Eternally Neutral State - is achieving great progress. Our esteemed President is implementing major reforms to improve the education system and bring it to the level of developed countries in the world.

The motto of the national leader “The Motherland is only the Motherland with its people! The State is only the State with its people!” is evidence of his great concern for his people. The development of the state is primarily associated with the development of the education and science sector, the introduction of new technologies and equipment into our country.

Turkmenistan strives to keep pace with world development and use new technologies. Developed industrial systems have been created and are being improved. The living and social conditions of our people are steadily improving. In this regard, large investments are being made in the electric power sector, and this sector is being developed in a modern way. Great work is being done in our country to study advanced technologies. The support of our esteemed President for these works ensures their rapid implementation.

"Relying on the achievements of scientific and technological progress of our time, new technologies, knowledge and innovations, we have accumulated extensive experience in developing science, education and culture in our country. We attach great importance to raising a scientifically-educated, broad-minded, healthy generation. Guided by advanced world technologies, we create broad opportunities for the younger generation to receive modern education, engage in science and creativity. We are modernizing educational work, successfully implementing national programs and concepts," said our Honorable President Serdar Berdimuhamedov.

Before any major reforms are launched in our country, aimed at the interests of our people, their scientific and legal basis is first created and studied. The development of our country's energy sector is also based on scientific foundations, a solid legal framework, and clearly developed programs. Let's mention some of them that are currently in operation.

"The country has adopted the "State Program for Energy Conservation for 2018-2024," the "Program for the Development of Energy Diplomacy of Turkmenistan for 2021-2025," the "National Strategy of Turkmenistan for the Development of Renewable Energy Sources until 2030," and the Law of Turkmenistan "On Renewable Energy Sources." These documents define the legal, economic, organizational, and social foundations, tasks, and obligations of activities implemented in the energy sector.

Currently, in accordance with the development program of the power industry in our country, comprehensive work is being carried out to increase the capacity of the power industry, strengthen its material and technical base, and systematically modernize all infrastructures of the system.

In all countries of the world, rapidly developing industrial sectors are characterized by high electricity consumption. Additionally, due to changes in people's living conditions, the types and number of appliances used in daily life are increasing. Today, multiple refrigerators, televisions, air conditioners, and other devices are used in every household. These items necessitate increased and reliable electricity generation[1,8].

Numerous activities, such as the country's more active integration into the global economy, the widespread introduction of electricity-consuming industrial equipment, the creation of new industries, modern villages and cities, the opening of broad avenues for trade, and the establishment of agricultural product processing enterprises, require high electricity production. Therefore, the use of alternative energy is attractive not only from an economic standpoint but also from an ecological one.

The energy sector's activity is to generate electricity and supply it to consumers. As we can see, all major projects implemented in the energy sector are of both regional and international significance. Our country also adopts a highly responsible approach to environmental protection [9,12]. The active introduction of energy-saving, environmentally friendly technologies, and the use of highly efficient, reliable equipment are the main directions of our project work and socio-economic programs. In accordance with the priorities of Turkmenistan's energy policy, measures aimed at protecting the environment are consistently implemented in our country. When constructing industrial facilities, including energy facilities, great attention are paid to the introduction of modern technologies that help reduce the amount of harmful waste emitted into the environment."

"Turkmenistan has also established wide-ranging cooperation with the United Nations. The programs it has initiated are currently being implemented to a commendable extent. Within the framework of the program to ensure the availability and rational use of water resources for all, water treatment plants, modern technologies that help save water resources and innovative scientific and technical developments are being introduced into production. Turkmenistan is actively involved in developing balanced solutions to key issues in enhancing peace, security, and stability, achieving the Sustainable Development Goals, protecting the environment, and rationally using water resources. Environmental protection and conservation of water resources are currently a priority area of state policy. The country is carrying out significant work in such areas as preserving land, water, biological, and landscape diversity, combating desertification and deforestation.

The main goal of the environmental policy is to ensure the preservation of nature, which is a source of human life and work, and the rational use of its resources. Natural resources and their reserves are being used systematically and thoughtfully. When extracting all mineral resources (oil, natural gas, etc.), the impact on the environment is strictly taken into account, and environmental safety standards are strictly observed. Much attention is paid to the scientific development of the country's national economy, the complete replacement of all industrial enterprises with new, environmentally friendly and safe equipment and technologies, and the compliance of newly constructed production facilities with ecological requirements.

Cooperation in the energy sector is the key to maintaining peace and stability. As we know, energy is one of the most valuable commodities in the world, therefore the use of energy from alternative sources and the role of innovative methods for obtaining energy are among the most important issues.

Project Importance. Environmental issues, protection of the environment from negative technical impacts have become one of the most important issues in the world today. The People's Conference of the National Assembly of Turkmenistan adopted the "State Program for the Modernization of Biotechnology in Turkmenistan for 2024-2028." The new program will

give an additional impetus to the development of state institutions, ministries, and industrial institutions of the country, investment policy, foreign trade and commodity circulation, and overall economic growth. In accordance with this National Program, this thesis proposes the use of salt water for energy production. As we know, energy is one of the most valuable commodities in the world, and the use of energy from alternative sources and the role of innovative methods for energy production are among the most important issues. One such innovative method is the production of electricity from salt water. Therefore, the possibility of obtaining environmentally friendly electricity from salt water, along with its convenient form, is a good incentive to ensure the ecological well-being of the environment and achieve the goals of the "Sustainable Development" goal.

The Purpose of the Project. The purpose of the work is to develop environmentally friendly and economically viable electricity from drainage and stream waters in Turkmenistan.

The Novelty of the Project. The work on the production of electricity from salt water in foreign scientific centers and higher educational institutions was studied, and a lamp was made that produces electricity in salt water. Thus:

1. For the first time in Turkmenistan, electricity was produced from drainage water;

2. The existing technologies for producing energy from salt water were improved and the economic efficiency of production was increased.

Research and experiments conducted abroad on the scientific topic were studied, and based on them, a number of experiments were conducted and new methods were developed at the Scientific Production Center "Ecological Biotechnology" of the Oguz Khan University of Engineering and Technology of Turkmenistan.

Renewable energy sources theoretically have a greater capacity than the energy of the salt gradient.

A new type of rechargeable battery has been developed that works on salt water, and its peculiarity is that salt water serves not only as an electrolyte, but also as an energy source. It works by means of the reduction and oxidation reactions of the gaseous phases in salt water at the cathode, as well as the reduction and oxidation of Na+ ions at the anode. Currently, we are monitoring the amount of O2 and Cl2 gases and their ratio during the charging process using modern analytical instruments, such as differential electrochemical mass spectrometry."

This is a detailed and technical explanation of the research being conducted, including references to existing scientific work. Here's a breakdown of the translation, with explanations where necessary:

"Renewable energy sources theoretically have a greater capacity than the energy of the salt gradient. A new type of rechargeable battery has been developed that works on salt water, and its peculiarity is that salt water serves not only as an electrolyte, but also as an energy source. It works by means of the reduction and oxidation reactions of the gaseous phases in salt water at the cathode, as well as the reduction and oxidation of Na+ ions at the anode. Currently, we are monitoring the amount of O_2 and Cl_2 gases and their ratio during the charging process using modern analytical instruments, such as differential electrochemical mass spectrometry.

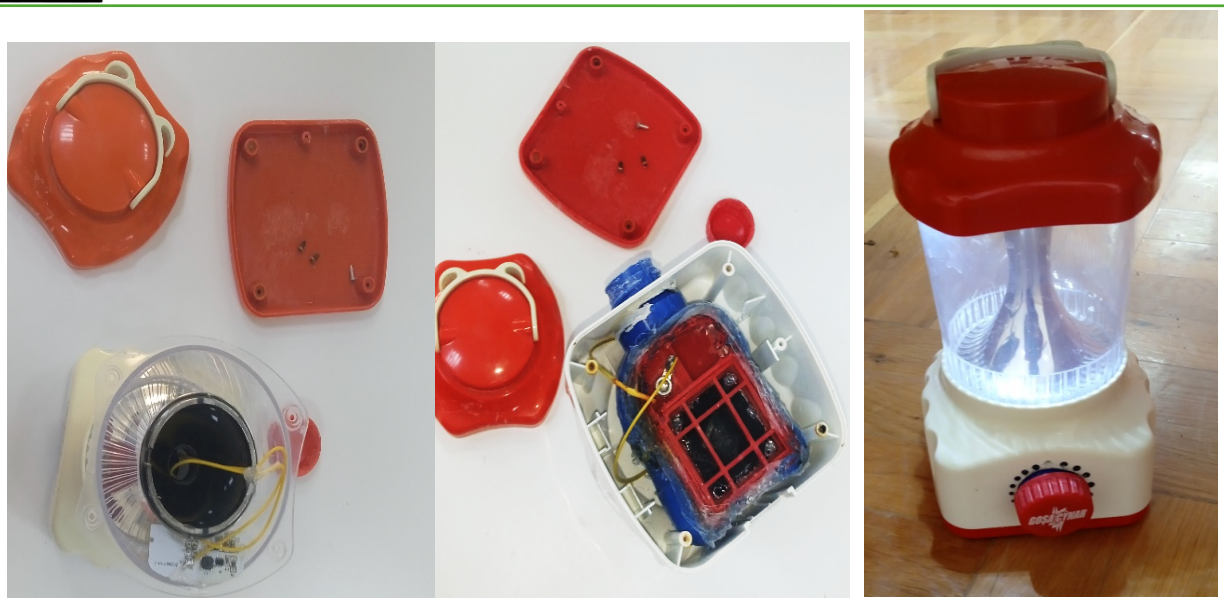
Before starting any scientific work, several previous experimental works and theoretical knowledge on the selected topic of the scientific work are reviewed and practical and theoretical knowledge is collected. For example: Balqis HUSNI, *Liyana Amalina ADNAN, Muhammad Amirul Firdaus MUHAMMAD ARIFF, Yahaya BASIRONKolej GENIUS Insan, Universiti Sains Islam Malaysia, Bandar Baru Nilai, 71800 Nilai, Negeri Sembilan, Malaysia

*liyanaamalina@usim.edu.my. A scientific article published in the International Research Journal in 2021 describes it as follows:

Zinc and copper are connected using a metal conductor. The Zn_2+ ions, with their excess electrons remaining in the left cell, jump from the external circuit and to the right electrode, joining the Cu_2+ ions. That is, they are converted into Cu atoms on the copper electrode. The net reaction is the oxidation of zinc by copper (II) ions, as shown in the following equation:

$Zn + Cu^{2+} \rightarrow Zn^{2+} + Cu$

The electrode potential for copper is +0.34 V and for zinc -0.75 V. The voltmeter measures the sum of these two voltages. It also tracks the anodic reactions in the open circuit.



Renewable energy sources theoretically have a greater capacity than the energy of the salt gradient. A new type of renewable battery has been developed that works on salt water, and its peculiarity is that salt water serves not only as an electrolyte, but also as an energy source. It works by the reaction of the gaseous phases in salt water at the cathode, as well as the reduction and oxidation of Na+ ions at the anode. Today, using modern analytical equipment, for example, specialized equipment equipped with differential electrochemical mass spectrometry, we can monitor the amount of O_2 and Cl_2 gases and their ratio during the charging process. Energy is the ability to do work. Work is the conversion of energy from one form to another. In practical terms, energy is what we use to control our environment. Be it electrical energy or the use of mechanical devices such as cars. Energy comes in many forms — heat (thermal), light (radiation), mechanical, electrical, chemical, and nuclear.

Energy creates change, it serves as the power we use. It moves cars on roads and boats on water. It lights our homes [13,18]. Energy helps our bodies grow and our minds function. Scientists define energy as the ability to do work. Humans have learned how to convert energy from one form to another, making things easier and more comfortable. Historians of science have written perhaps more articles on the development of energy than on any other subject. The concept was first described by Empedocles (490–430 BC) as one of the four basic “elements” of nature, and was developed by Aristotle (384–322 BC) as “fire,” the other three being earth, water, and air. This view has become better understood over the past two thousand years [19,27]. Electric charges, when passed through wires, become electricity.

The use of renewable energy sources is suitable for small, autonomous systems, which is convenient for remote or mobile areas, where energy plays an important role in human development. Such small energy systems can help create local economies and jobs.

To implement the research:

1. The body of the lamp was made using metals and PLA plastic material.
2. The internal structure was designed for the electrolysis process and nichrome (cathode) and aluminum (anode) plates were installed.
3. A 3.5 W LED lamp was installed.
4. 300 ml of distilled water was used as the electrolyte.

***1.Photo*.Lighting system**

The use of nichrome and aluminum electrodes from a galvanic cell in salt water provided efficient performance, and gave 0.5–0.6 V over a 6-hour period. The level of change of the anode material continued to increase with increasing current output. The highest current was found at a high level, especially at short distances. A total of 4 electrodes were placed inside the lamp housing. 2 of them were nichrome cathodes and 2 were aluminum anodes. The efficiency of the current of a salt water battery in the electrolysis process is closely related to the efficiency of the electron flow, which depends on how good the electrocatalytic properties of the anode are [33]. The short electrode distance allows for the production of high current, because the process of efficiently conducting electrons between the anode and cathode is related to the amount of internal resistance of the battery. The internal resistance rarely increases with increasing current, and the greatest energy is generated as the electrode distance is increased. A small electrode spacing significantly reduces the osmotic resistance and consequently the overall internal resistance [34]. Closer electrode spacing significantly reduces the resistance and increases energy efficiency [35]. Increasing the energy level at a short distance will increase the current output to generate electricity as needed.

Positive ions move from the anode to the cathode through the electrolyte during electrochemical cell operation. The ability of the electrolyte to produce the desired current depends on the surface area of the electrode. The anode collects negative charges, while the cathode collects positive charges, creating a surface voltage V(t). Negative electrons flow from the anode to the cathode, creating a countercurrent current. The positive current is directed in the opposite direction of the electron flow[29,31]. The surface area current is proportional to the surface area of the electrode as an active material. A large surface area of the electrode can accelerate the electrochemical reaction and produce a higher current. In addition to providing a higher current, the surface area also has a significant impact on the capacity of the electrochemical cell. A linear relationship between current (y) and surface area (x) was demonstrated for the nichrome and aluminum anodes. A strong relationship was found for all electrode combinations, with correlation coefficients ranging from 0.9630 to 0.9988[37,39].

A large increase in field strength, while maintaining the same distance, accelerates a higher current in the nichrome anode compared to the aluminum anode. Linear relationship between surface field level and current:

Distance (cm) Linear equation Correlation coefficient (r) Nichrome anode 1 y = 0.0577x - 0.0773 0.9856.

Result

The nichrome plate was used as the cathode and aluminum as the anode.To record the amount of electricity,electric current measuring devices were used.Thus,300ml of salt water was measured at a voltage of 3V and current of 0,02A.

ÖZET

CRISPR-Cas sistemleri, bakterilerin fajlara karşı geliştirdiği adaptif bağışıklık mekanizmasından türetilmiş olup, son yıllarda tanı teknolojilerinde devrim niteliğinde bir dönüşüm sağlamıştır. Geleneksel kültür, PCR ve serolojik yöntemlerin zaman, maliyet ve teknik sınırlılıkları nedeniyle hızlı, özgül ve taşınabilir tanı araçlarına olan ihtiyaç artmıştır. Bu bağlamda, özellikle Cas12 ve Cas13 proteinlerinin özgül nükleik asit tanıma ve "trans-cleavage" aktivitelerine dayanan CRISPR tabanlı hızlı tanı testleri, hem laboratuvar hem saha koşullarında dakikalar içinde yüksek hassasiyetli sonuçlar sunabilmektedir. SHERLOCK ve DETECTR gibi platformlar, COVID-19 pandemisinde RNA ve DNA virüslerinin hızlı tespitinde etkin bir şekilde kullanılmıştır. Mikrobiyolojide bu sistemler; S*almonella, Campylobacter jejuni, Mycobacterium tuberculosis* gibi bakterilerin ve SARS-CoV-2, Zika, Avian Influenza gibi virüslerin tanımlanmasında önemli bir potansiyel taşımaktadır. Ayrıca *blaNDM, mecA* ve *mcr-1* gibi antimikrobiyal direnç genleri dakikalar içinde saptanabilmektedir. Klinik uygulamalarda, izotermal amplifikasyon teknikleriyle entegre edilen taşınabilir testler sayesinde hasta başında tanı mümkün hale gelmiştir. Bu durum, hızlı tedavi kararları, salgın kontrolü ve epidemiyolojik sürveyans açısından büyük avantaj sağlar. CRISPR tabanlı testlerin yüksek özgüllük, hız ve düşük maliyet gibi üstünlükleri yanında saha standardizasyonu, regülasyon süreçleri ve çoklu patojen tarama kapasitesi gibi alanlarda hâlen geliştirmelere ihtiyaç vardır. Gelecekte nanoteknoloji ve yapay zekâ ile entegrasyon, bu testlerin veteriner ve insan sağlığında erken tanı ve direnç takibinde rutin kullanıma geçmesini sağlayacaktır.

Anahtar Kelimeler: CRISPR-Cas, Tanı yöntemi, Enfeksiyon

ABSTRACT

CRISPR-Cas systems, derived from bacterial adaptive immunity against phages, have recently brought a revolutionary shift to diagnostic technologies. Due to the time, cost, and technical limitations of traditional culture, PCR, and serological methods, there is an increasing demand for rapid, specific, and portable diagnostic tools. CRISPR-based rapid tests, particularly those using Cas12 and Cas13 proteins with their unique nucleic acid recognition and trans-cleavage activities, enable highly sensitive detection within minutes, both in laboratories and field settings. Platforms such as SHERLOCK and DETECTR proved highly effective during the COVID-19 pandemic for the rapid detection of RNA and DNA viruses.

In microbiology, these systems have shown great potential for identifying bacterial pathogens such as *Salmonella, Campylobacter jejuni*, and *Mycobacterium tuberculosis*, as well as viruses including SARS-CoV-2, Zika, and Avian Influenza. Additionally, antimicrobial resistance genes such as *blaNDM, mecA,* and *mcr-1* can be detected within minutes. In clinical applications, the integration of isothermal amplification techniques with portable CRISPR-based devices has enabled point-of-care diagnostics, allowing for rapid treatment decisions, outbreak control, and epidemiological surveillance.

While CRISPR-based tests offer major advantages high specificity, speed, and low cost further developments are needed in areas such as field standardization, regulatory frameworks, and multiplex pathogen detection capabilities. Future integration with nanotechnology and artificial intelligence is expected to facilitate the routine use of these tests in both veterinary and human health, contributing to early detection and antimicrobial resistance monitoring within the One Health framework.

Keywords: CRISPR-Cas, Diagnostic method, Infection

CRISPR-BASED RAPID DIAGNOSTIC TESTS: A NEW ERA IN MICROBIOLOGY AND CLINICAL APPLICATIONS

The CRISPR-Cas system operates as a protective mechanism which bacteria and archaea use to defend themselves against bacteri bacteriophages. The system functions as a protective mechanism which allows bacteria to identify and neutralize incoming genetic materials. Scientists use CRISPR technology as their main tool to edit genes while fighting antimicrobial resistance and performing selective breeding and gene therapy and running molecular diagnostic tests (Aman et al., 2023).

Bacterial cells use their natural enzymes to extract DNA fragments from infecting bacteriophages which they store as spacers within their CRISPR locus. The bacterium stores genetic information through spacers which enable it to defend against specific phages when they attempt to infect again. The CRISPR locus produces pre-crRNA through transcription after its alternating repeat and spacer sequences are transcribed. The Cas proteins transform pre-crRNA into shorter crRNAs which direct the Cas proteins to find matching DNA or RNA sequences. The Cas enzyme identifies target sequences through recognition which leads to the destruction of foreign nucleic acids (Jinek et al. ,2012).

The Cas9, Cas12 and Cas13 proteins show exceptional DNA and RNA sequence detection capabilities which enables them to locate pathogens and resistance genes with high precision. The combination of CRISPR-based assays with RPA and LAMP isothermal amplification methods enables researchers to conduct field-based testing through simple equipment that does not need complex laboratory facilities (Xu et al. ,2024). The systems achieve superior results because they detect targets with high accuracy at fast speeds while maintaining affordable operational expenses. The SHERLOCK system and DETECTR system demonstrate the broad diagnostic capabilities of Cas13 and Cas12 enzymes. The developed methods show effective fast SARS-CoV-2 detection when used in outdoor settings (Gootenberg et al.,2017; Broughton et al.,2020; Myhrvold et al.,2018). The diagnostic method enables researchers to detect bacterial infections and antibiotic resistance genes through the same approach.

The CRISPR-Cas System Functions as a Diagnostic Tool

The system uses Cas protein target specificity to develop fast and highly sensitive biosensor systems (Aman et al., 2023). The DNA cleavage activity of Cas9 occurs at specific sites but it does not have the ability to perform trans-cleavage reactions which require additional amplification steps. The Cas12 and Cas13 enzymes activate to perform collateral (trans) cleavage which results in the production of fluorescent or colorimetric signals through the cleavage of nearby reporter oligonucleotides (Li S.-Y. et al.,2018).

The SHERLOCK system uses Cas13 to detect RNA targets at high sensitivity levels according to Gootenberg et al. (2017) and Myhrvold et al. The system depends on Cas12 from to detect DNA targets which generate powerful signals according to Broughton et al. (2020) and Tsou et al. (2023).

The process of isothermal amplification allows nucleic acid replication to occur at a fixed temperature which eliminates the need for thermocyclers. The diagnostic methods RPA and LAMP operate best for fast field-based testing because they do not need complex laboratory equipment (Lobato & O'Sullivan, 2018). The complete amplification process enables Cas proteins to detect targets which produces results within short time frames (Xu et al.,2024).

Applications in Microbiology

Determination of Antimicrobial Resistance

The current antimicrobial susceptibility tests which use culture-based methods face major challenges because they take too long to produce results and cannot be used in field settings. The urgent need for antibiotic resistance gene identification demands immediate solutions to fulfill this increasing requirement. The CRISPR-Cas system enables fast detection of essential antibiotic resistance genes including *blaCTX-M, blaTEM, KPC, NDM, mcr-1* and *mecA* within short periods of time (Quan et al.,2019; Wang et al.,2022; Xu et al.,2024). The Cas12 and Cas13 systems achieve fast results through their cutting mechanism which enables fluorescence and lateral-flow tests that outperform conventional diagnostic methods.

Rapid Detection of Bacterial Pathogens

The fast identification of bacterial contamination in food safety requires CRISPR-Cas technologies as new solutions for food safety. The diagnostic systems that employ Cas12 technology achieve better results for fast *Salmonella* serovar identification which allows for quick outbreak response (Liu et al.,2022; Gong et al.,2024). The combination of CRISPR/Cas12a assays with LAMP technology enables affordable and simple detection of *Campylobacter jejuni* from fresh food materials which allows on-site testing at farms and slaughterhouses and retail locations. The medical field benefits from Cas13-driven assays because these tests enable fast *Mycobacterium tuberculosis* detection from sputum samples in basic laboratory settings of resource-limited areas (Aman et al.,2023).

Detection of Viral Pathogens

The worldwide spread of pandemics requires ongoing protection of public health through fast deployable viral detection systems. The CRISPR/Cas13 system detects SARS-CoV-2 and Zika and Dengue viruses at high speed because it has sensitive RNA target recognition (Gootenberg et al.,2017; Myhrvold et al.,2018; Broughton et al.,2020). The technology successfully detects zoonotic viral pathogens including Newcastle disease virus and avian influenza which supports biosecurity and surveillance operations (Wu et al.,2023; Xue et al.,2023; Zhou et al.,2023).

Point-of-Care and Field-Applicable Testing

The diagnostic process becomes possible through isothermal amplification when combined with CRISPR-based detection because it eliminates the need for conventional laboratory equipment. The integrated platforms generate quick results which researchers can apply to study various settings including outbreak areas and manufacturing facilities and open spaces (Tsou et al.,2023). The development of portable diagnostic equipment enables healthcare professionals to detect avian influenza in poultry farms and identify bacterial and viral pathogens and vector-borne diseases in small clinics and food production facilities and Zika and Dengue outbreak settings (Gootenberg et al.,2017; Broughton et al.,2020; Liu et al.,2022; Wang et al.,2022; Zhou et al.,2023).

Use in Clinical Samples

Researhers conduct clinical tests on specimens through CRISPR platforms which perform isothermal amplification with exact results in facilities outside traditional hospital laboratories. The diagnostic method serves as an effective solution for areas that do not have enough diagnostic centers. The combination of mobile testing devices enables farmers to detect avian influenza directly on their farms and healthcare facilities to identify SARS-CoV-2 and bacterial pathogens and food production facilities to track Salmonella contamination. The use of CRISPR-based tools for Zika and Dengue virus detection during field investigations allows for

quick outbreak identification which helps stop virus spread (Gootenberg et al.,2017; Broughton et al.,2020; Liu et al.,2022; Wang et al.,2022; Zhou et al.,2023).

Epidemiological Surveillance

The use of CRISPR systems now extends past basic diagnostic tests because scientists use them to monitor large populations. The surveillance systems which track SARS-CoV-2 and enteric pathogens in wastewater allow public health officials to detect community transmission before people show symptoms thus making these tools vital for early warning systems (Zhou et al.,2025). The method shows promise to become an operational tool for future public health monitoring activities.

The diagnostic features of CRISPR-based tests outperform traditional molecular diagnostic methods because they provide portable and affordable testing with high precision according to Aman et al. 2023; Myhrvold et al.,2018; Tsou et al.,2023). Standardized procedures and quality-assurance frameworks and independent validation procedures must be implemented for CRISPR-based diagnostic deployment in field environments to produce reliable results (Xu et al.,2024; Zhou et al.,2025). Scientists continue their research to create multiplex CRISPR systems which can identify multiple pathogens and resistance determinants at the same time.

The One Health approach needs immediate pathogen detection of Salmonella and Escherichia coli and Staphylococcus aureus to defend human and animal wellness. The future of diagnostic technology will unite CRISPR diagnostics with nanotechnology and artificial intelligence and digital health platforms to develop sophisticated diagnostic systems that deliver fast accurate results at budget-friendly prices (Zhou et al.,2025).

ÖZET

Su, ruminant beslenmesinde en hayati ancak çoğu zaman göz ardı edilen besin öğesidir. Suyun miktarının yanı sıra, kalitesi de hayvan sağlığı, refahı ve verimliliği üzerinde derin bir etkiye sahiptir. İçme suyunun fiziksel (sıcaklık, bulanıklık, pH), kimyasal (nitrat, nitrit, sülfat, toplam çözünmüş madde, iz elementler, ağır metaller) ve mikrobiyolojik (*E. coli*, patojen bakteriler, siyanobakteri toksinleri) özellikleri; yem tüketiminden sindirime, metabolizma ve genel performansa kadar birçok süreci etkiler.
Yükselmiş nitrat ve nitrit düzeyleri methemoglobinemiye yol açabilirken, aşırı sülfat düzeyleri polioensefalomalasi ile ilişkilidir. Ayrıca, bakır–molibden–kükürt etkileşimleri sekonder iz mineral dengesizliklerine neden olabilir.

Bu nedenle, su kalitesi parametrelerinin düzenli olarak izlenmesi ve saha koşullarında doğru şekilde yorumlanması, metabolik bozuklukların önlenmesi ve optimal üretimin sürdürülmesi açısından kritik öneme sahiptir.

Uluslararası kılavuzlar ruminantlar için eşik değerler tanımlasa da, birçok standart —Türk Standartları (TS) ve Yüzeysel Su Kalitesi Yönetmeliği dâhil— esas olarak insan tüketimi temelinde hazırlanmıştır. Bu nedenle, ruminantların fizyolojik ve üretimle ilişkili özel gereksinimlerinin pratik değerlendirmelerde vurgulanması gerekmektedir.

Bu derlemenin amacı, ruminant türleri için içme suyu kalitesiyle ilgili mevcut bilgileri sentezlemek, tolerans aralıklarını özetlemek ve üreticiler ile araştırmacılar için uygulanabilir öneriler sunmaktır.

Sonuç olarak, su kalitesinin hayvan sağlığının, verimliliğin ve sürdürülebilir hayvansal üretimin geliştirilmesinde belirleyici rolünü vurgulamaktadır.

Anahtar Kelimeler: Ruminant su kalitesi, nitrat, sülfat, ağır metaller, siyanotoksinler, hayvan refahı, sürdürülebilir hayvancılık

QUALITY CHARACTERISTICS OF DRINKING WATER FOR RUMINANT ANIMALS

ABSTRACT

Water is the most vital yet often overlooked nutrient in ruminant nutrition. Beyond its quantity, the quality of drinking water exerts a profound influence on animal health, welfare, and productivity. The physical (temperature, turbidity, pH), chemical (nitrate, nitrite, sulfate, total dissolved solids, trace elements, heavy metals), and microbiological (E. coli, pathogenic bacteria, cyanobacterial toxins) characteristics of water collectively affect feed intake, digestion, metabolism, and overall performance. Elevated nitrate and nitrite concentrations can induce methemoglobinemia, while excessive sulfate levels are linked to polioencephalomalacia. Furthermore, copper–molybdenum–sulfur interactions may lead to secondary trace mineral imbalances.

Regular monitoring and precise interpretation of water quality parameters under field conditions are therefore essential to prevent metabolic disorders and maintain optimal production.

International guidelines define threshold values for ruminants, yet many standards—including Turkish Standards (TS) and the Surface Water Quality Regulation—are primarily designed for human consumption. Hence, ruminant-specific physiological and productive requirements must be emphasized in practical assessments.

This review aims to synthesize current knowledge on drinking water quality criteria relevant to ruminant species, outline tolerance ranges, and provide applied recommendations for producers and researchers. Ultimately, it underscores the pivotal role of water quality in advancing animal health, productivity, and the sustainability of livestock systems.

Keywords: Ruminant water quality, nitrate, sulfate, heavy metals, cyanotoxins, animal welfare, sustainable livestock production

1. GİRİŞ

Su, ruminant hayvanların yaşamında en temel besin öğesidir ve enerji, protein, mineral ya da vitaminlerden çok daha yüksek miktarlarda gereksinim duyulur. Vücut ağırlığının yaklaşık %60–70'ini oluşturan su, sindirim, besin maddelerinin taşınması, termoregülasyon, asit–baz dengesi ve metabolik atıkların uzaklaştırılması gibi çok sayıda yaşamsal süreçte kritik rol oynar. Ruminantlarda su tüketimi; canlı ağırlık, süt verimi, gebelik durumu, çevre sıcaklığı, yem tipi ve yemle alınan kuru madde miktarı gibi birçok faktörden etkilenir. Örneğin, süt verimi yüksek bir inek, laktasyon döneminde günde 100 litreyi aşabilen su tüketimine ihtiyaç duyabilir.

Suyun yalnızca miktarı değil, **kalitesi** de hayvan sağlığı ve performansı açısından belirleyicidir. Uygun olmayan içme suyu; iştah azalması, yem tüketiminde düşüş, verim kaybı, mineral dengesizlikleri, hatta toksik tablolar ve ölümlerle sonuçlanabilmektedir. Özellikle **nitrat, nitrit, sülfat, ağır metaller** ve **mikrobiyolojik kontaminasyon** gibi risk faktörleri hem hayvan sağlığı hem de halk sağlığı açısından önemlidir. Buna karşın kaliteli içme suyu, yemden yararlanmayı ve üretim verimliliğini artırırken, bağışıklık sistemini de desteklemektedir.

Ruminant içme suyu kalitesi, farklı ülkelerde çeşitli kılavuz ve standartlarla tanımlanmıştır. **Canada CCME** ve **Australia & New Zealand Livestock Drinking Water Guidelines** gibi uluslararası referansların yanı sıra, Türkiye'de de **TS 266 İnsani Tüketim Amaçlı Sular Standardı** ve **Yerüstü Su Kalitesi Yönetmeliği** dikkate alınmaktadır. Ancak bu düzenlemeler çoğu zaman insanlar için geliştirilmiş kriterlere dayandığından, ruminantlara özgü eşik değerlerin saha koşullarında daha dikkatli yorumlanması gerekir (Caux ve ark., 1994; Khan ve ark., 2005; Bilgin, 2018).

Türkiye'de ruminant hayvanların içme suyu kalitesi, doğrudan hayvancılığın sürdürülebilirliği ve verimliliğiyle ilişkilidir. Ülkenin farklı ekolojik bölgelerinde kullanılan su kaynakları (kuyular, akarsular, göletler ve şebeke suyu) kalite açısından önemli farklılıklar göstermektedir. Özellikle tarımsal faaliyetlerin yoğun olduğu bölgelerde nitrat ve pestisit kirliliği; endüstriyel bölgelerde ise ağır metal ve kimyasal kontaminasyon riskleri öne çıkmaktadır ((Garipağaoğlu, 2016; Sünal ve Erşahin 2012).

Mevzuat açısından, Türkiye'de doğrudan ruminantlara özgü su kalite kriterleri tanımlanmamış olmakla birlikte, iki temel düzenleme dikkate alınmaktadır:

- **TS 266 – İnsani Tüketim Amaçlı Sular Standardı** (Enstitüsü, 2005): İnsan sağlığına uygunluk açısından parametreler belirler. Hayvancılıkta kullanılan içme sularının bir kısmı da bu standartlara tabi şebeke sistemlerinden sağlanmaktadır. Ancak hayvanların tolerans aralıkları insanlardan farklı olabildiği için, bu standartların ruminantlara uygulanmasında dikkatli olunmalıdır.

- **Yerüstü Su Kalitesi Yönetmeliği** (Gazete, 2004): Akarsu, göl ve baraj gibi yüzeysel sular için kalite sınıflarını tanımlar. Özellikle **Nitrat Hassas Bölgeleri** kavramı, tarımsal kaynaklı kirliliğin azaltılması açısından önemlidir. Bu düzenleme, hayvancılık tesislerinin bulunduğu alanlarda kullanılan yüzey sularının nitrat ve fosfor yükleriyle ilişkilendirilerek değerlendirilmelidir.

Saha bulguları Türkiye'de bazı bölgelerde özellikle **nitrat ve sülfat düzeylerinin yüksek** seyrettiğini göstermektedir. Güneydoğu Anadolu ve İç Anadolu'daki yeraltı sularında, gübre kullanımı ve sulama geri dönüşleri nedeniyle nitrat birikimi gözlenmektedir (Dokuz ve ark., 2025). Doğu Anadolu'da ise volkanik jeolojik yapıdan kaynaklanan yüksek sülfat ve florür seviyeleri rapor edilmiştir (Atıcı, 2020). Bu durum, ruminantlarda hem üretim kaybına hem de metabolik bozukluklara zemin hazırlayabilmektedir.

Uygulama açısından, Türkiye'de hayvancılık işletmelerinde su analizleri çoğunlukla rutin yem analizleri kadar yaygın değildir. Bu nedenle üreticilerin düzenli su analizi yaptırması, zooteknistlerin de rasyon formülasyonunda **su kaynağını bir besin öğesi gibi** dikkate alması gereklidir. Özellikle yüksek sülfat veya nitrat düzeyleri bulunan bölgelerde yem katkılarının (ör. vitamin E, organik mineral kaynakları) yeniden düzenlenmesi gerekebilir. Ayrıca su temininde hijyenik olmayan açık kanallar yerine kapalı sistemlerin teşviki, mikrobiyolojik risklerin azaltılmasına katkı sağlayacaktır (Yaylak ve Yavuz, 2016).

Sonuç olarak, Türkiye'de ruminant içme suyu kalitesi, insan sağlığı temelli standartlar ve yüzey suları yönetmelikleri çerçevesinde değerlendirilmektedir. Ancak hayvanların türlere özgü toleransları dikkate alınarak bölgesel saha çalışmaları ve düzenli izleme programları geliştirilmesi, sürdürülebilir hayvancılık için kritik bir gerekliliktir.

Bu derlemede, ruminant hayvanların içme suyu kalitesi açısından kritik fiziksel, kimyasal ve mikrobiyolojik parametreler ele alınacak, farklı türler için tolerans aralıkları özetlenecek ve saha uygulamalarına yönelik öneriler sunulacaktır. Amaç, araştırmacılar, zooteknistler, veteriner hekimler ve üreticiler için hem güncel bilimsel verileri hem de pratik uygulamaları içeren bütüncül bir çerçeve sunmaktır.

2. TÜR BAZINDA SU İHTİYACI VE EŞİKLER

Su, hayvan organizmasındaki moleküllerin neredeyse %98'ini kapsar (NRC, 2001). Vücutta, hücre dışı ve hücre içi sıvılar da dahil olmak üzere dağılır ve toplam vücut suyunun sırasıyla %31 ila %38'ini ve %62 ila %69'unu içerir. Ayrıca tüm canlılar arasında en bol bulunan ve hayati önem taşıyan kimyasal substrat olarak kabul edilir (NRC, 2007).

Yetişkin hayvanların vücut kütlesinin yaklaşık %60'ını su oluştururken, yavrularda bu oran daha da yüksektir. Hayvanların metabolik faaliyetlerini sürdürebilmeleri için düzenli şekilde su tüketmeleri zorunludur. Sıvı gereksinimleri yalnızca içme suyu ile değil, aynı zamanda tükettikleri yemlerden ve metabolik süreçler sonucunda ortaya çıkan sudan da karşılanabilmektedir. Su, vücut sıcaklığının düzenlenmesinde, canlı ağırlığın korunmasında, sindirim sisteminin sağlıklı çalışmasında ve boşaltım işlevlerinde temel bir unsurdur. Bununla birlikte hayvanlar idrar, dışkı, solunum ve terleme yoluyla sürekli su kaybederler; bu kaybın yerine konulması yaşamsal önem taşır. Dolayısıyla hayvanların suya erişimi olmadan 3–4 günden fazla yaşamlarını sürdürmeleri mümkün değildir. Yeterli düzeyde su tüketmeyen hayvanlarda, dış görünüşleri üzerinden sağlık problemleri kolayca fark edilebilmektedir (NRC, 2007; Akinmoladun ve ark., 2019).

Ruminantların su gereksinimleri, içtikleri suyun yanı sıra yemlerde bulunan su ve metabolik faaliyetler sonucu oluşan sudan karşılanmaktadır (NRC, 2001). Bununla birlikte, hayvanın türü, yaşı, çevre sıcaklığı, üretim düzeyi, yemin nem oranı, enerji kaynağı ve protein miktarı gibi birçok faktör, ihtiyaç duyulan toplam su miktarını belirlemektedir (NRC, 2007; Araújo ve ark., 2010). Ayrıca, hayvanların istedikleri zaman temiz ve yeterli miktarda suya ulaşabilmeleri, hayvan refahının vazgeçilmez bir bileşeni olarak kabul edilmektedir (Yaylak ve Yavuz, 2016). Ancak, yetiştiricilerin önemli bir kısmı suyun miktarı ve kalitesi hakkında yeterli bilgiye sahip değildir (Beede, 2012).

Ruminantların içme suyuna karşı toleransları tür, üretim dönemi ve çevresel faktörlere bağlı olarak farklılık gösterebilir. Özellikle toplam çözünmüş madde (TDS), nitrat/nitrit ve sülfat seviyeleri bu açıdan kritik parametreler arasında yer almaktadır (Araújo ve ark., 2010). Örneğin, sığırlarda süt yaklaşık %87, gübre %88 ve vücut kütlesi %56–65 oranında sudan oluşmaktadır. Laktasyondaki ineklerin, canlı ağırlıklarına kıyasla diğer türlere göre daha yüksek düzeyde suya gereksinim duyduğu bilinmektedir (Beede, 1993). Sığırların suya olan ihtiyacı; rumen fermantasyonunun sağlıklı şekilde gerçekleşmesi, yemlerin sindirim kanalından uygun hızda

ilerlemesi, besin öğelerinin sindirilip emilmesi, iyon ve kan hacmi dengesinin korunması, metabolik atıkların vücuttan uzaklaştırılması, vücut ısısının dengelenmesi, fetüsün uygun ortamda gelişimi ile dokulara besin öğelerinin taşınması gibi birçok yaşamsal fonksiyonla doğrudan ilişkilidir. Bu nedenle bol, temiz ve kaliteli suyun sürekli olarak sağlanması büyük önem taşımaktadır (Adams ve Sharpe, 1995; NRC, 2001).

Çizelge 1. Ruminant türlerine ve çeşitli fizyolojik durumlarına göre günlük su tüketim aralıkları*

Tür/Fizyolojik durum	Günlük su tüketimi	Notlar
Süt sığırı – laktasyonda	70–155+	Süt verimine bağlı olarak artar; 1 L süt için ≈ 4 L su gereklidir.[1,2]
Süt sığırı – kuru/gebelik	34–49	Ortalama değerler; laktasyon dönemi dışı.[2]
Besi sığırı	40–80	Ağırlık ve çevre sıcaklığına bağlı; sıcaklık arttıkça ihtiyaç artar.[2]
Koyun – koç/gebelik	3.8–7.6	Üretim evresine göre değişir.[2]
Koyun – laktasyon	7.6–11.4	Süt verimine bağlı olarak artar.[2]
Kuzu	0.4–1.1	Yaşa ve büyüme hızına bağlıdır.[2]
Keçi – erişkin (bakım)	3.8–11.4	Bakım koşullarında ortalama değerler.[3]
Keçi – laktasyon	1.9–2.0 L su / 1 L süt	Süt verimine ek su ihtiyacı.[3,4]

*Linn ve Raeth-Knight, 2010; Meehan ve ark. 2015; Giger-Reverdin ve Gihad, 1991; Ehrlenbruch ve ark., 2010

Hesaplama kuralları

• Genel başparmak kuralı: Canlı ağırlığın yaklaşık her 45 kg için 3.8–7.6 L su/gün.
• Süt sığırlarında: ≈0.5 gal su / 1 lb süt (yaklaşık 4 L su / 1 L süt).
• Murphy denklemi (süt sığırı): GSİ (kg/gün) = 15.99 + 1.58×KMT + 0.90×GSM + 0.05×GNaT + 1.20×MOS.
• Keçi için pratik denklemler:
– Su (L/gün) = 3.86×GKT (kg/gün) − 0.99
– Su (L/gün) = 0.0795×CA(kg) + 0.4907

- **GST** → Günlük su alımı (kg ≈ litre)
- **GKT** → Kuru madde tüketimi (kg/gün)
- **GSM** → Süt üretimi (kg/gün)
- **GNaT** → Sodyum alımı (g/gün)
- **MOS** → Minimum ortam sıcaklığı (°C)

- **CA** → Canlı ağırlık (kg)

Ruminantlarda su tüketimi çevre sıcaklığı, rasyonun bileşimi ve suyun kalitesi gibi faktörlerden önemli ölçüde etkilenmektedir. Sıcaklık arttıkça su tüketimi artar ve özellikle süt sığırlarında sıcak stresi dönemlerinde su tüketimi iki katına çıkabilmektedir. Ayrıca, rasyonun tuz ve protein içeriği arttıkça hayvanların su ihtiyacı da yükselir. Su kalitesinin düşük olması (örneğin yüksek tuzluluk düzeyleri) yem tüketimini ve dolayısıyla performansı olumsuz etkileyebilmektedir (Beede, 1993).

Süt üretimi, gebelik ve büyüme/gelişme dönemi gibi faktörler su tüketimini önemli ölçüde artırmaktadır. Bu nedenle su ihtiyacının doğru belirlenmesi ve kaliteli suya sürekli erişimin sağlanması hayvan sağlığı ve verimliliği açısından kritik öneme sahiptir.

2.1. Su Kalitesinin önemi

İçme suyunun kalitesini olumsuz etkileyen birçok unsur, doğrudan ölüm ya da hastalığa yol açmasa da, hayvanların büyüme, gelişme, süt verimi ve üreme performansını olumsuz etkileyerek ciddi ekonomik kayıplara sebep olabilmektedir. Sığırlar, insanlar kadar düşük kaliteli sudan etkilenmeseler de bazı bileşiklerin yüksek düzeylerde bulunması, su tüketim isteğini azaltmaktadır (Braul ve Kirychuk, 2001). Hayvanların bu tür sulara verdikleri tepki; yaş, fizyolojik durum ve rasyonun içeriği gibi faktörlere göre değişiklik göstermektedir. Özellikle buzağılar ve laktasyonun erken dönemindeki inekler, kötü kaliteli sulara karşı daha hassastır. Ayrıca, suyun taşıdığı olumsuz unsurlar, sindirim sistemindeki diğer besin öğeleri ile etkileşime girerek emilimi azaltabilmektedir (Beede, 2012). Örneğin, içme suyunda yüksek düzeyde molibden ve sülfat bulunması, bakırın emilimini baskılamaktadır.

Dolayısıyla hayvancılıkta kullanılan suyun kalitesi söz konusu olduğunda yalnızca hayvanların verimliliği değil, aynı zamanda suyun hastalık yapıcı etkisi ve ürünün insan sağlığına olası yansımaları da göz önünde bulundurulmalıdır. Kötü kaliteli suyun olumsuz etkileri yalnızca hayvanla sınırlı kalmayıp, aynı zamanda su borularında mineral birikimine ve mikroorganizmaların çoğalmasına bağlı olarak tıkanmalara yol açabilmektedir. Bu durum su akışını azaltırken, işletmenin sürdürülebilirliğini de olumsuz etkilemektedir (Araújo ve ark., 2010; Cemek ve ark., 2011; Anonim, 2013).

Sığırlar, yüksek süt verimleri nedeniyle fazla miktarda suya ihtiyaç duymakta, rumen ve sindirim kanalı ülserleri gibi sağlık sorunlarına yatkınlık göstermekte ve metabolizmanın sağlıklı işleyebilmesi için rumen pH'sının 6.4–7.0 aralığında tutulması gerekmektedir. Rumen mikroflorası ve metabolizması suya doğrudan bağlı olduğundan, bu tür nedenlerle sığırlar su kalitesine karşı oldukça duyarlıdır (Adams ve Sharpe, 1995).

2.2 Ruminatların içme suyu kalite ölçütleri

Bir suyun "içilebilir" kabul edilebilmesi için belirli kriterleri karşılaması gerekir. Bu kriterler, fiziksel (renk, koku, sıcaklık gibi), kimyasal (sertlik, pH) ve biyolojik (bakteri, virüs ve diğer zararlı mikroorganizmalar) özellikler temelinde değerlendirilir. İçme suları, bu özelliklere göre çok sayıda parametreye tabi tutularak analiz edilir ve yalnızca sonuçlar uygun çıktığında kullanım için şebekelere verilir (NRC, 2007).

Temel olarak içme sularında aranan başlıca özellikler şunlardır:

- Renksiz, kokusuz ve berrak olması,
- Uygun sertlik düzeyine sahip olması,
- Hastalık yapıcı mikroorganizmaları barındırmaması,
- Demir, mangan ve hidrojen sülfür gibi istenmeyen maddeleri içermemesi,

- Arsenik, kurşun, cıva, radyoaktif maddeler ve amonyum gibi zararlı kimyasallardan arındırılmış olması (Araújo ve ark., 2010; Beede, 2012; Bozorg-Haddad ve ark., 2016; Pandit ve Kumar, 2019).

İnsanlar için geçerli olan bu kriterler, ruminantlar için de büyük ölçüde benzerlik göstermektedir. Sığırların içme suları açısından beş temel kalite ölçütünden söz edilebilir. Bunlar: **organoleptik özellikler** (tat ve koku), **fizikokimyasal parametreler** (pH), toplam çözünmüş madde, toplam çözünebilen tuz, **toksik bileşikler** (ağır metaller, toksik mineraller, organofosfatlar ve hidrokarbonlar), **aşırı miktarda bulunan mineraller ve bileşikler** (nitratlar, sodyum sülfatlar, demir) ve **mikroorganizmaların varlığıdır** (Beede, 1993).

Çizelge 2. Çiftlik hayvanlarının içme suları çeşitli parametreleri: Verime etki tablosu

Parametre	Sorunsuz	Hafif uyumsuzluk	Verim kaybı riski
Toplam çözünmüş madde	0–960.0	960.0–3000.0	>3000.0
pH	6.0–8.5	8.5	>8.5
Alüminyum	0–5.0	5.0–10.0	>10.0
Arsenik	0–0.2	0.2	>0.2
Baryum	0–1.0	1.0	>1.0
Bikarbonat	0–1000.0	1000.0	>1000.0
Bor	0–5.0	5.0–30.0	>30.0
Kadmiyum	0–0.01	0.01–0.05	>0.05
Kalsiyum	0–100.0	100.0–200.0	>200.0
Klorid	0–100.0	100.0–300.0	>300.0
Krom	0–0.1	0.1–1.0	>1.0
Bakır	0–0.2	0.2–0.5	>0.5
Florür	0–2.0	2.0	>2.0
Demir	0–0.2	0.2–0.4	>0.4
Kurşun	0–0.05	0.05–0.1	>0.1
Magnezyum	0–50.0	50.0–100.0	>100.0
Manganez	0–0.05	0.05–0.5	>0.5
Civa	0–0.01	0.01	>0.01
Molibden	0–0.03	0.03–0.06	>0.06
Nikel	0–0.25	0.25–1.0	>1.0
Nitrat-Nitrojen	0–20.0	20.0–100.0	>100.0
Fosfor	0–0.7	0.7	>0.7
Potasyum	0–20.0	20.0	>20.0
Selenyum	0–0.05	0.05–0.1	>0.1
Gümüş	0–0.05	0.05	>0.05

Sodyum	0–50.0	50.0–300.0	>300.0
Sülfatlar	0–150.0	150.0–900.0	>900.0
Vanadyum	0–0.1	0.1	>0.1
Çinko	0–5.0	5.0–25.0	>25.0

*pH hariç diğer özelliklerin konsantrasyon birimi mg/L'dir.(Chase, 2002; Socha ve ark., 2003; Swistock, 2023; Afzal & Mahreen, 2024; Kamal, ve ark., 2024).

2.2.1 Suyun organoleptik özellikleri

Organoleptik özellikler, içme suyunun tat, koku, renk ve bulanıklık gibi duyularla algılanabilen nitelikleridir. Bu özellikler, suyun içilebilirlik açısından değerlendirilmesinde önemli ölçütler arasında yer almaktadır.

İçme suyunda hoş olmayan tat ve kokuların ortaya çıkmasının sebepleri genellikle suyun fizikokimyasal yapısı, bazı maddelerin normalin üzerinde bulunması ya da bakteriler ve onların metabolik yan ürünlerinin varlığı ile ilişkilidir (Beede, 2006). Ayrıca dışkı bulaşı, suyun tat ve kokusunu bozarak kalitesini düşürmektedir. Nitekim sudaki dışkı kalıntısının %0.25'in üzerine çıkması, sığırların su tüketimini belirgin şekilde azaltmaktadır (Braul ve Kirychuk, 2001). Bununla birlikte, demir ve mangan gibi minerallerin yüksek düzeylerde bulunması da suyun tat ve kokusunu olumsuz etkileyerek hayvanların suyu içmekten kaçınmasına ve farklı kaynaklardan su arayışına yönelmesine neden olmaktadır.

Çizelge 3. Ruminantlar için içme suyundaki parametreler, sınır değerleri ve olası olumsuzluklar*

Parametre (mg/L)	Ruminantlar üzerindeki olasi olumsuzluk etkileri
Toplam çözünmüş madde (TDS)	İştah azalması, su tüketiminde düşüş, elektrolit dengesizlikleri, ishal, verim kaybı
pH	Aşırı alkali pH → iştah azalması, mineral biyoyararlanımının bozulması
Alüminyum (Al)	Fosfor emiliminin engellenmesi, kemik gelişiminde bozulma, sinirsel etkiler
Arsenik (As)	Kronik zehirlenme, iştahsızlık, kilo kaybı, gastrointestinal sorunlar
Baryum (Ba)	Kas zayıflığı, kardiyak ritim bozukluğu, sinir sistemi bozuklukları
Bikarbonat (HCO_3^-)	Metabolik alkaloz, mineral emilim bozuklukları
Bor (B)	İshal, böbrek hasarı, üreme bozuklukları
Kadmiyum (Cd)	Böbrek ve karaciğer hasarı, hematolojik anormallikler, büyüme geriliği
Kalsiyum (Ca)	Hipomagnezemi riski, böbrek taşı, süt veriminde azalma
Klorid (Cl^-)	Tuz zehirlenmesi, iştah kaybı, dehidrasyon
Krom (Cr)	Oksidatif stres, karaciğer ve böbrek hasarı
Bakır (Cu)	Kronik bakır zehirlenmesi (özellikle koyunlarda), karaciğer nekrozu

Florür (F^-)	Dental fluorozis, kemik deformasyonları, süt veriminde düşüş
Demir (Fe)	Su tadında bozulma, iştah azalması, sekonder bakır ve çinko eksikliği
Kurşun (Pb)	Sinir sistemi bozuklukları, anemi, böbrek hasarı, gelişim bozuklukları
Magnezyum (Mg)	Laksatif etki, süt veriminde azalma
Manganez (Mn)	Büyüme geriliği, üreme bozuklukları, sinir sistemi etkileri
Cıva (Hg)	Şiddetli nörotoksisite, böbrek ve karaciğer hasarı
Molibden (Mo)	Bakır emilimini engeller → sekonder Cu eksikliği (anemi, ishal, pigment kaybı)
Nikel (Ni)	İştahsızlık, büyüme geriliği, toksisite
Nitrat-N (NO_3^--N)	Methemoglobinemia (hipoksi, ölümler), iştah azalması
Fosfor (P)	Üriner taş riski, Ca/P dengesizliği
Potasyum (K)	DCAD dengesizliği, doğum felci riskinde artış
Selenyum (Se)	Kronik Se zehirlenmesi → 'alkali disease' (tırnak deformasyonu, zayıflık)
Gümüş (Ag)	Yüksek düzeylerde gastrointestinal bozukluklar
Sodyum (Na)	Tuz zehirlenmesi, sinir sistemi bozuklukları, su tüketiminde artış
Sülfatlar (SO_4^{2-})	Polioencephalomalacia, ishal, iştah kaybı
Vanadyum (V)	İshal, sinir sistemi bozuklukları, büyüme geriliği
Çinko (Zn)	Kronik aşırı alım → anemi, bakır eksikliği, iştahsızlık

*Beede, 2012: Oraby ve ark., 2021; Florea, ve Büsselberg, 2006; Smedley ve Kinniburgh, 2002; Clarkson ve Magos, 2006; WHO. 2017; Jomova ve ark., 2011; Slivinska at al., 2020).

2.2.2 Suyun fizikokimyasal özellikleri

Su kaynaklarının değerlendirilmesinde en çok kullanılan ölçütlerden biri, suyun fizikokimyasal özellikleridir. Bu kavram; fiziksel nitelikleri, kimyasal bileşimi, tuzluluk, sertlik ve pH gibi parametreleri kapsamaktadır (Yaylak ve Yavuz, 2016). Söz konusu özellikler çoğunlukla doğrudan hayvan sağlığı için risk oluşturmaz; ancak bazı durumlarda çeşitli hastalıkların ortaya çıkmasında etkili faktörlerden biri olabilir (Adams ve Sharpe, 1995; NRC, 2001). Aşağıda, içme suyunun başlıca fizikokimyasal özelliklerinden bazıları ele alınmıştır.

2.2.3 Toplam çözünmüş madde (TDS)

Toplam çözünmüş madde (TDS), bir suyun içerdiği toplam mineral miktarını gösterir ve doğrudan hayvanın iştahını, yem tüketimini ve verimliliğini etkiler. Genel kabul gören görüşe göre, TDS düzeyinin 500 mg/L'nin altında olması tüm hayvan türleri için güvenli kabul edilmektedir. Bununla birlikte, farklı türler TDS seviyelerine karşı değişen tolerans aralıklarına sahiptir.

Çizelge 4. Türlere göre TDS düzeyleri (mg/L)*

Tür	Sorunsuz	Hafif uyumsuzluk	Verim kaybı riski	Uygun değil
Besi sığırı	0–4000	4000–5000	5000–10000	>10000
Süt sığırı	0–2400	2400–4000	4000–7000	>7000
Koyun	0–4000	4000–10000	10000–13000	>13000
Keçi	0–4000	4000–10000	10000–13000	>13000

*Soltanpour ve Raley, 1999; Lipson ve ark., 2019; McGregor March, 2004; De Camillis, ve ark., 2023; Swistock, 2023; Patra ve ark., 2024.

Süt ineklerinde yüksek TDS seviyeleri, özellikle **laktasyon döneminde süt verimini azaltabilmekte** ve **ishal ile mineral dengesizliklerine** yol açabilmektedir (NRC, 2001). Koyun ve keçiler, sığırlara kıyasla daha yüksek mineral yüküne tolerans gösterebilmekle birlikte, 10.000 mg/L üzerindeki değerler bu türlerde de üretim ve sağlık sorunlarına neden olmaktadır (Akinmoladun ve ark., 2019; CCME, 2002).

2.2.3.1 Suyun asitliği

Suyun asidik ya da alkali yapısını ifade etmek için pH kavramı kullanılmaktadır. pH değeri 7 olduğunda nötr, 7'nin altına düştüğünde asidik, 7'nin üzerine çıktığında ise alkali özellik göstermektedir. Suyun pH derecesinin hayvan sağlığı, verimi ve su tüketimi üzerindeki etkileri hakkında sınırlı sayıda araştırma bulunmaktadır. Bununla birlikte, sığırlar için ideal pH aralığı 6–8 olarak kabul edilmektedir. Bu aralığın dışındaki değerler; sindirim sistemi rahatsızlıkları, ishal, yemden yararlanmanın düşmesi, yem ve su tüketiminde azalma gibi olumsuzluklara yol açabilmektedir. Özellikle pH'nın 5.5'in altına düşmesi, hafif asidozis kaynaklı problemlerin görülmesine neden olurken; pH'nın 8.5'in üzerine çıkması durumunda su alkali özellik kazanmakta ve hayvanda hafif alkalozis belirtileri ortaya çıkabilmektedir (Göncü-Karakök ve ark., 2008).

2.2.3.2 Suyun tuzluluğu

Suyun tuzluluğu, toplam çözünmüş madde (TÇM), toplam çözünmüş tuzlar (TÇT) ve suda çözünebilen maddelerin bir göstergesi olup, genellikle **mg/L** veya **elektriksel iletkenlik (µmhos/cm)** cinsinden ifade edilmektedir (Bagley ve ark., 1997). Tuzluluk çoğunlukla sodyum klorür kaynaklıdır; ancak bikarbonat, sülfat, kalsiyum, magnezyum ve silisyum seviyeleri de bu duruma katkı sağlayabilmektedir (Yaylak ve Yavuz, 2016). Ayrıca kalsiyum, magnezyum ve sodyum iyonlarının; klor, sülfat, nitrat, karbonat ve bikarbonatlarla birleşmesi sonucunda oluşan inorganik tuzlar, çiftlik hayvanlarının sulama sularında yaygın şekilde görülmektedir (Thiex ve German, 2004; German ve ark., 2008).

Suya tuzluluk kazandıran minerallerin fazlalığı toksik etki gösterebilmekte ya da diğer elementlerle etkileşime girerek zararlı sonuçlar doğurabilmektedir. Örneğin fazla miktarda sodyum alımı kan basıncını yükseltebilir; farklı tuz türleri birlikte bulunduğunda ise eklemeli etkiler nedeniyle hayvan sağlığı daha ciddi şekilde olumsuz etkilenebilir. Bu nedenle, yalnızca toplam tuz miktarının değil, suda bulunan tuzların türlerinin de belirlenmesi önemlidir. Nitekim sülfat tuzlarının, klorür ve karbonat tuzlarına kıyasla daha fazla sağlık sorunu oluşturabileceği bildirilmektedir (Thiex ve German, 2004; German ve ark., 2008).

Çiftlik hayvanları için en uygun suyun tuzluluk seviyesi **0–1000 mg/L** aralığındadır. Tuzluluk değeri 3000 mg/L'yi aşan sular düşük kaliteli kabul edilmektedir. Tuz konsantrasyonu 10000 mg/L düzeyine ulaştığında su "yüksek tuzlu" sınıfına girmektedir. Yetişkin sığırlar bu

düzeydeki suları tüketebilmelerine rağmen, tuzluluk 35000 mg/L'nin üzerine çıktığında suyun yapısı deniz suyu veya salamura özelliği kazanmakta ve tüketim açısından ciddi risk oluşturmaktadır (Bagley ve ark., 1997; Yirga ve ark., 2024).

Çizelge 5. Sığırların içme sularında toplam çözünmüş tuzların (tçt) seviyeleri*

Tuz İçeriği (mg/L)	Sınıflandırma Kaynak 1 (UF)	Sınıflandırma Kaynak 2 (NMSU Extension)
0–1 000	Sorun yaratmaz; düşük tuzluluk	Mükemmel su; tüm hayvanlar için ideal
1 000–2 999	Genelde iyi; hafif ishal olabilir	Çok tatmin edici; geçici ishal riski
3 000–4 999	Tatmin edici (büyükbaş için); kanatlılar için kötü	Tatmin edici (büyükbaş için); kanatlılar için kötü
5 000–6 999	Makul güven; hamile/süt veren ve kanatlı hayvanlara uygun değil	Marjinal kalite; hamile ve süt veren hayvanlara uygun değil; kanatlıya uygun değil
7 000–10 000	Riskli; kaçınılmalı	Kanatlılar/domuzlar için uygun değil; riskli
> 10 000	Hiç önerilmez; riskli	Ciddi risk; kullanılmamalı
~35 000	Tuzlu su / salamura grubuna girer	Belirtilmemiş

*Bagley ve ark., 1997; Yirga ve ark., 2024.

2.2.3.3 Suyun sertliği

Bir suyun sertliği, içerdiği başlıca çözünmüş **kalsiyum ve magnezyum tuzlarından** kaynaklanmakta ve suyun sabunu çöktürme kapasitesi ile ilişkilendirilmektedir. Sertlik kavramı, sıklıkla tuzluluk ile karıştırılsa da aynı anlama gelmemektedir. Sabun, özellikle suda yaygın olarak bulunan kalsiyum ve magnezyum iyonları tarafından çökeltilirken; demir (Fe), alüminyum (Al), mangan (Mn) ve çinko (Zn) gibi diğer çok değerli metallerin yanı sıra hidrojen iyonları da bu etkiye katkı sağlayabilmektedir. Ancak bu iyonlar, genellikle oldukça düşük konsantrasyonlarda bulunduklarından sertlik açısından belirleyici değildir.

Suyun sertliği, çoğunlukla **kalsiyum ve magnezyum iyonlarının kalsiyum karbonat ($CaCO_3$) cinsinden toplam konsantrasyonu** şeklinde ifade edilir. Bununla birlikte, ölçülebilecek düzeylerde bulunan sertlik oluşturan diğer iyonları da kapsayabilmektedir. Sertlik iki ana kategoriye ayrılmaktadır:

- **Geçici (karbonat) sertlik**: Kalsiyum ve magnezyum bikarbonatlarının varlığından kaynaklanır. Kaynatma işlemi ile giderilebilir.
- **Kalıcı (karbonat olmayan) sertlik**: Kalsiyum ve magnezyum sülfat ile klorürlerden ileri gelir ve kaynatmayla ortadan kaldırılamaz.

Her iki sertliğin toplamına ise **toplam sertlik** adı verilmektedir. Sertlik derecesi, ülkemizde genellikle **Fransız sertliği (°Fr)** ya da **mg/L $CaCO_3$** birimleri ile sınıflandırılmaktadır. Bu ölçümler, suda bulunan iyonların miktarını tanımlamada kullanılır.

Mevcut bulgulara göre, sığırların sert su tüketmesi durumunda sağlık açısından olumsuz bir etki gözlenmemiştir (NRC, 2001; Yaylak ve Yavuz, 2016; Cervantes ve ark., 2024).

Çizelge 6. Su sertlik sınıflandırma değerleri*

Su sertlik dereceleri	Fransız sertliği(Fr derecesi)	sertlik Suda çözünmüş tuzların ağırlığına (mg/L) göre
Çok yumuşak su	0-5	
Yumuşak su	5-10	[1] Yumuşak 0-60 mg/l.
Orta sert su	10-20	[2] Orta sertlikte 61-120 mg/l.
Sert su	20-30	[3] Sert121-180 mg/l
Çok sert su	> 30	[4] Çok sert -180 mg/l'nin üzerinde

* NRC, 2021.

2.2.4 İçme sularında mineral veya bileşiklerin fazla miktarda bulunması

Nitratlar, sodyum, sülfatlar ve demir gibi element ya da iyonlar bu başlık altında incelenebilmektedir. İçme sularında mineral ve bileşiklerin fazla miktarda bulunması hayvanlarda verim düşmelerine, hastalıklara veya su tüketiminin azalmasına yol açabilmektedir. İçme sularında bulunan bazı mineral ve bileşikler aşağıda açıklanmıştır.

2.2.4.1 Nitratlar

Nitrat (NO_3^-) ve Nitrit (NO_2^-)

Ruminantlar için **nitrat (NO_3^-) ve nitrit (NO_2^-)** düzeyleri önemli toksikolojik riskler taşımaktadır.

Nitrat: Genel olarak güvenli kabul edilen düzey 100 mg/L'nin altıdır. Sığırlarda 400 mg/L'nin üzerine çıkıldığında yem tüketiminde azalma, methemoglobinemi ve verim kayıpları görülebilmektedir.

Nitrit: Daha yüksek toksisiteye sahiptir ve 10 mg/L'nin üzerindeki değerler riskli kabul edilmektedir (CCME, 2002; Kamra ve ark., 2015).

Nitrat ve nitrit seviyelerinin özellikle yoğun gübreleme yapılan tarım alanlarındaki kuyularda daha yüksek olduğu bildirilmektedir (Dokuz ve ark., 2025). Nitekim gübreler, içme sularındaki nitratın temel kaynaklarından biridir. Yeraltı ve yüzey sularındaki nitrat kirliliği, genellikle gübre depoları veya kimyasal gübrelerden kaynaklanan doğrudan bulaşma ile ilişkilidir (Beede, 2006). Nitrat, nitrite göre suda daha yüksek yoğunlukta bulunur (Thiex ve German, 2004; German ve ark., 2008). Rumen bakterileri nitratı nitrite indirgerken; nitrit, kanın oksijen taşıma kapasitesini azaltarak oksijen yetersizliğine bağlı ölümlere yol açabilmektedir (NRC, 2001). Bu nedenle hem su hem de yem kaynaklı nitrat miktarları birlikte değerlendirilmelidir.

Sığırların içme sularında **önerilen üst sınır** nitrat-nitrojen (N) için 100 mg/L veya nitrat (NO_3^-) için 450 mg/L'dir (Braul ve Kirychuk, 2001). Nitrat-nitrojen seviyesinin 100 mg/L'yi aşmasıyla olumsuz etkiler görülmeye başlamakta; 500–1000 mg/L arasında orta düzey belirtiler, 1000 mg/L'nin üzerinde ise akut klinik bulgular ortaya çıkmakta ve ölüm gerçekleşebilmektedir (Adams ve Sharpe, 1995). Zehirlenme genellikle nitrat alımını takiben 3–5 saat içerisinde ölümle sonuçlanabilir. Ancak nitratla kirlenmiş sularda çoğunlukla **akut yerine kronik zehirlenme** görülmektedir (Braul ve Kirychuk, 2001). Kronik vakalar klinik belirtiler göstermeksizin ilerleyebilir.

Akut nitrat/nitrit zehirlenmesinin belirtileri arasında koordinasyon bozukluğu, ayağa kalkamama, kas titremeleri, çırpınma, solunum güçlüğü, nabız artışı, ağızda köpüklenme, ağız

ve burunda siyanoz, göz çevresinde mavimsi renk değişimi ve kanın koyu kahverengi görünümü yer almaktadır (NRC, 2001; Thiex ve German, 2004; German ve ark., 2008). Kronik zehirlenmelerde ise iştahsızlık, kilo kaybı, bağışıklığın zayıflaması, düşük yapma riskinin artması gibi etkiler ortaya çıkmaktadır. Orta düzey maruziyetler, büyüme geriliğine, A vitamini kullanımında azalmaya ve genel sağlık sorunlarına yol açabilmektedir (NRC, 2001; Anonim, 2013). Ayrıca yapılan bazı çalışmalarda, sudaki nitrat düzeyinin artmasının tohumlama sayısını yükselttiği ve ilk tohumlamada gebelik oranını düşürdüğü belirlenmiştir (Kahler ve ark., 1975).

Çizelge 7. Ruminantların içme sularındaki nitrat düzeyleri*

Nitrat (NO_3,mg/L)	Nitrat-Nitrojen (NO_3N,mg/L)	Tavsiyeler
0-44	0-10	Ruminantlar için güvenli
45-132	10-20	Genellikle düşük nitratlı dengeli rasyonlarda güvenli
133-220	20-40	Uzun süre tüketildiğinde zararlı olabilir
221-660	40-100	Sığırlar için riskli ve ölüme neden olabilir
661	100	Güvenli değil, ölüm görülebilir ve su kaynağı olarak kullanılmamalı.

NRC, 2001.

2.2.4.2 Sülfür ve sülfatlar

Sülfat (SO_4^{2-}) düzeyi de ruminantlarda kritik bir parametredir.

- **<500 mg/L:** Genellikle güvenli.
- **500–1000 mg/L:** Bazı rehberlere göre hâlâ tolere edilebilir; ancak sıcak iklimlerde veya yüksek kükürt içerikli yemlerle beraber risk artmaktadır.

>2000–3000 mg/L: Özellikle genç ruminantlarda **polioensefalomalasi (PEM)** ve ishal riski önemli derecede yükselmektedir (Kandylis, 1984; Knight, 1985; Veenhuizen ve Shurson, 1992; Loneragan ve ark., 2001; Weeth ve Hunter, 1971).

Sülfatın rasyon mineralleriyle etkileşimi de dikkate alınmalıdır. Özellikle **yüksek sülfat + molibden varlığında** bakır emilimi azalır ve ikincil bakır yetersizliği gelişebilir (Suttle, 2010).

Suda **hidrojen sülfür** bulunması, suya çürük yumurta kokusu vermekte ve bu durum sığırların su tüketimini azaltabilmektedir (Beede, 2006). İçme suyunda sülfatın kabul edilebilir düzeyleri, hayvanın yaşına göre değişiklik göstermektedir. Önerilen sınır buzağılar için **500 mg/L**, yetişkin sığırlar için ise **1000 mg/L**'dir. Özellikle 1200 mg/L düzeyinde sülfat içeren suların, erken laktasyondaki ineklerde yem ve su tüketimini azalttığı, ayrıca gecikmiş plasenta atımı ile abomasum deplasmanını artırdığı bildirilmiştir (Beede, 2006).

Suyun sülfat içeriği 500 mg/L'nin üzerine çıktığında, bu değer sülfür formunun potansiyel toksisite riski açısından kritik kabul edilmektedir. Bu nedenle, sulardaki sülfat ve sülfürün hangi tuz formunda bulunduğunun belirlenmesi gereklidir. Zira farklı sülfat formlarının toksisite düzeyleri farklıdır (Socha ve ark., 2003). En yaygın sülfat tuzları; **kalsiyum, demir, magnezyum ve sodyum sülfatlar**dır. Bunlar arasında en zehirli form hidrojen sülfittir ve litrede yalnızca 0.1 mg gibi düşük konsantrasyonlarda bile su tüketimini azaltabilmektedir (NRC, 2001; Beede, 1993).

Sülfatlar genel olarak **laksatif etkiye** ve acı bir tada sahiptir. Bu formlar içerisinde en güçlü etkiyi gösteren **sodyum sülfat**, en fazla su tüketimini azaltan ise **demir sülfat** olarak bilinmektedir (Socha ve ark., 2003; Beede, 1993). Yüksek sülfat içeren sular (2000–2500 mg/L) sığırlar tarafından ilk tüketildiğinde ishale yol açmakta, fakat zamanla hayvanlarda bu etkiye karşı tolerans gelişmektedir. Bununla birlikte, aşırı sülfat seviyesi, **bakır ve selenyum gibi temel minerallerin emilimini** de olumsuz etkilemektedir (Socha ve ark., 2003).

Sülfat fazlalığının bir diğer olumsuz etkisi ise **sinir sistemi üzerindedir**. 3000 mg/L veya daha yüksek sülfat içeren suların tüketimi, **polioencephalomalacia (PEM)** olarak bilinen, beyinde yangı, ödem ve doku nekrozu ile seyreden ciddi bir nörolojik hastalığa yol açabilmektedir (Patterson ve ark., 2002; Patterson ve ark., 2003). PEM'in ortaya çıkmasında iki temel mekanizma rol oynamaktadır:

1. **Tiamin eksikliği**: Aşırı sülfür tüketimi sonucu gelişmekte, hayvanlara tiamin takviyesi yapıldığında önlenebilmektedir.

2. **Hidrojen sülfür toksisitesi**: Yüksek sülfatlı sular, rumende hidrojen sülfür (H_2S) üretimini artırmakta ve toksik etki oluşturmaktadır (Loneragan ve ark., 2001).

Yoğun yem tüketimi sonucu rumen pH'sının düşmesi de sülfüre bağlı PEM gelişimini kolaylaştırmaktadır. Ayrıca yüksek sülfür tüketimi, ruminantlarda **bakır eksikliğine** neden olabilmektedir. Özellikle genç sığırlarda sülfür düzeyi yüksek suların tüketilmesi, karaciğerdeki bakır depolarının hızla tükenmesine yol açmaktadır (Wright ve ark., 2000; Wright ve Patterson, 2005). Bu durum, hayvanların büyümesini, bağışıklığını ve üreme performansını olumsuz etkilemektedir (Thiex ve German, 2004; German ve ark., 2008).

2.2.4.3 Ağır metaller

Çiftlik hayvanlarının içme sularında bulunan ağır metaller, düşük düzeylerde dahi uzun süreli maruziyetle toksik etkiler gösterebilir. Ağır metaller çevresel açıdan kalıcıdır, biyobirikim yapabilir ve gıda zinciri yoluyla insan sağlığı için de risk oluşturur (WHO, 2017).

Ağır Metallerin Çevresel Kaynakları

- **Endüstriyel faaliyetler:** Madencilik, metal işleme, enerji santralleri ve kimyasal fabrikalar su kaynaklarına Pb, Cd, Cr, Hg gibi metallerin geçişine neden olabilir (Ali et al., 2019).

- **Tarımsal kaynaklar:** Fosfatlı gübrelerde Cd, pestisitlerde As bulunabilmekte, bu da sulama ve yeraltı sularına taşınabilmektedir.

- **Doğal jeolojik yapı:** Özellikle arsenik ve krom, bazı bölgelerde doğal kayaç yapılarından sulara karışabilir (Smedley & Kinniburgh, 2002).

Hayvan Sağlığı Üzerindeki Etkiler

Ağır metaller, ruminantlarda ve diğer çiftlik hayvanlarında metabolik, hematolojik ve üreme bozukluklarına yol açabilir:

- **Kadmiyum (Cd):** Uzun süreli maruziyet böbrek ve karaciğer hasarı, hematolojik parametrelerde düşüş ve oksidatif stres artışı ile ilişkilidir. Oraby ve ark. (2021) Ossimi koyunlarında Cd maruziyetinin rumen fermentasyonu ve kan değerlerinde ciddi bozulmalara neden olduğunu rapor etmiştir.

- **Kurşun (Pb):** Nörotoksik etki, anemi, böbrek fonksiyon bozukluğu ve büyüme geriliği ile ilişkilidir (Florea & Büsselberg, 2006).

- **Arsenik (As):** Kronik maruziyet deri lezyonları, gastrointestinal bozukluklar ve bazı kanser türleri ile ilişkilidir. Hayvanlarda üreme bozuklukları da bildirilmiştir (Jomova et al., 2011).

- **Cıva (Hg):** Sinir sistemi toksisitesi ön plandadır. Balıkla beslenen su kuşlarında ve suya yakın yetiştirilen hayvanlarda birikim gösterebilir (Clarkson & Magos, 2006).

Türkiye ve Dünyadan Bulgular

Türkiye'de farklı bölgelerde yapılan çalışmalar, içme sularında ağır metallerin varlığını ortaya koymuştur. Örneğin Iğdır'da yapılan bir çalışmada, Pb ve Cd düzeylerinin çoğunlukla sınırların altında olduğu, ancak düzenli izleme gerekliliğinin altı çizilmiştir (Karademir ve ark., 2020) Mısır'da yapılan çalışmalarda ise Cd maruziyetinin koyunlarda rumen metabolizmasını ve antioksidan kapasiteyi bozduğu gösterilmiştir (Oraby et al., 2021). Dünya genelinde özellikle Güney Asya'da arsenik kontaminasyonu yaygın olup, hem insan hem de hayvan sağlığında kritik sorunlara yol açmaktadır (Smedley & Kinniburgh, 2002).

Tolerans Değerleri ve Düzenlemeler

Çiftlik hayvanları için spesifik sınır değerler uluslararası kuruluşların önerilerine dayanmaktadır:

- **FAO/WHO (2011)**: İçme sularında Pb için <0.01 mg/L, Cd için <0.003 mg/L sınır değeri.

- Cotruvo **(2018)**: İçme suyunda Pb için maksimum kontaminant seviyesi 0.015 mg/L.

- Türkiye'de **TS 266 İçme Suyu Standardı** ve **Yüzeysel Su Kalitesi Yönetmeliği** esas alınmaktadır; ancak bu değerlerin çoğu insan sağlığına yönelik olup, hayvan fizyolojisine uyarlanması gereklidir.

Yönetim ve Önleme Stratejileri

- **Düzenli su analizi:** Mevsimsel olarak ağır metal analizlerinin yapılması.

- **Kaynak yönetimi:** Endüstriyel deşarjların kontrolü, tarımda ağır metal içeriği düşük girdilerin kullanılması.

- **Filtrasyon ve arıtım:** Aktif karbon, iyon değiştirici reçineler ve membran teknolojileri kullanılarak ağır metallerin sudan uzaklaştırılması (Fu & Wang, 2011).

- **Besleme desteği:** Selenyum, vitamin E ve C gibi antioksidanların kullanımı ile ağır metal kaynaklı oksidatif stresin azaltılması (Habeeb et al., 2019).

İçme sularında **mangan**, çoğunlukla **demir** ile birlikte değerlendirilmelidir. Sulama sistemlerinde, filtrelerde veya borularda görülen siyah lekeler ve tortular, sudaki mangan seviyesinin yüksek olduğuna işaret eder (Beede, 2006).

Süt sığırlarında sorun oluşturan en önemli minerallerden biri de demirdir. Özellikle sülfat ve klorür anyonları ile birlikte düşünüldüğünde, demir düzeyinin yüksekliği suyun kalitesini olumsuz etkileyebilir. Yem katkı maddelerinde bol miktarda **ferrik demir (Fe^{3+})** bulunduğundan demir eksikliği genellikle bir problem oluşturmaz. Ancak içme suyunda **0.3 mg/L'den fazla demir** bulunması, sığır sağlığı açısından riskli kabul edilmektedir (Beede, 2005).

Suda bulunan **ferro (Fe^{2+})** formu, yemlerdeki ferrik (Fe^{3+}) demire kıyasla daha kolay çözünebilmekte ve bu da suyla fazla miktarda demir alımına neden olarak zehirlenme riskini artırabilmektedir (Beede, 2006). Demirin yüksek düzeyde bulunması yalnızca su tüketimini azaltmakla kalmaz; aynı zamanda **demir bakterilerinin çoğalmasına** yol açarak suluklarda

koyu renkli çamur tabakaları oluşturur. Bu durum hem suyun akış hızını düşürmekte hem de hayvanların **bakır ihtiyacını artırmaktadır** (Adams ve Sharpe, 1995).

Ağır metaller genel anlamda çiftlik hayvanlarının sağlığı ve verimliliği üzerinde ciddi tehditler oluşturmaktadır. Bu minerallere maruziyet yalnızca hayvan refahını etkilemekle kalmaz, hayvansal ürünler yoluyla **insan sağlığı** açısından da risk taşır. Dolayısıyla düzenli izleme yapılması, hayvanlara özgü tolerans değerlerinin belirlenmesi, uygun su arıtma yöntemlerinin uygulanması ve çiftlik yönetiminde sürdürülebilir yaklaşımların benimsenmesi kritik önem taşımaktadır.

2.2.4.4 İçme sularında mikroorganizmalar

Hayvanların tükettiği sularda **virüs, bakteri, mavi-yeşil algler ve protozoaların** bulunması, düşük su kalitesinin göstergesidir. Patojenler doğrudan tespit edilemediğinde, genellikle indikatör organizmalar aracılığıyla suyun hijyen durumu belirlenmektedir (Yaylak ve Yavuz, 2016). Bu amaçla en sık kullanılan indikatörler **fekal koliformlar**dır. Toplam bakteri sayısı ise hem zararlı hem de zararsız bakterilerin varlığını gösterir (Popescu ve ark., 2011). **Toplam koliform bakteriler**, çevresel (toprak, bitki vb.) ve fekal (dışkı kaynaklı) türlerin toplamını ifade etmektedir (Beede, 1993; Popescu ve ark., 2011).

Araştırmalar, sığırların tükettikleri sularda mikrobiyal yük için üst sınırların farklı olduğunu göstermektedir. Looper ve Waltner (2002), toplam bakteri için **5000 adet/L,** toplam koliform için **150 adet/L,** fekal koliform için ise **100 adet/L** sınır değer bildirmiştir. Socha ve ark. (2003) ise bu sınırları sırasıyla **1000 adet/100 mL, 0.5 adet/100 mL** ve **0.1 adet/100 mL** olarak belirtmiştir. Buzağılarda toplam ve fekal koliform sınırı **1 adet/100 mL**, yetişkinlerde ise sırasıyla **10** ve **15 adet/100 mL** olmalıdır. Ayrıca fekal streptokokların, buzağılarda **3 adet/100 mL**, yetişkinlerde ise **30 adet/100 mL**'yi aşmaması önerilmektedir. Toplam bakteri sayısının **1 milyon/100 mL**'yi geçtiği durumlarda hiçbir çiftlik hayvanının bu suyu tüketmemesi gerektiği bildirilmiştir (Beede, 1993).

Su kaynağı türü, bulaşma riskini doğrudan etkilemektedir. Yüzey sularında bulaşma ihtimali daha yüksekken, kuyu suyunda koliform bakterilerin varlığı yüzeysel bir kirlenmeyi göstermektedir (Pfost ve ark., 2001). Ayrıca geçirgen toprak, kaya çatlakları ve delikler mikroorganizmaların suya karışmasını kolaylaştırır. Gübre depoları ve hayvanların bulunduğu alanlardan taşınan sular, bakterilerin ve parazitlerin depolara ulaşmasına neden olabilir (Braul ve Kirychuk, 2001).

ABD'de yapılan bir çalışmada, içme sularında fekal bakteriler yaygın bulunurken, gıda kaynaklı patojenlerin düşük seviyelerde görüldüğü bildirilmiştir (LeJeune ve ark., 2001). Romanya'da yapılan bir araştırmada ise çiftlik suluklarından alınan örneklerin %92'sinde bakteri, %70'inde toplam koliform, %63'ünde ise fekal koliform tespit edilmiştir (Popescu ve ark., 2011).

Fekal bulaşmış sularda **E. *coli, Cryptosporidia, Salmonella*** ve ***Leptospira* spp.** gibi patojenler yaygın olup, bunlar ishal, yavru atma ve kısırlığa yol açabilmektedir (Pfost ve ark., 2001). Ayrıca **Fusobacterium** türleri, sığırlarda tırnak çürüklüğü ve topallık vakalarının başlıca nedenlerindendir. Yeni veya yabancı patojenlerin suya bulaşması durumunda özellikle genç hayvanlarda hızla hastalık görülmesi mümkündür (Anonim, 2013).

2.2.4.5 Mavi ve yeşil algler

Mavi-yeşil algler, sıcak havalarda, suyun besin maddelerince zenginleşmesi, akış hızının azalması ve rüzgârla taşınan organik maddeler nedeniyle çoğalarak toksin üretirler (Beede, 2006). Bu toksinler sığırların iştahsızlaşmasına, ishal ve halsizlik gelişmesine, ileri vakalarda

zayıflama ve ölüme neden olabilir. Alg toksinleri, suya küf kokusu verirken, aynı zamanda TÇM, azot ve fosfor seviyelerini yükseltmektedir (Beede, 1992; Yaylak ve Yavuz, 2016).

Alglerin ürettiği toksinler iki grupta incelenmektedir:

1. **Nörotoksinler** → Ani ölümlere yol açabilir.

2. **Hepatotoksinler (karaciğer toksinleri)** → 1–2 saat ile birkaç gün arasında ölüme sebep olabilir. Klinik belirtiler, maruziyetten sonraki ilk 15 dakikada ortaya çıkabilmektedir. Yüksek toksin maruziyeti, şiddetli karaciğer hasarı ve ölümle sonuçlanabilmektedir (Beede, 2006).

Bu tür risklerden korunmanın en etkili yolu, **sulara besin maddesi girişini engellemek** ve **su kaynağını düzenli havalandırmaktır** (Braul ve Kirychuk, 2001).

3. SU VE HAYVANSAL VERİM ARASINDAKİ İLİŞKİ

Su, çiftlik ve kümes hayvanlarının temel bileşenlerinden biridir; vücut ağırlıklarının %50–80'ini oluşturur. Çözücü özelliği sayesinde vücut sıcaklığının dengelenmesinde, süt üretiminde, sindirim ve metabolizmanın düzenlenmesinde, atıkların uzaklaştırılmasında, ozmotik basıncın korunmasında ve üreme gibi pek çok yaşamsal işlevde kritik rol oynar (Cemek ve ark., 2011). Hayvanlar su ihtiyaçlarını, doğrudan içme suyu, kar/buz tüketimi, yemlerdeki su ve metabolik süreçlerden karşılamaktadır.

Yüksek kalitede, bol ve sürekli içme suyu, hayvan sağlığı ve üretim verimliliği için zorunludur. Düşük kaliteli su ise yem tüketiminin azalmasına, besin öğelerinden yararlanmanın bozulmasına, verim kaybına ve dolayısıyla işletme karlılığının düşmesine neden olur (Adams ve Sharpe, 1995; NRC, 2001; Socha ve ark., 2003).

Sığır yetiştiriciliğinde suyun kalitesi ile üretim performansı arasında güçlü bir ilişki vardır. Sığırların su tüketimi, kuru madde alımı ve süt verimi arasında yüksek korelasyon bulunmaktadır. Suyun yetersiz veya kalitesiz olması süt üretimini doğrudan düşürür. Vücuttaki suyun %2'sinin azalması ısı dengesini bozar; %7'lik azalma aşırı yorgunluk, halüsinasyon ve solunum sıkıntısı oluşturur; %10'luk azalma ise dolaşım ve böbrek yetmezliği ile ölüme yol açar (Göncü-Karakök ve ark., 2008).

Yapılan araştırmalara göre süt veren bir ineğin vücudunun yaklaşık %56'sı sudan oluşur ve ürettiği sütün %87'si sudur. Bir litre süt üretebilmek için 3–4 litre su tüketmesi gerekir. Bu nedenle su, süt verimi için en kritik girdilerden biridir. Ayrıca suların mineral içeriği, hayvanların mineral alımına katkı sağlayabilmektedir. Nitekim ABD'de süt sığırcılığı işletmelerinden alınan 3618 su örneğinin mineral analizleri, suların sığırların mineral tüketiminde önemli bir paya sahip olduğunu ortaya koymuştur (Socha ve ark., 2003; Erickson & Kalscheur, 2020; Golher ve ark., 2021).

Buna rağmen, birçok yetiştirici suyun önemini yeterince dikkate almamaktadır. Su kalitesinin düşük olmasının hayvan sağlığını ve performansını olumsuz etkilediği bilinmesine karşın, çoğu yetiştirici suyun kalitesini düzenli olarak kontrol etmemektedir (Socha ve ark., 2003; Popescu ve ark., 2011).

3.1 Fizyolojik dönemler ve çevresel stres

- **Laktasyon:** Süt ineklerinin su ihtiyacı çok yüksektir; bu nedenle TDS, sülfat ve nitrat sınır değerleri daha sıkı yorumlanmalıdır.

- **Büyüme:** Genç ruminantlar toksik etkilere karşı daha duyarlıdır; bu nedenle yüksek sülfat veya nitrat içeren sularda risk artar.

- **Sıcaklık stresi:** Yüksek çevre sıcaklıklarında su tüketimi artar ve hayvan daha fazla mineral yüküne maruz kalır. Bu nedenle yaz aylarında güvenli kabul edilen eşik değerlerin dahi sorun yaratabileceği unutulmamalıdır (NRC, 2016).

4. NUMUNE ALMA, İZLEME VE LABORATUVAR

İçme suyu kalitesinin güvenilir biçimde değerlendirilebilmesi için uygun numune alma ve analiz süreçlerinin titizlikle yürütülmesi gereklidir. Yanlış alınmış veya taşınmış numuneler, gerçek saha koşullarını yansıtmayarak hatalı sonuçlara yol açabilmektedir.

4.1 Numune alma yöntemi

Numuneler doğrudan **hayvanın içtiği noktadan** alınmalıdır. Eğer su boru hattı veya çeşmeden sağlanıyorsa, en az 2–3 dakika akıtıldıktan sonra numune alınması önerilmektedir (APHA, 2017). Numune kapları temiz, tercihen steril cam veya polietilen şişeler olmalı; **mikrobiyolojik analiz için kullanılan şişeler sodyum tiyosülfat ile hazırlanmalı** ve kontaminasyondan korunmalıdır. Şişeler üzerine **kaynak, tarih, saat ve örnekleyici bilgisi** etiketlenmeli; çapraz karışıklıkların önüne geçilmelidir (WHO, 2017).

4.2 Saklama ve taşıma

Alınan numuneler **4 °C'de soğuk zincir** altında taşınmalı ve mümkünse aynı gün içinde laboratuvara ulaştırılmalıdır. Mikrobiyolojik analiz için numuneler **24 saat içinde** işleme alınmalıdır; aksi halde sonuç güvenilirliğini kaybeder. Kimyasal parametreler (ör. nitrat, sülfat, ağır metaller) daha uzun süre stabildir; ancak yine de 48 saat içinde analize alınması önerilir (APHA, 2017).

4.3 İzleme sıklığı

Su kalitesi **mevsimsel ve hidrometeorolojik koşullara** bağlı olarak değişkenlik gösterebilir. Özellikle yağışlı dönemlerde yüzey sularında bulanıklık, mikrobiyal yük ve besin elementleri artabilmektedir. Bu nedenle:

- **Yeraltı suları:** Yılda en az 1–2 kez analiz edilmeli.
- **Yüzey suları (gölet, akarsu):** Mevsimsel değişiklikler göz önünde bulundurularak en az 3–4 ayda bir kontrol edilmeli.

Acil durumlar: Alg çiçeklenmesi, ani koku/tat değişimi veya hayvanlarda sağlık problemi gözlendiğinde ek analiz yapılmalıdır (Hammoumi ve ark., 2024).

4.4 Sahada hızlı testler ve laboratuvar analizleri

Bazı parametreler (pH, sıcaklık, elektriksel iletkenlik, çözünmüş oksijen) **taşınabilir cihazlarla sahada** ölçülebilir. Bu yöntem, hızlı karar vermek için avantaj sağlar. Ancak **mikrobiyolojik kalite (*E. coli*, toplam koliformlar)** ve spesifik kimyasal analizler (ör. ağır metaller, siyanotoksinler) için **akredite laboratuvar testleri** gereklidir (WHO, 2017; CCME, 2002).

Sonuç olarak, güvenilir bir izleme sistemi; doğru numune alma, uygun taşınma koşulları, düzenli izleme sıklığı ve sahada hızlı testlerle desteklenen laboratuvar doğrulamasına dayanmaktadır. Böylece hayvan sağlığını tehdit edebilecek olası riskler zamanında tespit edilip önleyici tedbirler alınabilir.

5. RİSK YÖNETİMİ VE İYİLEŞTİRME SEÇENEKLERİ

Ruminant içme suyu kalitesi yalnızca düzenli izleme ile değil, aynı zamanda etkin risk yönetimi ve iyileştirme stratejileri ile güvence altına alınabilir. Bu stratejiler hem **su kaynağının korunmasını** hem de **kalitenin sürdürülebilir şekilde iyileştirilmesini** kapsar.

5.1 Kaynak koruma

Su kaynağının korunması, risk yönetiminin ilk basamağıdır. Hayvanların doğrudan su kaynağına (ör. gölet, akarsu) girişinin sınırlandırılması, **erozyon ve dışkı kaynaklı mikrobiyal kontaminasyonu** azaltır (Jarvis et al., 2019). Ayrıca drenaj kontrolü, tarımsal alanlardan gelen gübre ve pestisit yükünün suya karışmasını engelleyerek nitrat ve fosfat kirliliğini düşürür.

5.2 Basit arıtım yöntemleri

Su kalitesinin iyileştirilmesinde çeşitli düşük maliyetli arıtım yöntemleri kullanılabilir:

- **Ön çökeltim ve filtrasyon**, bulanıklığın ve partikül yükünün azaltılmasını sağlar.
- **Klorlama**, özellikle mikrobiyal kontaminasyon için etkili bir yöntemdir. Serbest klor düzeyi **0.2–0.5 mg/L** arasında tutulmalı, pH'ın yüksek olduğu sularda klor etkinliğinin düştüğü göz önünde bulundurulmalıdır (WHO, 2017).
- Yerinde uygulanan **ultraviyole (UV) sistemleri**, küçük ölçekli işletmelerde bakteri inaktivasyonu için alternatif yöntemdir (APHA, 2017).

5.3 Siyanobakteri çiçeklenmeleri

Sıcak mevsimlerde gölet ve barajlarda siyanobakteri (mavi-yeşil alg) çiçeklenmeleri ortaya çıkabilmektedir. Bu durum, özellikle **mikrosistin-LR gibi hepatotoksinlerin** suya salınımına neden olabilir. Çiçeklenme şüphesi durumunda suyun hemen hayvan tüketiminden çekilmesi, alternatif bir kaynak sağlanması ve suyun laboratuvar testleri yapılana kadar kullanılmaması önerilmektedir. Gerekirse yüzey suyu yerine **derin kuyu suyu** veya tanker ile temiz su temini sağlanmalıdır (Hammoumi ve ark., 2024).

5.4 Mineraller arası etkileşimler ve rasyon ayarlamaları

Su kaynaklı yüksek sülfat düzeyleri, ruminantlarda **polioensefalomalasi (PEM)** riskini artırabilmektedir (Kandylis, 1984; Knight, 1985). Ayrıca sülfat ve molibdenin birlikte yüksek olması, **bakır emilimini azaltarak ikincil bakır yetersizliğine** yol açmaktadır (Suttle, 2010). Bu durumlarda veteriner hekim ve beslenme uzmanları tarafından rasyona **bakır takviyesi** yapılması veya organik mineral formlarına yönelinmesi gerekebilir. Benzer şekilde, yüksek nitrat içeren sularda enerji kaynağı olarak kolay fermente olabilen karbonhidratların rasyona eklenmesi, toksisite riskini azaltabilir (Loneragan & Gould, 2002).

6. Türkiye Bağlamı ve Uygulama Notları

Türkiye'de ruminant hayvancılıkta kullanılan içme suyu kaynakları çoğunlukla **yeraltı kuyuları, göletler, akarsular ve yerleşim şebekeleri** üzerinden sağlanmaktadır. Su kalitesinin değerlendirilmesinde çoğunlukla **insan sağlığına yönelik standartlar** veya **genel çevresel mevzuat** referans alınmaktadır.

6.1 TS 266 STANDARDI VE HAYVANCILIK TESİSLERİ

Türkiye'de en temel yasal düzenleme, **TS 266 – İnsani Tüketim Amaçlı Sular Standardı**dır (Enstitüsü, 2005). Bu standart, insan tüketimine yönelik parametre sınırlarını (ör. pH, nitrat, ağır metaller, florür) tanımlamakla birlikte, hayvancılıkta kullanılan şebeke suları da çoğunlukla bu kriterlere göre değerlendirilmektedir. Ancak ruminantların mineral toleransları insanlardan farklı olduğundan, bu standartların doğrudan hayvanlara uygulanması her zaman uygun değildir. Özellikle **sülfat ve toplam çözünmüş madde (TDS)** açısından ruminant toleranslarının daha geniş aralıklara sahip olabileceği göz önünde bulundurulmalıdır.

6.2 Yerüstü su kalitesi yönetmeliği ve nitrat hassas bölgeler

Yerüstü Su Kalitesi Yönetmeliği (Gazete, 2016), göl, akarsu ve baraj gibi yüzeysel sular için kalite sınıflarını belirler. Bu yönetmelikte, **tarımsal kaynaklı kirliliğin azaltılması** amacıyla **Nitrat Hassas Bölgeleri** kavramı tanımlanmıştır. Gübreleme ve hayvansal atık yönetiminin yetersiz olduğu alanlarda nitrat yükü hızla artabilmekte, bu durum hem ekosistem hem de ruminant sağlığı açısından risk oluşturmaktadır (Sünal ve Erşahin 2012).

6.3 Bölgesel saha bulguları

Türkiye'nin farklı bölgelerinden yapılan saha çalışmaları, **nitrat ve sülfat konsantrasyonlarının bölgesel farklılıklar gösterdiğini** ortaya koymaktadır:

- **İç Anadolu ve Güneydoğu Anadolu'da** yoğun tarımsal faaliyetler nedeniyle yeraltı sularında **yüksek nitrat (>100 mg/L NO_3^-)** rapor edilmiştir (Dokuz ve ark., 2025).
- **Doğu Anadolu Bölgesi'nde**, volkanik jeolojik yapı nedeniyle özellikle **sülfat ve florür düzeylerinin yüksek** seyrettiği belirtilmiştir (Atıcı, 2020).

Ege ve Marmara'da bazı endüstriyel bölgelerde **ağır metal kontaminasyonu (As, Pb)** riskine işaret eden çalışmalar bulunmaktadır (Garipağaoğlu, 2016).

Bu bulgular, su kalitesinin bölgesel ekolojik, jeolojik ve tarımsal faktörlere bağlı olarak değiştiğini göstermektedir. Bu nedenle, **Türkiye'de ruminant içme suyu için tek tip bir değerlendirme yerine, bölgesel saha verilerine dayalı risk analizlerinin yapılması** gereklidir.

7. SONUÇ

Ruminant hayvanlarda içme suyu kalitesi, hayvan sağlığı, refahı ve üretim verimliliği açısından kritik bir faktördür. Su kalitesinin bozulması, yem tüketiminde azalma, mineral dengesizlikleri, metabolik bozukluklar ve verim kayıplarıyla sonuçlanabilmektedir. Bu nedenle içme suyunun yalnızca miktarının değil, aynı zamanda kalitesinin de sürekli izlenmesi ve yönetilmesi gereklidir.

7.1 Sahada uygulanabilir karar ağacı

Uygulamada etkin bir yaklaşım için **izleme–müdahale–önleme döngüsüne dayalı bir karar ağacı** önerilmektedir:

1. **İzleme:** Düzenli numune alma ve saha ölçümleri ile pH, TDS/EC, nitrat/nitrit, sülfat, E. coli gibi kritik parametrelerin takip edilmesi.
2. **Müdahale:** Eşik değerler aşıldığında su kaynağının değiştirilmesi, basit arıtım yöntemleri (filtrasyon, klorlama) veya rasyon ayarlamaları (bakır, enerji katkıları) ile riskin azaltılması.
3. **Önleme:** Kaynak koruma önlemleri (drenaj yönetimi, hayvan erişiminin sınırlandırılması) ve düzenli saha analizleri ile kontaminasyonun oluşmadan engellenmesi (Jarvis et al., 2019).

7.2 Gelecek araştırma alanları

Mevcut kılavuzlar (CCME, 2002) çoğunlukla klasik parametrelere odaklanmıştır. Ancak yeni çevresel riskler dikkate alınmalıdır:

- **Per- ve polifloroalkil maddeler (PFAS):** Son yıllarda su kaynaklarında tespit edilen bu kalıcı organik kirleticilerin ruminant sağlığı üzerindeki etkileri büyük ölçüde belirsizdir (Brase et al., 2021).

- **Pestisit kalıntıları:** Tarımsal alanlarda yoğun kullanılan herbisit ve insektisitlerin uzun vadede su kalitesi ve hayvan sağlığına etkileri hakkında saha verileri sınırlıdır (Sünal ve Erşahin 2012).

- **Bentik siyanobakteriler:** Yüzeysel sularda daha az görünür olan ancak toksin üretme potansiyeline sahip bentik türlerin ruminantlar üzerindeki riskleri yeterince araştırılmamıştır (Wood et al., 2020).

7.3 Genel değerlendirme

Ruminant hayvanlarda içme suyu kalitesi, hayvan sağlığı, refahı ve üretim verimliliği açısından kritik bir faktördür. Su kalitesinin bozulması, yem tüketiminde azalma, mineral dengesizlikleri, metabolik bozukluklar ve verim kayıplarıyla sonuçlanabilmektedir. Bu nedenle içme suyunun yalnızca miktarının değil, aynı zamanda kalitesinin de sürekli izlenmesi ve yönetilmesi gereklidir. Sonuç olarak, Türkiye'de ruminant içme suyu yönetimi insan sağlığına dayalı standartlarla yönlendirilse de, **hayvanlara özgü tolerans değerlerinin saha gerçeklerine uyarlanması** gerekmektedir. Araştırmacıların ve üreticilerin işbirliğiyle geliştirilecek saha odaklı izleme programları, hem hayvan sağlığını koruyacak hem de sürdürülebilir üretime katkı sağlayacaktır.

ÖZET

Bu derleme, ruminantların içme suyu kalitesini etkileyen kimyasal, biyolojik ve yeni ortaya çıkan kirleticileri kapsamlı bir şekilde değerlendirmektedir. pH, sertlik, tuzluluk, nitrat, sülfat, ağır metaller ve mikrobiyolojik kontaminasyon gibi klasik parametrelerin yanı sıra; pestisit kalıntıları, per- ve polifloroalkil maddeler (PFAS), siyanotoksinler ve mikroplastikler gibi yeni risk faktörleri de son yıllarda giderek daha fazla önem kazanmıştır. 2023–2025 yıllarına ait güncel literatürün sentezi, su kalitesinin yalnızca metabolik sağlık ve üretim performansını değil, aynı zamanda hayvan refahını, davranışsal göstergeleri ve antimikrobiyal direnç riskini de doğrudan etkilediğini ortaya koymaktadır.

Buna ek olarak, Nesnelerin İnterneti (IoT) sensörleri, yakın kızılötesi spektroskopi (NIR) ve yapay zekâ destekli modelleme gibi dijital teknolojilerin entegrasyonu, hayvancılık sistemlerinde su kaynaklarının gerçek zamanlı, öngörücü ve sürdürülebilir yönetimi açısından yeni olanaklar sunmaktadır.

Politika ve mevzuat düzeyinde ise FAO, WHO, Avrupa Birliği ve Türkiye tarafından oluşturulan çerçeveler incelenmiş; özellikle 2026 yılında yürürlüğe girecek olan AB'nin PFAS düzenlemelerinin uyum süreçlerindeki belirleyici rolü vurgulanmıştır.

Genel olarak bu çalışma, kimyasal, mikrobiyolojik ve yeni kirleticilerin değerlendirilmesini; refah göstergeleri ve dijital izleme teknolojileriyle bütünleştiren, çok disiplinli ve bütüncül bir yaklaşımın ruminant içme suyu yönetiminde benimsenmesi gerektiğini ortaya koymaktadır.

Anahtar Kelimeler: Ruminant, içme suyu kalitesi, PFAS, mikrobiyolojik risk, hayvan refahı, dijital izleme

CURRENT APPROACHES TO RUMINANT DRINKING WATER QUALITY: CHEMICAL, MICROBIOLOGICAL AND EMERGING CONTAMINANTS, DIGITAL MONITORING AND POLICY PERSPECTIVES*

***Assoc. Prof. Dr. Cemal BUDAĞ**

Van Yuzuncu Yil University, Faculty of Agriculture, Department of Animal Science.

Email: cbudag@yyu.edu.tr

ORCID: 0000-0003-3532-7727

ABSTRACT

This review provides a comprehensive evaluation of the chemical, biological, and emerging contaminants influencing the drinking water quality of ruminants. Beyond classical parameters such as pH, hardness, salinity, nitrate, sulfate, heavy metals, and microbiological contamination, recent attention has focused on emerging risk factors including pesticide residues, per- and polyfluoroalkyl substances (PFAS), cyanotoxins, and microplastics. A synthesis of recent studies (2023–2025) demonstrates that water quality affects not only metabolic health and production performance but also animal welfare, behavioral indicators, and the risk of antimicrobial resistance.

In addition, the integration of digital technologies—such as Internet of Things (IoT) sensors, near-infrared spectroscopy (NIR), and artificial intelligence (AI)-assisted modeling—offers new opportunities for real-time, predictive, and sustainable management of water resources in livestock systems.

At the policy and regulatory level, frameworks established by the FAO, WHO, European Union, and Türkiye were examined, with particular emphasis on the EU's forthcoming PFAS regulations (effective 2026) and their implications for harmonization efforts.

Overall, this review underscores the necessity of a multidisciplinary and holistic approach to ruminant water management, integrating chemical, microbiological, and emerging contaminant assessments with welfare indicators and digital monitoring technologies to ensure sustainable livestock production.

Keywords: Ruminant, driking water quality, PFAS, emerging contaminants, antimicrobial resistance, animal welfare, digital monitoring

1. GİRİŞ

Su, tüm canlılar için yaşamın temel bileşenidir ve ruminantlarda besin maddelerinin sindirimi, metabolizması, termoregülasyon ve homeostazın sürdürülmesi açısından vazgeçilmezdir. Bir ineğin süt üretiminin yaklaşık %87'si sudan oluşmakta, bu nedenle günlük su alımı doğrudan süt verimi ve hayvan refahı ile ilişkilendirilmektedir. Ruminantların su gereksinimleri yalnızca içme suyundan değil; yemlerdeki nem içeriği ve metabolik süreçler sonucu ortaya çıkan sudan da karşılanmaktadır. Ancak suyun miktarının yanı sıra kalitesi, hayvan sağlığı ve performansı üzerinde belirleyici bir faktör olarak öne çıkmaktadır (Tulu ve ark., 2024).

Su kalitesi, fizikokimyasal (pH, toplam çözünmüş madde, sertlik, tuzluluk, nitrat ve sülfat gibi parametreler), mikrobiyolojik (koliform bakteriler, *E. coli*, enterokoklar), kimyasal kirleticiler (ağır metaller, pestisitler, emerging kirleticiler/PFAS) ve organoleptik özellikler (tat, koku, renk, berraklık) çerçevesinde değerlendirilmektedir. Son yıllarda yapılan araştırmalar, içme suyunda görülen olumsuzlukların yem tüketimini azalttığını, rumen fermantasyonunu bozduğunu, elektrolit ve mineral dengesizliklerine yol açtığını ve özellikle genç hayvanlarda mortaliteyi artırabildiğini ortaya koymuştur. Ayrıca eutrofik koşulların tetiklediği alg patlamaları sonucu gelişen siyanotoksinler, ruminantlarda hepatotoksik etkilerle ilişkili bulunmuş; PFAS gibi kalıcı organik kirleticilerin ise sığır serumunda ve sütünde biriktiği bildirilmiştir (Kamal ve ark., 2024; Llonch ve ark., 2024; Bensalem ve ark., 2025; Villalobos ve ark., 2025).

Küresel iklim değişikliği, artan sıcaklıklar ve su kaynaklarının azalması, ruminant yetiştiriciliğinde suyun hem miktar hem de kalite açısından daha stratejik bir unsur hâline gelmesine yol açmaktadır. Bu bağlamda, güncel literatürün değerlendirilmesi ve su kalitesi parametrelerinin ruminant sağlığı, verimliliği ve gıda güvenliği üzerindeki etkilerinin bütüncül bir bakış açısıyla ele alınması büyük önem taşımaktadır.

1.1. Ruminantlarda su gereksinimleri ve güncel yaklaşımlar

Ruminantların su gereksinimleri yalnızca doğrudan içilen suyla sınırlı değildir. Yemlerde bulunan serbest ve bağlı su miktarı ile metabolik faaliyetler sonucu oluşan su da toplam su ihtiyacına katkı sağlamaktadır. Bununla birlikte, hayvanın türü, yaşı, çevresel sıcaklık, üretim düzeyi, yemin nem oranı, kullanılan enerji kaynağı ve protein içeriği gibi çok sayıda faktör, bireysel su gereksiniminin düzeyini belirlemektedir (NRC, 2021).

Son yıllarda yapılan çalışmalar, ruminantlarda su gereksiniminin **dinamik ve çevresel koşullara duyarlı bir parametre** olduğunu ortaya koymuştur. Örneğin, iklim değişikliğiyle artan **ısı stresi**, su tüketiminde belirgin artışa yol açmakta; aynı zamanda suyun kalitesi ve erişilebilirliği, hayvanların sağlık ve performansını doğrudan etkilemektedir (Chamberlain ve ark., 2023). 2023 sonrası literatürde özellikle **su verimliliği (water use efficiency)** kavramı öne çıkmış ve yem-su etkileşimlerinin ruminant beslemede kritik rol oynadığı vurgulanmıştır (Wisser ve ark., 2024; FAO, 2024). Ayrıca, dijital izleme teknolojileri (otomatik suluk sensörleri, davranışsal izleme sistemleri) sayesinde bireysel hayvan düzeyinde su tüketim profilleri daha doğru biçimde belirlenebilmekte, böylece **su yönetiminde hassas hayvancılık yaklaşımları** giderek önem kazanmaktadır (Kaur ve ark., 2023; Džermeikaitė ve ark., 2023).

1.2. Küçük ruminantlarda su stresi, iklim değişikliği ve adaptasyon

Pérez ve ark. (2023), küçük ruminantlarda su stresine karşı geliştirilen adaptasyon mekanizmalarını incelemiştir. Çalışmaya göre koyun ve keçiler gibi türler, suya erişimin kısıtlandığı koşullarda fizyolojik adaptasyonlar geliştirmekte, ancak bu durum uzun vadede üretim verimliliğini olumsuz etkilemektedir. Araştırma, özellikle iklim değişikliğine bağlı sıcaklık artışlarının küçük ruminantlarda suya duyulan ihtiyacı artıracağını vurgulamaktadır.

Son yıllarda yapılan çalışmalar, küçük ruminantların **su kıtlığına karşı nispeten daha yüksek tolerans gösterdiğini**, ancak bu toleransın **fizyolojik ve metabolik maliyetlerle** sınırlı olduğunu ortaya koymuştur (Pérez ve ark., 2023). Örneğin, dehidratasyon koşullarında plazma osmolalitesinde artış, idrar konsantrasyonunda yükselme ve yem tüketiminde azalma tipik adaptasyon mekanizmaları olarak rapor edilmiştir (Koluman veGöncü, 2025). Bununla birlikte, kronik su stresi koşulları **büyüme performansı, süt verimi ve üreme parametrelerinde** düşüşlere neden olmaktadır (Sözcü ve Altınçekiç, 2024).

İklim değişikliğine bağlı olarak artan sıcaklık dalgaları ve kuraklık periyotları, küçük ruminantların **suya erişimini kısıtlayan en önemli çevresel faktörler** arasında yer almaktadır. Bu nedenle, son dönem literatürde özellikle **ısıl stres – su stresi etkileşimi** ve bunun üretim verimliliği üzerindeki sinerjik etkileri üzerinde durulmaktadır (FAO, 2024). Ayrıca, **genetik seleksiyon ve yerel ırkların dayanıklılık özelliklerinin korunması**, küçük ruminant yetiştiriciliğinde iklim değişikliğine adaptasyon için öne çıkan stratejilerden biridir (Wanjala, 2024).

Wanjala, G. (2024). *Genome-Wide Analysis of the Genetic Diversity of Native Sheep Breeds and Determination of Potential Selection Signatures for Climate Change Adaptation* (Doctoral dissertation, Debreceni Egyetem (Hungary)).

1.3. Sığırların içme davranışları ve davranışsal izleme teknolojileri

Islam ve ark. (2023) tarafından yapılan deneysel çalışmada, etçi sığırların su kısıtlamasına verdikleri içme davranışı yanıtları incelenmiştir. Bulgular, suyun yalnızca miktarının değil, aynı zamanda erişim süresi ve düzenliliğinin de yem tüketimi ve canlı ağırlık artışı üzerinde etkili olduğunu göstermektedir. Bu sonuçlar, yetiştiricilik uygulamalarında suyun planlı yönetiminin önemini ortaya koymaktadır.

Son yıllarda yapılan araştırmalar, sığırların içme davranışlarının **sağlık, refah ve üretim performansının dolaylı bir göstergesi** olabileceğini ortaya koymuştur. İçme frekansı, süre ve zamanlama parametreleri; hem su kalitesi hem de çevresel stres faktörlerinden etkilenmektedir (Kok, 2024). Özellikle sıcaklık-hastalık ilişkisi kapsamında, **ısı stresi altındaki sığırların içme davranışlarında belirgin değişiklikler** gözlemlenmiştir (Antanaitis ve ark., 2024).

Davranışsal izleme teknolojilerindeki gelişmeler, bu alanda yeni olanaklar sunmaktadır. Otomatik suluklara entegre **IoT tabanlı akış sensörleri**, RFID tabanlı bireysel takip sistemleri ve bilgisayarla görme (computer vision) tabanlı kamera analizleri, sığırların içme davranışlarını gerçek zamanlı olarak ölçebilmektedir (Kok, 2024). Ayrıca yapay zekâ algoritmaları, büyük veri setleri üzerinden içme davranışındaki sapmaları analiz ederek **erken hastalık tanısı ve refah izlemi** için kullanılmaya başlanmıştır (Islam ve ark., 2023). Bu gelişmeler, **hassas hayvancılık (precision livestock farming)** uygulamalarının su yönetiminde de giderek daha fazla yer bulduğunu göstermektedir.

1.4. Su kullanımı, iklim değişikliği ve küresel su stresi

Wisser ve ark. (2024), hayvancılık sistemlerinde doğrudan içme suyu tüketiminin yanı sıra yem üretimi için kullanılan suyun da küresel su stresine katkısını modellemiştir. Çalışma, ruminantların su ayak izini değerlendirirken hem doğrudan hem de dolaylı su kullanımının dikkate alınması gerektiğini vurgulamaktadır.

Son yıllarda yapılan çalışmalar, hayvancılık sektörünün küresel su tüketiminde önemli bir paya sahip olduğunu ve özellikle **gizli su tüketiminin (virtual water)** yem üretimi aracılığıyla giderek daha kritik bir boyuta ulaştığını göstermektedir (Higazy ve ark., 2024). Bu bağlamda ruminant yetiştiriciliği, tarımsal su ayak izinin en büyük bileşenlerinden biri olarak değerlendirilmektedir.

İklim değişikliğiyle birlikte artan kuraklık, sıcaklık dalgaları ve su kıtlığı, yalnızca hayvanların **doğrudan içme suyu tüketimini** değil, aynı zamanda **yem üretiminde kullanılan sulama suyunu** da ciddi şekilde etkilemektedir (FAO, 2024). Bunun sonucunda, ruminant yetiştiriciliğinde **su verimliliği (water productivity)** kavramı önem kazanmış; üretim sistemlerinin su kullanımına göre sınıflandırılması ve sürdürülebilir stratejilerin geliştirilmesi yönünde yeni yaklaşımlar ortaya çıkmıştır (Ridoutt ve ark., 2023).

Ayrıca, 2025 itibarıyla yayınlanan senaryolar, su stresi altındaki bölgelerde hayvancılığın gelecekteki sürdürülebilirliği için **alternatif yem kaynakları, entegre su yönetimi politikaları ve bölgesel adaptasyon stratejilerinin** zorunlu hale geleceğini ortaya koymaktadır (Asif ve ark., 2023). Bu kapsamda, **iklim değişikliği ile uyumlu su yönetimi** hem çevresel sürdürülebilirlik hem de gıda güvenliği için temel bir gereklilik olarak öne çıkmaktadır.

1.5. Su kalitesi, üreme, üretim performansı, sağlık ve refah ilişkisi

Su, ruminantların yaşamı için temel bir gereksinim olmasının ötesinde, **üreme verimliliği, üretim performansı, sağlık durumu ve hayvan refahı** üzerinde doğrudan ve dolaylı etkilere sahiptir. Tulu ve ark. (2024), kurak bölgelerden elde edilen veriler ışığında su kalitesinin hayvansal üretim üzerindeki etkilerini derlemiş ve yüksek mineral içerikli veya kontamine olmuş su kaynaklarının ruminantlarda verim kayıplarına, metabolik bozukluklara ve refah sorunlarına yol açabileceğini bildirmiştir.

Üreme ve döl verimi

Son dönem çalışmalar, özellikle **nitrat, sülfat ve ağır metaller** ile kontamine olmuş içme sularının üreme üzerinde olumsuz etkiler yarattığını göstermektedir. Bu etkiler arasında **azalmış döl tutma oranı, embriyo kaybı, abortus ve infertilite** gibi sorunlar yer almaktadır (De Camillis 2023). Ayrıca, suyun aşırı tuzluluğu ve sertliği, üreme performansında indirekt kayıplara neden olabilmektedir.

Verim performansı

Suyun kalitesi, **süt verimi ve bileşimi, et üretimi** ve **yemden yararlanma etkinliği** ile doğrudan ilişkilidir. Yüksek sülfat düzeyleri, genç ruminantlarda kobalt ve bakır metabolizmasını bozarak büyüme performansını düşürmekte; aşırı tuzluluk ise yem tüketimini kısıtlayarak süt veriminde azalmaya yol açmaktadır (Chamberlain & Sinclair, 2023).

Sağlık ve metabolik bozukluklar

Su kalitesindeki dengesizlikler, **hipomagnezemi, asidoz, enterotoksin kaynaklı ishaller** ve mineral eksiklikleri gibi metabolik bozukluklara neden olabilmektedir. Ayrıca, mikrobiyolojik olarak kirlenmiş su kaynakları, **enterik enfeksiyonların** (ör. *E. coli*, *Salmonella*) yayılımını kolaylaştırmaktadır. Bu da hem hayvan sağlığı hem de gıda güvenliği açısından ciddi bir risk oluşturmaktadır (Jurkovich ve ark., 2024)

Hayvan refahı

Dünya Hayvan Sağlığı Örgütü (WOAH), **temiz, güvenilir ve sürekli içme suyuna erişimi** hayvan refahının beş temel özgürlüğünden biri olarak tanımlamaktadır. Kirli veya yetersiz su kaynakları yalnızca fizyolojik stres yaratmakla kalmamakta, aynı zamanda **davranışsal değişikliklere** (su için rekabet, içme süresinde artış, yem tüketiminde azalma) de neden olmaktadır (Jurkovich ve ark., 2024). Bu durum, hayvan refahı ve sürdürülebilir üretim sistemleri açısından kritik önemdedir.

1.6. Çevresel faktörler ve su tüketimi dinamikleri

He ve ark. (2023) tarafından yürütülen çalışma, soğuk mevsimlerde içme suyunun ısıtılmasının sığırlarda büyüme performansını ve rumen fonksiyonlarını iyileştirdiğini göstermiştir. Bu bulgu, çevresel sıcaklıkların su tüketimi ve hayvan sağlığı üzerindeki dolaylı etkilerini açıkça ortaya koymaktadır.

Son yıllarda yapılan araştırmalar, ruminantlarda su gereksinimlerinin yalnızca miktar değil, aynı zamanda **su kalitesi, erişim düzeni ve çevresel faktörlerle birlikte** ele alınması gerektiğini ortaya koymuştur (Jones ve ark., 2024). Özellikle **yüksek çevre sıcaklıkları**, hayvanlarda terleme ve solunum yoluyla su kayıplarını artırmakta; bu durum, **ısı stresi ile ilişkili su tüketiminde belirgin artışlara** yol açmaktadır (Antanaitis ve ark., 2024). Bunun tersine, düşük sıcaklıklarda hayvanların su tüketimi azalmakta, fakat suyun sıcaklığının artırılması bu negatif etkiyi azaltabilmektedir (He ve ark., 2023).

Nem oranı, rüzgar hızı, barınak koşulları ve suyun fiziksel özellikleri (ör. sıcaklık, akış hızı, erişim kolaylığı) gibi çevresel parametreler de **su içme davranışlarını** doğrudan etkilemektedir (Ferreira ve ark., 2025). Ayrıca, iklim değişikliğinin neden olduğu **kuraklıklar ve su kaynaklarındaki kalitesel bozulmalar**, ruminant yetiştiriciliğinde su yönetimini stratejik bir unsur haline getirmiştir (FAO, 2024).

Güncel yaklaşımlar, bu bağlamda **çevresel faktörleri entegre eden su tüketim modelleri** ve **hassas hayvancılık teknolojilerinin (IoT sensörler, akıllı suluklar, davranışsal izleme sistemleri)** kullanımı üzerine odaklanmaktadır. Böylece su tüketimi ile çevresel değişkenler arasındaki ilişki daha doğru biçimde belirlenebilmekte ve **proaktif su yönetim stratejileri** geliştirilebilmektedir (Islam ve ark., 2023).

1.7. Su kalitesi, sürdürülebilir ruminant yetiştiriciliği ve sağlıklı yaşam (One Health) perspektifi

Ruminant yetiştiriciliğinde su kalitesi, hayvan sağlığı ve üretim performansının korunmasında kritik bir rol oynamaktadır. Kurak ve yarı kurak bölgelerde yapılan çalışmalar, yüksek mineral içerikleri, toksik elementler ve mikrobiyal kontaminasyonun verimlilik üzerinde olumsuz etkilere yol açtığını göstermektedir (Tulu ve ark. 2024). Güncel yönergeler, büyük ve küçükbaş hayvanların içme suyunda nitrat, sülfat ve alg toksinleri gibi parametrelerin sınır değerler dâhilinde tutulması gerektiğini vurgulamaktadır (Australian & New Zealand Guidelines, 2023). Benzer şekilde, Oklahoma ve Texas'ta yürütülen saha çalışmaları, bölgesel farklılıkların suyun fiziksel ve kimyasal özelliklerini etkileyerek hayvan performansını değiştirdiğini ortaya koymuştur (Water Quality for Livestock Across Oklahoma and Texas, 2025). Etçi sığırlar üzerine hazırlanan teknik raporlar da sülfat ve nitrat gibi unsurların yüksek düzeylerde bulunmasının yem tüketimi ve canlı ağırlık artışı üzerinde sınırlayıcı etki oluşturabileceğini bildirmektedir (University of Tennessee, 2023). Türkiye'de yapılan araştırmalarda ise, hayvan refahı ve iyi tarım uygulamaları standartlarının su kalitesiyle doğrudan ilişkili olduğu ve bu bağlamda izleme ve denetim mekanizmalarının güçlendirilmesi gerektiği belirtilmektedir (Aydın, 2023).

Ruminantlarda içme suyu kalitesine ilişkin çalışmalar, kimyasal (nitrat, sülfat, tuzluluk/TDS), mikrobiyolojik ve yönetimsel ölçütlerin birlikte değerlendirilmesi gerektiğini ortaya koymaktadır. Llonch ve ark., (2024)'nın yürüttüğü kontrollü bir denemede, içme suyunda 220 mg/L NO_3^- düzeyine kadar yaklaşık beş ay süreyle yüksek konsantre diyetle beslenen ruminantlarda sağlık, yem tüketimi ve rumen fermantasyonu üzerinde olumsuz etki gözlenmemiştir. Ancak araştırmacılar, bu bulgunun rasyon bileşimine duyarlı olduğuna dikkat çekmektedir. Sülfat üzerine yapılan bir çalışmada Evans ve ark., (2023), etçi düvelerde suya sodyum sülfat ilavesiyle birlikte sülfat konsantrasyonu arttıkça su tüketiminin doğrusal biçimde

arttığını bildirmiştir. Literatürde ise kaba yem oranı yüksek rasyonlarla beslenen sığırlarda yaklaşık 2500 mg/L sülfatın tolere edilebildiği sıkça vurgulanmaktadır. Tuzluluk konusunda Yirga ve ark., (2024), Blackhead Ogaden koyunları ve Somali keçileri üzerinde yaptıkları deneysel çalışmada, artan su tuzluluğunun su alımı, ısı düzenleme parametreleri ve hematolojik-biyokimyasal göstergeleri anlamlı biçimde etkilediğini, ayrıca türler arasında tuzluluk toleransının farklılık gösterdiğini ortaya koymuşlardır. Mikrobiyolojik kaliteye yönelik olarak Soares ve ark., (2023), Portekiz'de süt sığırı işletmelerinden elde edilen içme suyu örneklerinde *Koliform* ve *Enterococcus* türlerinin varlığını raporlamış; bu bulgu, suluk hijyeni ve düzenli dezenfeksiyonun önemini göstermiştir. Benzer biçimde, Kamal ve ark., (2024)'nın yürüttüğü saha çalışmasında yüksek toplam çözünmüş madde, sülfat, nitrat ve mikrobiyal yüklerin özellikle buzağılarda mortalite artışı ile ilişkili olabileceği belirlenmiştir. Tüm bu sonuçlar, içme suyunda kimyasal ve mikrobiyolojik parametrelerin düzenli analizlerle izlenmesi gerektiğini ortaya koymaktadır.

2. SU KALİTESİ PARAMETRELERİ

2.1. Organoleptik özellikler bağlamında ruminant içme suyu kalitesi

Ruminantların içme suyu kalitesinde organoleptik özellikler — yani **tat, koku, renk ve berraklık** — önemli bir belirleyici faktördür. Tulu ve ark. (2024)'nın kurak ve yarı kurak bölgelerde su kalitesini inceledikleri derleme çalışmasında, suyun duyusal özelliklerinin (örneğin hoş olmayan tat veya koku) hayvanların su tüketiminde belirleyici rol oynadığı vurgulanmıştır. Benzer biçimde, *Water Quality for Dairy Cattle* rehberinde (University of Arkansas, 2023), süt sığırlarının hoş olmayan tat ve kokuya sahip suları içmekten kaçınabileceği, bu durumun ise su tüketimini ve dolayısıyla yem alımını azaltarak üretim performansına olumsuz yansıyabileceği belirtilmiştir.

Çiftliklerde yapılan saha çalışmalarında da, su örneklerinde **renk, bulanıklık ve koku gibi organoleptik parametreler** incelenmiş ve bu özelliklerin hayvanların suya olan isteğini doğrudan etkileyebileceği ortaya konmuştur (Soares ve ark., 2024). Ayrıca, son yıllarda yapılan çalışmalar, **alg patlamaları, fenolik bileşikler ve mikroplastik kirliliğinin** de suyun tat ve kokusunu değiştirerek ruminantların su tüketiminde kısıtlamalara yol açabileceğini göstermiştir (Wolfe, 2021).

Tüm bu bulgular, içme suyu kalitesinin yalnızca kimyasal ve mikrobiyolojik değil, aynı zamanda **duyusal nitelikleriyle de düzenli olarak değerlendirilmesi gerektiğini** göstermektedir. Bu bağlamda, organoleptik özelliklerin rutin izlenmesi, ruminantların **su tüketim davranışlarını optimize etme, yemden yararlanmayı artırma ve refah koşullarını iyileştirme** açısından kritik öneme sahiptir.

2.2. Suyun fizikokimyasal özellikleri ve ruminantlarda önemi

İçme suyunun fizikokimyasal özellikleri — **pH, toplam çözünmüş maddeler (TDS), elektriksel iletkenlik, sertlik, klorür, sülfat, nitrat gibi iyon konsantrasyonları ve sıcaklık** gibi parametreler — ruminantların su tüketimini, sağlık durumunu ve üretim performansını doğrudan etkilemektedir.

Kibara ve ark. (2023) tarafından yürütülen saha çalışmasında, buzağı ölüm nedenleri ile suyun pH, TDS, sertlik, klorür, nitrat ve sülfat gibi parametreleri arasında anlamlı korelasyonlar bulunmuş; özellikle **nitrat düzeyi en güçlü yordayıcı** olarak rapor edilmiştir. Aynı araştırma grubunun 2025 yılında yayımladığı başka bir çalışmada da, farklı kimyasal ölçütlerin (örneğin TDS, sertlik, sülfat) hayvan mortalitesi ile yakından ilişkili olduğu vurgulanmıştır (Kamal ve ark., 2025).

ABD'de yürütülen *Water Quality for Livestock Across Oklahoma and Texas* çalışmasında (Congio ve ark., 2025), 72 gölet su örneği incelenmiş; suyun kimyasal bileşiminin özellikle iyonik içerik açısından bölgesel farklılıklar gösterdiği bildirilmiştir. Benzer şekilde, Chamberlain ve Sinclair, (2023) tarafından yapılan bir değerlendirmede, su örneklerinin pH, iletkenlik, TDS ve bulanıklık gibi fiziksel-kimyasal parametrelerinin çoğunlukla kabul edilebilir sınırlar içinde olduğu; ancak bazı örneklerde **kontaminasyon izlerine** rastlandığı rapor edilmiştir.

Tulu ve ark. (2024) ise kurak ve yarı kurak bölgelerde yaptıkları derlemede, **yüksek iyonik yüklerin yem tüketimini azalttığını, büyüme verimliliğini düşürdüğünü ve metabolik stres oluşturduğunu** bildirmiştir. Son dönemde literatür, özellikle **yüksek TDS ve sülfat düzeylerinin rumen mikroflorasında dengesizlik, mineral emiliminde bozulma ve suyun lezzetliliğinde azalma** gibi olumsuz etkiler yaratabileceğini vurgulamaktadır (De Camillis ve ark., 2023).

Bu bulgular birlikte değerlendirildiğinde, içme suyunun fizikokimyasal dengesinin bozulması, ruminantlarda **su alımını azaltmakta, iyonik stres yaratmakta ve sonuç olarak verim, sağlık ve refah parametrelerinde olumsuzluklara** yol açabilmektedir. Dolayısıyla fizikokimyasal kalite parametrelerinin düzenli olarak izlenmesi, hem **hayvan sağlığının korunması** hem de **sürdürülebilir üretimin sağlanması** açısından kritik önemdedir.

2.3. Toplam çözünmüş madde (TDS), tuzluluk ve ruminantlarda önemi

Toplam çözünmüş madde (TDS), içme suyundaki **iyonik ve organik çözeltilerin toplamını** ifade eden temel bir fizikokimyasal parametredir. Son yıllarda yapılan çalışmalar, TDS düzeylerinin ruminantların **su tüketimi, yem alımı, sindirim süreçleri, metabolik dengeleri ve verim performansı** üzerinde belirleyici rol oynadığını göstermektedir.

Patra ve ark. (2023), farklı TDS konsantrasyonlarına sahip suların keçi ve koyunlarda **yem alımı, besin madde sindirimi, enerjetik denge, metan emisyonu, rumen fermentasyonu ve kan bileşenleri** üzerindeki etkilerini karşılaştırmış; 8300 mg/kg'ye kadar olan TDS seviyelerinde olumsuz etkilerin sınırlı olduğunu, ancak daha yüksek düzeylerde metabolik stresin ve performans kayıplarının ortaya çıktığını rapor etmiştir. Benzer şekilde, Patra (2024) tarafından yürütülen bir çalışmada, çözünmüş tuzların bileşimi ve konsantrasyonu artırıldığında **su tüketiminde değişimler, plazma elektrolit dengesinde kaymalar ve rumen fermentasyonunda bozulmalar** gözlenmiştir.

Kamal ve ark. (2025), içme suyu kalitesi parametrelerini inceledikleri çalışmada, özellikle **TDS düzeyleri ile hayvansal performans göstergeleri** arasında anlamlı korelasyonlar bulmuş; yüksek TDS'nin canlı ağırlık artışı, süt verimi ve buzağı yaşama gücü üzerinde olumsuz etkiler yaratabileceğini belirtmiştir.

Tulu ve ark. (2024)'nın derlemesinde ise, TDS'nin **1000 ppm altındaki düzeylerinin genellikle güvenli** olduğu; ancak **3000 ppm'in üzerindeki konsantrasyonlarda yem alımı ve su tüketiminde düşüşler, iyonik stres ve mineral metabolizmasında bozulmalar** görülebileceği vurgulanmıştır. Ayrıca, yalnızca TDS'nin toplam miktarı değil, suyun içerdiği iyonların türü ve oranı da kritik öneme sahiptir. Özellikle **Na^+, Cl^- ve SO_4^{2-} iyonlarının yüksek düzeyleri**, hayvanlarda laksatif etkilere, iştah azalmasına ve elektrolit dengesizliklerine neden olabilmektedir.

Tüm bu bulgular, ruminantlarda içme suyu yönetiminde TDS'nin yalnızca **toplam miktarının değil**, aynı zamanda **bileşimsel özelliklerinin** (özellikle tuz tiplerinin) düzenli olarak izlenmesi gerektiğini ortaya koymaktadır.

2.4. Suyun Asitliği (pH) ve ruminantlar

İçme suyunun pH değeri, ruminantların **su tüketimi, metabolik dengeleri ve genel fizyolojik fonksiyonları** açısından kritik bir parametredir. University of Tennessee (2023) tarafından hazırlanan *Water Quality for Beef Cattle* rehberinde, sığırlar için ideal pH aralığının **6,5–8,5** olduğu, 5'in altındaki veya 9'un üzerindeki değerlerin ise su tüketiminde azalmaya, yem alımında kısıtlanmaya ve dolayısıyla üretim performansında bozulmalara yol açabileceği belirtilmektedir.

Kamal ve ark. (2024), buzağı ölümleri üzerine yaptıkları saha çalışmasında pH ile birlikte TDS, sülfat ve nitrat gibi parametreleri de değerlendirmiş ve **pH sapmalarının neonatal mortalite riskini artırabileceğini** rapor etmiştir. Benzer şekilde, Tulu ve ark. (2024) tarafından yapılan derlemede, suyun düşük veya yüksek pH değerlerinin **iyon dengesini bozarak mineral metabolizmasını olumsuz etkilediği** ve yem-su etkileşimlerini zayıflattığı bildirilmiştir.

Son dönem çalışmalarda, pH'nın yalnızca su kalitesiyle sınırlı kalmadığı, aynı zamanda **rumen ekosistemi ile etkileşim halinde olduğu** da gösterilmiştir. Iritz ve ark. (2025), süt ineklerinde tuzlu içme suyunun rumen pH'sı üzerinde etkili olduğunu; yüksek tuzluluk koşullarında rumen pH'sında artış eğilimi gözlendiğini ortaya koymuştur. Bu durum, **su pH'sı ile rumen fermantasyonu arasındaki bağlantının** önemini göstermektedir.

Dolayısıyla, içme suyunun asitliği yalnızca **kimyasal kalite parametresi** olarak değil, aynı zamanda **fizyolojik, metabolik ve davranışsal düzeylerde etkileri olan bütüncül bir faktör** olarak ele alınmalıdır. Düzenli su pH ölçümleri, ruminant sağlığının ve üretim verimliliğinin korunması için kritik bir izleme aracı olarak öne çıkmaktadır.

2.5. Suyun tuzluluğu ve ruminantlarda önemi

Ruminantların içme sularındaki **tuzluluk düzeyi (salinite)**, hem üretim performansı hem de sağlık açısından kritik bir parametredir. Iritz ve ark. (2025)'ın çalışmasına göre, yüksek tuzluluk düzeyine sahip sular süt ineklerinde **su tüketimini artırmakla birlikte lif sindirimini olumsuz etkileyebilmektedir**. Abera ve ark. (2024) ise Somali keçileri ve Blackhead Ogaden koyunlarında **11 g/L TDS'nin üzerindeki tuzlu su tüketiminin karkas ağırlığı, sakatat oranları ve et kalitesi parametrelerinde düşüşlere** yol açtığını bildirmiştir.

Patra (2024), farklı tuzluluk düzeylerine sahip suların **yem alımı, enerji dengesi, rumen fermentasyonu ve kan biyokimyası** üzerindeki etkilerini incelemiş ve hayvanların tuzluluğa karşı belirli bir adaptasyon kapasitesine sahip olduğunu, ancak bu kapasitenin sınırları aştığında **iyonik stres, iştah azalması ve mineral metabolizmasında bozulmaların** ortaya çıktığını vurgulamıştır. Benzer şekilde, Nguyen ve ark. (2024), süt ineklerinde sulandırılmış deniz suyu uygulamalarıyla yapılan deneylerde, artan tuzluluğun **su ve yem davranışlarını değiştirdiğini** ve özellikle belirli eşik değerler aşıldığında **performans kayıpları ve fizyolojik stres** yarattığını göstermiştir.

Tulu ve ark. (2025), pastoral üretim sistemlerinde yaptıkları çalışmada, yüksek tuzluluğun küçükbaş hayvanlarda **su alımı, elektrolit dengesi, yem kullanımı ve verim parametreleri** üzerinde sınırlandırıcı bir etkiye sahip olduğunu belirtmiştir. Güncel literatür ayrıca, tuzluluğun yalnızca toplam TDS düzeyine bağlı olmadığını; **Na^+, Cl^-, SO_4^{2-} ve Mg^{2+} iyonlarının oranları** gibi suyun bileşimsel farklılıklarının da hayvan sağlığı üzerinde farklı etkilere sahip olduğunu ortaya koymaktadır.

İçme sularındaki tuzluluk yalnızca **su miktarı** üzerinden değil, aynı zamanda **iyonik bileşim ve hayvanın adaptasyon kapasitesi** göz önünde bulundurularak değerlendirilmelidir. Bu parametrelerin düzenli takibi, **performans kayıplarını önlemek ve sağlık sorunlarını azaltmak** açısından önemlidir.

2.6. Suyun Sertliği ve ruminantlarda önemi

Suyun sertliği, **kalsiyum (Ca^{2+}) ve magnezyum (Mg^{2+}) iyonlarının derişimiyle** tanımlanmakta olup, ruminantlarda hem fizyolojik hem de üretim performansı açısından önemli bir parametredir. University of Tennessee (2023) tarafından hazırlanan rehberde, **500 mg/L'ye kadar olan sertliğin genellikle güvenli** olduğu, ancak bu sınırın üzerindeki değerlerin özellikle genç hayvanlarda **ishal, su tüketiminde azalma ve büyüme performansında gerilemeye** yol açabileceği belirtilmektedir.

Kamal ve ark. (2024), saha çalışmalarında yüksek sertlik değerlerine sahip sularda **buzağılarda mortalite oranlarının arttığını** ve sertliğin özellikle **TDS ve nitrat gibi diğer parametrelerle birlikte** değerlendirilmesi gerektiğini rapor etmiştir. Benzer şekilde, Tulu ve ark. (2024)'nın derlemesinde, kurak ve yarı kurak bölgelerde yüksek sertliğin **mineral dengesizlikleri yoluyla yemden yararlanmayı azalttığı, süt verimini düşürdüğü ve metabolik stres oluşturabileceği** vurgulanmıştır.

Chamberlain ve Sinclair, (2023), hayvan çiftliklerinden aldıkları içme suyu örneklerinde pH, TDS ve sertlik parametrelerini ölçmüş; bazı örneklerde sertlik değerlerinin kabul edilebilir sınırları aştığını ve bunun hayvan sağlığı için **potansiyel risk faktörü** oluşturabileceğini bildirmiştir. Güncel literatür, yüksek su sertliğinin yalnızca **su lezzetliliğini ve tüketim davranışını** etkilemekle kalmadığını, aynı zamanda **elektrolit dengesi, mineral emilimi (özellikle Ca ve Mg) ve metabolik süreçler** üzerinde de etkili olduğunu ortaya koymaktadır (Wolfe, 2021).

Bulgular, sertliğin yalnızca bir kimyasal parametre değil, aynı zamanda **hayvan sağlığı, üretim performansı ve refahını doğrudan etkileyen kritik bir unsur** olduğunu göstermektedir. Bu nedenle, içme suyu yönetiminde sertlik değerlerinin düzenli olarak izlenmesi ve gerektiğinde suyun arıtılması sürdürülebilir hayvancılık için gereklidir.

2.7. Nitratlar ve ruminantlarda önemi

Ruminantların içme sularında **nitrat (NO_3^-)** ve **nitrit (NO_2^-)** düzeyleri, özellikle rumende gerçekleşen mikrobiyal indirgeme süreçleri nedeniyle kritik öneme sahiptir. Aşırı nitrat alımı, nitrit birikimine ve bunun sonucunda **methemoglobin oluşumuna** yol açarak oksijen taşınmasını sınırlamakta ve akut ya da kronik **nitrat/nitrit zehirlenmelerine** neden olabilmektedir.

Llonch ve ark. (2024), sütçü-etçi sığırlar üzerinde yaptıkları uzun süreli deneysel çalışmada, içme suyunda **220 mg/L NO_3^- seviyesine kadar beş aylık bir dönemde herhangi bir olumsuz etki gözlenmediğini**; sağlık, yem tüketimi ve rumen fermentasyon parametrelerinin stabil kaldığını rapor etmişlerdir. Bununla birlikte, araştırmacılar **rasyon bileşiminin, özellikle konsantre yem düzeyinin nitrat toleransını etkileyebileceğini** vurgulamışlardır.

Kamal ve ark. (2024), saha çalışmalarında buzağı ölümlerini analiz etmiş ve **nitrat, sülfat ve TDS** gibi parametreler arasında özellikle **yüksek nitrat düzeylerinin mortalite için en güçlü yordayıcı** olduğunu bildirmiştir. Benzer şekilde, Tulu ve ark. (2024) yaptıkları derlemede, kurak bölgelerde sulardaki nitrat kirliliğinin özellikle **yoğun gübre uygulamaları ve yüzey sularındaki tarımsal akışa** bağlı olarak arttığını, bunun da **yem tüketimi ve verimlilik üzerinde sınırlayıcı etkiler** yaratabileceğini belirtmiştir.

University of Tennessee (2023) tarafından hazırlanan rehberde ise, sığırlar için güvenli kabul edilen **üst sınırın yaklaşık 100–200 mg/L NO_3^-** olduğu; bu seviyelerin aşılması durumunda özellikle **genç hayvanlarda methemoglobinemi ve ani ölümler** gibi ciddi riskler ortaya çıkabileceği belirtilmektedir. Güncel literatür ayrıca, nitratın **subklinik düzeylerde dahi yem**

tüketiminde azalma, rumen mikrobiyal aktivitesinde bozulma ve üreme performansında düşüş ile ilişkili olabileceğini göstermektedir (Llonch ve ark., 2024).

Son çalışmalar, nitratın yalnızca **su kalitesinde izlenmesi gereken temel bir parametre** olmakla kalmadığını, aynı zamanda **yem bileşimi ve çevresel kirlilik kaynaklarıyla birlikte** ele alınması gerektiğini ortaya koymaktadır. Düzenli nitrat analizleri, ruminant sağlığının ve üretim verimliliğinin korunması açısından kritik önemdedir.

2.8. Sülfür ve sülfatların ruminantlarda etkisi

İçme suyundaki **sülfat (SO_4^{2-}) düzeyi**, ruminantların **su ve yem tüketimi, mineral dengesi, sinir sistemi sağlığı ve performansı** üzerinde belirleyici bir rol oynamaktadır. Wyffels ve ark. (2023), farklı sülfat konsantrasyonlarının besleme alanında su ve yem alımı, sindirilebilirlik ve rumen fermentasyon parametreleri üzerindeki etkilerini incelemiş; yüksek sülfatlı sularda **su tüketiminde artış gözlenirken, yem tüketimi ve besleme verimliliğinde olumsuzluklar** rapor edilmiştir.

Evans ve ark. (2023), etçi danalar üzerinde yürüttükleri çalışmada, sodyum sülfattan zenginleştirilmiş içme sularında **sülfat konsantrasyonu arttıkça su tüketiminin lineer olarak arttığını, ancak kuru madde alımının (DMI) değişmediğini** bildirmişlerdir. Bununla birlikte artan sülfat yükü, rumende **hidrojen sülfür (H_2S) üretimini teşvik ederek toksisite riskine** yol açabilmektedir. H_2S birikimi özellikle rumende gaz fazında toksik etkilere neden olabilir ve **polioensefalomalasi (PEM)** gibi sinir sistemi bozukluklarıyla bağlantılıdır (Malyugina, 2023).

Sülfat içeriği yüksek suyun **hoş olmayan tadı** hayvanların su tüketimini kısıtlayabilir (MSU Extension, 2022). Ayrıca, **su ve yem kaynaklarında yüksek sülfat kombinasyonu**, özellikle **bakır (Cu) metabolizmasını bozarak sekonder bakır eksikliğine** neden olabilmektedir. Bu durum, performans kayıpları, bağışıklık sisteminde zayıflama ve üreme problemleri ile ilişkilendirilmektedir (Evans ve ark., 2023).

Montana State University Extension rehberinde, sülfat konsantrasyonlarının **500 mg/L altında tutulmasının güvenli olduğu, 1.000 mg/L ve üzerindeki seviyelerin ise ishal, performans düşüşü ve sinir sistemi bozuklukları (örneğin PEM) riskini artırdığı** belirtilmektedir. 2024 sonrası literatür de, özellikle kurak bölgelerde **yüksek sülfatlı yeraltı sularının** artan risk faktörü olduğuna işaret etmektedir (Tulu ve ark., 2024).

Dolayısıyla, sülfat düzeylerinin düzenli izlenmesi ve yem-su kombinasyonunun mineral metabolizması üzerindeki etkileşimlerinin dikkate alınması, ruminant sağlığı ve üretim verimliliği açısından kritik bir önlemdir.

2.9. Ağır metaller ve element toksisiteleri (Pb, Cd, As, Al, Fe, Mn vb.)

Ruminantların içme sularında **ağır metallerin varlığı,** özellikle **kurşun (Pb), kadmiyum (Cd), arsenik (As), cıva (Hg) ve krom (Cr)** gibi elementler, hem sağlık hem de üretim performansı açısından ciddi riskler taşımaktadır. Bu elementler su kaynaklarına genellikle **jeolojik yapı, endüstriyel faaliyetler, tarımsal uygulamalar (pestisit, gübre) ve maden işletmeleri** aracılığıyla ulaşmaktadır.

Soares ve ark. (2023), Portekiz'de süt sığırı işletmelerinden alınan su örneklerinde mikrobiyolojik parametrelerle birlikte ağır metal düzeylerini de incelemiş ve bazı çiftliklerde **arsenik ve kurşun gibi elementlerin sınır değerlere yakın olduğunu** rapor etmiştir. Kamal ve ark. (2024), saha çalışmasında buzağı mortaliteleri ile su kalitesi parametreleri arasındaki ilişkiyi incelemiş; özellikle **arsenik ve kadmiyum varlığının mortalite riskini artırabileceğini** ortaya koymuştur.

Tulu ve ark. (2024) tarafından yapılan derlemede, **kurak ve yarı kurak bölgelerde jeolojik yapı ve antropojenik kirlilik kaynaklarının** yeraltı sularında ağır metal birikimini artırabileceği; bunun da **yem tüketimi, büyüme performansı ve üreme sağlığı** üzerinde olumsuz etkilere yol açtığı vurgulanmıştır. Chamberlain ve Sinclair, (2023) ise çiftliklerde yaptıkları su kalite analizlerinde özellikle **Cd ve Pb gibi ağır metallerin toksik potansiyel taşıdığını**, bu nedenle düzenli kimyasal analizlerin yapılmasının zorunlu olduğunu bildirmiştir.

Güncel literatür ayrıca ağır metallerin yalnızca akut toksisiteye değil, aynı zamanda **kronik ve subklinik etkilerle** de ilişkili olduğunu göstermektedir. Örneğin düşük dozda arsenik alımı, **karaciğer ve böbrek fonksiyon bozuklukları, oksidatif stres artışı ve bağışıklık sisteminde zayıflama** ile bağlantılı bulunmuştur. Kadmiyumun ise **Ca ve Zn metabolizmasını bozarak kemik sağlığı ve üreme performansını** olumsuz etkileyebileceği rapor edilmiştir (Chowdhury, 2025).

Bu bulgular, ruminant yetiştiriciliğinde ağır metallerin düşük düzeylerde bile **kümülatif ve kronik etkilere** yol açabileceğini ve suyun düzenli analizlerle sürekli izlenmesi gerektiğini ortaya koymaktadır.

3. KİRLETİCİLER VE RİSK FAKTÖRLERİ

3.1. Mikrobiyolojik kalite ve antimikrobiyal direnç riski

Ruminant işletmelerinde içme suyunun **mikrobiyolojik kalitesi**, başlıca **toplam koliformlar, fekal koliform/*Escherichia coli* ve enterokok düzeyleri** üzerinden değerlendirilmekte olup; bu kalite, suluk hijyeni, suyun kaynağı ve çevresel/iklimsel koşullara bağlı olarak değişkenlik göstermektedir.

Soares ve ark. (2023), Portekiz'de süt sığırı işletmelerinde yaptıkları saha çalışmasında, sulardan sıklıkla **koliformlar ve *Enterococcus* spp.** izole etmiş; mikrobiyolojik kalitede **işletme hijyeni ve dezenfeksiyon uygulamalarının belirleyici** olduğunu ortaya koymuştur. Burkhardt ve ark. (2024), ticari bir sürüde **8.000'den fazla içme epizodunu** izledikleri çalışmalarında, **çevre sıcaklıklarının artışıyla birlikte hem su tüketiminin hem de yalaklardaki mikrobiyal çoğalma riskinin arttığını** bildirmiştir. Aynı çalışmada, **yalak tipi ve temizlik sıklığının** mikrobiyolojik kalite üzerinde kritik etkiye sahip olduğu vurgulanmıştır.

Douglas ve Pandey, (2025), süt sığırlarının içme sularında **yüksek nitrat yüküyle birlikte bakteriyel yükün de arttığını**, özellikle buzağılar için koliform eşiklerinin düşük tutulması gerektiğini belirtmiştir. Nitekim Kamal ve ark. (2024), saha verilerinde **buzağı mortalitesiyle suyun mikrobiyolojik parametreleri arasında anlamlı ilişkiler** bulmuştur. Silva ve ark. (2025) ise çiftlik ölçeğinde **mikrobiyolojik kalite izlemesinin (özellikle suluklardaki biyofilm oluşumunun) düzenli ve şematik şekilde yapılmasının** zorunlu olduğunu güncel verilerle ortaya koymuştur.

Güncel literatürde öne çıkan bir diğer risk de **antimikrobiyal direnç (AMR)** faktörüdür. Mikrobiyal açıdan kontamine olmuş sularda, özellikle **Enterobacteriaceae üyelerinin ve *Enterococcus* spp.'nin** çoklu antibiyotik direnç genleri taşıyabildiği gösterilmiştir (Pandey ve ark., 2024). Bu durum yalnızca hayvan sağlığını değil, aynı zamanda **One Health perspektifi** bağlamında insan sağlığını da tehdit etmektedir.

Dolayısıyla, ruminant işletmelerinde içme suyu kalitesinin yalnızca **koliform sayımıyla değil, antimikrobiyal direnç göstergeleriyle birlikte** düzenli olarak değerlendirilmesi; suluk biyofilmlerinin izlenmesi ve mevsimsel risk faktörlerinin göz önünde bulundurulması, sürdürülebilir hayvancılık ve gıda güvenliği açısından kritik bir gerekliliktir.

3.2. Pestisitler, ilaç kalıntıları ve yeni ortaya çıkan kirleticiler (PFAS odağı)

Pestisitlerin **tarımsal drenaj ve yüzey akışıyla su kaynaklarına taşınması**, ruminant içme suyu açısından önemli bir **kronik maruziyet riski** oluşturmaktadır. Son yıllarda yapılan çalışmalar, ruminant performans göstergeleri ile suyun kimyasal kalitesi arasındaki bağlantıları daha net ortaya koymuştur (Kamal ve ark., 2025). Pestisit kalıntılarının uzun vadeli etkileri yalnızca **yem tüketimi ve büyüme performansını** etkilemekle kalmamakta, aynı zamanda **üreme ve bağışıklık fonksiyonları** üzerinde de baskı yaratabilmektedir.

Emerging kirleticiler son zamanlarda konu edinmeye başlayan bu kavram, Bu başlıkta özellikle **kalıcı organik florlu maddeler (PFAS: Per- and Polyfluoroalkyl Substances)** öne çıkmaktadır. PFAS bileşikleri, **biyobirikim potansiyeli yüksek, yarı ömürleri uzun ve çevrede kalıcılık gösteren emerging kirleticiler** arasında yer almaktadır. Wanjala ve ark. (2025), yaşam boyu PFAS'a maruz kalan süt sığırlarında **kanda ve deride anlamlı birikim** rapor etmiştir. Mikkonen ve ark. (2023) ile Edhlund ve ark. (2025), özellikle **perfluorooktansülfonik asit (PFOS)** için günlük birikim ve dokulara geçişi öngören modeller geliştirmiş, bu modellerin **gıda güvenliği risk değerlendirmelerinde kullanılabileceğini** belirtmiştir.

Yeni ortaya çıkan kirleticiler, klasik kirleticiler dışında kalan, çevrede yeni fark edilen, toksikolojik etkileri tam bilinmeyen veya mevzuatta henüz düzenlenmemiş maddeleri kapsar. Bunlar genellikle şunlardır (Li ve ark., 2024).

- **Farmasötikler ve kişisel bakım ürünleri (PPCPs)**
  - İlaç kalıntıları (antibiyotik, analjezik, antidepresan vb.)
  - Kozmetik ürün bileşenleri (parabenler, UV filtreleri vb.)
- **Endokrin bozucular**
  - Bisfenol A (BPA)
  - Ftalatlar
  - Nonilfenoller
- **Mikro kirleticiler**
  - Mikroplastikler, nanoplastikler
  - Sentetik elyaf parçacıkları
- **Yeni tarım ve endüstri kaynaklı kimyasallar**
  - Yeni nesil pestisitler ve herbisitler
  - Per- ve polifloroalkil maddeler (PFAS, "forever chemicals")
- **Biyolojik kirleticiler**
  - Antibiyotik direnç genleri ve dirençli bakteriler
  - Yeni patojenik mikroorganizmalar
- **Diğer emerging gruplar**
  - Yan ürünler (ör. dezenfeksiyon yan ürünleri – DBPs)
  - Yangın geciktiriciler (polibromlu difenil eterler)
  - Tat–koku veren yeni organik bileşikler (Li ve ark., 2024; Pandey ve ark., 2024; Lupton ve ark., 2025).

Mikkonen ve ark. (2025), çiftlik koşullarında PFAS'ın **yem-su-toprak rotaları** üzerinden dinamik bir maruziyet paterni oluşturduğunu; hayvanların **kirlenmemiş su kaynağına erişim sağladığında kısmi eliminasyon** gösterebildiğini ortaya koymuştur. Bu bulgular, maruziyetin sürekli izlenmesi gerektiğini ve **biyobirikim riskinin çevresel koşullara bağlı olarak değişebileceğini** göstermektedir.

Resmî belgeler de bu konuda paralel uyarılar yapmaktadır. Minnesota Tarım Dairesi (2023), ve USDA-ARS (2024) raporlarında, sığırlarda PFAS'ın **su ve yem yoluyla birikebildiği, süte geçebildiği ve insan sağlığı açısından risk oluşturabileceği** belirtilmiştir. Aynı raporlarda, PFAS için **plazma tabanlı arıtma teknolojileri, adsorban bazlı sistemler ve ileri oksidasyon yöntemleri** gibi yeni nesil çözümler üzerinde çalışıldığı vurgulanmıştır. Bu bulgular, pestisit kalıntıları ve PFAS'ın ruminant içme suyunda **izlenmesi gereken yeni "zorunlu parametreler"** haline geldiğini ortaya koymaktadır. Bu durum yalnızca **hayvan sağlığı** için değil, aynı zamanda **ürün güvenliği ve tüketici sağlığı** açısından da kritik önemdedir (Lupton ve ark., 2025).

3.3. Alg ve siyanotoksinler: iklim değişikliği ile ilişkisi

Eutrofik koşullarda siyanobakteri artışı, ruminantların içme sularında **mikrosistinler, anatoksinler ve silindrospermopsin** gibi toksinlerin birikmesine yol açabilmekte, bu da uzun süreli **subklinik ve klinik etkiler** oluşturabilmektedir. Özellikle **mikrosistin-LR**, karaciğer üzerine güçlü hepatotoksik etkileriyle öne çıkmakta ve **oksidatif stres, histopatolojik bozulmalar ve üretim kayıpları** ile ilişkilendirilmektedir.

Bensalem ve ark. (2025), Cezayir'de Ramsar alanındaki sığır sürülerinde yürüttükleri çalışmada, **kronik mikrosistin maruziyetinin biyokimyasal, histolojik ve oksidatif stres göstergeleri üzerinden hayvan sağlığını olumsuz etkilediğini** raporlamıştır. Rodríguez Uro ve ark. (2024), Yüksek And havzasındaki barajlarda **toksijenik siyanobakteri ve siyanotoksin varlığını doğrulamış** ve bu durumun hem sulama hem de hayvan içme suyu için **risk yönetimi** gerektirdiğini vurgulamıştır.

Douglas ve Pandey, (2025) ise süt sığırlarında, içme suyunda **yüksek nitrat ve bakteriyel yükün alg gelişimi için uygun ortam yarattığını,** bunun da hem **duyusal riskleri (tat, koku, bulanıklık)** hem de **toksik etkileri** artırabileceğini ortaya koymuştur. Bu bulgular, suyun yalnızca kimyasal ve mikrobiyolojik değil, aynı zamanda **fitoplanktonik dinamikler** açısından da düzenli değerlendirilmesi gerektiğini göstermektedir.

İklim değişikliği, artan **sıcaklık ve düzensiz yağış rejimleri** yoluyla yüzey sularında **alg patlamaları** daha sık ve yoğun hale getirmektedir (Igwaran ve ark., 2024). Bu nedenle, ruminant içme suyu yönetiminde özellikle sıcak mevsimlerde **siyanotoksin taraması (ör. mikrosistin-LR) ve görsel alg izleme protokollerinin** uygulanması önerilmektedir (Bensalem ve ark., 2025).

3.4. Organik kirleticiler: fenoller, deterjanlar, mikro/nano plastikler ve farmasötikler

Ruminant içme sularında fenolik bileşikler ve deterjan kalıntıları gibi organik kirleticiler suyun tat-koku profilini bozarak tüketimi azaltabilir ve subklinik toksisite riskini yükseltebilir; güncel saha rehberleri bu tür organik kirlenmelerin performansı baskılayabileceğini belirtir (University of Tennessee, 2023). Emerging kirleticiler arasında mikroplastikler ve PFAS'lar öne çıkmaktadır: ruminantlarda plastik partiküllerinin emilimi sınırlı görünmekle birlikte iz miktarlarının süte çıkışı deneysel koşullarda gösterilmiştir (USDA-ARS, 2024). PFAS'ların su/yem yoluyla alınması ve sığır sütüne geçişi, hayvan ve insan sağlığı açısından çok disiplinli izlem gerektirmektedir (Wanjala ve ark., 2025; Minnesota Tarım Dairesi, 2023; Edhlund ve ark., 2025). Bu çerçevede, ruminant su kalitesi programlarına organik kirletici taramaları

(fenoller/deterjanlar için hedef bileşikler; PFAS için panel bazlı analiz) eklenmesi önerilmektedir (Kamal ve ark., 2025; Lupton ve ark., 2025).

4. RUMİNANT İÇME SULARINDA GÜNCEL YAKLAŞIMLAR

4.1. İçme suyu kalitesi, ruminant refahı ve davranışsal göstergeler

İçme suyu kalitesi, ruminantlarda yalnızca **fizyolojik sağlık ve üretim performansını** değil, aynı zamanda **hayvan refahını** ve **davranışsal yanıtları** da doğrudan etkilemektedir. Suyun **tat, koku, bulanıklık, mineral yükü ve mikrobiyal kontaminasyonu**, hayvanların suya ulaşma motivasyonunu, su içme davranışını ve yem tüketim paternlerini değiştirebilmektedir (Pandey ve ark., 2025).

Davranışsal göstergeler

Düşük kaliteli suyun sunulduğu sürülerde yapılan gözlemlerde, hayvanların **su yalaklarına erişim için rekabet ettiği, içme süresinin uzadığı, yem tüketiminde azalma görüldüğü ve geviş getirme süresinin kısaldığı** bildirilmiştir (Burkhardt ve ark., 2024). Bu tür davranışsal değişimler, hayvan refahının bozulduğuna dair **erken uyarı göstergeleri** olarak kabul edilmektedir.

Stres ve fizyolojik yanıtlar

Su kalitesi ile **stres biyobelirteçleri** arasında güçlü bir ilişki vardır. Özellikle yüksek TDS, sülfat veya nitrat yüküne sahip sularda yetiştirilen hayvanlarda **kortizol düzeylerinde yükselme, oksidatif stres belirteçlerinde artış** ve **bağışıklık fonksiyonunda zayıflama** rapor edilmiştir (Malyugina, 2023). Bu durum, içme suyu kalitesinin sadece metabolik değil, aynı zamanda **refah temelli bir parametre** olduğunu göstermektedir.

Refah protokollerinde içme suyu

Dünya Hayvan Sağlığı Örgütü (WOAH, 2024) ve Avrupa Gıda Güvenliği Otoritesi (EFSA, 2025) tarafından yayımlanan refah protokollerinde, **hayvanların sürekli, temiz ve uygun suya erişimi**, refahın temel kriterlerinden biri olarak tanımlanmaktadır. Bu nedenle**, su kalitesi izleme sonuçlarının refah değerlendirme protokollerine dahil edilmesi** önerilmektedir. Örneğin, davranışsal göstergeler (su yalaklarında bekleme süresi, suya yaklaşma sıklığı) ile suyun kimyasal/mikrobiyolojik parametreleri birlikte analiz edilerek **refah odaklı izleme sistemleri** geliştirilmektedir (Silva ve ark., 2025).

4.2. Dijital teknolojiler ve su kalitesi izleme (IoT, NIR, yapay zekâ destekli modeller)

Ruminant yetiştiriciliğinde içme suyu kalitesinin düzenli ve doğru izlenmesi, hem **hayvan sağlığı ve performansı** hem de **sürdürülebilir üretim** açısından kritik öneme sahiptir. Geleneksel laboratuvar analizleri çoğunlukla **yüksek maliyetli, zaman alıcı ve kesintili ölçümler** sunmaktadır. Son yıllarda dijital teknolojiler (IoT sensörleri, yakın kızılötesi spektroskopi – NIR, yapay zekâ tabanlı modellemeler) bu alanda **devrimsel çözümler** olarak öne çıkmaktadır.

IoT tabanlı sensör sistemleri

IoT destekli su kalite sensörleri, **pH, sıcaklık, çözünmüş oksijen, iletkenlik ve TDS gibi parametreleri gerçek zamanlı olarak ölçerek** çiftlik yönetim yazılımlarına entegre edilebilmektedir. Bu sistemler, **uzaktan erişim ve erken uyarı mekanizmaları** sayesinde, su kalitesindeki ani değişimlerin hayvan sağlığına yansımadan kontrol edilmesine olanak sağlamaktadır (Posam ve Vidhyapathi, 2025).

NIR spektroskopisi ve taşınabilir cihazlar

Yakın kızılötesi (NIR) spektroskopisi, son dönemde **su örneklerinde nitrat, sülfat ve organik madde konsantrasyonlarını hızlı ve non-invaziv** şekilde belirlemek için kullanılmaktadır. Çiftlik koşullarında taşınabilir NIR cihazları ile yapılan analizler, **laboratuvar analizlerine benzer doğruluk oranları** vermektedir (Agiomavriti ve ark., 2025).

Yapay zekâ (AI) ve büyük veri analitiği

Makine öğrenmesi (ML) ve derin öğrenme (DL) algoritmaları, su kalitesine ilişkin **büyük veri setlerini analiz ederek kontaminasyon tahmin modelleri** geliştirmektedir. Bu modeller, **iklimsel veriler, gübre kullanımı, hidrolojik koşullar ve çiftlik içi sensör çıktıları** ile entegre edilerek, nitrat, ağır metal veya mikrobiyal kontaminasyon risklerini önceden tahmin edebilmektedir (Hardas ve Tomar, 2024).

Sürdürülebilirlik ve karar destek sistemleri

Dijital teknolojiler yalnızca izleme değil, aynı zamanda **karar destek mekanizmaları** da sunmaktadır. Blockchain tabanlı izlenebilirlik sistemleri ile su kalitesi kayıtları güvence altına alınabilmekte, **çiftlik düzeyinde sürdürülebilir su yönetimi stratejileri** geliştirilebilmektedir (FAO, 2024). Bu sayede hem **hayvan refahı ve verimliliği artırılmakta** hem de **tüketici güveni** güçlendirilmektedir.

4.3. Politika, düzenleme ve standartlar (FAO, WHO, EU ve Türkiye karşılaştırması)

Ruminant içme suyu kalitesi; farklı uluslararası kurumların, bölgesel otoritelerin ve ulusal mevzuatların kesişiminde şekillenen çok katmanlı bir düzenleme alanıdır. Bu alandaki temel referans noktaları **FAO, Dünya Sağlık Örgütü (WHO), Avrupa Birliği (AB)** ve **Türkiye**'deki ulusal standartlardır.

FAO (Food and Agriculture Organization of the United Nations), hayvancılıkta su kalitesi yönetimini hayvan sağlığı ve üretim performansı bağlamında ele alır. FAO'nun "*Water Quality for Agriculture*" başlıklı teknik rehberi, özellikle elektriksel iletkenlik, tuzluluk, nitrat ve sülfat düzeyleri için sınır değerler belirlemekte; 5 dS/m'nin üzerindeki iletkenliğin ruminantlarda performans kaybı riskini artırabileceğini bildirmektedir (FAO, 2019). Bu yaklaşım, suyun sadece toksikolojik değil **fizyolojik ve üretimsel etkilerini** de içermesi bakımından özgündür.

WHO (World Health Organization) ise su kalitesi politikalarını insan sağlığı odağında belirler. Nitrat, nitrit, florür ve arsenik gibi parametreler için bağlayıcı olmayan *Guidelines for Drinking-Water Quality* eşikleri tanımlar; ülkeler bu değerleri genellikle kendi içme suyu mevzuatlarına referans olarak alır (Andries ve ark., 2024). Hayvancılık için doğrudan WHO limiti bulunmamakla birlikte, birçok ülke bu değerleri dolaylı biçimde **hayvan içme suyu değerlendirmelerinde** de kullanmaktadır.

Avrupa Birliği (EU) düzeyinde, 2020/2184 sayılı *İçme Suyu Direktifi* içme suyu parametrelerini güncellemiş, özellikle **PFAS** (per- ve polifloroalkil maddeler) için iki yeni grup limit getirmiştir: "sum of 20 PFAS = 0.1 µg/L" ve "PFAS total = 0.5 µg/L" European Commission, 2020 (Andries ve ark., 2024). Üye ülkeler bu sınırları 12 Ocak 2026 itibarıyla uygulamakla yükümlüdür. Avrupa Çevre Ajansı (EEA, 2023) bu yeni politikaların su kaynaklı PFAS birikimini izleme ve azaltma açısından kritik bir dönüm noktası olduğunu vurgulamaktadır.

Türkiye'de ise ruminant içme suyu kalitesi için bağımsız bir düzenleme bulunmamakta; **TS 266 (İnsani Tüketim Amaçlı Sular Standardı) ve İnsani Tüketim Amaçlı Sular Hakkında Yönetmelik** esas alınmaktadır. Bu kapsamda pH, iletkenlik, nitrat gibi temel parametreler için WHO ve AB standartlarıyla uyumlu sınır değerler kullanılmakta, PFAS gibi yeni kirleticiler

konusunda ise AB'nin 2026 limitleriyle **uyumlaştırma süreci** devam etmektedir (Gazete, 2016; BfR, 2023).

Sonuç olarak, ruminant içme suyu kalitesi politikaları küresel ölçekte henüz tam bir bütünlük kazanmış değildir. FAO performans temelli; WHO insan sağlığı temelli; AB çevre ve kimyasal güvenlik temelli; Türkiye ise uyumlaştırma temelli bir yaklaşım benimsemektedir. Bu çok katmanlı yapı, özellikle PFAS ve diğer emerging kirleticiler açısından, hayvansal üretim güvenliğini doğrudan etkileyen **yeni nesil su kalite politikalarının** geliştirilmesini zorunlu kılmaktadır (Wisser ve ark., 2024).

Ruminant içme suyu uyum kontrol çizelgesi*

Parametre	İzleme Sıklığı (öneri)	Eylem Planı (eşik aşıldığında)
pH	3 ayda bir	pH düzeltme (asit/baz dozajı, aerasyon)
Nitrat (NO_3^-)	3 ayda bir (özellikle buzağılar için)	Kaynağın değiştirilmesi, arıtım (iyon değiştirici, biyolojik denitrifikasyon)
Nitrit (NO_2^-)	3 ayda bir	Kuyu kapatma, biyolojik filtrasyon
Tuzluluk / İletkenlik (EC)	6 ayda bir	Alternatif kaynak, sulandırma, karıştırma
Sertlik (Ca^{2+} + Mg^{2+})	6 ayda bir	Yumuşatma (iyon değiştirici)
Sülfat (SO_4^{2-})	3 ayda bir	Alternatif kaynak, karıştırma, RO
Ağır metaller (As, Pb, Cd)	Yılda 1	Kaynağı devre dışı bırakma, arıtım (adsorban, membran)
Mikrobiyolojik (koliform/E. coli)	Aylık	Dezenfeksiyon, suluk temizliği
PFAS	Yılda 1 (AB'ye uyumlu izleme)	İleri arıtım (adsorban, plazma oksidasyon, GAC/RO)

***FAO** eşikleri performans odaklıdır; özellikle **tuzluluk ve TDS** için "kullanılabilirlik" sınıfları tanımlar.

WHO değerleri çoğunlukla insan sağlığına yöneliktir ancak ülkeler bunları referans alır.

AB (2020/2184) içme suyu direktifi 2026'dan itibaren PFAS parametrelerini zorunlu hale getirmektedir.

Türkiye TS 266 ve İTASHY ile büyük ölçüde AB/WHO ile uyumludur; PFAS için uyumlaştırma aşamasındadır.

SONUÇ

Bu çalışmada ruminantların içme sularında karşılaşılabilecek **kimyasal, biyolojik ve emerging kirleticiler** kapsamlı biçimde ele alınmış, 23 alt başlık altında güncel literatür (2023–2025) ışığında değerlendirilmiştir. Bulgular, su kalitesinin yalnızca fizyolojik sağlık ve üretim performansı açısından değil, aynı zamanda **hayvan refahı, davranışsal göstergeler, antimikrobiyal direnç riski ve gıda güvenliği** boyutlarında da belirleyici olduğunu ortaya koymaktadır.

Nitrat, sülfat, ağır metaller ve mikrobiyolojik parametreler gibi klasik risklerin yanında, **PFAS, pestisit kalıntıları, mikroplastikler ve siyanotoksinler** gibi yeni nesil kirleticilerin de ruminant sağlığı ve ürün güvenliği açısından dikkate alınması gerektiği görülmektedir.

Özellikle **iklim değişikliği ve tarımsal uygulamaların etkisiyle artan su kirliliği**, gelecekte su kalitesinin daha dinamik ve bütüncül bir yaklaşımla ele alınmasını zorunlu kılmaktadır.

Geleneksel analiz yöntemleri yanında, **IoT tabanlı sensörler, NIR spektroskopisi ve yapay zekâ destekli tahmin modelleri**, içme suyu kalitesinin gerçek zamanlı ve düşük maliyetle izlenmesine olanak tanımaktadır. Bu teknolojilerin çiftlik düzeyinde uygulanabilirliği, hem **erken uyarı sistemleri** geliştirilmesini hem de **sürdürülebilir su yönetimi** stratejilerinin hayata geçirilmesini kolaylaştırmaktadır.

Politika ve düzenleme boyutunda ise FAO, WHO (2024), AB ve Türkiye'nin ortaya koyduğu çerçeveler, büyük ölçüde **insan içme suyu standartlarını** temel almakta; ancak ruminantlar için özel eşik değerler ve saha uyarlamaları çoğunlukla **rehber düzeyinde** kalmaktadır. AB'nin 2026'dan itibaren geçerli olacak **PFAS limitleri**, Türkiye dâhil birçok ülke için uyum sürecinde kritik bir dönüm noktası olacaktır.

Sonuç olarak, ruminant içme suyu yönetiminde **multidisipliner bir yaklaşım** benimsenmeli; su kalitesi izleme çalışmaları **kimyasal, mikrobiyolojik, emerging kirleticiler, refah göstergeleri ve dijital teknolojiler** ile bütünleşik şekilde yürütülmelidir. Bu yaklaşım yalnızca hayvan sağlığı ve verimliliğini değil, aynı zamanda **gıda güvenliğini, tüketici sağlığını ve sürdürülebilir hayvancılık politikalarını** güvence altına alacaktır.

ÖZET

Bu çalışma, Adıyaman ilinde 2015-2016 yetiştirme sezonunda destek sulama koşullarında yürütülmüştür. Deneme, tesadüf blokları deneme deseni esas alınarak 4 tekerrürlü olarak kurulmuştur. Araştırmada, 20 ileri kademe ekmeklik buğday hattı ve 5 tescilli (kontrol) ekmeklik buğday çeşidi karşılaştırılmıştır. Çalışmada amaç, Adıyaman ilinde destek sulama koşullarında adaptasyonu yüksek, verim ve kalite yönünden kontrol çeşitlerden daha üstün hatları belirlemektir. Araştırılan tüm özelliklerde genotipler arasında $p \leq 0.01$ düzeyinde önemli farklılıklar olduğu tespit edilmiştir. Tane verimi 110.72-376.04 kg da^{-1}, hektolitre ağırlığı 76.20-84.05 kg hl^{-1}, bin tane ağırlığı 24.63-47.00 g, protein oranı %13.70-19.05 ve zeleny sedimantasyon miktarı 22.50-41.00 ml arasında değişim göstermiştir. Çalışmada, tane veriminde 2, hektolitre ağırlığında 4, protein oranında 6 ve zeleny sedimantasyon miktarında 4 hattın tüm kontrol çeşitlerden üstün olduğu belirlenmiştir. Tane veriminde G1 (376.04 kg da^{-1}) ve G19 (375.74 kg da^{-1}) ileri kademe ekmeklik buğday hatlarının ön sırada yer aldığı tespit edilmiştir. Fiziksel kalite özelliklerinde G8 (83.80 kg hl^{-1}), G9 (84.05 kg hl^{-1} ve 42.73 g), Hilar (47.00 g) ve G19 (83.95 kg hl^{-1}) en iyi genotiplerdir. Teknolojik kalite özelliklerinde G1 (39.00 ml), G6 (41.00 ml), G7 (%18.85 ve 39.00 ml), G17 (%18.80 ve 41.00 ml) ve G22 (%19.05) en iyi genotiplerdir. Son olarak, verim veya kalite bakımından öne çıkan genotiplerin gözlem altına alınarak çalışmanın en az bir yıl daha devam ettirilmesinin faydalı olacağı sonucuna varılmıştır.

Anahtar Kelimeler: Buğday, kalite, destek sulama

EVALUATION OF SOME BREAD WHEAT *(TRITICUM AESTIVUM* L.*)* GENOTYPES IN TERMS OF YIELD AND QUALITY UNDER SUPPLEMENTARY IRRIGATION CONDITIONS

ABSTRACT

This study was carried out under supplementary irrigation conditions in Adıyaman province during the 2015-2016 growing season. The trial was established based on a randomized experiment block design with 4 replications. In the study, 20 advanced bread wheat lines and 5 registered bread wheat varieties (controlled) were compared. The aim of the study was to determine the lines that were highly adaptable to the supplementary irrigation conditions in Adıyaman province and were superior to the control varieties in terms of yield and quality. It was determined that there were significant differences between genotypes at the $p \leq 0.01$ level in all investigated traits. Grain yield 110.72-376.04 kg da^{-1}, test weight 76.20-84.05 kg hl^{-1}, thousand-grain weight 24.63-47.00 g, protein ratio 13.70-19.05% and zeleny sedimentation varied between 22.50-41.00 ml. In the study, it was determined that 2 lines in grain yield, 4 lines in test weight, 6 lines in protein content and 4 lines in zeleny sedimentation amount were superior to all control varieties. It was determined that G1 (376.04 kg da^{-1}) and G19 (375.74 kg da^{-1}) advanced bread wheat lines were in the first place in grain yield. In terms of physical quality traits, G8 (83.80 kg hl^{-1}), G9 (84.05 kg hl^{-1} and 42.73 g), Hilar (47.00 g) and G19 (83.95 kg hl^{-1}) were the best genotypes. In terms of technological quality characteristics, G1 (39.00 ml), G6 (41.00 ml), G7 (18.85% and 39.00 ml), G17 (18.80% and 41.00 ml) and G22 (19.05%) were the best genotypes. Finally, it was concluded that it would be beneficial to continue the study for at least one more year by observing the genotypes that stand out in terms of yield or quality.

Keywords: Wheat, quality, supplementary irrigation

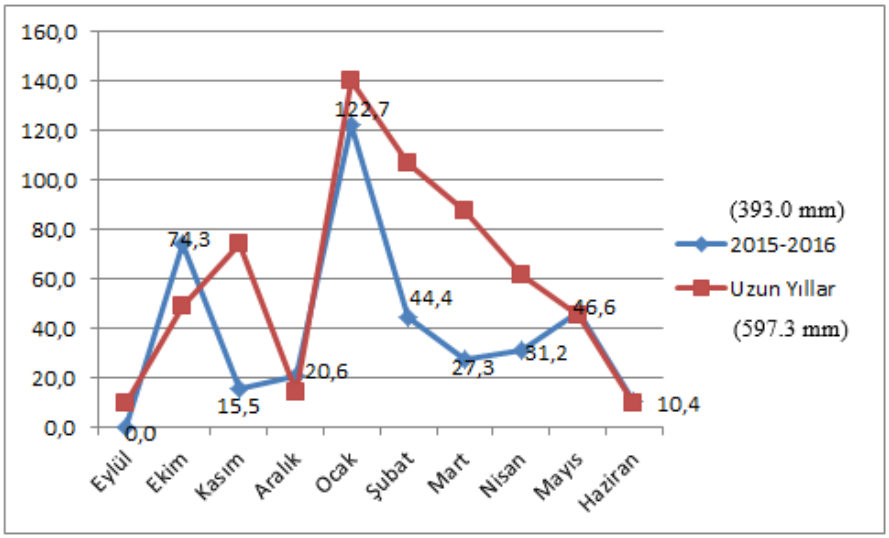
1. GİRİŞ

Buğday, dünya nüfusunun yaklaşık 1/3'ünün ana besin kaynağı olması nedeniyle stratejik tarla bitkilerden biri olmakla beraber dünya nüfusunun ihtiyaç duyduğu kalorinin ve proteinin önemli bir kısmını karşılamaktadır (Ali, 2017; Akan ve ark., 2021). Türkiye'de buğday ekiliş ve üretim durumu Türkiye İstatistik Kurumu'nun (TÜİK) verilerine göre değerlendirildiğinde 663 milyon dekarlık alanda ekim ve 19.8 milyon ton üretim yapıldığı bildirilmiştir (Güney ve ark., 2024; Daşkın ve Alp, 2025).

Buğdayın, B vitamini ve mineral maddeler açısından zengin olmasının yanı sıra dünya nüfusunun enerji ihtiyacının %20'sini karşıladığı vurgulanırken (Özberk ve ark., 2016), farklı araştırıcılar insan ve hayvan beslenmesinde temel proteinlerin %20'sini, kalorinin ise %19'unu karşıladığını bildirmiştir (Bozoğlu ve ark., 2022; Özer ve ark., 2023; Daşkın ve Alp, 2025).

Buğdaydan elde edilen ekmek, bulgur, kuskus gibi ürünler Türkiye nüfusunun temel besin kaynağıdır. Buğdaydan elde edilen farklı ürünlerin tüketimi dikkate alındığında yıllık kişi başı ortalama buğday tüketiminin >200 kg olduğu belirlenmiştir. Bu tüketim miktarı ile Türkiye'nin dünyada en ön sırada yer aldığı tespit edilmiştir (Morgounov ve ark., 2016; Atak ve ark., 2021).

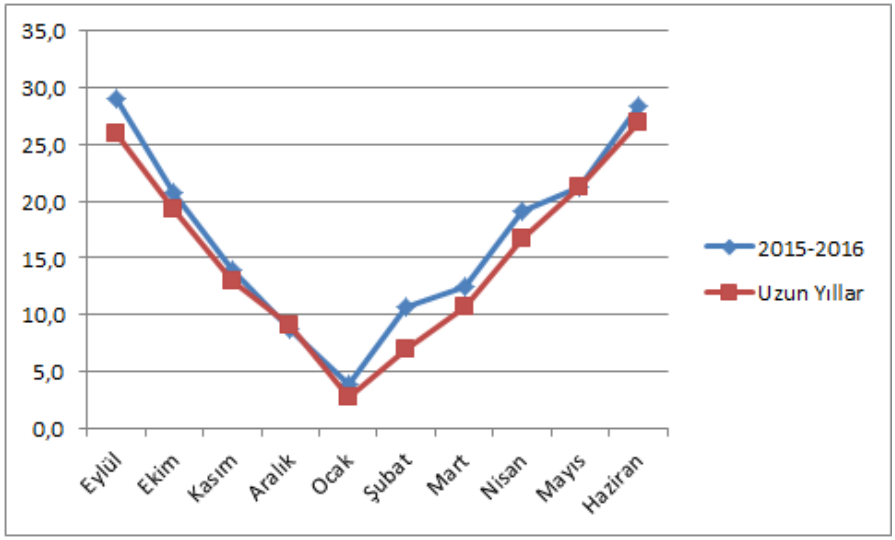
Buğdayda kalite genotipik ve çevresel faktörlerin etkisi altında gelişmektedir. Fiziksel kalite özelliklerinden olan hektolitre ağırlığı ve bin tane ağırlığı buğday tanesini kalite açısından değerlendirmede önem arz etmektedir (Kün, 1996; Elgün ve ark., 2002; Ulucan & Atak, 2020). Başka çalışmalarda, bin tane ağırlığının genotipik özellik olmasının yanı sıra yüksek sıcaklık, kuraklık ve toprak verimliliği gibi unsurlardan etkilendiği bildirilmiştir (Çölkesen ve ark., 2002; Aktaş ve ark., 2017).



Bu çalışmanın amacı, yurt dışından temin edilen ileri kademe ekmeklik buğday hatlarını Adıyaman ili koşullarında adaptasyon yeteneği bakımından test etmenin yanı sıra verim, kalite özellikleri bakımından kontrol çeşitlerden üstün ve bölgede gelecek vadeden, tescil adayı olabilecek materyali belirlemektir.

2. MATERYAL VE YÖNTEM

Çalışma, Adıyaman ilinde 2015-2016 yetiştirme sezonunda destek sulamalı koşullarda tesadüf blokları deneme desenine göre 4 tekrarlamalı olarak yürütülmüştür. Çalışma materyalini 20 adet ileri kademe ekmeklik buğday hattı ve 5 adet tescilli (kontrol) çeşit (Dinç, Hilar, Tekin: GAP Uluslararası Tarımsal Araştırma ve Eğitim Merkezi Müdürlüğü, Pehlivan: Trakya Tarımsal Araştırma Enstitüsü Müdürlüğü, Ceyhan-99: Doğu Akdeniz Tarımsal Araştırma Enstitüsü Müdürlüğü) oluşturmuştur.



Deneme alanı topraklarının; killi-tın sınıfta, hafif tuzlu, fosfor içeriği az ve organik madde yönünden yetersiz olduğu tespit edilmiştir. Bitki besin elementi takviyesi için saf madde üzerinden 6 kg da^{-1} fosfor (P_2O_5) ve 6 kg da^{-1} azot (N) ekim ile beraber verilmiş olmakla beraber bitkilerin kardeşlenme döneminde olduğu dönemde de ilave olarak 8 kg da^{-1} N üst gübre olarak tatbik edilmiştir. Çalışmada, buğday bitkisinin süt olum döneminin sonlarına doğru her parsel suya doyuncaya kadar karık sulama usulüyle bir defa sulanmıştır. Hasat-harman işlemi, 25 Haziran 2016 tarihinde parsel biçerdöveri ile tamamlanmıştır.

Çalışmada, gerçekleşen yağış miktarının uzun yıllar ortalaması ile kıyaslandığında, yağışın aylar bazında dağılımının düzensiz olduğu, Ekim ve Aralık aylarında daha fazla, Mayıs ve Haziran aylarında benzer, diğer aylarda ise daha az yağış meydana geldiği gözlemlenmiştir (Şekil 1).

Şekil 1. Adıyaman ilinin 2015-2016 ve uzun yıllar ortalama yağış görseli

Sezona ilişkin aylar bazında gerçekleşen ortalama sıcaklık verilerine göre Mayıs ayında uzun yılların ortalamasıyla aynı veriler gerçekleşirken, Aralık ayında daha düşük ve geriye kalan tüm aylarda ise daha yüksek sıcaklıkların meydana geldiği saptanmıştır (Şekil 2).

Şekil 2. Adıyaman ilinin 2015-2016 ve uzun yıllar ortalama sıcaklık görseli

Araştırmada; tane verimi, hektolitre ağırlığı, bin tane ağırlığı, protein oranı ve zeleny sedimantasyon parametreleri araştırılmıştır. Denemede, tane verimi 4 tekerrür üzerinden değerlendirilirken, kalite özellikleri iş yoğunluğu ve maliyet nedeniyle 3 tekrar üzerinden değerlendirilmiştir. İstatistiki analizler, J.M.P 13.0 pro paket programı kullanılarak yapılmış olup, oluşan gruplar, gruplar arası farklılıklar ve önem düzeyleri LSD ($p \leq 0.05$) testi dikkate alınarak belirlenmiştir (Gomez ve Gomez, 1984).

3. BULGULAR VE TARTIŞMA

Araştırmada, incelenen tüm özelliklerde genotipler arasında $p \leq 0.01$ düzeyinde anlamlı farklılıklar olduğu gözlemlenmiştir. Araştırmada, tane verimi yönünden genotipler arasında geniş varyasyon olduğu gözlemlenirken tane veriminin 110.72-376.04 kg da^{-1} arasında değişim gösterdiği belirlenmiştir. Deneme ortalamasının 241.38 kg da^{-1} olduğu ve 14 adet genotipin deneme ortalamasının üzerinde tane verimi verdiği tespit edilmiştir. Çalışmada, G1 (376.04 kg

da^{-1}) ve G19 (375.74 kg da^{-1}) ileri kademe ekmeklik buğday hatlarının tüm kontrol çeşitlerden daha verimli olduğu ve ön sırada yer aldıkları belirlenmiştir (Tablo 1). Birim alandan elde edilen tane verimi, kalıtımın yanı sıra çevre koşullarının etkisi altında şekillenmektedir (Erdem ve Sakin, 2023).

Hektolitre ağırlığı, tane verimi ve un randımanı üzerinde etkili olan önemli fiziksel kalite özelliklerinden biridir. Hektolitre ağırlığının 76.20-84.05 kg hl^{-1} arasında farklılık gösterdiği belirlenmiştir. Deneme ortalamasının 81.23 kg hl^{-1} olduğu ve 4 adet genotipin deneme ortalamasının üzerinde hektolitre ağırlığı verdiği gözlemlenmiştir. Araştırmada, G8 (83.80 kg hl^{-1}), G9 (84.05 kg hl^{-1}), G18 (83.25 kg hl^{-1}) ve G19 (83.95 kg hl^{-1})'un tüm kontrol çeşitlerden daha yüksek hektolitre ağırlığına sahip olduğu saptanmıştır (Tablo 1). Yozgat ili koşullarında 14 ekmeklik buğday çeşidi ile yürütülen çalışmada hektolitre ağırlığının 76-82 kg hl^{-1} arasında değişim gösterdiği bildirilmiştir (Özen ve Akman, 2015). Çalışmamızda elde edilen sonuçlar paralellik arz etmektedir.

G.ortalama: genel ortalama, TV: tane verimi, HL: hektolitre ağırlığı, BT: bin tane ağırlığı, ZS: zeleny sedimantasyon miktarı, KÜHS: kontrolden üstün hatların sayısı

Bin tane ağırlığı tane iriliğine bağlı olarak artan veya azalan teknolojk kalite özelliklerindendir. Araştırmada, bin tane ağırlığı bakımından genotipler arasında geniş bir varyasyon olduğu belirlenmiş olmakla birlikte bin tane ağırlığının 24.63 g-47.00 g arasında değiştiği saptanmıştır. Çalışmada, ortalama bin tane ağırlığının 34.33 g olduğu ve 11 adet genotipin deneme ortalamasının üzerinde bin tane ağırlığı verdiği gözlemlenirken, Hilar kontrol çeşidinden daha yüksek bin tane ağırlığı veren hattın olmadığı saptanmıştır (Tablo 1). Yozgat ili koşullarında ekmeklik buğdayda bin tane ağırlığı ile ilgili yapılan çalışmada bin tane ağırlığının 33-44 g arasında farklılık gösterdiği belirlenmiştir (Özen ve Akman, 2015). Çalışmamızda benzer değerler tespit edilmiş olmakla birlikte genotipler arasında daha geniş varyasyon olduğu gözlemlenmiştir.

Protein oranı önemli kalite özelliklerinden olmakla birlikte ekmeklik buğdayın hangi ürüne işleneceğine karar vermede önemlidir. Protein oranının %13.70-19.05 arasında farklılık gösterdiği, deneme ortalamasının %15.84 olduğu ve 11 adet genotipin deneme ortalamasının üzerinde protein oranı verdiği tespit edilmiştir. Araştırmada; G4 (%16.95), G6 (%17.60), G7 (%18.85), G17 (%18.80), G21 (%16.75) ve G22 (%19.05) ileri kademe ekmeklik buğday hatlarının tüm kontrol çeşitlerden daha yüksek protein oranı verdiği saptanmıştır (Tablo 1). Özen ve Akman (2015), tarafından ekmeklik buğdayda protein oranı ile ilgili yapılan çalışma sonucunda protein oranının %8-13, Eliş ve ark. (2024), tarafından yapılan çalışmada ise %14.5-18.1 aralığında olduğu vurgulanmıştır. Çalışmamızda elde edilen sonuçlar Eliş ve ark. (2024) ile benzer, Özen ve Akman (2015)'nın sonuçlarından daha yüksek değerler olmuştur.

Zeleny sedimantasyon miktarı un kalitesini belirlemede önemli kalite özelliklerinden biridir. Çalışmada, zeleny sedimantasyon miktarının 22.50-41.00 ml arasında değişim gösterdiği gözlemlenirken deneme ortalamasının 33.10 ml olduğu tespit edilmiştir. Denemede 14 adet genotipin deneme ortalamasının üzerinde zeleny sedimantasyon değeri verdiği belirlenmiştir. Kontrol çeşitler ile kıyaslandığında G1 (39.00 ml), G6 (41.00 ml), G7 (39.00 ml) ve G17 (41.00 ml) ileri kademe ekmeklik buğday hatları daha yüksek zeleny sedimantasyon miktarını vermiştir (Tablo 1).

Zeleny sedimantasyon miktarı yönünden genotipler arasındaki farklılıkların kalıtımın etkisinden kaynaklandığı, iklim gibi çevre faktörlerinin etkisi göz ardı edilmemekle beraber zeleny sedimantasyonda çevresel etkilerin diğer kalite özelliklerine nazaran minimum düzeyde olduğu bildirilmiştir (Atlı ve ark., 1999; Karaman ve ark., 2012).

4. SONUÇ VE ÖNERİLER

Araştırmada, bin tane ağırlığı hariç incelenen tüm özelliklerde kontrol çeşitlerden daha üstün ekmeklik buğday hatları olduğu gözlemlenmiştir. Tane veriminde G1 ve G19 ileri kademe ekmeklik buğday hatları ön sırada yer alırken, fiziksel kalite özelliklerinde (hektolitre ve/veya bin tane ağırlığı) G8, G9, G19, Teknolojik kalite özelliklerinde (protein ve/veya zeleny sedimantasyon) ise G1, G6, G7, G17 ve G22 ileri kademe ekmeklik buğday hatlarının tüm kontrol çeşitlerden daha üstün olduğu tespit edilmiştir. İncelenen özellikler bakımından kontrol çeşitlere göre daha iyi olan ileri kademe ekmeklik buğday hatları gelecekte tescil adayı olmaya yönelik umut vermekle beraber çalışmanın en az bir yıl daha tekrar edilmesinin güvenilir sonuçlara ulaşma açısından önem arz etmektedir.

ÖZET

Kırmızı mercimek, zengin besin içeriği ve havadaki serbest azotu toprağa fikse etme yeteneği sayesinde, önemli yemeklik tane baklagil türlerinden biridir. Kırmızı mercimek, yüksek protein içeriği ile birlikte A, B, C ve D vitaminlerini içermesi ve Fe, Mg, Ca, P, K gibi mikro ve makro elementlerce zengin olması nedeniyle beslenme açısından önemli bir baklagil türüdür. Mercimek, kurak iklim koşullarına dayanıklı olması, erken hasat edilmesi, kendisinden sonra ekilen bitkilere azotça zengin bir toprak bırakması ve toprak yapısını iyileştirici ile koruyucu özellik göstermesi nedeniyle münavebe sistemlerinde önemli bir yere sahiptir.

Bu çalışma, 2023 yılında Muş ilinde yağışa dayalı koşullarda, geç ilkbahar ekim döneminde yürütülmüştür. Araştırmada amaç, Türkiye'de tescilli bazı kırmızı mercimek çeşitlerini verim ve bazı tarımsal özellikler bakımından incelemektir. Çalışmada, çiçeklenme süresi ($p \leq 0.05$) hariç incelenen tüm özelliklerde genotipler arasında $p \leq 0.01$ düzeyinde önemli farklılıklar olduğu tespit edilmiştir. Tane verimi 9.08-83.47 kg da^{-1}, ana dal sayısı 1.30-2.10 adet $bitki^{-1}$, ilk bakla yüksekliği 8.75-14.25 cm, bitki boyu 17.38-23.75 cm, çiçeklenme süresi 50.67-57.33 gün ve bin tane ağırlığı 22.58-35.58 g arasında değişim göstermiştir.

Çalışmada, Altıntoprak kırmızı mercimek çeşidinin tane verimi bakımından ilk sırada olduğu gözlenmekle beraber birim alan tane verimlerinin genel olarak düşük olduğu saptanmıştır. Sonuç olarak, bir yıllık çalışma sonuçları dikkate alındığında geç ilkbahar ekimi koşullarında kırmızı mercimek yetiştiriciliğinin ticari anlamda uygun olmadığı ön görülürken bölgede kırmızı mercimek ile ilgili farklı ekim zamanlarını içeren çalışmaların yapılması bölge üreticilerine ve bilim camiasına katkı sağlayacaktır.

Anahtar Kelimeler: Kırmızı mercimek, verim, morfoloji

EVALUATION OF RED LENTIL *(LENS CULINARIS* MEDIK*.)* VARIETIES REGISTERED IN TURKEY IN TERMS OF YIELD AND SOME MORPHOLOGICAL CHARACTERISTICS IN CONDITIONS OF MUŞ PROVINCE

ABSTRACT

Red lentil *(Lens culinaris* Medik*.)* is one of the most important edible legume species due to its rich nutritional content and its ability to fix atmospheric nitrogen into the soil. Its high protein content, along with vitamins A, B, C and D, and its richness in micro and macro lements such as Fe, Mg, Ca, P, and K, make it a valuable food source for human nutrition. Furthermore, red lentil is well adapted to dry climatic conditions, reaches maturity early, enriches the soil with nitrogen for subsequent crops, and improves soil structure, thus holding an important place in crop rotation systems.

This study was conducted under rainfed conditions during the late spring sowing period in Muş province in 2023. The aim was to evaluate some registered red lentil cultivars in Türkiye in terms of grain yield and certain agronomic characteristics. Except for flowering time ($p \leq 0.05$), significant differences ($p \leq 0.01$) were found among genotypes for all other examined traits. Grain yield ranged from 9.08 to 83.47 kg da^{-1}, number of main branches from 1.30 to 2.10 per plant, first pod height from 8.75 to 14.25 cm, plant height from 17.38 to 23.75 cm, flowering time from 50.67 to 57.33 days, and thousand-grain weight from 22.58 to 35.58 g.

In the study, it was observed that the Altıntoprak red lentil variety was in the first place in terms of grain yield, but the grain yields per unit area were generally low. In conclusion, considering the results of a one-year study, it is predicted that red lentil cultivation in late spring planting conditions is not commercially viable, while conducting studies that include different planting times for red lentils in the region will contribute to the regional producers and the scientific community.

Keywords: Red lentil, yield, morphology

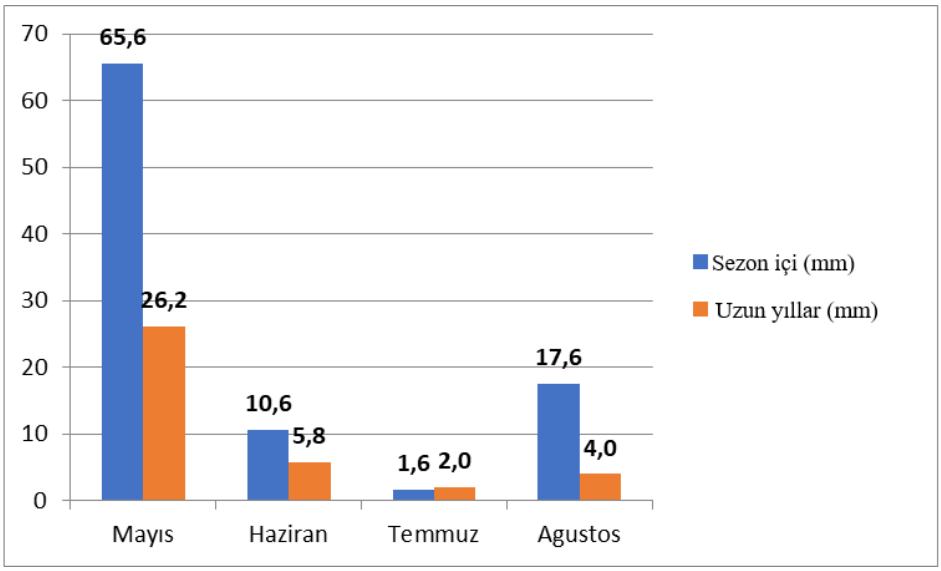
1. GİRİŞ

Yemeklik tane baklagiller zengin protein, vitamin, karbonhidrat, mineral, diyet lifi ve fitokimyasal madde içerikleri sebebiyle birçok ülkede insan beslenmesinde temel besin kaynağı olarak değerlendirilmektedir (Amarowicz ve ark., 2010; Nilüfer-Erdil ve Gedik, 2018). Yemeklik tane baklagiller, havadaki serbest azotu toprağa fikse edip toprağı azot yönünden zenginleştirmesi sebebiyle tarla bitkileri yetiştiriciliğinde önem arz etmektedir (Özdemir, 2002, Doğan ve Doğan, 2020). Yemeklik tane baklagil yetiştiriciliğinin yapıldığı alanlarda toprağın kimyasal, fiziksel ve biyolojik özelliklerinin düzeldiği bildirilmiştir (Şehirali ve ark., 1995). Ayrıca, toprağa 6.4-21.6 kg da^{-1} arasında saf azot bağlandığı, mercimek yetiştiriciliğinde ise bu miktarın 8.4 kg da^{-1} olduğu bildirilmiştir (Sepetoğlu, 1987; Doğan ve Doğan, 2020).

Mercimek, toprak tekstürünü ve strüktürünü koruması, kendisinden sonra ekilecek olan bitkiye azotça zengin bir toprak bırakması ve kuraklığa karşı mukavemetinin yüksek olması nedeniyle yemeklik tane baklagil bitkileri içerisinde öne çıkmaktadır (Tullu ve ark., 2001). Kırmızı mercimek, Türkiye'de tane olarak tüketilmesinin yanı sıra samanı da hayvan beslenmesinde çok değerlidir.

Türkiye'de tarım yapılan alanlarının %3.9'luk kısmında baklagil yetiştiriciliği yapılmaktadır. Mevcut baklagil ekiminin %36.7'si ise mercimek ekim alanlarından oluşmaktadır. Türkiye'de toplam mercimek üretiminin dağılımı incelendiğinde %93'lük payı kırmızı mercimek ve %7'lik payı ise yeşil mercimek oluşturmaktadır (TÜİK, 2018). Mercimek yetiştiriciliğinde özellikle fide döneminde bitki gelişiminin yabancı otlar ile kıyaslandığında yavaş olması sebebiyle erken dönemde yabancı ot mücadelesine önem verilmesi gerektiği vurgulanmıştır (Basler, 1981; Özer ve ark, 1998; Aksoy ve ark., 2014; Sırrı, 2020).

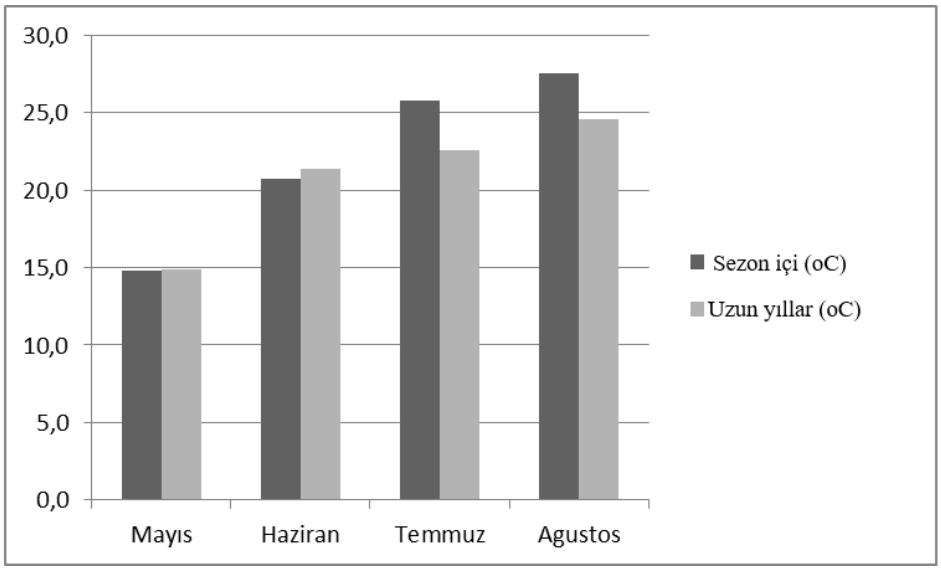
Bu çalışmada amaç, Türkiye'de tescilli kırmızı mercimek çeşitlerinin Muş ili koşullarında adaptasyon kabiliyetini test etmenin yanı sıra tane verimi bazı morfolojik özellikler bakımından değerlendirmektir.



2. MATERYAL VE YÖNTEM

Bu araştırma, Muş ilinde 2023 yılının yağışa dayalı ve geç ilkbahar ekimi koşullarında yürütülmüştür. Deneme, tesadüf blokları deneme deseni dikkate alınarak 10 adet kırmızı mercimek çeşidi ile 3 tekerrürlü olarak tasarlanmıştır. Çeşitler ve orijin merkezleri Tablo 1'de verilmiştir.

Tablo 1. Çalışmada yer alan çeşitlere ilişkin bilgiler



Çeşitler	Orijin Merkezi/Islahçı kuruluş
Atacan	GAP Tarımsal Araştırma Enstitüsü Müdürlüğü
Şakar	Dicle Üniversitesi Ziraat Fakültesi
Çiftçi	Tarla Bitkileri Merkez Araştırma Enstitüsü Müdürlüğü
Şanlıbey	GAP Tarımsal Araştırma Enstitüsü Müdürlüğü
Seyran-96	GAP Uluslararası Tarımsal Araştırma ve Eğitim Merkezi Müdürlüğü
Evirgen	Mersin Ticaret Borsası Toh. A.Ş.
Kafkas	Tarla Bitkileri Merkez Araştırma Enstitüsü Müdürlüğü
Tigris	GAP Uluslararası Tarımsal Araştırma ve Eğitim Merkezi Müdürlüğü
Özbek	Tarla Bitkileri Merkez Araştırma Enstitüsü Müdürlüğü
Altıntoprak	GAP Uluslararası Tarımsal Araştırma ve Eğitim Merkezi Müdürlüğü

Denemede, her parsel 4 sıra, sıra arası 20 cm ve 4 m uzunluğunda kurulmuştur. Ekim işlemi, metrekareye 300 kırmızı mercimek tanesi düşecek şekilde 11.05.2023'te yapılmıştır. 2023 yılı üretim sezonuna ait iklim verilerine bakıldığında Temmuz ayı hariç tüm aylarda meydana gelen yağışın uzun yıllar ortalamasından fazla ve toplam yağış miktarının 95.4 mm olduğu tespit edilmiştir (Şekil 1). Üretim sezonundaki sıcaklık değerlerinin ise Temmuz ve Ağustos aylarında uzun yıllar ortalamasının üzerinde geriye kalan aylarda birbirine yakın değerler olduğu gözlemlenmiştir (Şekil 2).

Şekil 1. Muş ilinin 2023 sezonuna ve uzun yıllara ilişkin ortalama yağışı (mm)

Araştırmada, deneme alanı topraklarının tuzsuz %0.35, hafif bazik Ph:7.91, fosfor içeriği az 2.2 kg.da^{-1} ve organik madde içeriğinin ise %1.67 yetersiz olduğu tespit edilmiştir. Bitki besin maddesi eksikliğini gidermek için ekimle beraber saf madde üzerinden 6 kg P_2O_5 ve 2.3 kg N verilmiştir. Denemede, üst gübreleme için herhangi bir gübre uygulanmamıştır. Denemede bitkilerin yaklaşık 5 cm ve 10 cm olduğu iki farklı dönemde yabancı otlar el ile yolunarak mücadele yapılmıştır.

Şekil 2. Muş ilinin 2023 sezonuna ve uzun yıllara ilişkin ortalama sıcaklığı (ºC)

Hasat yapılmadan önce her parselin başından ve sonundan 0.5 m kesilip, parselin 1. ve 4. sırası devre dışı bırakılıp atıldıktan sonra ortadaki 2 sıra 11.08.2023 tarihinde el ile hasat edilmiştir. Harmanlama işlemi ise farklı çaptaki elekler yardımıyla Ağustos ayı içerisinde tamamlanmıştır.

Çalışmada, her parselde rastgele seçilen 10 bitki üzerinden; ana dal sayısı (ADS), ilk bakla yüksekliği (İBY), bitki boyu (BB) ölçülmüş ve aritmetik ortalaması alınarak özellik bazında ortalama değerler elde edilmiştir. Çiçeklenme süresi (ÇS) tespiti için ekimden parselin >%50'si çiçekleninceye kadar geçen süre gün cinsinden belirlenerek tespit edilmiştir.

Bin tane ağırlığı, 4 farklı gruptan oluşan 100'er mercimek tanesinin ağırlığı 0.001 hassas terazide tespit edildikten sonra aritmetik ortalaması alınmış ve ardından 10 ile çarpılarak belirlenmiştir. Tane verimi için her parselin ortadaki iki sırasından (1.2 m^2) hasat ve harman işleminin ardından 0.001 hassas terazide verimi $kg.da^{-1}$ cinsinden belirlenmiştir.

Araştırmada, istatistiki analizler J.M.P 5.0 paket programında yapılmıştır. Oluşan gruplar ve önem düzeyleri LSD testine göre $p \leq 0.05$ seviyesinde saptanmıştır (Gomez & Gomez, 1984).

3. BULGULAR VE TARTIŞMA

Araştırmada, incelenen tüm özelliklerde çeşitler arasında anlamlı ($p \leq 0.01$) farklılıklar olduğu belirlenmiştir.

Tablo 2. İncelenen özelliklere ait ortalama değerler ve oluşan gruplar

Çeşit	TV ($kg\ da^{-1}$)		BTA (g)		ADS (adet)		İBY (cm)		ÇS (gün)		BB (cm)	
Atacan	9.08	ı	28.52	cd	1.30	d	10.50	c	50.67	c	18.38	cd

TV: tane verimi, BTA: bin tane ağırlığı, ADS: ana dal sayısı, İBY: ilk bakla yüksekliği, ÇS: çiçeklenme süresi, BB: bitki boyu

Araştırmada, kırmızı mercimek verimlerinde çeşitler arasında geniş varyasyon olduğu tespit edilmiştir. Tane verimlerinin 9.08-83.47 kg da^{-1} arasında farklılık gösterdiği, deneme ortalamasının ise 41.84 kg da^{-1} olduğu belirlenmiştir (Tablo 2). Altıntoprak kırmızı mercimek çeşidi mevcut materyal içerisinde en yüksek tane verimi ile ilk sırada yer almıştır. Kırmızı mercimekte tane veriminin kalıtsal etkenlere bağlı olarak değiştiği, iklim ve toprak yapısından da önemli ölçüde etkilendiği bildirilmiştir (Aydoğan ve ark., 2008; Beşok Küçükay ve ark., 2019). Ayrıca, özellikle ekim zamanının birim alan tane verimi üzerinde etkili olduğu düşünülmektedir.

Bin tane ağırlığına ilişkin değerler incelendiğinde 22.58-35.58 g arasında değişen farklı tane iriliğine sahip çeşitler olduğu gözlemlenmiştir. Bin tane ağırlığı bakımından deneme ortalamasının 28.49 g olduğu ve Şanlıbey, Seyran-96, Özbek kırmızı mercimek çeşitlerinin aynı grupta yer alarak çalışma materyali içerisinde en iri taneli çeşitler olarak ön sırada yer aldıkları belirlenmiştir (Tablo 2). Sivas ve Adana illerinde birçok mercimek hattı ile yapılan çalışmada bin tane ağırlığının 12.0-51.7 g arasında farklılık gösterdiği tespit edilmiştir (Toklu ve ark, 2017). Çalışmamızda elde edilen sonuçlar referans sınırları içerisinde yer almaktadır.

Mercimek çeşitlerinde ana dal sayısının 1.30-2.10 adet arasında farklılık gösterdiği tespit edilmiştir (Tablo 2). Çalışmada, ana dal sayısına ilişkin deneme ortalamasının 1.70 adet olduğu, Kafkas ve Özbek kırmızı mercimek çeşitleri ana dal sayısı yönünden aynı grupta yer alarak en yüksek ana dal sayısını vermiştir. Konya koşullarında kışlık ekim koşullarında kırmızı mercimekte yapılan bir çalışmada ana dal sayısının 4.53-4.67 adet arasında değişim gösterdiği belirlenmiştir. Çalışmamız, geç ilkbahar koşullarında yapıldığından dolayı daha düşük ana dal sayısı değerleri elde edilmiştir (Hakkoymaz ve Önder, 2021).

Tablo 3. Özellikler arası ilişkiler ve önem düzeyleri ($p \leq 0.05$ veya $p \leq 0.01$)

Özellikler	TV	ADS	İBY	BB	ÇS
ADS	0.342				
İBY	**0.3929***	**0.4158***			
BB	0.2255	0.3364	**0.5829****		
ÇS	**0.3905***	0.2711	**0.3866***	-0.0763	
BTA	**-0.5465****	-0.1094	**-0.5642****	-0.079	**-0.5563****

TV: tane verimi, BTA: bin tane ağırlığı, ADS: ana dal sayısı, İBY: ilk bakla yüksekliği, ÇS: çiçeklenme süresi, BB: bitki boyu

Kırmızı mercimek çeşitlerinde ilk bakla yüksekliğinin 8.75-14.25 cm arasında değişim gösterdiği gözlemlenmiştir. İlk bakla yüksekliği deneme ortalamasının 11.3 cm olduğu, Kafkas ve Şakar kırmızı mercimek çeşitlerinin aynı grubu paylaşarak en yüksek ilk bakla yüksekliği değerlerini verdiği tespit edilmiştir. Makineli hasat için ilk bakla yüksekliğinin minimum >10 cm olması önem arz etmektedir. Bu bağlamda, Şanlıbey, Seyran-96 kırmızı mercimek çeşitleri hariç diğer çeşitlerin geç ilkbahar ekimi koşullarında makineli hasada uygun olduğu belirlenmiştir (Tablo 2). Isparta ilinin kışlık ekim koşullarında kırmızı mercimekte yapılan çalışmada ilk bakla yüksekliğinin 9.23-20.20 cm arasında farklılık gösterdiği tespit edilmiştir. Çalışmamız, geç ilkbahar koşullarında yapıldığından dolayı daha düşük değerler elde edilmiştir (Beşok Küçükay ve ark., 2019).

Mercimek çeşitlerine ilişkin çiçeklenme süresinin 50.67-57.33 gün arasında farklılık gösterdiği saptanmıştır. Çiçeklenme süresi deneme ortalaması 52.53 gün olmakla birlikte Çiftçi, Evirgen

ve Kafkas kırmızı mercimek çeşitlerinin aynı grupta yer alarak en uzun çiçeklenme süresini verdiği tespit edilmiştir (Tablo 2). Ceylanpınar kışlık ekim koşullarında kırmızı mercimek ile yapılan çalışmada çiçeklenme süresinin 158.0-163.0 gün olduğu bildirilmiştir (Koç ve Akdeniz, 2019). Çalışmamız geç ilkbahar koşullarında yapıldığından dolayı çiçeklenme süresinin çok daha kısa olduğu belirlenmiştir. Çiçeklenme süresinin kısa olmasının birim alan tane verimlerini olumsuz etkilediği düşünülmektedir. Nitekim, çiçeklenme süresi ile tane verimi arasında pozitif ve önemli ilişki olduğu saptanmıştır (Tablo 3).

Çalışmada yer alan çeşitlere ait bitki boylarının 17.38-23.75 cm arasında değişen değerler gösterdiği tespit edilmiştir. Deneme ortalamasının 19.98 cm, Şakar kırmızı mercimek çeşidinin en uzun bitki boyu ile ilk sırada yer aldığı gözlemlenmiştir (Tablo 2). Isparta koşullarında kırmızı mercimek ile ilgili yapılan çalışmada bitki boyunun 27.50-32.80 cm arasında değişim gösterdiği tespit edilmiştir (Beşok Küçükay ve ark., 2019). Çalışmamızda daha düşük bitki boylarının elde edilmesi yazlık ekim koşullarından kaynaklandığı düşünülmektedir.

Korelasyon analizi sonuçlarına göre tane verimi ile ilk bakla yüksekliği (r=0.3929*) ve çiçeklenme süresi (r=0.3905*) arasında pozitif ve önemli ilişki olduğu belirlenirken, bin tane ağırlığı (-0.5465**) ile negatif ve önemli ilişki olduğu saptanmıştır(Tablo 3).

4. SONUÇ

Geç ilkbahar ekim sezonu koşullarında yapılan bu çalışmada, Altıntoprak kırmızı mercimek çeşidinin tane verimi yönünden en verimli çeşit olduğu belirlenirken, Kafkas ve Evirgen çeşitlerinin tane verimi yönüyle takip eden çeşitler olduğu gözlemlenmiştir. Çalışmada, ilk bakla yüksekliği ve çiçeklenme süresinin tane verimi ile pozitif ilişkili olduğu, çiçeklenme süresi uzadıkça bin tane ağırlığının düştüğü tespit edilmiştir. Denemede; Şanlıbey, Seyran-96 kırmızı mercimek çeşitleri hariç diğer çeşitlerin makineli hasada uygun olduğu saptanırken, deneme materyalinin en az bir yıl daha ekilerek çalışmanın tekrarlanmasının sağlıklı yorum yapabilmek için gerekli olduğu sonucuna varılmıştır.

ABSTRACT

Lavandula angustifolia Mill. is one of the most important medicinal and aromatic plants cultivated worldwide, with expanding production in Turkey due to its essential oil quality and economic value. Despite its growing importance, large-scale cultivation is limited by low, irregular, and delayed seed germination, which restricts uniform seedling supply. This study was conducted to evaluate the efficiency of different pre-sowing treatments in improving germination performance. Seeds from three local populations collected in the Isparta and Burdur regions were subjected to potassium nitrate (KNO_3), gibberellic acid (GA_3), hydropriming, osmopriming, and their combined applications. Laboratory trials were performed under controlled conditions in accordance with ISTA rules.

The results revealed statistically significant differences among treatments ($p < 0.05$). Control seeds exhibited poor performance, with germination percentages ranging from 38% to 44% and mean germination times exceeding 11 days. In contrast, all enhancement treatments improved seed performance, though to varying degrees. The most effective treatment across all populations was osmopriming combined with GA_3, which achieved germination rates of 66–69% and reduced the mean germination time to approximately 9.2 days. Hydropriming + GA_3 and osmopriming + KNO_3 also promoted germination compared to the control, but their effects were less pronounced.

These findings indicate that the integration of priming techniques with hormonal stimulators can successfully overcome dormancy barriers and ensure more rapid and uniform seedling emergence. The application of osmopriming + GA_3, in particular, stands out as a practical and reliable strategy for lavender seedling production. The outcomes of this research provide a scientific basis for improving propagation practices, supporting the sustainable expansion of lavender cultivation in Turkey and other regions with similar agroecological conditions.

Keyword: Lavander, Priming, GA_3, KNO_3, Seed

INTRODUCTION

Lavandula angustifolia Mill. is a leading medicinal-aromatic plant that has spread from the Mediterranean basin to the rest of the world due to its volatile oil composition, wide range of uses in the pharmaceutical and cosmetic industries, and contribution to rural development. However, irregular and delayed emergence, low germination rates, and significant heterogeneity between populations in seed propagation create a critical bottleneck in the production chain (ISHS, 1978; Miclea et al., 2018; Lahsen et al., 2020). Heterogeneous germination in lavender seeds is related to intraspecific genetic variation as well as dormancy type, intensity and seed coat (ISHS, 1978). In controlled production, seedling supply highlights seed enhancement approaches in terms of uniform emergence in the field and stability of yield components (Devika et al., 2021; Sano et al., 2021).

The fundamental hormonal axis governing processes at the seed level is the opposing balance between abscisic acid (ABA) and gibberellin (GA). ABA establishes dormancy during maturation; for germination, the ABA signal must decrease and GA biosynthesis/response must increase (Nonogaki, 2014; Shu et al., 2016; Tuan et al., 2018; Sano et al., 2021; Abley et al., 2021). Small changes here significantly affect germination timing distributions and ultimate success (Abley et al., 2021). Various studies have shown that GA_3 applications in L. angustifolia can increase germination rate and speed; its effect is enhanced when used in combination with classical pretreatments such as stratification (cold-moist conditioning), scarification, and surface sterilization (Miclea et al., 2018; Lahsen et al., 2020).

The second prominent approach in seed enhancement is priming applications. Hydro-priming, osmo-priming (PEG, mannitol), salt-priming (especially KNO_3), nutrient, biostimulant, and hormone-based priming approaches use controlled soaking-drying cycles to "kick-start" metabolism and prepare the seed for faster and more uniform germination before radicle emergence. (McDonald, 2000; Devika et al., 2021; Debbarma and Das, 2017). KNO_3 is one of the most frequently used salts in the literature for its ability to reduce dormancy and accelerate germination in many species (Hernández et al., 2021; Steiner et al., 2018; Rehman et al., 2024). Specifically for L. *angustifolia*, osmotic priming has been reported to reduce the average germination time and increase the germination rate (Demirkaya et al., 2018). These findings highlight the practical importance of systematically comparing different priming agents (KNO_3, PEG, etc.) in lavender (Emiralioğlu, 2022).

In addition to environmental factors that determine germination (water, temperature, oxygen, light), species-specific coating layers (testa/endosperm) with mechanical and chemical barriers, population origin, and seed quality parameters such as harvest, maturity also play a critical role (Nonogaki, 2014; Nalwa and Seth, 2017). The most frequently used combinations for lavender are cold-humid stratification (e.g., 2–6 weeks at around 4 °C), light scarification, pre-treatment with GA_3, KNO_3 priming, and appropriate light-temperature regimes (ISHS, 1978; Lahsen et al., 2020; Miclea et al., 2018; Hernandez et al., 2021). In the Isparta and Burdur basins of Turkey, where lavender is rapidly spreading, the limiting factors for seed production interact with local ecology and population origin; therefore, the comparative testing of germination enhancers on local population seeds will provide results that can be directly transferred to the field (Cantürk, 2023; Sezgin, 2020; Emiralioğlu, 2022).

This study aims to comparatively reveal the effectiveness of different germination-promoting applications on lavender seeds from three selected village populations in the Isparta and Burdur regions.

MATERIALS AND METHODS

All laboratory analyses for this study were conducted at the Ege University Seed Technology Application and Research Center (TOTEM) laboratories. *Lavandula angustifolia* Mill. seeds were used as research material in the study. Lavender seeds were collected from the producer's field in the Isparta Burdur region in 3 different populations (population I, II, III).

Chemical applications

To promote germination and overcome seed dormancy, KNO_3 and GA_3—two substances recommended by the International Seed Testing Association (ISTA)—were incorporated into the moistening medium during germination and emergence tests for each seed type. Their potential effects on seed performance were then evaluated.

KNO_3 applications

During sowing, a 0.2% potassium nitrate solution was applied directly at the germination and emergence stages. This treatment enhanced both germination and emergence rates of black cumin seeds (ISTA, 2022).

GA_3 applications

Gibberellins, which are plant growth regulators, have a crucial role in breaking seed and bud dormancy as well as in regulating and stimulating germination. They occur naturally in high concentrations in developing seeds. Gibberellins induce the production of enzymes that are important for the mobilization of stored food reserves, particularly by converting starch into sugars during the early germination phase (Hartmann et al., 1990). In this experiment, gibberellic acid (GA_3) was applied at a concentration of 1,000 ppm. Seeds were treated with GA_3 for 24 h prior to being tested in germination assays (ISTA, 2022).

Priming (pre-germination) applications

Osmotic seed priming has shown the efficiency of the aerated container technique. Polyethylene glycol (PEG 6000), used as the osmoticum, generates osmotic pressure that regulates radicle protrusion during treatment. Due to its high molecular weight, PEG allows limited water absorption by seeds, maintaining a balance between the internal and external environments. Consequently, radicle emergence is delayed, but the compound itself does not penetrate the cell wall and can be removed from seeds easily through washing.

In this study, osmotic priming was conducted with PEG 6000 at −1.0 MPa for 1, 2, or 3 days in aerated (bubble-column, BK) containers. A solution containing 273 g/L PEG was used. Seeds placed in permeable bags within the aerated container were exposed to the PEG solution for the designated durations. Following treatment, they were washed under tap water for 4 minutes, rinsed with distilled water, and then dried for 2 hours (McDonald, 2000).

Germination tests

Seed germination capacity and percentage were assessed following ISTA guidelines. Seeds were placed on filter paper inside Petri dishes, and the experiment was arranged as a randomized block design with four replications, each containing 100 seeds. Germination tests were carried out under optimal temperature conditions of 20°C, in accordance with ISTA standards.

To calculate the mean germination time, daily counts were carried out. Seeds that developed a radicle of at least 2 mm were considered “germinated” and subsequently removed from the Petri dishes. The germination rate (%) value was determined according to Larsen and Andreasen (2004).

$CG = \Sigma n / N \times 100$

n: number of germinated/emerged seeds

N: total number of seeds

The germination rate was calculated according to Pederson et al. (1993).

Average germination time (T50) = $\Sigma(g \times n) / \Sigma n$ □

gx: day of counting from the start of the test

nx: Number of germinated seeds on the day of counting

Σnx: total number of germinated seeds

Combined treatments

Germination assays were also performed with combined treatments involving osmotic priming, KNO_3, and GA_3. Seeds were coated in three different ways: only with polymer, with polymer containing 0.2% KNO_3, and with polymer containing 0.1% GA_3. After coating, seeds were dried for 24 hours. Additionally, seeds that had undergone priming were subjected to the same coating process after drying.

The experimental design therefore included all possible treatment combinations derived from these applications.

1. Control
2. KNO_3
3. GA_3
4. Hydropriming
5. Osmopriming
6. Hydropriming + GA_3
7. Osmopriming + KNO_3
8. Osmopriming + GA_3

Statistical analysis

Analysis of variance (ANOVA) was conducted to evaluate seed germination and growth parameters. Differences among treatment means were compared using the LSD test at a significance level of $p < 0.05$, performed with the TotemStat statistical software (Acikgoz et al., 2004).

RESEARCH RESULTS AND DISCUSSION

The effects of the treatments applied to seeds from *Lavandula angustifolia* Mill. population I on germination parameters are summarized in Table 1 and Figures 1 and 2, while the daily germination progression is shown in Figure 3.

As indicated in Table 1, both germination percentage and mean germination time differed significantly among treatments. The highest germination percentage (68%) was observed in the Osmopriming + GA_3 treatment, followed by GA_3 alone at 56%. The control group exhibited a germination percentage of 40%.

Regarding mean germination time, the shortest times were recorded in the Osmopriming + GA_3 (9.16 days) and Osmopriming (9.22 days) treatments, whereas the control group required 11.42 days for germination.

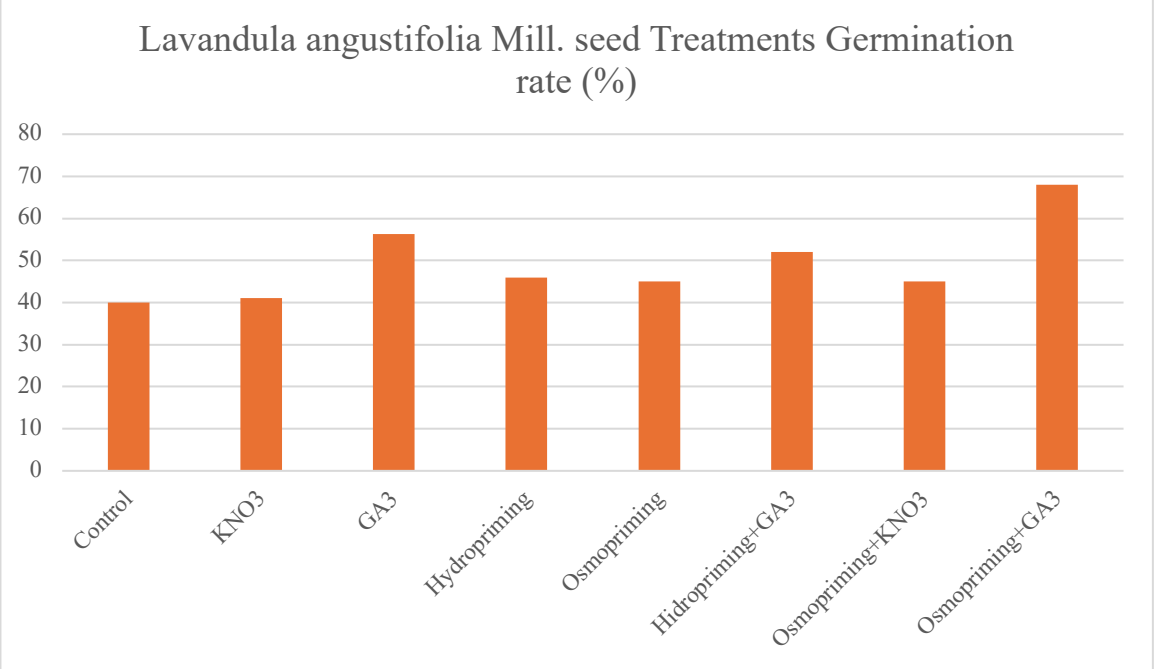

Figure 1. Effects of Applications on Germination Rate in Population 1 Seeds

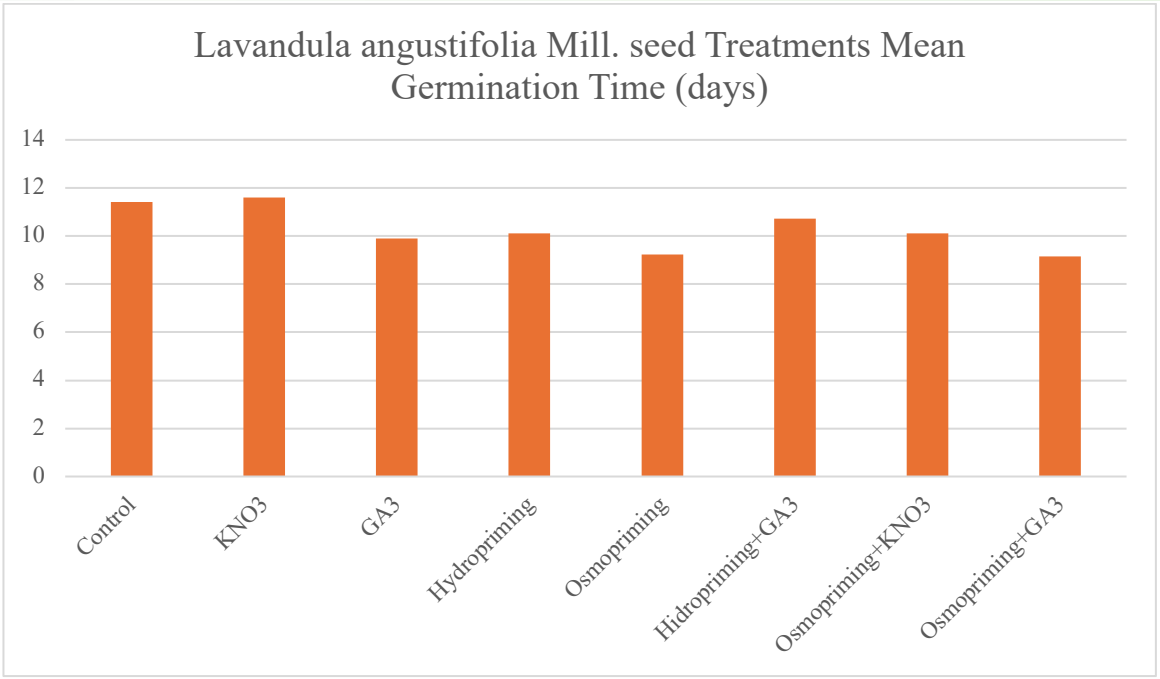

Figure 2. Effects of Applications on the Average Germination Time of Population I Seeds

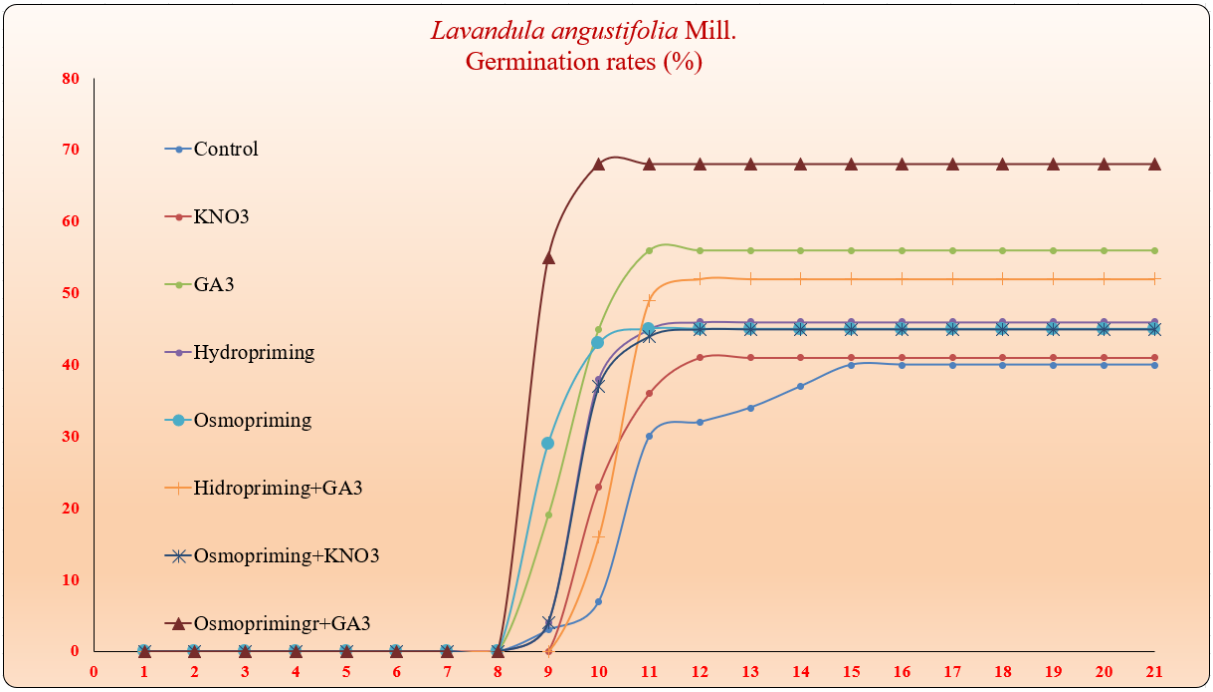

Figure 3. Daily germination values of Lavandula seeds collected from population I after treatments

Table 2 shows that the difference between the treatments is statistically significant and that the seeds reached the highest germination power after the Hydropriming+GA_3 and Osmopriming+GA_3 treatments (Figures 4, 5). The effects of the treatments on daily germination values are shown in Figure 6.

Our study determined that the Hidropriming+GA_3 and Osmopriming+ GA_3 treatments increased germination compared to the control. The highest germination rate was determined to be 66.0%. This was followed by the GA_3 treatment with 53.0%.

The effect of the applications on the average germination time (days) was also found to be statistically significant. The best result in terms of average germination time was found in the Osmopriming+ GA_3 application with 9.17 days.

Table 2. Effect of applications on germination values of *Lavandula angustifolia* Mill. seeds collected from Population II

Application	***Germination rate (%)***	***Average Germination Time (days)***

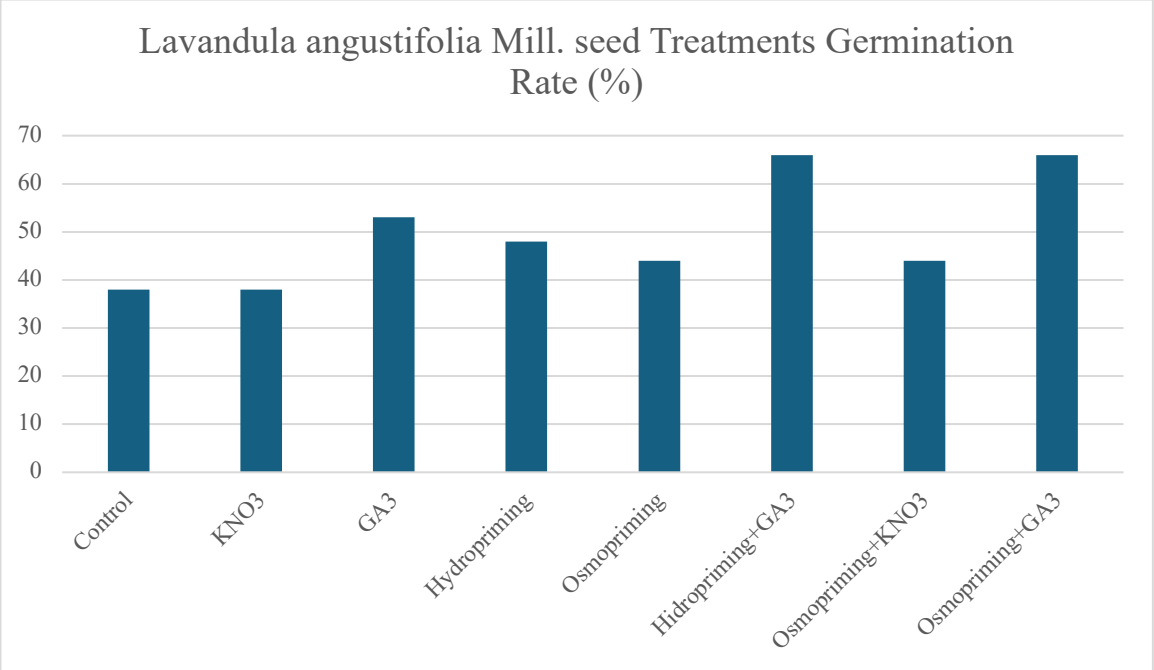

Figure 4. Effects of Applications on Germination Rate in Population II Seeds

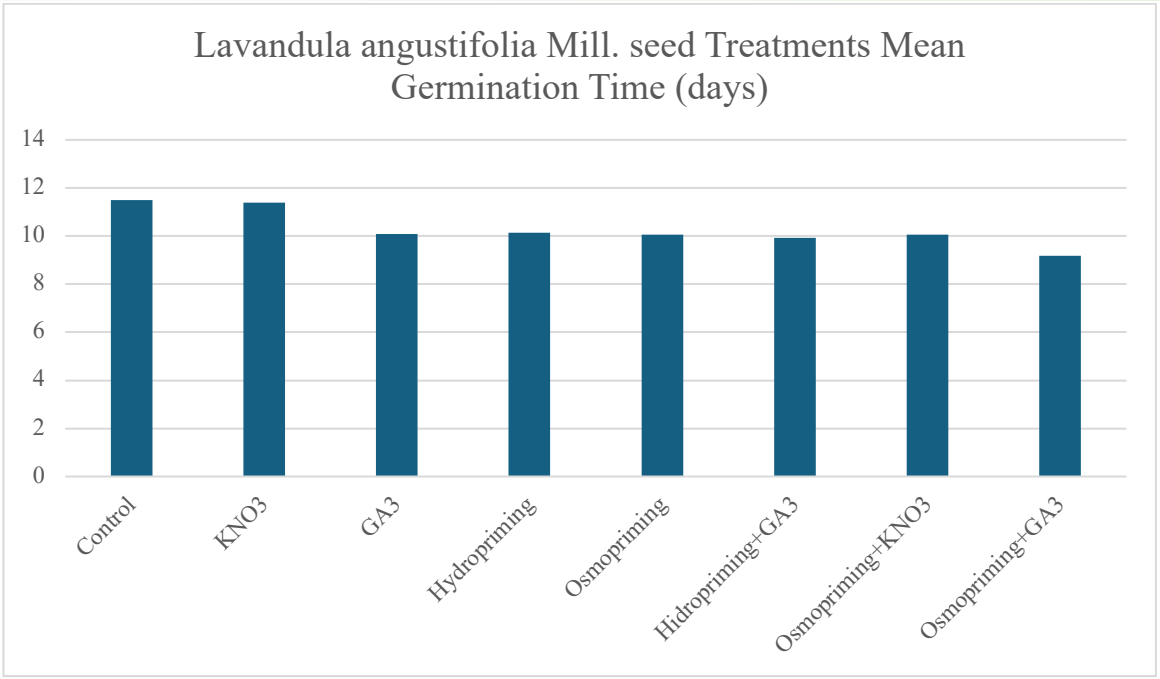

Figure 5. Effects of Applications on the Average Germination Time of Population II Seeds

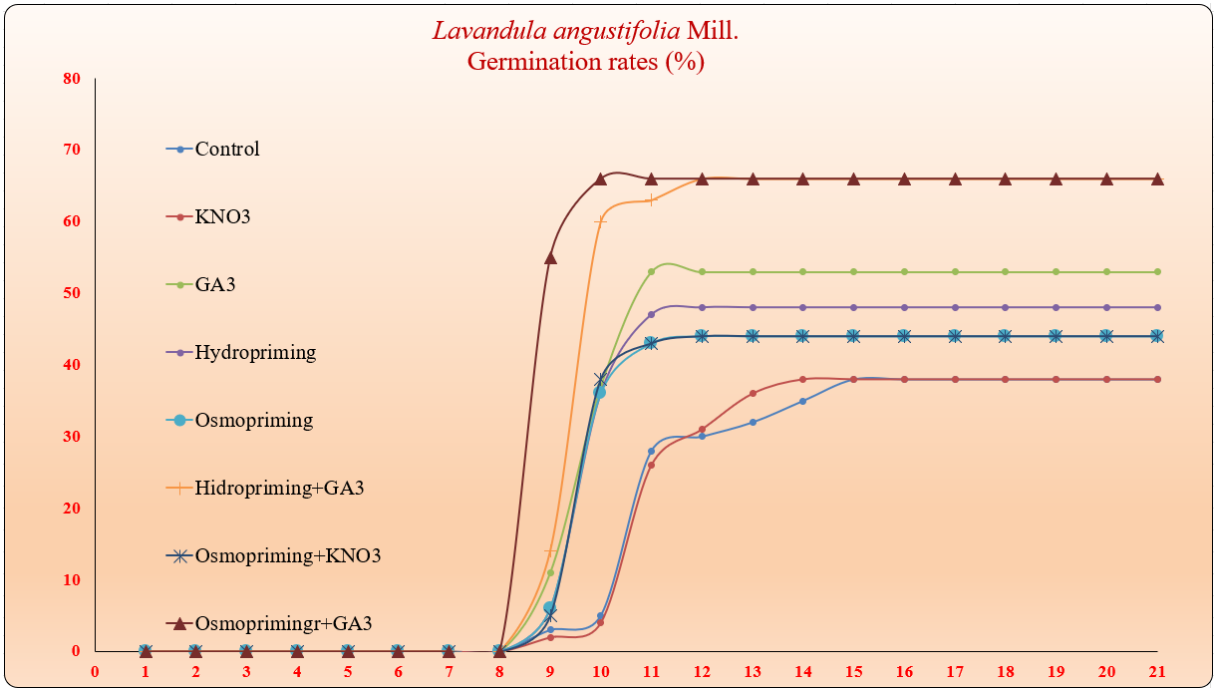

Figure 6. Daily germination values of Lavandula seeds collected from Population II after treatments

Statistical analysis of the germination power figures revealed significant differences at the $p<0.05$ level (Table 3). The highest germination power, 69.0%, was obtained from the Osmopriming+GA_3 application. This application was followed by Osmopriming and Osmopriming+KNO_3 (64.0%). The germination power of the control group was found to be 44.0% (Figures 7, 8).

When the results for germination time were examined, the Osmopriming+ GA_3 application (9.20 days) ranked first, followed by the Osmopriming+KNO_3 application (9.80 days). The germination time of the control group was found to be 11.02 days (Figure 9).

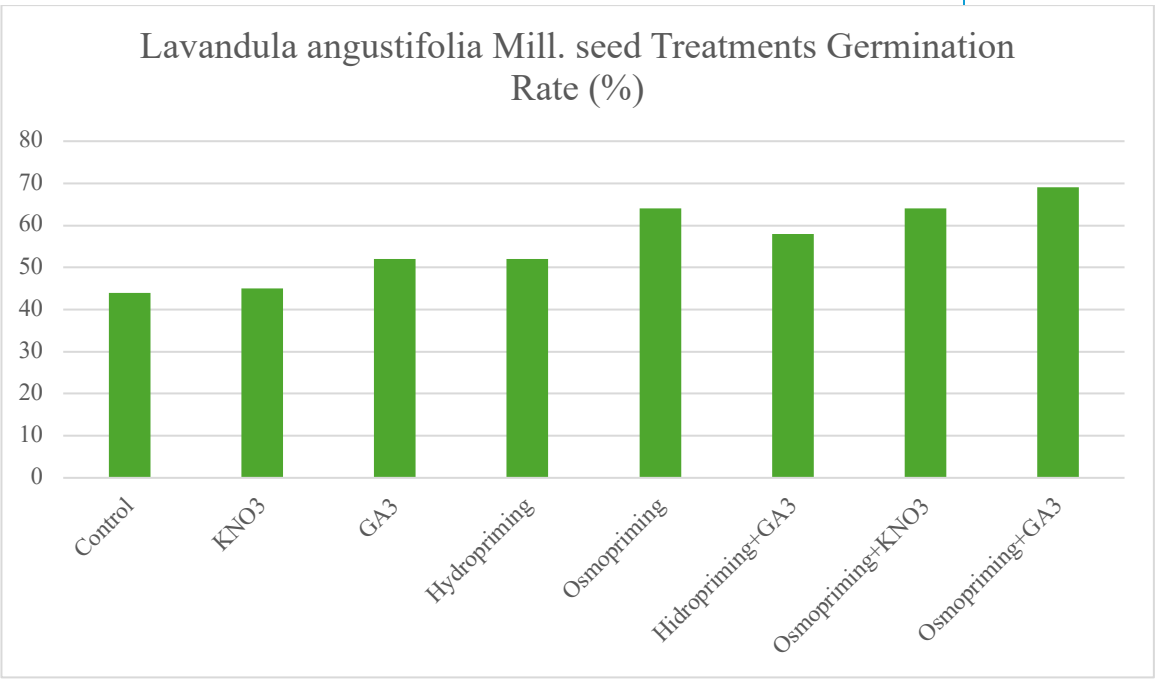

Figure 7. Effects of Applications on Germination Rate in Population III Seeds

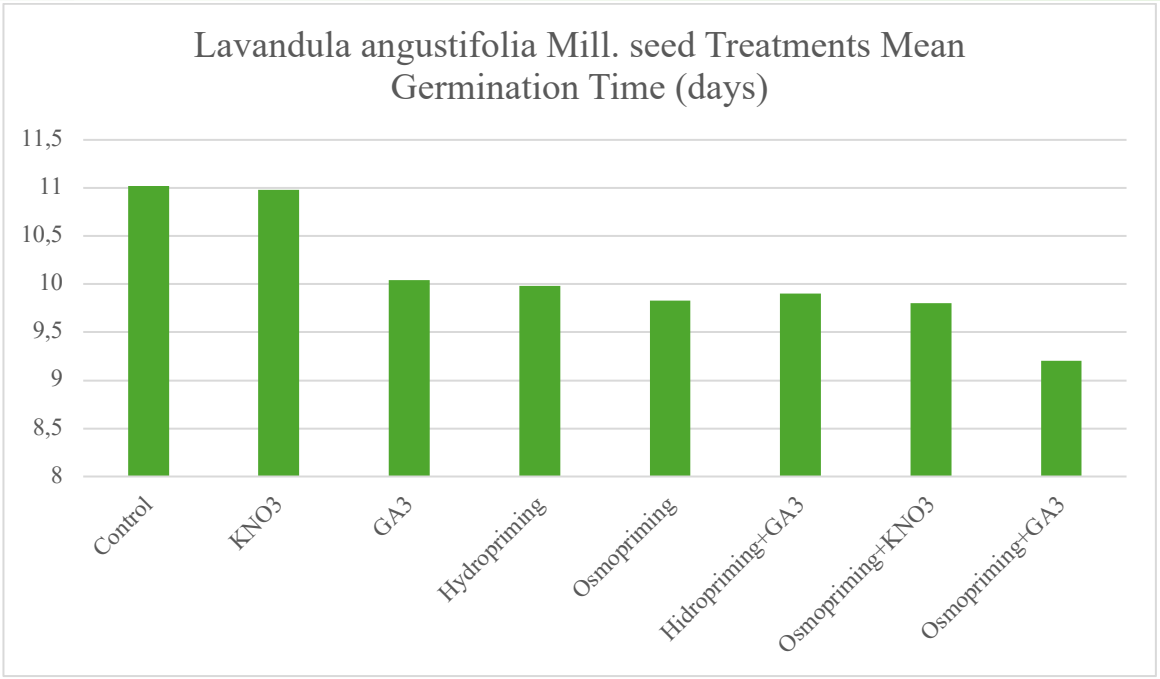

Figure 8. Effects of Applications on the Average Germination Time of Population III Seeds

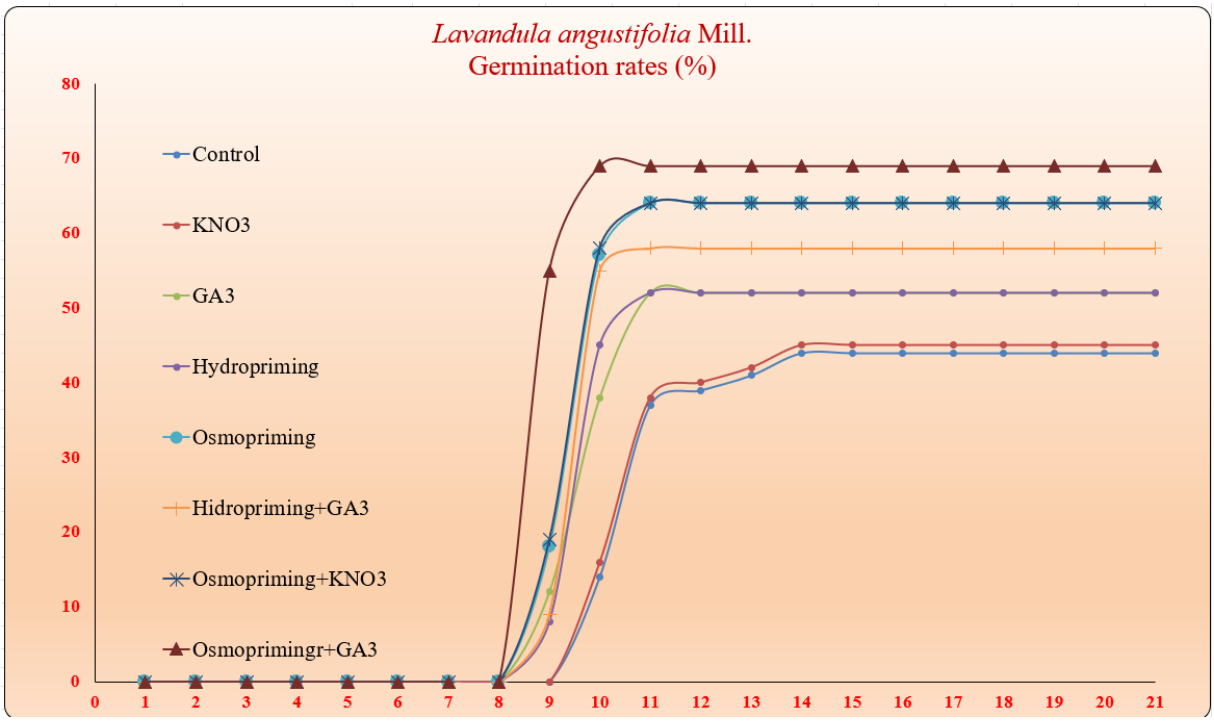

Figure 9. Daily germination values of Lavandula seeds collected from Population III after treatments

Lavandula angustifolia Mill. seeds were exposed to different concentrations of GA_3 (100, 200, and 300 ppm). The treatments demonstrated that GA_3 was effective in breaking seed dormancy and enhancing germination. Furthermore, germination showed a positive correlation with the increasing doses of GA_3 (Varga et al. 2021). In a study on germination techniques of species from the Labiatae family, it was indicated that suitable germination could be achieved at constant temperatures of 15 °C or 20 °C, as well as under alternating temperature regimes of 10–30 °C and 15–25 °C. (Ellis et al. 1985).

Previous studies have shown that priming treatments accelerate germination (Asaduzzaman et al., 2021; Kayacetin, 2021). In addition, numerous reports highlight that pre-sowing applications such as priming, KNO_3, and GA_3 positively influence germination percentage and average germination time (Ajouri et al., 2004; Duman et al., 2011; Ahmadian et al., 2015).

For the seeds of Izmir oregano (*Origanum onites* L.), lavender (*Lavandula stoechas* L.), and basil (*Ocimum basilicum* L.) In this study, the Priming + Polymer + GA_3 and Priming + Polymer + KNO_3 treatments provided the most favorable outcomes in terms of germination percentage and mean germination time compared to the control (Ekren et al., 2024). Similarly, our findings support these results, showing that combined applications were more effective.

CONCLUSIONS

In this research, pre-sowing treatments were applied to seeds from populations I, II, and III of *Lavandula angustifolia* Mill. with the aim of improving germination performance and seed quality. For this purpose, seven different treatments were applied to all seeds from the three populations: KNO_3 application, GA_3 application, Hydropriming, Osmopriming, Hydropriming+GA_3, Osmopriming+KNO_3, and Osmopriming+GA_3. Osmopriming+GA_3 treatments. The effects of these treatments on seed germination and emergence rates, as well as on the average speed of germination and emergence, were evaluated in comparison with the control group. The findings indicate that the Osmopriming + GA_3 application in the cultivation of *Lavandula angustifolia* Mill. is effective and provides positive outcomes.

ÖZET:

Bu çalışma, Muş ovası sınırları dâhilinde yetiştiriciliği yapılan Bilensoy-80 yonca çeşidinin ve yerel yonca genotiplerinin verim ve özelliklerinin tespit edilmesi amacıyla 2022 yılında yapılmıştır. Çalışmanın yürütüldüğü 13 ayrı köyde (Bağlar, Bozbulut, Çöğürlü, Karakuyu, kepenek, Kıyıbaşı, Kızılağaç, Muratgören, Özdilek, Serinova, Suboyu, Sungu ve Taşoluk) toplam 52 adet yonca (22 adet Bilensoy-80 yonca çeşidi parseli ve 30 adet yerel yonca genotipleri parseli) parseli ürünün %10 çiçeklenme dönemine ve ürünün birinci biçimine denk gelen dönemde ziyaret edilmiştir. Çalışmada 10 adet bitki bir tekerrür olacak şekilde her parselden rastgele seçilen 15 bitkinin boyu en alt noktasından en üst noktasına kadar olan kısmı cm cinsinden ölçülmüş ve bitkilerin ortalama ölçümleri alınarak bitki boyları tespit edilmiştir. Her tesadüf bloku deneme deseninden dört tekerrürlü olarak alınan toplam 208 adet örnek laboratuvar ortamına alınmıştır. Son olarak dört ayrı tekerrürden rastgele alınan bir kilogram yonca kurutulmaya bırakılarak kuru ot verimleri hesaplanmıştır. Kurutulan yonca örnekleri öğütüldükten sonra kalite parametreleri NIRS cihazı ile analiz edilmiş ve Bilensoy-80 yonca çeşidinde, bitki boyu 67.80-134.00 cm, yeşil ot verimi dekara 1901.25-6782.50 kg, kuru ot verimi dekara 360.75-1380.76 kg, kuru ot oranı %17.67-29.60, ham protein verimi dekara 73.32-224.95 kg arasında, yerel genotiplerin üretimlerinde ise bitki boyu 58.87-125.27 cm, yeşil ot verimi dekara 1770.00- 4723.00 kg, kuru ot verimi dekara 415.25-875.28 kg, kuru ot oranı %18.14-26.57, ham protein verimi dekara 67.41-175.95 kg ise 99.42-113.17 arasında değişim gösterdiği saptanmıştır. Bilensoy-80 yonca çeşidi ile yerel yonca genotiplerin üretim parametreleri karşılaştırıldığında, analiz edilen koşullar arasındaki farklar Duncan testi kullanılarak karşılaştırılmış ve tüm koşullar arasında gözlenen farklılıklar istatistiksel olarak önemli bulunmuştur.

DETERMINATION OF YIELD CARACTERISTICS OF ALFALFA (*MEDICAGO SATIVA* L.) GENOTYPE CULTURED IN MUS PLAIN

ABSTRACT

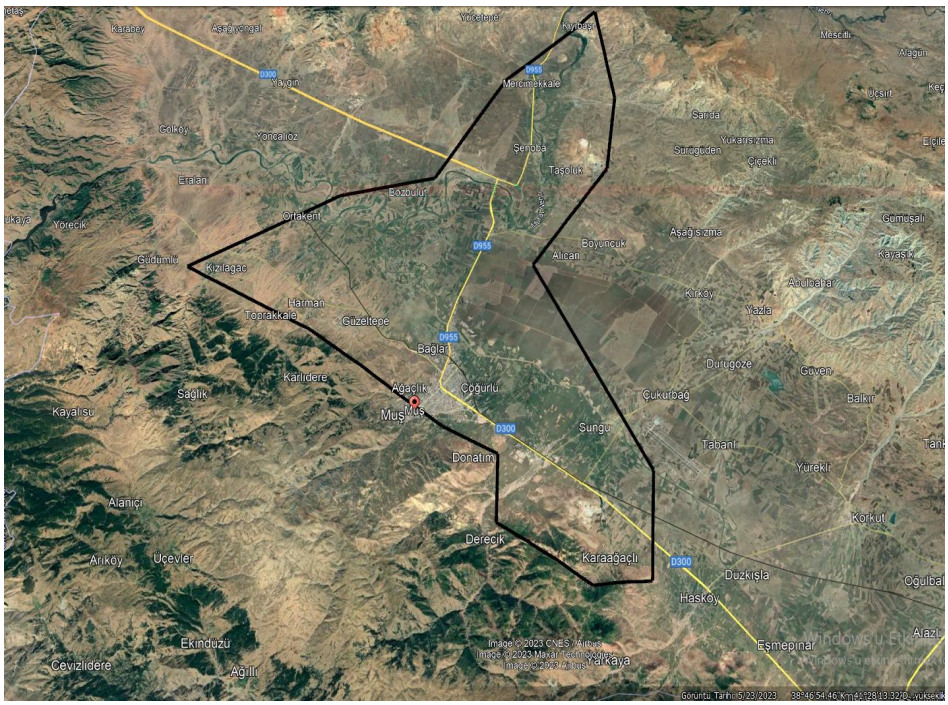
This study was conducted in 2022 to determine the yield and characteristics of Bilensoy-80 alfalfa variety and local alfalfa genotypes grown within the borders of the Muş plain. In 13 different villages (Bağlar, Bozbulut, Çöğürlü, Karakuyu, kepenek, Kıyıbaşı, Kızılağaç, Muratgören, Özdilek, Serinova, Suboyu, Sungu and Taşoluk) where the study was carried out, a total of 52 clover (22 Bilensoy-80 clover variety plots and 30 local clover plots) were collected. genotypes plot) was visited during the period corresponding to the 10% flowering period of the crop and the first form of the crop. In the study, the height of 15 plants randomly selected from each plot, 10 plants in one replication, was measured in cm from the lowest point to the highest point, and the plant heights were determined by taking the average measurements of the plants. A total of 208 samples, taken from each randomized block trial design with four replications, were taken into the laboratory environment. Finally, one kilogram of alfalfa randomly taken from four separate replicates was dried and the hay yield was calculated. After the dried alfalfa samples were ground, the quality parameters were analyzed with the NIRS device and in Bilensoy-80 alfalfa variety, plant height was 67.80-134.00 cm, green grass yield was 1901.25- 6782.50 kg per decare, hay yield was 360.75-1380.76 kg per decare, dry grass rate was 17.67%. 29.60, crude protein yield 73.32-224.95 kg per decare is between 100.23-116.39, in the production of local genotypes, plant height is 58.87-125.27 cm, green grass yield is 1770.00-4723.00 kg per decare, hay yield is 415.25-875.28 kg per decare, dry grass rate is 18.14-26.57%, crude protein yield 67.41-175.95 kg per decare was found to vary between 99.42-113.17. When the production parameters of Bilensoy-80 alfalfa variety and local alfalfa genotypes were compared, the differences between the analyzed conditions were compared using the Duncan test and the differences observed between all conditions were found to be statistically significant.

Keywords: Alfalfa, Bilensoy-80, Certified Variety, Mus Plain, Native Variety

1. GİRİŞ

Üretimi çok eski zamanlara dayanan yonca (Medicago sativa L.) dünya genelinde geniş üretim sahasına sahip en önemli yem bitkilerindendir (Uluocak, 1984). Eski kaynaklarda yonca bitkisinin Türkiye'deki tarihinin üç bin üç yüz yıl öncesine dayandığı bildirilmiştir (Hanson ve ark., 1988). Yonca bitkisine ilişkin verilen bilgiler incelendiğinde yoncanın kültüre alınma çalışmalarının çok eski zamanlara dayandığı görülmektedir (Michaud ve ark., 1988).

Yonca, dünya genelinde hem **yüksek besleme değeri**, hem de **iklim uyum yeteneği** nedeniyle en önemli çok yıllık yem bitkilerinden biridir. "Yem bitkilerinin kraliçesi" olarak adlandırılan bu tür, hem kuru hem yaş ot üretiminde temel kaynaklardan biridir (Yeşil ve Şengül, 2009).



Türkiye'de 2022 TÜİK verilerine göre yonca üretim alanları toplam tarım alanlarının yalnızca **%2,7'sini** oluşturmakta, bu da kaliteli kaba yem açığının sürdüğünü göstermektedir. Doğu Anadolu'da, özellikle **Muş Ovası**, sahip olduğu **geniş tarım alanları**, **yüksek hayvan varlığı** ve **geleneksel üretim alışkanlıkları** nedeniyle bu açıdan kritik bir konumdadır.

Yem bitkileri yetiştiriciliği kapsamında dünyanın en büyük üretim alanına sahip olan yoncanın ülkemizde de gerekli önemi kazanması gerekmektedir. Türkiye'de 2022 TUİK verileri incelendiğinde yonca üretim alanlarının toplam tarım alanlarına oranı %2,71 olduğu görülmektedir (Anonim, 2022). Bu kapsamda yapılacak çalışmalar neticesinde en verimli yonca çeşitlerin bulunup ıslah çalışmalarına dâhil edilmesi ülkemizde yonca bitkisinin üretim alanlarını arttıracaktır. Muş ili toplam 1 206.030 küçükbaş hayvan varlığı ile ülke sıralamasında 13. ve bölgede 4. sırada yer almaktadır. Büyükbaş hayvan varlığında ise toplam 298.404 adet baş ile ülke sıralamasında 15. ve bölgede 5. sırada yer almaktadır (Anonim, 2022a). Doğu Anadolu Bölgesinin bütün illerinde hayvan yetiştiriciliğinin ana girdisi olan kaliteli yem ihtiyacı mera ve çayır alanlarından elde edilen çayır otunun yanında yem bitkileri (yonca, s. mısır, korunga, fiğ vb.) yetiştiriciliği yapılarak karşılanmaktadır (Anonim 2022b). Muş'ta yonca yetiştiriciliği büyük oranda tescil edilmemiş yerel tohum genotipleriyle yapılmaktadır. Yetiştiriciler tarafından tercih edilen bu yerel genotiplerin verim ve kalite özelliklerinin belirlenmesi oldukça önemlidir.

Ancak bölgede kullanılan tohumların büyük çoğunluğu **sertifikasız, yerel genotiplerdir**. Bu nedenle bu çalışma, **yerel genetik kaynakların performansını**, **sertifikalı bir çeşitle** bilimsel olarak kıyaslayan ilk detaylı çalışmalardan biridir.

2. MATERYAL ve YÖNTEM

2.1. Materyal

Şekil 1. Tez çalışma lokasyonlarına ait uydu görüntüsü

Araştırma 2022 yılında, Muş Ovası'na bağlı **13 farklı köyde** (Bağlar, Bozbulut, Çöğürlü, Karakuyu, Kepenek, Kıyıbaşı, Kızılağaç, Muratgören, Özdilek, Serinova, Suboyu, Sungu ve Taşoluk) yürütülmüştür.

Toplam **52 parsel**de;

- 22 parsel **Bilensoy-80 sertifikalı çeşidi**,
- 30 parsel ise **yerel genotipler** içermektedir.

Denemeler, **tesadüf blokları deneme deseninde dört tekerrürlü** olarak planlanmıştır.Her parselde, ürünün %10 çiçeklenme döneminde rastgele seçilen bitkilerden **bitki boyu (cm)**, **yeşil ot ve kuru ot verimi (kg/da)**, **ham protein oranı (%), ADF, NDF, SKM, KMT ve Nispi Yem Değeri (NYD)** gibi 12 farklı parametre ölçülmüştür.

Laboratuvar analizleri **NIRS cihazı** ile yapılmış, istatistiksel farklar **Duncan testi (P<0.01)** ile değerlendirilmiştir.

2.2. İklim Özellikleri

Çizelge 3.2. Muş ili uzun yıllar iklim verileri ortalaması

MUŞ	**Ortalama Sıcaklık (°C)**		**Ortalama Nispi Yem (%)**		**Toplam Yağış (ml)**	
Aylar	**Uzun Yıllar**	**2022**	**Uzun Yıllar**	**2022**	**Uzun Yıllar**	**2022**
Ocak	-6.95	-7.50	84.02	85.97	89.5	72.90
Şubat	-4.32	-4.28	82.64	87.98	96.5	41.45
Mart	2.38	-1.68	76.82	85.22	108.5	159.65

Nisan	9.87	10.08	64.08	60.78	101.9	27.35
Mayıs	14.58	12.38	64.30	68.50	69.1	67.05
Haziran	20.16	19.88	50.89	52.62	27.1	21.43
Temmuz	24.75	24.16	37.83	34.17	7.7	1.15
Ağustos	24.98	25.54	34.38	28.67	5.4	0.77
Eylül	19.96	19.94	38.82	38.02	15.6	17.18
Ekim	12.87	13.68	56.86	57.92	52.8	27.73

Aralık	-2.09	2.02	83.92	82.35	88.1	6.57
Ort./Toplam	10.06	10.00	62.36	63.25	758.9	481.10

Muş ilinde uzun yıllar ortalama sıcaklık **10,06°C**, yıllık yağış **758,9 mm** iken 2022 yılı araştırma döneminde yağış **481 mm** olarak kaydedilmiştir. Bu durum, bitki gelişim döneminde **nispeten kurak bir sezon** yaşandığını göstermektedir.

2.2.1. Toprak Özellikleri

Çizelge 3.3. Muş ili BTG (Büyük Toprak Gruplarının)kapladıkları alanlar

Büyük Toprak Grubu (BTG)	**Alan**	
	ha	**%**
Vertisoller	65.526	7,53
Alüviyaller	43.078	4,95
Kireçsiz Kahverengi Topraklar	19.423	2,23
Kestanerengi Topraklar	134.173	15,41
Bazaltik Topraklar	6.937	0,80
Kolüviyaller	9.889	1,14
Kireçsiz Kahverengi Orman Toprakları	4.329	0,50
Regosoller	5.345	0,61
İşlenmeyen	582.065	66,85
Toplam	870.768	100,00

Yaşar M., Turgut Y.Ş., Koca Y. K., 2020. / Anemon Muş Alparslan Üniversitesi Sosyal Bilimler Dergisi, 2020 8 (UMS'20) 81-90

Toprak analizleri, Muş Ovası'nın **kestanerengi-killi yapıda**, **pH'sı nötr**, **tuzluluk oranı düşük** bir karaktere sahip olduğunu ortaya koymuştur. Dolayısıyla yonca üretimi için **uygun bir fizyolojik zemin** mevcuttur.

3. ARAŞTIRMA SONUÇLARI

3.1. Bitki Boyu (cm)

Farklı alanlarda yetiştirilen yonca (*Medicago sativa* L.) genotiplerinin bitki boyları arasında istatistiksel açıdan %1 önem düzeyinde ($p<0.01$) anlamlı fark bulunmuştur. Bu sonuç, incelenen genotiplerin bitki boyu bakımından önemli farklılıklar gösterdiğini ortaya

koymaktadır.

11	Özdilek-1	113.07 j	**22**	Bozbulut-4	86.87 h1
		ORTALAMA			**92.86**

Yerel yonca popülasyonlarının ortalama bitki boyları Çizelge 3.1'de, Bilensoy-80 çeşidine ait değerler ise Çizelge 3.2'de verilmiştir. Yerel popülasyonlarda bitki boyu 58.87–125.27 cm arasında değişmiş ve ortalama 97.16 cm olarak belirlenmiştir. Bilensoy-80 çeşidinde ise bu değerler 67.80–134.00 cm aralığında olup ortalama 92.86 cm olarak saptanmıştır.

Yerel popülasyonlarda en yüksek bitki boyu Çöğürlü Köyü birinci parselde, en düşük değer ise Muratgören Köyü üçüncü parselde; Bilensoy-80 çeşidinde ise en yüksek boy Çöğürlü Köyü ikinci, en düşük boy ise Özdilek Köyü üçüncü parselde belirlenmiştir.

Farklı zaman, lokasyon ve çalışmalarda elde edilen sonuçların benzerlik göstermesi, bitki boyundaki farklılıkların hem genetik yapıdan hem de çevresel faktörlerden kaynaklandığını ortaya koymaktadır (Smith ve ark., 1989; Smith ve ark., 1991; Juan ve ark., 1993).

3.2. Yeşil Ot Verimi (kg/da)

Muş Ovası sınırları dâhilinde yetiştirilen yonca genotiplerine ait yeşil ot veriminin varyans analizi sonuçlarına göre, farklı alanlarda yetiştirilen yerel ve Bilensoy-80 yonca genotiplerinin yeşil ot verimleri arasında istatistiksel olarak %1 önem düzeyinde ($p<0.01$) anlamlı fark tespit edilmiştir. Bu durum, incelenen genotiplerin yeşil ot verimi bakımından önemli farklılıklar gösterdiğini ortaya koymaktadır.

Çizelge 3.3. Yerel yonca popülasyonlarına ait yeşil ot verimleri

Yerel ve Bilensoy-80 yonca popülasyonlarına ait yeşil ot verimlerine ilişkin sonuçlar Çizelge 3.4 ve Çizelge 3.5'de verilmiştir. Yerel popülasyonlarda yeşil ot verimi dekara 1770.00–4723.00 kg arasında değişmiş ve ortalama 2971.29 kg olarak belirlenmiştir. Bilensoy-80 çeşidinde ise bu değerler 1901.25–6782.50 kg arasında değişmiş, ortalama 3122.48 kg olarak tespit edilmiştir.

Yerel popülasyonlarda en yüksek yeşil ot verimi Sungu Beldesi'ndeki dördüncü parselde, en düşük verim ise Kepenek Köyü ikinci parselde belirlenmiştir. Bilensoy-80 çeşidinde en yüksek verim Özdilek Köyü birinci parselde, en düşük verim ise Sungu Beldesi üçüncü parselde elde edilmiştir.

Aynı köy sınırları içinde yapılan değerlendirmelerde, bazı lokasyonlarda yerel genotiplerin, bazı lokasyonlarda ise Bilensoy-80 çeşidinin daha yüksek yeşil ot verimi gösterdiği belirlenmiştir. Ancak genel ortalamalar dikkate alındığında Bilensoy-80 çeşidinin yeşil ot veriminin daha yüksek olduğu görülmüştür.

Literatürde Saruhan ve Kuşvuran (2011), yerel genotipte dekara 4640 kg, Bilensoy çeşidinde ise 3515 kg yeşil ot verimi bildirmiştir. Altınok ve Karakaya (2002) 1242–1644 kg, Şeker (2003) 4735.6–5804.1 kg, Karaköy ve Saraç (2018) 3519–7481 kg, Kır ve Soya (2008) 931–1359 kg, Gündel ve ark. (2014) ise 5094.5 kg değerleri belirlemişlerdir. Bu sonuçlar, çalışmadan elde edilen verilerle genel olarak uyumluluk göstermektedir.

3.3. Kuru Ot Verimi (kg/da)

Muş Ovası'nda yetiştirilen yonca genotiplerinin kuru ot verimine ait varyans analizi *sonuçları Farklı alanlarda yetiştirilen yerel ve Bilensoy-80 yonca popülasyonlarının kuru ot verimleri arasındaki fark istatistiksel olarak %1 önem düzeyinde (p<0.01) anlamlı bulunmuştur.*

+: Aynı sütun içerisinde benzer harf ile gösterilen ortalamalar Duncan testine göre P≤0,01 hata sınırları içinde birbirinden farksızdır

Yerel ve Bilensoy-80 yonca popülasyonlarına ait kuru ot verimleri Çizelge 3.5 ve Çizelge 3.6'da verilmiştir. Yerel popülasyonlarda kuru ot verimi dekara 415.25–875.28 kg arasında değişmiş ve ortalama 618.02 kg olarak belirlenmiştir. Bilensoy-80 çeşidinde ise bu değerler 360.75–1380.76 kg arasında olup ortalama 663.65 kg olarak saptanmıştır.

Yerel popülasyonlarda en yüksek kuru ot verimi Sungu Beldesi dördüncü parselde, en düşük verim ise Muratgören Köyü üçüncü parselde belirlenmiştir. Bilensoy-80 çeşidinde ise en yüksek verim Özdilek Köyü birinci parselde, en düşük verim Sungu Beldesi üçüncü parselde tespit edilmiştir.

Aynı köy sınırları içinde yapılan değerlendirmelerde, bazı lokasyonlarda yerel genotiplerin, bazı lokasyonlarda ise Bilensoy-80 çeşidinin kuru ot veriminin daha yüksek olduğu belirlenmiştir. Ancak genel ortalamalar dikkate alındığında Bilensoy-80 çeşidinin kuru ot veriminin daha fazla olduğu görülmüştür.

Literatürde Şeker (2003) 1101.7–1333.5 kg, Gündel ve ark. (2014) 1135 kg, Karaköy ve Saraç (2018) 884–1766 kg, Şengül ve ark. (2003) 1445–1893 kg, Dumlu ve ark. (2017) 1270.5–1555.1 kg, Engin ve Mut (2017) 1326.2–2508.9 kg, Saruhan ve Kuşvuran (2011) 945–1266 kg, Kır ve Soya (2008) ise 191.7–289.5 g/da kuru ot verimi bildirmiştir. Bu değerler, çalışmadan elde edilen sonuçlarla genel olarak uyum göstermektedir.

3.4. Kuru Ot Oranı (%)

Muş Ovası sınırları dâhilinde yetiştirilen yonca genotiplerine ait kuru ot oranlarının varyans analizi sonuçları Çizelge 3.10'da sunulmuştur. Analiz sonuçlarına göre, farklı lokasyonlarda yetiştirilen yerel ve Bilensoy-80 yonca genotiplerinin kuru ot oranları arasındaki fark istatistiksel olarak %1 önem düzeyinde ($p<0.01$) anlamlı bulunmuştur. Bu durum, incelenen genotiplerin kuru ot oranı bakımından önemli farklılıklar gösterdiğini ortaya koymaktadır.

Çizelge 3.7. Yerel yonca popülasyonlarına ait kuru ot oranları

		ORTALAMA			**21.80**

+: Aynı sütun içerisinde benzer harf ile gösterilen ortalamalar Duncan testine göre P≤0.01 hata sınırları içinde birbirinden farksızdır

Yerel ve Bilensoy-80 yonca popülasyonlarına ait kuru ot oranları Çizelge 3.7 ve Çizelge 3.8'de verilmiştir. Muş Ovası sınırları dâhilinde yetiştirilen yerel yonca popülasyonlarında kuru ot oranı %18.14–26.57 arasında değişmiş ve ortalama %21.15 olarak belirlenmiştir. Kuru ot oranı en yüksek Kepenek Köyü ikinci parselde, en düşük ise Çöğürlü Köyü üçüncü parselde tespit edilmiştir.

Bilensoy-80 yonca çeşidinde kuru ot oranı %17.67–29.60 arasında değişmiş, ortalama %21.80 olarak saptanmıştır. Bu çeşitte en yüksek kuru ot oranı Karakuyu Köyü birinci parselde, en düşük oran ise Sungu Beldesi ikinci parselde belirlenmiştir.

Elde edilen bulgular, yerel ve Bilensoy-80 genotiplerinin kuru ot oranı bakımından birbirine yakın değerlere sahip olduğunu göstermektedir. Çaçan ve ark. (2012), Güneydoğu Anadolu Bölgesi doğal meralarından toplanan bazı *Medicago* türlerinde ortalama kuru ot oranını %22.4 olarak bildirmiştir. Bu çalışma sonuçlarıyla karşılaştırıldığında, Muş Ovası koşullarında elde edilen kuru ot oranı değerlerinin literatürde bildirilen sonuçlardan bir miktar düşük olduğu görülmektedir.

3.5. Ham Protein Verimi (kg/da)

Muş Ovası sınırları dâhilinde yetiştirilen yonca genotiplerine ait ham protein verimlerinin varyans analizi sonuçlarına göre, Muş Ovası'nda farklı alanlarda yetiştirilen yerel ve Bilensoy-80 yonca genotiplerinin ham protein verimleri arasındaki fark istatistiksel olarak %1 önem düzeyinde ($p<0.01$) anlamlı bulunmuştur. Bu sonuç, incelenen genotiplerin ham protein verimi bakımından önemli farklılıklar gösterdiğini ortaya koymaktadır.

Çizelge 3.9. Yerel yonca popülasyonlarına ait ham protein verimleri

11	Özdilek-1	224.95 a	**22**	Bozbulut-4	127.77 g-k
		ORTALAMA			**120.22**

+: Aynı sütun içerisinde benzer harf ile gösterilen ortalamalar Duncan testine göre P≤0.01 hata sınırları içinde birbirinden farksızdır.

Yerel ve Bilensoy-80 yonca popülasyonlarına ait ham protein verimleri Çizelge 3.9 ve Çizelge 3.10'te sunulmuştur. Muş Ovası sınırları dâhilinde yetiştirilen yerel yonca popülasyonlarında ham protein verimi dekara 67.41–175.95 kg arasında değişmiş ve ortalama 110.48 kg olarak belirlenmiştir. Bilensoy-80 yonca çeşidinde ise ham protein verimi dekara 73.32–224.95 kg arasında değişmiş, ortalama 120.22 kg olarak saptanmıştır.

Yerel popülasyonlarda en yüksek ham protein verimi Sungu Beldesi'ndeki dördüncü parselde, en düşük verim ise Muratgören Köyü üçüncü parselde belirlenmiştir. Bilensoy-80 çeşidinde ise en yüksek ham protein verimi Özdilek Köyü birinci parselde, en düşük verim aynı köyün dördüncü parselinde tespit edilmiştir.

Elde edilen sonuçlar, bazı lokasyonlarda yerel genotiplerin, bazı lokasyonlarda ise Bilensoy-80 çeşidinin daha yüksek ham protein verimi gösterdiğini ortaya koymaktadır. Genel ortalamalar dikkate alındığında ise Bilensoy-80 çeşidinin ham protein veriminin yerel popülasyonlara göre daha yüksek olduğu görülmüştür.

Ham protein verimine ilişkin elde edilen bulgular; Şengül ve Tahtacıoğlu (1996) tarafından dekara 208.3 kg, Turan (2010) tarafından 121–185 kg ve İnal (2015) tarafından 88.2–112.9 kg olarak bildirilen sonuçlarla uyum göstermektedir. Ancak Görgülü (2018)'in 16–69 kg olarak, Manga (1981)'in 307–445 kg, Kır (2010)'un 254.4–332.7 kg, Avcı ve ark. (2011)'ın 327.1 kg ve Yılmaz ve Albayrak (2016)'ın 317.4–383.8 kg olarak belirlediği değerlerle karşılaştırıldığında, çalışmada elde edilen ham protein verimlerinin bu araştırmalara göre daha düşük olduğu görülmektedir.

4. SONUÇLAR ve ÖNERİLER

Bu çalışma, Muş Ovası ekolojik koşullarında 13 farklı köyden temin edilen 52 parselde yetiştirilen yerel ve sertifikalı (Bilensoy-80) yonca çeşitlerinin ot verimi ve kalite özelliklerinin belirlenmesi amacıyla yürütülmüştür. En yüksek bitki boyu, Çöğürlü Köyü'nde yetiştirilen Bilensoy-80 çeşidinde 134.00 cm olarak belirlenmiştir. Ortalama değerlere göre yerel genotipler (97.16 cm), Bilensoy-80 çeşidine (92.86 cm) göre daha fazla boylanmıştır. En yüksek yeşil ot verimi Özdilek Köyü birinci parselde 6782.50 kg/da (Bilensoy-80) olarak saptanmıştır. Ortalama değerlere göre Bilensoy-80 çeşidi (3122.48 kg/da), yerel genotiplerden

(2971.29 kg/da) daha yüksek yeşil ot verimi göstermiştir. En yüksek kuru ot verimi Özdilek Köyü birinci parselde 1380.76 kg/da (Bilensoy-80) olarak belirlenmiştir. Ortalama kuru ot verimi Bilensoy-80 çeşidinde 663.65 kg/da, yerel genotiplerde ise 618.02 kg/da'dır. En yüksek kuru ot oranı Karakuyu Köyü birinci parselde %29.60 (Bilensoy-80) olarak tespit edilmiştir. Ortalama olarak Bilensoy-80 çeşidi (%21.80), yerel genotiplere (%21.15) göre daha yüksek kuru ot oranı göstermiştir. En yüksek ham protein verimi Özdilek Köyü birinci parselde 224.95 kg/da (Bilensoy-80) olarak belirlenmiştir. Ortalama ham protein verimi Bilensoy-80 çeşidinde 120.22 kg/da, yerel genotiplerde 110.48 kg/da'dır. Sonuçlar genel olarak göstermiştir ki: **Bilensoy-80 çeşidi**, yüksek **yeşil ot**, **kuru ot** ve **ham protein verimi** ile öne çıkmaktadır. **Yerel genotipler** ise özellikle **iklim adaptasyonu**, **sindirilebilirlik istikrarı** ve **lif dengesi** bakımından avantajlıdır. Buna göre: Muş Ovası'nda **sertifikalı Bilensoy-80** gibi çeşitlerin yaygınlaştırılması, bölgesel verimi artıracaktır. Yerel genotiplerin **ıslah programlarına dâhil edilmesi**, genetik çeşitliliğin korunmasına katkı sağlayacaktır. Bölgeye özgü **yonca tohum üretim merkezleri** kurulmalı, **yerel tohum bankaları** oluşturulmalıdır. Çiftçilere yonca tarımı, biçim zamanı ve yem kalitesi konularında **yayım eğitimi** verilmesi önerilmektedir. Bu bulgular doğrultusunda **üreticilerin sertifikalı Bilensoy-80 yonca tohumlarını kullanmaları** önerilmektedir. Bununla birlikte araştırmadan kesin bir sonuç elde edilmesi için araştırmanın en az bir yıl daha yürütülmesi gerekmektedir.

ÖZET

Lonicera cinsi, tatlı kokulu çiçekleri nedeniyle süs bitkisi olarak dikilen dekoratif çalılar olarak bilinmektedir. *Lonicera japonica* Thunb. (hanımeli çiçeği), Çin, Kore ve Japonya dâhil olmak üzere Doğu Asya'ya özgü bir hanımeli türüdür ve büyüme sırasında ağaçların veya çeşitli bitkilerin etrafına sarılarak gelişir. Farmakolojik çalışmalar, *Lonicera japonica* Thunb. ekstraktlarının hepatoprotektif, sitoprotektif, antimikrobiyal, antibiyotik, antioksidatif, antiviral ve antiinflamatuvar etkilere sahip olduğunu göstermiştir. Aynı zamanda *Lonicera japonica* Thunb., başta fenolik asitler, flavonoidler, terpenoidler olmak üzere çeşitli aktif bileşenler içermektedir. Bu çalışmada, hanımeli bitkisinin çiçeklerinden farklı solventler kullanılarak elde edilen ekstraktların toplam fenolik içerikleri ve antioksidan kapasiteleri incelenmiştir. Kurutulmuş bitki örnekleri üç farklı çözgenle ekstrakte edilmiştir: etanol ile maserasyon, metanol ile maserasyon ve su ile hazırlanan infüzyon. Elde edilen ekstraktların toplam fenol miktarı Folin-Ciocalteu yöntemiyle belirlenmiş ve sonuçlar mg GAE/g dw olarak ifade edilmiştir. Antioksidan kapasiteleri ise CUPRAC ve ABTS yöntemleriyle belirlenmiş, sonuçlar mg TE/g dw olarak verilmiştir. Analizler sonucunda, metanol ile yapılan maserasyon en yüksek fenol içeriği ve antioksidan kapasiteye sahip bulunmuştur (toplam fenol: 37,12 ± 0,36 mg GAE/g dw; CUPRAC: 126,06 ± 0,57 mg TE/g dw; ABTS: 33,68 ± 0,67 mg TE/g dw). Etanol ekstraktı ve infüzyon ise daha düşük değerler göstermiştir. Bu sonuçlar, hanımeli yapraklarındaki biyolojik olarak aktif bileşenlerin veriminde kullanılan çözgen ve yöntemlerin belirleyici olduğunu ortaya koymaktadır. Ayrıca, çalışmadan elde edilen bulgular hanımeli ekstraktlarının doğal antioksidan kaynağı olarak değerlendirilebileceğini ve gıda, kozmetik ile farmasötik ürünlerde potansiyel uygulamalara sahip olduğunu göstermektedir.

Anahtar Kelimeler: Hanımeli çiçeği, *Lonicera japonica* Thunb., Antioksidan aktivite, Toplam fenolik madde.

PHENOLIC CONTENT AND ANTIOXIDANT ACTIVITY OF HONEYSUCKLE FLOWER (*Lonicera japonica* thunb.) EXTRACTS OBTAINED USING DIFFERENT SOLVENTS

ABSTRACT

The *Lonicera* genus is known as decorative shrubs planted as ornamental plants because of their sweet-scented flowers. *Lonicera japonica* Thunb. is a species of honeysuckle native to East Asia, including China, Korea, and Japan, and develops by twining around trees or various plants during growth. Pharmacological studies have shown that *Lonicera japonica* Thunb. extracts have hepatoprotective, cytoprotective, antimicrobial, antibiotic, antioxidative, antiviral, and anti-inflammatory activities. *Lonicera japonica* Thunb. also contains various active compounds, primarily phenolic acids, flavonoids, and terpenoids. In this study, total phenolic contents and antioxidant capacities of extracts obtained from honeysuckle flowers using different solvents were investigated. Dried plant samples were extracted with three different solvents: ethanol maceration, methanol maceration, and water infusion. The total phenol content of the extracts was determined by the Folin-Ciocalteu method, and the results were expressed as mg GAE/g dw. Antioxidant capacities were determined by CUPRAC and ABTS methods, and the results are given as mg TE/g dw. As a result of the analyses, maceration with methanol was found to have the highest phenol content and antioxidant capacity (total phenol: 37.12 ± 0.36 mg GAE/g dw; CUPRAC: 126.06 ± 0.57 mg TE/g dw; ABTS: 33.68 ± 0.67 mg TE/g dw). Ethanol extract and infusion showed lower values. These results reveal that the solvent and methods used are determinant in the yield of biologically active components in honeysuckle leaves. Additionally, the findings from the study indicate that honeysuckle extracts can be considered as a natural antioxidant source and have potential applications in food, cosmetics and pharmaceutical products.

Keywords: Honeysuckle flower, *Lonicera japonica* Thunb., Antioxidant activity, Total phenolic substance.

1. INTRODUCTION

Lonicera species, belonging to the Caprifoliaceae family, include approximately 250 plant species distributed in the Northern Hemisphere, from temperate to subarctic climate zones. (Bieniasz et al., 2019). The fruits of many *Lonicera* plants are inedible and are cultivated as ornamental shrubs or climbing plants because of their long blossoming season, fragrant flowers, and appealing fruit. Fruit colors range from white or yellow to deep red or navy blue, which is considered an indicator of the plant's maturity. Some *Lonicera* species are widely cultivated as ornamental groundcovers in Australia, Argentina, the United States, Brazil, Mexico, New Zealand, and China. However, a few species have sweet and edible fruits. For example, *L. caerulea* fruit is commercially produced as an edible crop in the northern United States, Russia, and Japan. Additionally, some *Lonicera* plants are extensively grown for their tolerance to extreme cold. Approximately 98 *Lonicera* species are found in various regions of China, with the largest number occurring in the southwestern part of the country. *Lonicera japonica* Thunb. is a species of honeysuckle listed in the Chinese Pharmacopoeia. It has recently attracted considerable attention as a health food and is the most widely used and researched plant of the *Lonicera* genus (Ge et al., 2022, Li et al., 2019).

Through GC and GC–MS analyses, the essential volatile constituents of honeysuckle (*Lonicera japonica Thunb.*) were comprehensively profiled, resulting in the detection of nearly 150 compounds spanning multiple chemical classes such as hydrocarbons, alcohols, aldehydes, ketones, and esters. Compounds like linalool and several jasmonate derivatives were identified as the main aroma determinants. Time-based headspace measurements demonstrated that the strongest fragrance emission occurred around midnight (Ikeda et al., 1994). Extensive pharmacological evaluations have verified that *L. japonica* displays broad therapeutic potential due to its antibacterial, antiviral, anti-inflammatory, and anticancer attributes. The plant's pharmacological potency is linked to its diverse phytochemical composition, including flavonoids, iridoids, triterpenoid saponins, and other polyphenolic metabolites. Traditionally, it has been regarded in Chinese medicine as a valuable remedy against respiratory and inflammatory illnesses. Contemporary studies have expanded these findings, showing the plant's effectiveness in addressing arthritis, hepatitis, gastrointestinal disturbances, and infectious diseases (Xiong et al., 2013; Muro et al., 2025). The aqueous extract particularly exhibits potent bacteriostatic activity against *E. coli*, *Staphylococcus*, and other pathogenic species, with phenolic acids playing a central role in this activity (Xu et al., 2023). The present research explores how different solvents influence the phenolic composition and antioxidant strength of honeysuckle flower extracts.

2. MATERIALS AND METHODS

2.1. MATERIALS

Plant material of *Lonıcera Japonıca* Thunb. flowers was obtained from a local botanical garden located in Kırklareli, Turkey (Figure 1). Folin-Ciocalteu's phenol reagent, sodium carbonate, copper (II) chloride, ammonium acetate, neocuproine, ethanol, nutrient broth, nutrient agar were obtained from Merck (Darmstadt, Germany). tetramethylchromane-2-carboxylic acid (Trolox), Gallic acid, ABTS (2,20-azino-bis-3-ethylbenzthiazoline-6-sulphonic acid), potassium persulfate were obtained from Sigma-Aldrich (Steinheim, Germany).

Figure 1. Fresh *Lonıcera Japonıca* Thunb. flowers (a), Dried *Lonıcera Japonıca* Thunb. flowers (b).

2.2. EXTRACTION OF PLANT MATERIAL

Fresh plants were dried in the shade at 25 ± 2 °C. The dried plants were subjected to three different extraction methods (Figure 2): Ethanolic/Methanolic maceration: Five grams of milled dried plants were extracted with 50 mL of an ethanol–water mixture (80:20, v/v)/methanol-water mixture (80:20, v/v) for 24 h at 200 rpm in an orbital shaker at room temperature, following the method described by Xu et al. (9). Aqueous infusion: 5 g of dried plants were steeped in 50 mL of freshly boiled water for 5 min, as reported by Özkan et al. (10). All extracts were filtered through Whatman No. 1 filter paper and subsequently centrifuged at 8,000 rpm for 10 min at 4 °C The resultant supernatants were gathered and kept at -18 °C until analysis.

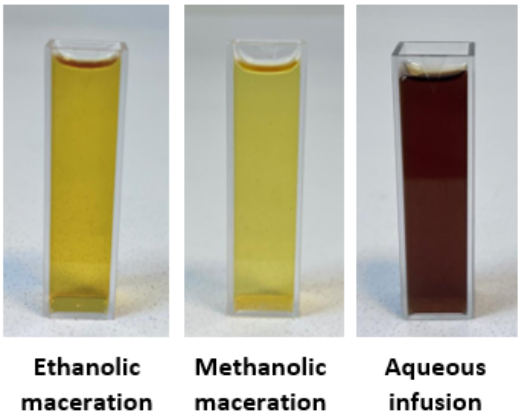

Figure 2. Extracts of *Lonicera japonica* Thunb. obtained by 3 different solvents.

2.3. DETERMINATION OF TOTAL PHENOLIC CONTENT

The total phenolic content of the extracts was determined using the Folin-Ciocalteu method (Singleton et al. 1999). An aliquot of 0.5 mL of appropriately diluted extract was mixed with 2.5 mL of 0.2 N Folin-Ciocalteu reagent, followed by the addition of 2 mL of 7.5% Na_2CO_3 solution. After incubation in the dark at room temperature (25 °C) for 30 minutes, the absorbance was measured at 760 nm using a UV/VIS spectrophotometer (Shimadzu UV-1800, Kyoto, Japan). The results were expressed as mg gallic acid equivalents per gram of dry sample (mg GAE/ g dw).

2.4. ANTIOXIDANT CAPACITY ASSAYS

The copper reducing antioxidant capacity (CUPRAC) assay was carried out following the procedure described by Apak et al. (2004). Briefly, 1 mL each of $CuCl_2$ solution (0.01 M), neocuproine solution (7.5 mM), and ammonium acetate buffer (1 M, pH 7.0) were mixed in a test tube. Subsequently, 0.1 mL of the extract and 1 mL of distilled water were added. The

reaction mixtures were incubated in the dark at 25 °C for 30 minutes. Absorbance was then recorded at 450 nm using a UV/VIS spectrophotometer. The antioxidant capacity was expressed as mg Trolox equivalents per g of dried samples (mg TE/g dw).

The Re et al. (1999) method was applied to ascertain the extracts' ABTS radical scavenging activity. 2.45 mM $K_2S_2O_8$ and 7 mM ABTS were combined to create the ABTS radical cation stock solution and allowing the mixture to stand in the dark at 25 °C for 16 h. Prior to analysis, the stock solution was diluted with distilled water to obtain an absorbance of 0.700 at 734 nm. Subsequently, 0.1 mL of appropriately diluted extract was mixed with 2 mL of the diluted ABTS solution. After 6 min of incubation, the absorbance of the reaction mixture was measured at 734 nm using a UV/VIS spectrophotometer. The antioxidant capacity was expressed as mg Trolox equivalents per g of dried samples (mg TE/g dw).

2.5. STATISTICAL ANALYSIS

The data was statistically evaluated using SPSS software (version 18.0; IBM Corp., Armonk, NY, USA). The mean ± SD is used to express the results. Duncan's multiple range test, with statistical significance set at $p < 0.05$, was used to ascertain mean differences.

3. RESULTS AND DISCUSSION

The antioxidant potential and total phenolic content (TPC) of *Lonicera japonica* extracts varied significantly depending on the extraction solvent used (Table 1). The methanolic maceration extract exhibited the highest TPC value (37.12±0.36 mg GAE·g^{-1}), followed by aqueous infusion (28.30±0.18 mg GAE·g^{-1}), while ethanolic maceration showed the lowest phenolic content (22.94±0.02 mg GAE·g^{-1}). A similar trend was observed for antioxidant capacity assessed by CUPRAC and ABTS assays. The methanolic extract demonstrated superior antioxidant activity (CUPRAC: 126.06±0.57 mg TE·g^{-1}; ABTS: 33.68±0.67 mg TE·g^{-1}) compared to both aqueous (88.87±0.00 mg TE·g^{-1}; 24.65±0.60 mg TE·g^{-1}) and ethanolic extracts (83.09±1.25 mg TE·g^{-1}; 19.39±0.05 mg TE·g^{-1}). These findings indicate that methanol is more efficient in extracting phenolic compounds with high radical-scavenging capacity from *L. japonica*, potentially due to its polarity and better solubilization of diverse phenolic constituents. Conversely, ethanol showed lower extraction performance, which may be attributed to its relatively lower polarity compared to methanol. Overall, the results highlight that solvent selection is a critical factor influencing the recovery of bioactive compounds and the resulting antioxidant properties of *L. japonica* extracts.

Table 1. Bioactive properties of *Lonıcera Japonıca* extracts obtained by different solvents

Solvent type	TPC	CUPRAC	ABTS
Methanolic maceration	37.12±0.36^{c}	126.06±0.57^{c}	33.68±0.67^{c}
Ethanolic maceration	22.94±0.02^{a}	83.09±1.25^{a}	19.39±0.05^{a}
Aqueous infusion	28.30±0.18^{b}	88.87±0.00^{b}	24.65±0.60^{b}
Unit	mg GAE.g-1	mg TE.g-1	mg TE.g-1

Consistent with the present findings, Hsu et al. (2016) evaluated the antioxidant potential of *Lonicera japonica* (LJ) flower bud extracts prepared using different extraction methods, including aqueous, ethanolic, and supercritical CO_2 techniques. Their study demonstrated that

extracts derived from dried LJ samples exhibited stronger antioxidant capacity compared to those from fresh materials. Moreover, the aqueous extracts were found to contain higher total phenolic and flavonoid levels, as well as greater amounts of chlorogenic acid and luteolin-7-O-glucoside, than the other extraction types. Similarly, Yu et al. (2019) analyzed the distribution of free phenolic compounds across different plant organs—flowers, leaves, and stems—and observed that the flower fraction possessed the highest phenolic concentration. In another related investigation, Wang et al. (2015) incorporated honeysuckle flower extract (HCE) into chitosan-based active packaging films and demonstrated that HCE supplementation enhanced both the antioxidant and antimicrobial properties of the films. The DPPH radical scavenging activity increased proportionally with HCE concentration, reaching its peak when 30% HCE was added. Collectively, these earlier reports align closely with the outcomes of the present research, supporting the view that *L. japonica* extracts are rich in bioactive phenolics contributing significantly to antioxidant performance.

4. CONCLUSION

In this study, the phenolic compound contents and antioxidant activities of extracts obtained from the *Lonicera japonica* plant using different solvents were evaluated. It was revealed that the extraction solvent is one of the most important factors determining the efficiency of bioactive compounds. Methanol was the most effective solvent for the extraction of phenolic compounds, providing the highest antioxidant activity values. Aqueous extracts, on the other hand, showed moderate performance, while ethanolic extracts had the lowest bioactive capacity. The obtained data indicate that *L. japonica* is a potent natural antioxidant source and that its potential for food, pharmaceutical, and nutraceutical applications can be enhanced, particularly through the selection of appropriate solvents. Based on these findings, it is believed that the plant can be utilized in functional product development studies, and that further studies are important to elucidate its phenolic profile and health effects.

ÖZET

Keten (*Linum usitatissimum* L.), yüksek katma değerli yağı ve çok yönlü kullanım alanlarıyla dikkat çeken önemli bir endüstriyel tarım bitkisidir. Tarihsel süreçte lif, yağ ve tıbbi amaçlı olarak değerlendirilen keten, günümüzde aynı zamanda fonksiyonel bir gıda bileşeni olarak da büyük öneme sahiptir. Keten tohumu, zengin kimyasal bileşimiyle öne çıkmakta olup; yüksek düzeyde yağ (özellikle omega-3 ve omega-6 yağ asitleri), α-linolenik asit, linoleik asit, protein, diyet lifi, lignan ve secoisolariciresinol diglukozit (SDG) içermektedir. Bu bileşenler, keten tohumuna kardiyovasküler hastalıklar, diyabet, kanser, artrit ve osteoporoz gibi kronik rahatsızlıklara karşı koruyucu etkiler kazandırmakta; ayrıca antibakteriyel, antiviral ve antiinflamatuvar özellikler de sağlamaktadır.

Bu çalışmada, Sarı-85, Yılmaz, Beyaz Gelin, Antares, Florinda ve Dakota olmak üzere altı farklı tescilli keten çeşidinin yağ verimi ve yağ asidi kompozisyonu karşılaştırmalı olarak incelenmiştir. Analizler sonucunda elde edilen veriler, çeşitler arasındaki ilişkileri ve varyasyonları ortaya koymak amacıyla Temel Bileşenler Analizi (PCA) ve hiyerarşik kümeleme (heatmap, SRplot) yöntemleriyle değerlendirilmiştir.

Elde edilen bulgulara göre, en yüksek yağ verimi 2,34 g ile Sarı-85 çeşidinde belirlenirken, en düşük yağ verimi 1,55 g ile Yılmaz çeşidinde kaydedilmiştir. Yağ asidi profili açısından değerlendirildiğinde, α-linolenik asit oranının en yüksek olduğu çeşit yine Sarı-85 (%56,47) olurken, en düşük oran Florinda (%51,24) çeşidinde tespit edilmiştir.

Bu araştırmanın temel amacı, yerli ve yabancı kökenli tescilli keten çeşitlerinin yağ verimi ve yağ asidi kompozisyonlarını belirleyerek, çeşitler arası farklılıkları bilimsel olarak ortaya koymaktır. Elde edilen verilerin, yağ kalitesi ve biyokimyasal bileşim açısından keten genotiplerinin değerlendirilmesinde referans oluşturması; aynı zamanda araştırmacılar ve endüstriyel uygulayıcılar için karar destek verisi sağlaması hedeflenmektedir.

COMPARATIVE ANALYSIS OF OIL YIELD AND FATTY ACID COMPOSITION IN LOCAL AND FOREIGN FLAX (*Linum usitatissimum* l.) CULTIVARS

ABSTRACT

Flax (*Linum usitatissimum* L.) is an important industrial crop characterized by its versatile oil and wide range of applications. Historically utilized for fiber, oil, and medicinal purposes, flax has recently gained prominence as a functional food due to its rich biochemical composition. Flaxseed contains high levels of oil (particularly omega-3 and omega-6 fatty acids), α-linolenic acid, linoleic acid, protein, dietary fiber, lignans, and secoisolariciresinol diglucoside (SDG). These bioactive compounds confer significant cardioprotective, antidiabetic, anticancer, antibacterial, antiviral, and anti-inflammatory properties, as well as potential benefits against arthritis and osteoporosis.

In the present study, six registered flax cultivars (Sarı-85, Yılmaz, Beyaz Gelin, Antares, Florinda, and Dakota) were analyzed to compare their oil yield and fatty acid composition. The relationships and variations among cultivars were evaluated using Principal Component Analysis (PCA) and hierarchical clustering (heatmap via SRplot). The findings revealed that the highest oil yield was recorded in the Sarı-85 cultivar (2.34 g), while the lowest was observed in Yılmaz (1.55 g). Regarding fatty acid composition, the α-linolenic acid content was highest in Sarı-85 (56.47%) and lowest in Florinda (51.24%).

The main objective of this study is to characterize and compare the oil yield and fatty acid profiles of both local and foreign registered flax cultivars, thereby elucidating their biochemical diversity. The results provide valuable decision-support data for researchers and industrial sectors focusing on oil quality assessment, cultivar improvement, and functional product development in flax.

1. GİRİŞ

Dünya nüfusunun hızla artması ve çevresel kaynakların kirlenmesi, insanlığın temel gıda kaynaklarına erişimini ciddi biçimde tehdit etmektedir. Bu olumsuz gelişmeler, beslenme alışkanlıklarında değişimlere yol açmakta ve özellikle bitkisel kaynaklı ürünlere yönelik talebi giderek artırmaktadır (Bennett et al., 2012; Koçak, 2023). Artan bu talebin sürdürülebilir biçimde karşılanabilmesi için yalnızca hammadde temini yeterli olmayıp, aynı zamanda endüstriyel üretime uygun bitki türlerinin seçilmesi büyük önem arz etmektedir (Ruttan, 1999). Bu çerçevede, keten üretimi de dâhil olmak üzere çeşitli bitki türlerinin tarımı ön plana çıkmıştır. Tek yıllık, otsu yapıya sahip olan ve kendine tozlaşma özelliği gösteren keten (*Linum usitatissimum* L.), Linaceae familyasının bir üyesi olup, 2n=30 kromozoma sahip diploid bir türdür. Bu bitki, genellikle ılıman iklim kuşağında yayılım göstermekte ve toplamda 22 cins ile yaklaşık 300 türü içeren bir familyaya aittir (Tchoumtchoua et al., 2019; Koçak et al., 2022). Türkiye'de ise keten bitkisi yöresel olarak "bezir, bızıktan, cimit, kön, siyelek ve zeyrek" gibi farklı isimlerle bilinmektedir (Koçak et al., 2023). Arkeolojik bulgular, ketenin yaklaşık 10.000 yıl öncesine uzanan bir kullanım geçmişine sahip olduğunu ve ilk kez Orta Doğu'da, özellikle de Tell Abu Hureyra (Kuzey Suriye) bölgesinde eski Mısır ve Mezopotamya medeniyetleri tarafından kültüre alındığını göstermektedir (Saha & Hazra, 2004). Ayrıca, "Etiyopya, Orta Asya ve Hindistan" ketenin ikincil yayılım ve genetik çeşitlilik merkezleri olarak tanımlanmaktadır (Vavilov, 1951).

Günümüzde keten, birçok ülkede sınırlı ölçekte yetiştirilmekle birlikte, küresel ölçekte başlıca üretici ülkeler arasında Kanada, Çin, Rusya ve Hindistan öne çıkmaktadır (Saleem et al., 2020). Tohumunun endüstriyel kullanımı oldukça çeşitlidir. Özellikle hızlı kuruma özelliği sayesinde boya, vernik, sabun, macun ve polimer üretimi gibi alanlarda kullanılmakta; ayrıca biyodizel üretiminde ve gıda endüstrisinde önemli bir yer tutmaktadır (Sulas et al., 2019). Keten tohumu, %35-65 arasında değişen yağ içeriği ile öne çıkan önemli bir yağ bitkisidir. Bu yağ; "başta α-linolenik asit (omega-3), linoleik asit (omega-6), oleik asit, palmitik asit ve stearik asit" olmak üzere çeşitli yağ asitlerini içerir. Ayrıca, "lignan, diyet lifi, protein, vitamin ve mikro besin öğeleri" bakımından da zengin bir kompozisyona sahiptir (Xie et al., 2020). Yapısındaki biyoaktif bileşenler sayesinde keten tohumu, meme, kan, kolon ve deri kanserleri gibi çeşitli kanser türlerinin önlenmesi ve destekleyici tedavisinde potansiyel bir kaynak olarak değerlendirilmektedir (Kajla vd, 2015).

Mevcut tez çalışmasında Türkiye genelinde kullanılan ve bazı kamu ve özel kuruluşlardan temin edilen bazı yerel keten çeşitleri ve yabancı orjinli keten çeşitlerinin yağ oranları ve kalite analizleri detaylı bir şekilde yapılmıştır. Analizler sonucunda elde edilen bu veriler ile hem Türkiye'de hem de farklı ülkelerde bu çeşitlerin yağ verimleri ve yağ asitleri komposizonları araştırıcılar için kayda değer bir kaynak oluşturması bakımından bilime katkı sağlanmış olacaktır.

2. MATERYAL ve METOT

2.1. Materyal

Tez çalışmamızda önceden belirlenmiş olan çeşitlerin; ülkemizin farklı şehirlerinde bulunan, bazı kamu ve özel kuruluşlardan temin edilen yurtiçi ve yurtdışı tescilli çeşitler materyal olarak kullanılmıştır. Tablo 1 "de çeşitlerin elde edildikleri yer ve orjini oldukları ülkeler verilmiş olup, çalışmanın diğer aşamalarında da kullanılan çeşit numaraları belirtilmiştir".

Tablo 1. Çalışmada kullanılan keten (*L. usitatissimum* L.) çeşit ve özellikleri

Çeşit/Genotip Numarası	Genotipin Adı	Orjin ülke	Temin Edilen Yer	Yetişme formu	Çiçek rengi	Tane rengi
1	Beyaz Gelin	Türkiye	T.T.A.Enst.	Yazlık	Mavi	Kahve
2	Antares	Fransa	K.T.A.Enst	Yazlık	Mavi	Kahve
3	Dakota	K.D.B. Dev.	T.T.A.Enst.	Yazlık	Mavi	A.Kahve
4	Sarı-85	Türkiye	T.T.A.Enst.	Yazlık	Beyaz	Sarı
5	Yılmaz	K.D.B. Dev.	T.T.A.Enst.	Kışlık	Mavi	Kahve
6	Florinda	Romanya	Türkiye Ziraat Enstitüsü	Yazlık	Mavi	Kahverengi

2. METOT

2.1.1. Keten Tohumu Yağ Ekstraksiyonu;

Tez çalışması kapsamında temin edilen her bir tescilli yerli ve yabancı keten çeşidi için yaklaşık 10 gram keten tohumu bir laboratuvar blenderi tarafından öğütülerek toz haline getirildi. Sonrasında, öğütülmüş keten tohumu 30 mL hekzan ile 4 gün boyunca oda sıcaklığında (25°C±1) ekstrakte edildi. Yapılan işlem sonunda, ekstre edilen tohum çözeltisi bir filtre kağıdı ile süzüldükten sonrasında darası alınmış 50 mL plastik falkon tüpe aktarıldıktan sonra, 40°C'de düşük basınç altında uzaklaştırılmıştır.

Toplam yağ miktarı, "ağırlık kaybı dikkate alınarak % 0 nem oranına göre hesaplanmıştır. Yağ asidi analizi için, elde edilen keten yağı amber renkli cam kaplara aktarıldıktan sonra analiz için +4°C'de"muhafaza edilmiştir (Koçak, 2022).

Keten tohumundan elde edilen yağ verimi aşağıdaki formül yardımıyla hesaplanmıştır;

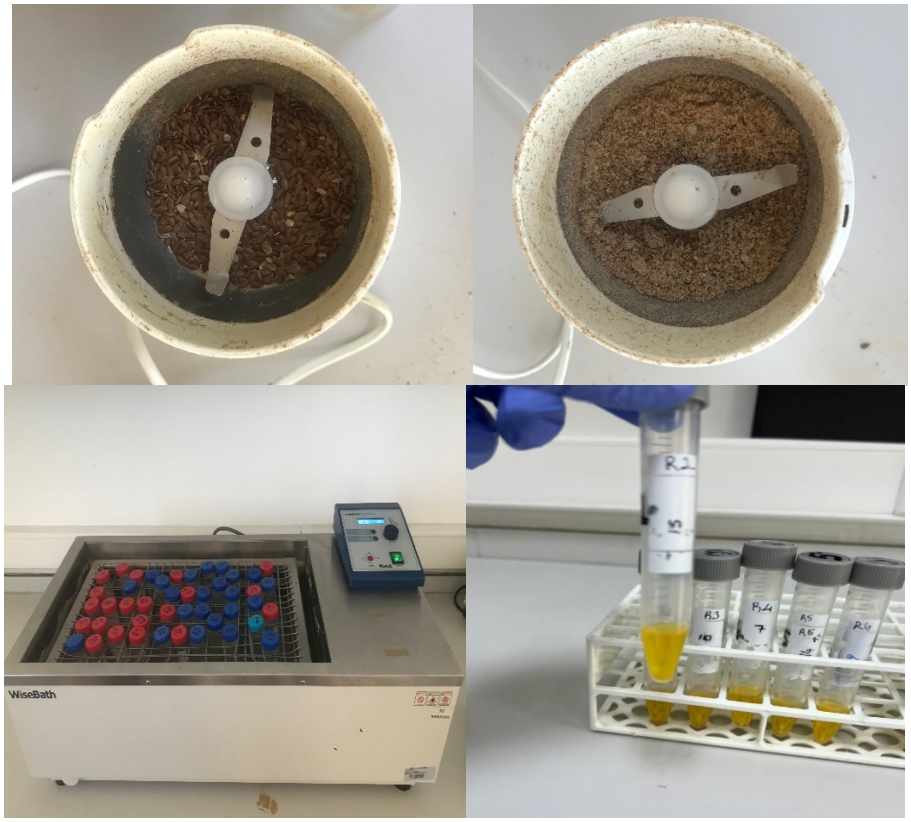
Yield (%) = $\frac{We}{Wt}$ x 100 (Capar ve ark., 2021).

W_e = ekstrakte edilen yağın ağırlığı, W_t = ekstraksiyon için alınan numunenin ağırlığı

2.1.2. Gaz Kromatografi Alev İyonlaşma Dedektörü (GC-FID)

Elde edilen keten tohumu örneklerine ait yağlardan "0.2 g 15 ml'lik kapaklı santrifüj tüplerine alınarak üzerlerine 10 mL hekzan eklenip iyice çalkalanmıştır. Daha sonra örneklerin bulunduğu tüplerde 0.2 mL 1 N metanolde çözülerek hazırlanan KOH ilave edilmiştir. Daha sonra iyice çalkalanıp faz ayrımı görülür ve üst faz berraklaşıncaya kadar 2 saat karanlık ortamda bekletilmiştir. Berraklaşma işlemi gerçekleştikten sonra üst fazdan bir miktar viallere alınarak, alev iyonlaşma dedektörü (FID) bulunan SP 2560 100m*0,25mm*0,2µm kapiler kolon takılı Agilent 7820 A GC-FID" cihazı ile "yağ asitleri analizi yapılmıştır. Enjeksiyon portu ve FID sıcaklığı 240ºC, split enjeksiyon modunda 400ml/min basınçta 1/10 split" oranındadır. Kolon sıcaklığı "140ºC'de 5 dakika bekledikten sonra dakikada 4ºC artarak 250ºC'ye ulaşıp 15 dakika bekledikten sonra 260ºC'ye" çıkılmıştır. Helyum taşıyıcı gaz "41 cm/sec(Hydrogen)" olarak kullanılmıştır. Cihaza 1 µL enjekte edilen örnekler "Supelco ® 37 Component FAME Mix-Sigma-Aldrich" standart karışımının toplam 37,75 dakikalık analizinde elde edilen GC-FID kromatogramı ile karşılaştırılmıştır. Palmitik asit "(C16:0),

stearik asit (C18:0), oleik asit (C18:1n9c), linoleik asit (C18:2n6c), α-linolenik asit (C18:3n6)" yağ asitleri miktarları % olarak bulunmuştur (Koçak, 2021).



Bitkisel Kalite Analizleri ve Verim Unsurları Değerlendirilmesi

2.1.3. Ham Yağ Oranı (%)

Elde edilen keten tohumları 10 gram tohum öğütme işlemi yaplarak 50 ml plastik falkon tüpüne koyulmuş daha sonra üzerine 30 ml n-hekzan ile hazırlanan numuneler 4 gün boyunca IKA KS 400 model sallayıcı yardımıyla beklenen ham yağ elde edilmiştir.

2.1.4. Yağ Asitleri Bileşimi (%)

Temin edilen 6 tescilli çeşit keten tohumlarından ham yağ elde edilmiştir. Bunlara ek olarak, "hem yağ Iğdır Üniversitesi Araştırma Laboratuvarı Uygulama ve Araştırma Merkezi (ALUM)'nde, Gaz Kromatografi Alev İyonlaşma Dedektörü (GC-FID)" cihazı yardımyla yağ asitlerinin metil esterlerinin sonuçları elde edilmiştir.

Şekil 1. Ekstraksiyon yöntemi ve ketende yağın elde edilme durumu

2.2. Çalışmada Kullanılan Bitki Materyali

Tez çalışmamızda kullanılan çeşitlerin; ülkemizin farklı şehirlerinde bulunan, bazı kamu ve özel kuruluşlardan temin edilen yurtiçi ve yurtdışı tescilli çeşitler materyal olarak kullanılmıştır (Tablo 2).

Tablo 2. Çalışmada kullanılan keten (*Linum usitatissimum* L.) çeşitleri

No	Çeşit
1	Beyaz Gelin
2	Antares

3	Dakota
4	Sarı-85
5	Yılmaz
6	Florinda

2.3. İstatistiksel Değerlendirmeler

Bu tez çalışmasında yapılan her uygulama için incelenen özelliklerde toplam 6 keten çeşidi kullanılmıştır. Analiz ve gözlem sonuçlarının değerlendirilmesi için çeşitlerde; ayrıca, incelenen parametrelere ilişkin verilerin görselleştirilmesi, ayrımlanması ve birbiri ile korelasyonunu belirlemek amacıyla, Principal Component Analysis (PCA) (PAST Software) ve heatmap ile kümelendirme çalışması yapılmıştır (SRplot).

3. BULGULAR ve TARTIŞMA

Çalışmada kullanılan keten "(*L. usitatissimum* L.) çeşitlerin yağ oranı ve yağ asidi kompozisyonu Tablo 3'de, temel bileşenler analizi (PCA) Şekil 2'de ve ısı haritası (heatmap) kümelemesi Şekil 3"de sunulmuştur**.**

3.1. Yağ Asitleri Bileşimi

Ülkemizde yağ ihtiyacı, hem bitkisel hem de hayvansal kaynaklardan temin edilmekle birlikte, özellikle bitkisel yağlar bu ihtiyacın karşılanmasında önemli bir rol üstlenmektedir. Bitkisel yağlar genellikle tohum ve meyvelerden elde edilmekte olup, farklı bitki türlerinden çeşitli yağ bileşenleri sağlanmaktadır (Yuan vd., 2014).

α-Linolenik Asit (ALA), Omega-3 (C18:3) grubunda yer alan esansiyel birçoğu doymamış yağ asididir. Hücresel fonksiyonlarda kritik rol oynamakta, özellikle hücre zarlarında lokalize olmaktadır. İnsan vücudunda sentezlenemediği için dışarıdan besin yoluyla alınması zorunludur. ALA eksikliği; büyüme bozuklukları, depresyon ve öğrenme güçlükleri gibi çeşitli sağlık sorunlarına yol açabilmektedir. Bu yağ asidine en yüksek oranda keten tohumu yağı başta olmak üzere, "susam, kanola, zeytin ve Ayçiçek" yağında rastlanmaktadır (Barceló-Coblijn ve Murphy, 2009).

Linoleik Asit (C18:2) ise omega-6 grubuna ait, çoklu doymamış bir yağ asididir ve bitkisel yağların majör bileşenlerinden biridir. Özellikle keten tohumu yağı ve diğer bitkisel yağlarda yüksek oranda bulunmaktadır. İnsan vücudu bu asidi sentezleyemediğinden, dışarıdan alınması gerekmektedir. Eksikliğinde beyin ve göz gelişiminde gerilik, davranış bozuklukları ve depresyon gibi ciddi sağlık problemleri ortaya çıkabilmektedir. Ayrıca bağışıklık sistemini güçlendirici ve büyüme-gelişmeyi destekleyici etkileri mevcuttur. Bu asit, keten, fındık, zeytin, mısır, soya ve yer fıstığı yağlarında yüksek oranda bulunmaktadır (Uken vd., 2021).

Oleik Asit, insan vücudunda en yaygın bulunan tekli doymamış yağ asididir. Yüksek yoğunluklu lipoprotein (HDL) düzeylerini artırırken, düşük yoğunluklu lipoprotein (LDL) düzeylerini azaltması gibi kardiyovasküler sağlığa olumlu etkileriyle bilinmektedir. Ayrıca antiinflamatuar, antihipertansif, glikoz metabolizmasını düzenleyici ve bağışıklık sistemini güçlendirici etkileri de rapor edilmiştir. Fındık, zeytinyağı ve ceviz yağı bu asidin en zengin kaynakları arasında yer alırken, keten yağı da dikkate değer bir miktarda oleik asit içermektedir (Powell ve Rokach, 2014).

Palmitik Asit, yaygın olarak zoometrik asit olarak da bilinmekte olup, tekli doymamış yağ asitleri grubunda yer almaktadır. Bitkisel yağlarda genellikle %1'in altında bulunur. A, B1, B12, C, E ve K vitaminlerinin metabolizmasında rol oynamasının yanı sıra, antioksidan özelliklere

de sahiptir. Omega-7 bakımından zengin olan palmitik asit, tıbbi açıdan yanık tedavisi, egzama, yaşlanma karşıtı uygulamalar, ülser ve bazı kanser türlerinin önlenmesinde destekleyici olarak değerlendirilmektedir (Tang vd., 2021).

Stearik Asit, doymuş bir yağ asidi olup, bitkisel sıvı yağlarda genellikle gliserit stearin formunda bulunmaktadır. Endüstriyel olarak vernik ve yüzey aktif madde üretiminde yaygın olarak kullanılmaktadır. Keten yağı, "palm yağı, ayçiçek yağı ve pamuk" yağı ile karşılaştırıldığında, stearik asit içeriği açısından daha düşük bir düzeye sahiptir (Denke, 1994).

3.2 Ham Yağ Oranı (%)

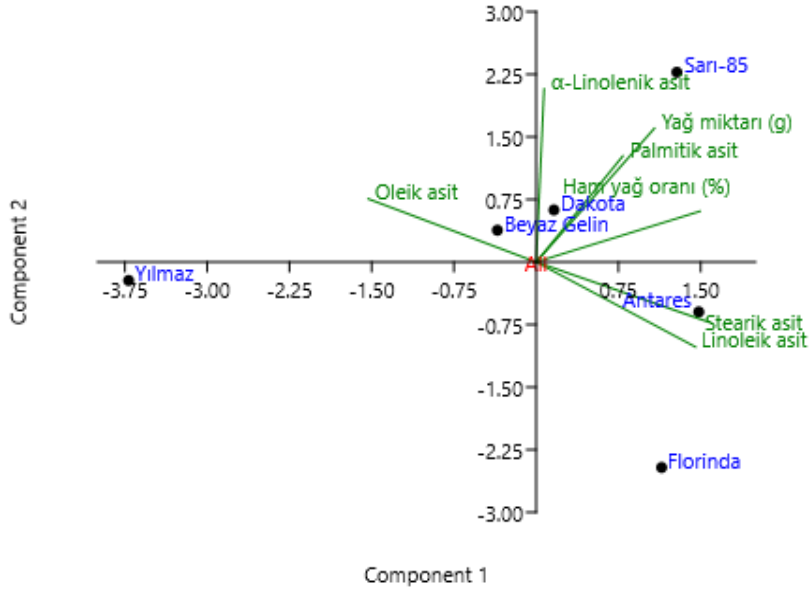
Karbonhidratlar, proteinler ve yağlar birçok canlı organizmada temel yapı taşları olarak yer almakta ve hayatta kalma için gerekli başlıca enerji kaynaklarını oluşturmaktadır (Mobarhan ve ark., 2016). Bu çerçevede, keten yağı hem gıda hem de sanayi endüstrisinde önemli bir hammadde olarak geniş kullanım alanlarına sahiptir. Ayrıca, hayvan beslenmesinde yem katkısı olarak da değerlendirilmektedir. Keten tohumu, diğer yağlı tohumlarda olduğu gibi yüksek yağ içeriğine sahip bir ürün olup bu özelliği ile ekonomik açıdan da dikkat çekmektedir (Wang ve ark., 2020).

Yürütülen bu tez çalışmasında, incelenen keten çeşitleri için ortalama ham yağ verimi oranı %27 olarak belirlenmiştir. Elde edilen veriler doğrultusunda, en yüksek ham yağ verimi %37,6 ile Sarı-85 çeşidinde tespit edilirken, en düşük verim ise %27 ile Yılmaz çeşidinde gözlemlenmiştir (Tablo 3). Ancak, literatürde bildirilen önceki bulgularla karşılaştırıldığında elde edilen değerlerin daha düşük olduğu dikkat çekmektedir. Örneğin Eliasson ve ark. (2003) çalışmasında %46, Tayınmak (2019) tarafından ise %47,29 oranında ham yağ verimi rapor edilmiştir. Bu farkın, kullanılan keten çeşitlerinin yetiştirildiği ekolojik koşullar, tohumların hasat sonrası depolama şartları ve denemeye alınmadan önce geçen süre gibi faktörlerden kaynaklanabileceği düşünülmektedir.

3.3 Yağ Asitleri Bileşimi

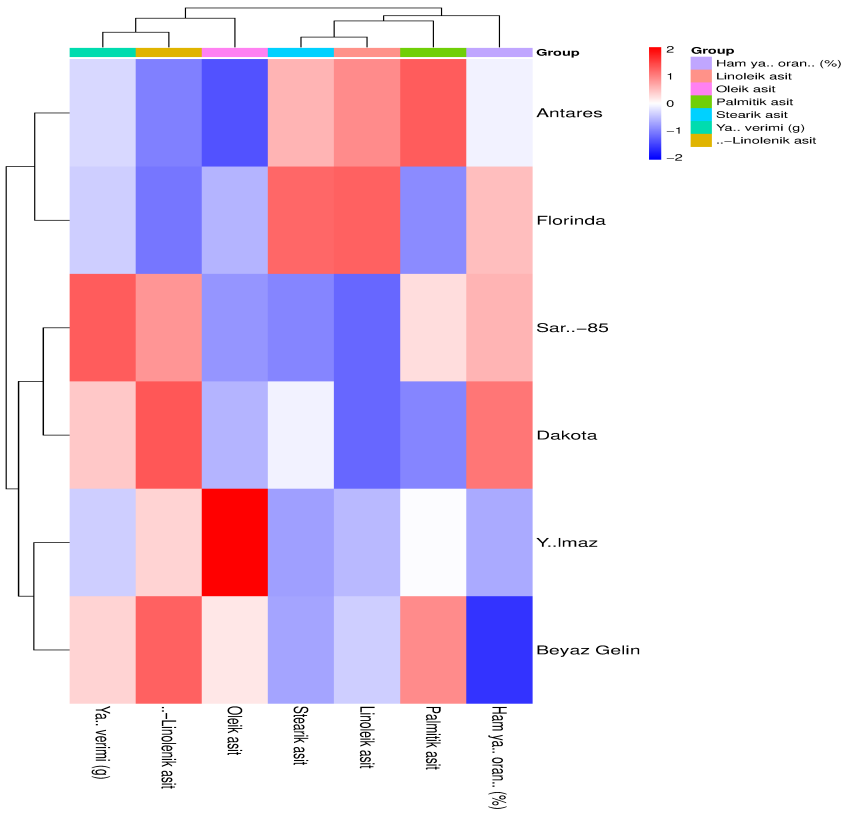
Keten tohumlarında bulunan yağlar, büyük oranda tekli doymamış yağ asitleri (MUFA) ve çoklu doymamış yağ asitleri (PUFA) içermektedir. Yağ asitleri, sahip oldukları biyolojik işlevler ve çeşitli hastalıkların önlenmesine yönelik potansiyel etkileri nedeniyle birçok çalışmada önemli araştırma konusu olmuştur (Orsavova ve ark., 2015). Genel olarak tüm yağ bitkilerinde olduğu gibi, keten de "α-linolenik asit (C18:3), linoleik asit (C18:2), oleik asit (C18:1), palmitik asit (C16:0) ve stearik asit (C18:0)" gibi başlıca yağ asitleri ile karakterize edilmektedir. Ayrıca, bu yağ asitlerinin doymuş ya da doymamış yapıda olmaları ve birbirlerine oranları, hem insan sağlığı açısından hem de bitkinin çevresel koşullara adaptasyonu bakımından büyük önem arz etmektedir (Shramko ve ark., 2020)

Mevcut tez çalışmasında yapılan GC-FID analizleri sonucunda, çeşitler arasında yağ asidi bileşimi bakımından önemli farklılıklar gözlemlenmiştir. α-linolenik asit içeriği bakımından en yüksek oran Sarı-85 çeşidinde %56,47 olarak tespit edilirken, en düşük oran %51,14 ile Florinda çeşidinde belirlenmiştir. Ayrıca, Sarı-85 çeşidinde elde edilen sonuç, literatürde Mohamed Ahmed (2023) tarafından bildirilen %55,27'lik değere yakınlık göstermektedir. Öte yandan, Florinda çeşidine ait α-linolenik asit oranı, Kınay ve Yılmaz (2016) tarafından bildirilen %53,46'lik değere kıyasla belirgin şekilde daha düşük bulunmuştur. Bu farklılıkların, kullanılan çeşitlerin muhafaza koşulları, tohumların yetiştirildiği bölgelerin ekolojik özellikleri ve hasat zamanlaması gibi faktörlerden kaynaklandığı düşünülmektedir. Benzer şekilde, linoleik asit oranı en yüksek %17,06 ile Florinda çeşidinde, en düşük ise %11,73 ile Yılmaz çeşidinde belirlenmiştir. Oleik asit içeriği açısından ise en yüksek oran %22,98 ile yine Yılmaz çeşidinde saptanırken, en düşük oran %17,73 ile Antares çeşidinde kaydedilmiştir. Bu bulgular, literatürle karşılaştırıldığında bazı farklılıklar göstermektedir. Örneğin, Kınay ve Yılmaz (2016)



tarafından Florinda çeşidinde bildirilen oleik asit oranı %17,94 olup, bu çalışmada elde edilen değerle paralellik göstermektedir. Bu farklılıklar, genetik çeşitlilik ve çevresel etmenlerin yanı sıra analiz öncesi uygulanan işleme ve muhafaza koşullarından da etkilenebileceği yönünde önemli ipuçları sunmaktadır.

Tablo 3. Keten (*Linum usitatissimum* L.) çeşitlerine ait yağ oranı ve yağ asitleri değerleri



Çeşit	Yağ miktarı (g)	Ham yağ oranı (%)	Palmitik asit	Stearik asit	Oleik asit	Linoleik asit	α-Linolenik asit
Sarı-85	2.34	37.6	6.79	5.83	19.98	14.59	56.47
Yılmaz	1.55	27	5.94	5.02	22.98	11.73	53.28
Beyaz Gelin	1.92	31.2	6.45	5.66	19.58	14.34	54.63
Antares	1.88	33.6	6.91	6.06	17.73	16.51	52.73
Florinda	1.73	34.6	5.73	6.27	17.82	17.06	51.24
Dakota	1.97	35.4	6.15	5.78	19.16	13.69	55.22

3.4. Temel Bileşenler Analizi (PCA) ve Isı Haritası (Heatmap) Yardımıyla Keten Çeşitlerinin Yağ Verimi ve Yağ Asidi Kompozisyonları

Temel Bileşenler Analizi (PCA) sonuçlarına göre, analizde değerlendirilen 13 değişkenin, özdeğeri (Eigenvalue) 1'in üzerinde olan üç faktör altında toplandığı belirlenmiştir. Bu faktörlerden birincisi (PC1, özdeğer: 3,823), yağ asidi kompozisyonundaki toplam varyansın %54,62'i açıklarken; ikinci faktör (PC2, özdeğer: 2,436), varyansın %34,80'i açıklamaktadır (Şekil 2). İlk iki temel bileşen birlikte değerlendirildiğinde, toplam varyansın %89,42'sini açıklanmakta olup, bu oran yağ asidi bileşenlerinin çeşitler arasında anlamlı farklılıklar gösterdiğine işaret etmektedir. Araştırma bulgularına göre, en yüksek yağ verimi Sarı-85 ve Dakota çeşitlerinden elde edilmiştir. PCA analizine ek olarak, ısı haritası kullanılarak gerçekleştirilen hiyerarşik kümeleme analizinde iki ana küme belirlenmiştir (Şekil 3). Çeşitlerin dağılımına göre; Sarı-85 ve Dakota aynı kümede, Antares, Florinda aynı küme içerisinde ve Yılmaz, Beyaz Gelin ise aynı küme içerisinde toplanmıştır. Yağ asidi bileşenlerine ilişkin yapılan değerlendirmelerde; α-linolenik asit, oleik asit ve yağ verimi benzer varyasyon göstererek aynı grupta yer almış; buna karşılık ham yağ miktarı, linoleik asit, stearik asit ve palmitik asit farklı bir grupta kümelenmiştir.

Şekil 2. Keten (*Linum usitatissimum* L.) çeşitlerinde yağ ve yağ asitlerinde temel bileşenler analizi [Principal Component Analysis (PCA)]

Şekil 3. Keten (*Linum usitatissimum* L.) çeşitlerinde yağ ve yağ asitlerine ait ısı haritası (heatmap clustering)

4. SONUÇ

Keten tohumu (*Linum usitatissimum* L.), yağ asitleri, organik asitler, diyet lifi, protein, fenolik bileşikler ve flavonoidler bakımından zengin bir bileşime sahiptir. Bu bitkinin ekonomik ve tarımsal öneminin artırılabilmesi için, bölgesel ekolojik koşullara uygun yağ asidi profiline sahip keten çeşitlerinin belirlenmesi büyük önem taşımaktadır. Bu durum, bitkisel yağ ithalatçısı konumunda bulunan ülkemiz açısından hem pazarların çeşitlendirilmesi hem de üreticilere sunulacak ürün seçeneklerinin artırılması açısından stratejik bir değere sahiptir. Farklı çalışmalarda ortaya konduğu üzere, bu çalışmada da bazı tescilli yerli ve yabancı keten tohumu çeşitlerinin yağ asidi profilleri karşılaştırmalı olarak incelenmiştir. Elde edilen verilere göre, yağ miktarı (g) ve ham yağ oranı (%) bakımından en yüksek değerler Sarı-85 çeşidinde tespit edilmiş, en düşük değerler ise Yılmaz çeşidinde belirlenmiştir. Ayrıca, keten tohumunda baskın yağ asidi bileşeni α-linolenik asit olup, bu bileşiğin oranı çeşitler arasında değişiklik göstermiştir. α-Linolenik asit içeriği en yüksek Sarı-85 ve Dakota da, en düşük ise Antares ve Florinda çeşitlerinde tespit edilmiştir. Keten tohumu yağının yüksek oranda çoklu doymamış yağ asitleri (PUFA) içermesi, bu yağların oksidatif stabilitesini azaltmakta ve buna bağlı olarak yemeklik yağ olarak kullanım potansiyelini sınırlamaktadır. Ancak bu yağ asitlerinin sağlık açısından taşıdığı besleyici değer, keten tohumu yağının fonksiyonel gıda ve sağlık ürünleri kapsamında değerlendirilmesini mümkün kılmaktadır.

ÖZET

İklimsel değişkenler, süt sığırı yetiştiriciliğinde hayvan refahı, üretim verimliliği ve genel sağlık durumunu doğrudan etkileyen temel çevresel faktörler arasında yer almaktadır. Özellikle son yıllarda küresel iklim değişikliğine bağlı olarak artan sıcaklıklar, aşırı nem oranları ve dengesiz hava koşulları, hayvanların fizyolojik ve davranışsal tepkilerini önemli ölçüde değiştirmektedir. Süt inekleri, homeotermik canlılar olarak çevresel stres faktörlerine karşı çeşitli davranışsal adaptasyonlar geliştirerek termal dengeyi korumaya çalışır. Bu nedenle, davranışsal göstergeler; hayvanın bulunduğu çevre koşullarına uyum sağlayıp sağlamadığını ve ne derece stres altında olduğunu değerlendirmede önemli birer araçtır.

Bu derleme çalışmasında, başta sıcaklık, nem ve sıcaklık-nem indeksi (SNİ) olmak üzere iklimsel parametrelerin süt ineklerinin temel aktivite davranışları üzerindeki etkileri kapsamlı bir şekilde incelenmiştir. Yatma, ayakta durma, yem tüketimi, geviş getirme, su içme, hareketlilik ve gölgelik kullanımı gibi davranışlar, hayvanın çevresel stres faktörlerine verdiği tepkileri yansıtan önemli göstergeler olarak ele alınmıştır. Literatürde farklı ülkelerde ve üretim sistemlerinde yapılmış çalışmalar ışığında, özellikle sıcaklık artışına bağlı olarak gözlenen davranışsal değişimler karşılaştırmalı olarak değerlendirilmiştir. Örneğin, yüksek SNİ değerlerinde yatma süresinde azalma, su tüketiminde artış ve yem alımında düşüş gibi davranışlar yaygın olarak gözlemlenmiştir. Ayrıca çalışmada, modern sensör teknolojilerinin kullanımıyla hayvan davranışlarının gerçek zamanlı olarak izlenebilmesi ve bu sayede ısı stresine bağlı gelişen değişimlerin erken dönemde tespit edilebilmesi üzerinde de durulmuştur. Akselerometreler, geviş getirme sensörleri ve sıcaklık izleme sistemleri gibi teknolojiler, erken uyarı mekanizmaları açısından büyük avantaj sağlamaktadır.

Sonuç olarak, süt ineklerinin iklimsel değişkenlere verdiği davranışsal yanıtların izlenmesi, hem hayvan refahını korumak hem de sürdürülebilir hayvancılık uygulamalarını desteklemek açısından kritik öneme sahiptir. Bu bağlamda, iklim dostu barınak tasarımları, uygun yemleme stratejileri ve çevresel kontrol sistemlerinin geliştirilmesi, hem hayvan sağlığı hem de verimlilik açısından stratejik bir gereklilik olarak değerlendirilmektedir.

THE RELATIONSHIP BETWEEN COW ACTIVITY BEHAVIORS AND CLIMATE

ABSTRACT

Climatic variables are among the most critical environmental factors directly affecting animal welfare, production efficiency, and overall health in dairy cattle farming. In recent years, due to global climate change, increased ambient temperatures, excessive humidity, and unstable weather conditions have significantly altered the physiological and behavioral responses of dairy cows. As homeothermic animals, cows attempt to maintain thermal balance by developing various behavioral adaptations in response to environmental stressors. Therefore, behavioral indicators serve as valuable tools for evaluating the animal's adaptation to its environment and the degree of heat stress it experiences.

This review comprehensively examines the effects of key climatic parameters, particularly temperature, humidity, and the temperature-humidity index (THI), on the core activity behaviors of dairy cows. Behaviors such as lying, standing, feed intake, rumination, drinking, mobility, and shade-seeking are analyzed as critical indicators of environmental stress. Based on a wide range of international studies and research conducted under different climatic and production systems, the review highlights significant behavioral changes associated with increased THI. For example, reduced lying time, decreased dry matter intake, and increased water consumption are among the most frequently reported responses to heat stress. Additionally, the review emphasizes the role of advanced sensor technologies in monitoring animal behavior in real time. Devices such as accelerometers, rumination sensors, and thermal sensors enable early detection of behavior changes linked to heat stress, facilitating timely and appropriate management interventions.

In conclusion, monitoring behavioral responses to climatic stressors is essential not only for maintaining animal welfare but also for ensuring sustainable dairy production. Climate-responsive housing designs, strategic feeding management, and environmental control systems must be implemented to mitigate the adverse effects of heat stress and improve overall herd productivity and well-being.

Keywords: Cow Behavior, Temperature-Humidity Index, Heat Stress, Animal Welfare

1. GİRİŞ

Süt sığırı yetiştiriciliği, dünya genelinde önemli bir hayvansal üretim sektörü olup, ekonomik ve sosyal açıdan büyük bir öneme sahiptir. Ancak bu üretim dalı, iklimsel faktörlerin etkilerine karşı oldukça hassastır. Küresel iklim değişikliği sonucunda artan ortalama sıcaklıklar, değişken yağış rejimleri ve yükselen nem oranları, süt sığırlarının fizyolojik durumlarını ve davranış kalıplarını doğrudan etkilemektedir (West, 2003; Herbut ve ark., 2018). Bu değişiklikler, özellikle sıcaklık nem indeksi (SNİ) gibi çevresel stres göstergelerinin yükselmesiyle birlikte hayvanların termoregülasyon mekanizmalarını zorlamakta, sonuçta hayvan refahı, verim ve üreme performansında ciddi düşüşlere neden olmaktadır (Rhoads ve ark., 2009).

Süt inekleri, homeotermik canlılar olarak vücut sıcaklıklarını dar bir aralıkta tutabilmek için çeşitli davranışsal ve fizyolojik adaptasyonlar geliştirirler. Bu adaptasyonların başında, yatma, ayakta durma, yem tüketimi, içme sıklığı ve süresi, geviş getirme gibi temel davranışların değişimi gelmektedir (Cook and Nordlund, 2009; Borchers ve ark., 2016). Örneğin, yüksek sıcaklık ve nem koşullarında hayvanlar, ısı yükünü azaltmak için yatma sürelerini kısaltıp daha fazla ayakta durabilir, bu da enerji harcamasını ve dolayısıyla stres düzeyini artırabilir (Grant ve Albright, 2001). Benzer şekilde, yem tüketimi ve geviş getirme davranışlarında görülen azalmalar, sindirim sistemi fonksiyonlarını olumsuz etkileyerek süt üretiminde düşüşe yol açar (West, 2003).

Bu derlemenin amacı, farklı iklim koşullarının süt ineklerinin davranışları üzerindeki etkileri kapsamlı bir şekilde inceleyerek, hayvan refahı ve üretim verimliliği açısından ortaya çıkan riskleri ve potansiyel adaptasyon stratejilerini ortaya koymaktır. Ayrıca, iklim değişikliğine bağlı artan çevresel stres faktörlerinin izlenmesi ve yönetimi için davranışsal göstergelerin önemi vurgulanarak, güncel teknolojik gelişmeler ışığında erken uyarı sistemlerine yönelik yaklaşımlar değerlendirilmiştir.

2. İKLİMSEL FAKTÖRLER VE ISI STRESİ

Süt ineklerinin sağlıklı ve verimli bir şekilde yaşamalarını sürdürebilmeleri için bulundukları çevrenin iklimsel koşulları kritik öneme sahiptir. Her tür gibi ineklerin de belirli bir konfor sıcaklık aralığı bulunmaktadır. Bu aralıkta hayvanlar minimum enerji harcamasıyla vücut ısılarını dengede tutabilirler. Süt inekleri için konfor sıcaklık genellikle 5–20 °C aralığında tanımlanmıştır (Collier ve ark., 2011). Bu sınırın üzerindeki sıcaklık değerlerinde, özellikle nem oranlarının da yüksek olması durumunda, ineklerde ısı stresi gelişir ve bu durum hem hayvan refahı hem de üretim performansı açısından olumsuz sonuçlar doğurur.

Isı stresinin tanımlanmasında en yaygın kullanılan çevresel ölçütlerden biri Sıcaklık-Nem İndeksi (SNİ)'dir. SNİ, sıcaklık ve nemin kombinasyonunu hesaplayarak hayvanların termal stres düzeyini nicel olarak ifade eder. Genel kabul görmüş SNİ eşikleri aşağıda sunulmuştur (Armstrong, 1994):

- SNİ < 68: Termal konfor bölgesi, stres yok
- SNİ 68–72: Hafif ısı stresi
- SNİ 72–78: Orta düzey ısı stresi
- SNİ > 78: Şiddetli ısı stresi

SNİ'nin artması, hayvanların vücut ısısını dengelemek için daha fazla çaba göstermesine neden olur. Bu durum, metabolik stresin artması, yem tüketiminin azalması ve dolayısıyla süt veriminde azalma gibi zincirleme olumsuzluklara yol açar (Rhoads ve ark., 2009). Isı stresine maruz kalan inekler, vücut sıcaklıklarını düşürmek ve ısı yükünü azaltmak amacıyla çeşitli davranışsal ve fizyolojik adaptasyonlar geliştirirler. Davranışsal olarak, inekler:

- Yatma süresini kısaltır, çünkü ayakta durmak vücut ısısının daha iyi dağıtılmasına yardımcı olur (Herbut ve ark., 2018).
- Daha sık ve hızlı solunum yaparak vücut ısısını düşürmeye çalışır (Borchers ve ark., 2016).
- Gölgelik arar ve doğrudan güneş ışığından kaçınır, böylece terlemeyle kaybedilen suyu yerine koyarlar (Schütz ve ark., 2014).
- Yem tüketimini azaltarak metabolik ısı üretimini sınırlar, ancak bu durum süt üretimini olumsuz etkiler (West, 2003).
- Su tüketimini artırır, çünkü sıcaklıkla birlikte artan terleme ve solunum kayıplarını dengelemek için daha fazla hidrasyona ihtiyaç duyar (Legrand ve ark., 2011).

Isı stresi altında kalan ineklerde kalp atış hızı, solunum sayısı, vücut sıcaklığı ve terleme oranında belirgin artışlar gözlemlenmektedir (West, 2003; Rhoads et al., 2009). Buna ek olarak, hormonal dengenin bozulması ve stres proteinlerinin (örneğin HSP70) artışı gibi moleküler yanıtlar da bu fizyolojik değişikliklere eşlik etmektedir (Collier et al., 2011). Küresel iklim değişikliği ve artan sıcaklık dalgalanmaları, süt inekleri için ısı stresinin daha sık ve şiddetli yaşanmasına neden olmaktadır. Bu nedenle, yetiştiricilik sistemlerinin termal konforu artıracak şekilde planlanması, gölgelik alanlarının sağlanması ve su kaynaklarının erişilebilir olması büyük önem taşımaktadır. Ayrıca, erken ısı stresi tespiti için davranışsal ve fizyolojik göstergelerin izlenmesi ve uygun yönetim stratejilerinin uygulanması gerekmektedir.

3. İKLİM KOŞULLARININ AKTİVİTE DAVRANIŞLARINA ETKİSİ

Süt ineklerinin günlük yaşamında sergilediği temel aktivite davranışları, hayvan refahı ve sağlık durumu hakkında önemli bilgiler sunar. Bu davranışların süre ve dağılımı, hem fizyolojik ihtiyaçların karşılanması hem de çevresel koşullara adaptasyonun göstergesi olarak değerlendirilir. Grant ve Albright (2001) tarafından yapılan çalışmalar, sağlıklı ve konforlu bir ortamda bulunan süt ineklerinin 24 saatlik (günlük) süreçteki aktivite dağılımlarını genel olarak şu şekilde ortaya koymuştur:

- Yatma süresi: 12–14 saat/gün
- Ayakta durma süresi: 4–6 saat/gün
- Yem tüketimi: 3–5 saat/gün
- Geviş getirme: 7–10 saat/gün
- Su içme: 0.5–1 saat/gün

Çevresel iklim koşulları, süt ineklerinin temel aktivite davranışlarını doğrudan etkileyerek hayvan refahı ve üretim performansında önemli değişikliklere yol açmaktadır. Özellikle sıcaklık ve nem artışları, ineklerin termal konforunu bozar ve davranışsal adaptasyon mekanizmalarını tetikler. Bu bölümde, iklimsel faktörlerin süt ineklerinin yatma, ayakta durma, yem tüketimi, geviş getirme, içme davranışı ve hareketliliğine olan etkileri ayrıntılı olarak incelenmektedir.

3.1. YATMA VE AYAKTA DURMA DAVRANIŞI

Yatma davranışı, özellikle dinlenme ve sindirim için kritik bir aktivitedir. Uzun süreli yatma, enerji tasarrufu sağlarken, geviş getirme gibi sindirim sürecinin etkinliği için elzem olan davranışları da destekler (Cook ve Nordlund, 2009). Ayakta durma süresi ise genellikle yem arama ve termoregülasyon amaçlıdır. Yatma süresi, süt ineklerinde hem rahatlık hem de sindirim fonksiyonları için kritik bir parametredir. İnekler yüksek sıcaklık ve nem koşullarında,

vücuttan ısı kaybını artırmak amacıyla yatma süresi azalmakta ve hayvanlar daha fazla ayakta durmayı tercih etmektedir (Cook ve Nordlund, 2009).

Nordlund ve ark. (2019) tarafından gerçekleştirilen çalışmada, THI'nin 79'a yükseldiği koşullarda süt ineklerinin yatma sürelerinde günlük ortalama 2.8 saatlik önemli bir azalma gözlenmiştir. Benzer şekilde, Polonya'da Herbut ve ark. (2018) tarafından yapılan saha çalışmasında, ısı stresi yaşanan günlerde ineklerin % 20 oranında daha az yattığı ve % 25 oranında daha fazla ayakta kaldığı raporlanmıştır. Bu durum, hayvanların ısı kaybını artırma çabalarının bir göstergesidir. Hayvanlar, özellikle termal stres altında, sabahın geç saatleri ve öğleden sonranın erken saatlerindeki en yüksek aktivite, gölge veya daha serin bölgeler aramak için daha fazla ayakta durma veya hareket etme gibi davranışsal termoregülasyon çabalarını yansıtabilir (Sakar ve ark., 2025). Bu davranış değişikliği, hem termal stresin hem de alan kullanımının hayvan davranışları üzerindeki etkisini ortaya koymaktadır.

3.2. YEM TÜKETİMİ VE GEVİŞ GETİRME

Yem tüketimi, süt verimi ve genel sağlık için doğrudan bir göstergedir. Stres faktörleri, yem alımında azalmaya yol açarak beslenme yetersizliklerine ve buna bağlı olarak süt üretiminde düşüşe neden olabilir (West, 2003). Benzer şekilde, geviş getirme davranışındaki azalma sindirim sistemindeki fonksiyonel bozuklukların belirtisi olarak kabul edilir ve genellikle sıcak stres altında gözlemlenir (Rhoads ve ark., 2009).

Sıcaklık-nem indeksindeki (SNİ) artışla birlikte, süt sığırlarında kuru madde alımında anlamlı bir azalma gözlemlenmiştir (Rhoads ve ark., 2009). West (2003), THI'de meydana gelen her bir birimlik artışın, günlük kuru madde tüketimini ortalama 0,45 kg azaltabileceğini belirtmiştir. Bu bulgular, ısı stresinin yem tüketimi üzerindeki baskılayıcı etkisini açıkça ortaya koymaktadır. Ayrıca, Rhoads ve ark. (2009), yüksek sıcaklık koşullarında geviş getirme süresinde yaklaşık %15 oranında bir azalma tespit etmiş ve bu durumun sindirim sisteminin termal strese verdiği doğrudan bir fizyolojik yanıt olduğunu vurgulamıştır.

3.3. SU İÇME DAVRANIŞI

Su içme davranışı, hayvanın hidrasyon durumunu koruması ve termal konforunu sürdürebilmesi açısından kritik öneme sahiptir. Özellikle sıcaklık ve nemin arttığı koşullarda, hayvanların su ihtiyacı artar ve buna bağlı olarak daha sık ve daha fazla su tüketirler (Legrand ve ark., 2011). Bu durum, ineklerde termal stres altında gözlemlenen su tüketim artışıyla da uyumludur. Su alımındaki bu artış, hayvanların vücut ısısını düzenlemeye yönelik doğal bir tepki olup, ısıyı dışarı atma mekanizmasının önemli bir parçasıdır. Bu nedenle su içme davranışının izlenmesi, hem hayvan refahı hem de çevresel koşullara uyum açısından önemli bir gösterge niteliğindedir. Schütz ve ark. (2014) sıcaklık 30 °C'ye ulaştığında ineklerin su tüketiminde % 40'a varan artış olduğunu raporlamıştır. Ayrıca, ısı stresine karşı adaptasyon amacıyla ineklerin soğuk suyu tercih ettiği ve içme sıklığını artırdığı gözlemlenmiştir. Bu davranışlar, vücudun termoregülasyonunu destekleyerek aşırı ısınmayı önlemeye yöneliktir.

3.4. HAREKETLİLİK VE GÖLGELİK KULLANIMI

Isı stresi, ineklerin hareketlilik düzeyini azaltmakta ve özellikle açık alanlarda gölgede bulunma davranışını teşvik etmektedir. Bu, hayvanların termal konforu artırmak ve doğrudan güneş ışığından kaçınmak için geliştirdiği önemli bir davranışsal adaptasyondur. Schütz ve ark. (2014) merada bulunan ineklerin sıcak günlerde gölgelik alanlara yönelme oranının % 90'a kadar çıktığını bildirmiştir. Bu yüksek orandaki gölgede kalma davranışı, ısı stresinin etkilerini azaltmak için tercih edilen stratejilerden biridir. Legrand ve ark. (2011) ise gölgede bulunan ineklerin yatma süresinin, açık alandaki ineklere kıyasla % 25 daha fazla olduğunu göstermiştir. Bu sonuç, gölgelik alanların hayvan refahı ve davranışlarının düzenlenmesinde kritik bir rol oynadığını vurgulamaktadır.

Süt ineklerinin temel davranışlarındaki süre ve sıklık değişimleri, çevresel stresin erken ve güvenilir göstergeleri olarak değerlendirilir (Schütz ve ark., 2014). Bu nedenle hayvanların aktivitelerinin detaylı ve sürekli izlenmesi, hem hayvan refahının korunması hem de üretim kayıplarının önlenmesi açısından büyük önem taşır. Günümüzde bu izleme işlemi, teknolojik gelişmeler sayesinde daha hassas ve gerçek zamanlı olarak gerçekleştirilebilmektedir. İklim koşullarının süt inekleri üzerindeki davranışsal etkileri, ısı stresine karşı etkili yönetim stratejilerinin geliştirilmesine temel oluşturur. Bu bağlamda, uygun barınak tasarımı, etkin sulama sistemleri, gölgelik alanların sağlanması ve davranışların sürekli izlenmesi gibi uygulamalar, sürdürülebilir hayvancılık için kritik rol oynamaktadır.

4. DAVRANIŞSAL İZLEME VE ERKEN UYARI SİSTEMLERİ

Süt ineklerinin refahı ve üretim verimliliğinin korunmasında, çevresel stres faktörlerinin erken tespiti büyük önem taşımaktadır. Özellikle ısı stresi gibi iklim kaynaklı sorunların hızlı ve doğru biçimde belirlenmesi, etkili müdahalelerin yapılabilmesi için kritik bir gerekliliktir. Geleneksel yöntemlerle hayvan davranışlarının manuel gözlemi hem zaman alıcı hem de subjektif sonuçlar doğurabilmektedir. Ancak teknolojik gelişmeler, bu süreci daha objektif, hızlı ve hassas hale getirmiştir. Günümüzde süt ineklerinin davranışsal aktiviteleri, gelişmiş sensör teknolojileri kullanılarak gerçek zamanlı ve kesintisiz şekilde izlenebilmektedir. Bu teknolojiler arasında en yaygın kullanılanlar şunlardır (Borchers ve ark., 2016):

- Akselerometreler (ivmeölçerler): Hayvanların hareketlerini, yatma ve ayakta durma sürelerini, yürüyüş ve dinlenme döngülerini ölçer. Bu sayede hareketlilikteki ani değişiklikler veya aktivitelerde azalma gibi stres belirtileri kolayca tespit edilir.
- Ruminasyon sensörleri: Özellikle geviş getirme süresi ve sıklığını ölçen bu sensörler, sindirim sistemi sağlığının ve yem tüketim alışkanlıklarının değerlendirilmesinde kullanılır. Isı stresi durumunda geviş getirme süresindeki kısalma, bu sensörlerle erken dönemde fark edilir.
- Sıcaklık ve nem sensörleri: Barınak içi ve dış ortam sıcaklık-nem değerlerinin sürekli ölçülmesi, sıcaklık nem indeksi (SNİ) gibi kritik parametrelerin hesaplanmasını sağlar. Bu veriler, davranışsal değişikliklerle birlikte analiz edilerek hayvanların termal konfor durumları izlenir.
- Biyometrik ve video analiz sistemleri: Kameralar ve yapay zeka destekli görüntü işleme teknikleri, ineklerin pozisyon, hareket ve sosyal davranışlarını analiz ederek stres belirtilerinin belirlenmesine katkı sağlar.

Bu sensör tabanlı sistemler sayesinde ineklerin davranışlarında ısı stresine bağlı değişiklikler ortaya çıkar çıkmaz sistemler tarafından algılanır ve üreticiye anlık bildirimler gönderilir; bu sayede sıcaklık stresinin hayvan üzerindeki olumsuz etkileri büyümeden önleyici tedbir alınabilir (Ranzato ve ark., 2023). Ayrıca, bu teknolojiler sayesinde elde edilen davranışsal veriler (örneğin yatarak geçirme süresi, aktivite, yemleme davranışı) ile iklim parametreleri (sıcaklık, nem, THI gibi) arasında makine öğrenmesi ve istatistiksel modeller kullanılarak önemli ilişkiler tespit edilmiştir; bu da bireysel hayvan ve sürü düzeyinde uyum stratejilerinin geliştirilmesine olanak verir (Hut ve ark., 2022).

Sonuç olarak, sensör tabanlı davranış izleme ve erken uyarı sistemleri, süt sığırcılığında iklim kaynaklı stresin yönetiminde yenilikçi ve sürdürülebilir çözümler sunmaktadır. Bu teknolojilerin yaygınlaşması, hayvan refahının artırılması ve üretim kayıplarının minimize edilmesi açısından gelecekte daha da kritik bir rol oynayacaktır.

5. ISI STRESİYLE MÜCADELE YÖNTEMLERİ

Süt ineklerinde ısı stresinin önlenmesi ve etkilerinin azaltılması, hayvan refahının korunması ve üretim kayıplarının minimize edilmesi için hayati önem taşımaktadır. İklim değişikliğinin

etkilerinin giderek arttığı günümüzde, çiftliklerde uygun yönetim ve çevresel düzenlemelerin yapılması gerekmektedir. Bu amaçla kullanılan başlıca yöntemler aşağıda detaylandırılmıştır.

5.1. BARINAK TASARIMI

Barınak tasarımı, süt sığırlarının termal konforunu sağlamak açısından kritik bir rol oynar. Özellikle yüksek tavanlar ve doğal havalandırma sistemleri, sıcak havanın yükselerek ortamdan uzaklaşmasına ve ısının birikmesinin önlenmesine katkı sağlar. Bu tür yapısal önlemler, ısı stresinin etkilerini azaltmakla kalmaz, aynı zamanda hayvan davranışlarını da olumlu yönde etkileyerek verimliliği destekler (Cook ve Nordlund, 2009; Herbut ve ark., 2018).

5.2. GÖLGELİK SİSTEMLERİ

Açık alanlarda hayvanların doğrudan güneş ışığına maruz kalmasını engellemek için UV geçirgen olmayan tente veya gölgelik sistemleri kullanılmaktadır. Bu gölgelikler, özellikle meralarda ve açık otlak alanlarında ısı yükünü azaltarak hayvanların termal konforunu artırır (Schütz ve ark., 2014). Gölgelik alanlar, ineklerin sıcak saatlerde dinlenme ve serinleme ihtiyaçlarını karşılamak için kritik öneme sahiptir.

5.3. SUYA ERİŞİM

Isı stresinin etkilerini azaltmada su tüketimi en önemli faktörlerden biridir. Süt ineklerinin yeterli miktarda ve temiz suya kolay erişimi sağlanmalıdır. Çiftliklerde, yeterli sayıda ve yaygın otomatik suluklar kurulmalı, suyun özellikle sıcak günlerde soğuk tutulmasına özen gösterilmelidir (Legrand ve ark., 2011). Su temininin kesintisiz ve kolay olması, hayvanların hidrasyonunun korunmasına ve termoregülasyonun etkin yürütülmesine katkı sağlar.

5.4. YEMLEME ZAMANLAMASI

Isı stresi dönemlerinde yem tüketimi azalabildiğinden, yemleme zamanlamasının günün daha serin saatlerine kaydırılması önerilir. Genellikle yemleme sabah erken saatlerde ve akşam geç saatlerde yapılmalıdır (West, 2003). Bu uygulama, ineklerin yem tüketimini optimize ederek metabolik ısı üretimini azaltmaya yardımcı olur. Ayrıca, yüksek enerjili ve sindirimi kolay yemlerin tercih edilmesi, stresin etkilerini hafifletmek için önem taşır.

5.5. SERİNLETME SİSTEMLERİ

Evaporatif soğutma sistemleri, özellikle fan ve sprey kombinasyonları, sıcaklığın yüksek olduğu dönemlerde süt sığırları için etkili bir serinletme yöntemi olarak kullanılmaktadır (Armstrong, 1994; West, 2003). Bu sistemlerde, hayvanların üzerine su püskürtülürken aynı anda hava akımı sağlanarak buharlaşma yoluyla vücut ısısı düşürülür. Fanların düzenli ve yeterli güçte çalışması, spreylerin ise uygun miktarda su püskürtmesi, serinletme etkinliğini artırır. Bunun yanı sıra, su spreyi ve rüzgar kombinasyonu ile yapılan mekanik serinletme uygulamaları da ineklerin termal konforunu artırmaktadır (Collier ve ark., 2011). Ancak bu sistemlerin aşırı nem oluşturabilecek kapalı ortamlarda dikkatli kullanılması gerekmektedir.

6. SONUÇ

İklimsel faktörler, süt ineklerinin davranışları üzerinde doğrudan etkili olup, hayvan refahı ve süt verimi açısından kritik sonuçlar doğurmaktadır. Özellikle sıcaklık ve nem artışıyla birlikte yatma süresi azalmakta, ayakta durma süresi artmakta, yem alımı ve geviş getirme davranışları olumsuz yönde etkilenmektedir. Bu davranışsal değişiklikler, çevresel stresin erken göstergeleri olarak değerlendirilmekte ve üretim kayıplarının önlenmesinde önemli rol oynamaktadır. Bu bağlamda, sensör tabanlı davranış izleme sistemleri, ısı stresinin erken tespitine olanak sağlayarak adaptif yönetim stratejilerinin zamanında devreye alınmasını mümkün kılmaktadır. İklim değişikliğiyle birlikte çevresel stres faktörlerinin daha sık ve şiddetli hale geleceği öngörüldüğünden, iklime duyarlı hayvan yönetimi ve davranış temelli erken uyarı sistemleri, sürdürülebilir süt sığırcılığı için vazgeçilmez araçlar haline gelmektedir.

ÖZET

Polimer ambalajlarda kullanılan plastikleştirici katkı maddesi fitalat asit esterlerinin (PAE'ler) oyuncaklar, kişisel bakım ürünleri ve gıda ambalajları dahil olmak üzere çok çeşitli tüketici ürünlerinde yaygın olarak kullanılmaktadır. Plastik matrise kovalent olarak bağlı olmadıklarından, üretim, kullanım, depolama ve imha süreçleri sırasında çevreye kolaylıkla salınmakta ve yaygın çevresel kirliliğe neden olmaktadırlar. Son yıllarda yalnızca çevresel sistemlerde değil, aynı zamanda gıda güvenliği alanında da önemli bir endişe kaynağı haline gelmiştir. PAE'ler, ağırlıklı olarak ambalaj kaynaklı olarak gıdalarda sıkça tespit edilen kontaminantlardır ve potansiyel toksik ile kanserojen etkileri nedeniyle önemli bir halk sağlığı sorunu oluşturmaktadır. Plastik bazlı ambalaj malzemelerinin ve süt ürünlerinin yaygın kullanımı göz önüne alındığında, PAE'lere maruziyet açısından bu ürünler önemli bir gıda grubunu oluşturmaktadırlar. Bazı ürünlerin ambalaj malzemeleri, PAE'lerin gıdalara göç etmesinde birincil kaynağı teşkil etmektedir. Özellikle yüksek yağ içeriğine sahip gıdalar, ambalajdan gıdaya PAE göçüne daha duyarlıdır; bu durum, tereyağı gibi ürünlerde maruziyet riskini artırmaktadır.

Gıdadan göç, ambalaj malzemesinin fiziksel özellikleri, gıdanın matris yapısı (özellikle su veya yağ fazı), depolama sıcaklığı ve süresi gibi çeşitli faktörlerden etkilenmektedir. Özellikle düşük moleküler ağırlıklı PAE'ler bileşenlerinin göçü için yüksek lipofilikli gıdalar uygun bir ortam sağlamaktadır. Bununla birlikte, doğrudan tereyağı ürünleri ile yapılan spesifik çalışmaların eksikliği, bu alanda yeni araştırmalara ihtiyaç olduğunu göstermektedir. Yüksek tüketim değerine sahip değerli bir süt ürünü olan tereyağında olası kontaminasyonun araştırılması, en önemli bilimsel hedeflerden biri olmalıdır. Bu derlemenin amacı, tereyağında PAE göçünü ve potansiyel maruziyeti literatür ışığında değerlendirmektir. Böylece, tüketici sağlığı açısından risklerin daha iyi anlaşılması ve gelecekteki güvenlik önlemlerinin geliştirilmesine katkı sağlanması hedeflenmektedir.

Anahtar kelimeler: fitalat, migrasyon, tereyağı, gıda ambalajı

MIGRATION OF PHTHALATE ACID ESTERS FROM PLASTIC PACKAGING INTO BUTTER: A LITERATURE-BASED PERSPECTIVE

ABSTRACT

Phthalate acid esters (PAEs), which are plasticizer additives used in polymer packaging, are widely present in many consumer products, including toys, personal care items, and food packaging. Because they are not covalently bound to the plastic matrix, PAEs are easily released into the environment during production, use, storage, and disposal, leading to widespread environmental pollution. In recent years, they have become a significant concern not only in environmental systems but also in food safety. PAEs are frequently detected as contaminants in foods, primarily originating from packaging, and pose a major public health problem due to their potential toxic and carcinogenic effects. Given the extensive use of plastic-based packaging materials and dairy products, these products represent a significant food group in terms of PAE exposure. Packaging materials for certain products are a primary source of PAE migration into foods. Foods with high fat content are particularly susceptible to PAE migration from packaging, increasing the risk of exposure in products such as butter.

Migration from food packaging is influenced by several factors, including the physical properties of the packaging material, the matrix structure of the food (particularly the water or oil phase), storage temperature, and storage duration. Highly lipophilic foods create a favorable environment for the migration of low-molecular-weight PAE compounds. However, the lack of specific studies on butter products underscores the need for further research in this area. Investigating potential contamination in butter, a valuable and widely consumed dairy product, should be a key scientific objective. The purpose of this review is to assess PAE migration and potential exposure in butter based on existing literature. This will help improve understanding of the risks to consumer health and support the development of future safety measures.

Key words: phthalate, mıgratıon**,** butter, food packaging

1. GİRİŞ

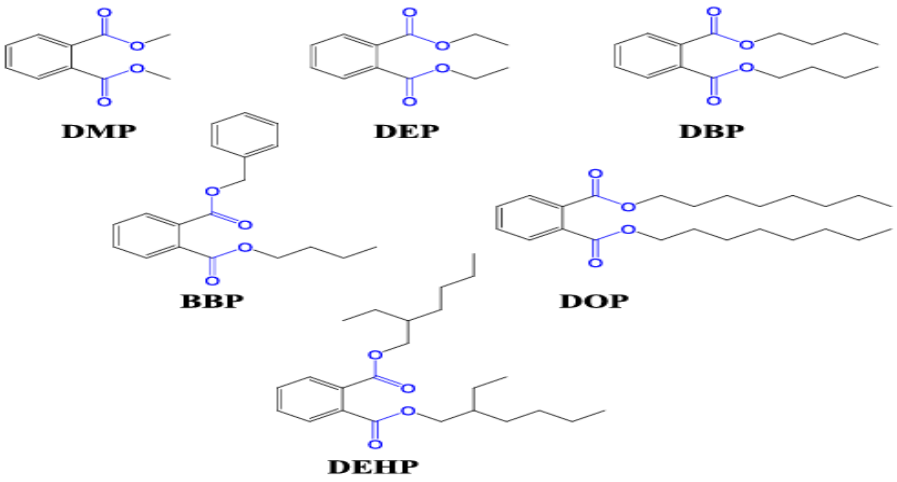
Ambalaj, gıdaların taşınabilirliğini ve kullanım kolaylığını artırmanın yanı sıra, mikroorganizmalar ile biyolojik ve kimyasal bozunmalara karşı koruma sağlayarak ürünlerin raf ömrünü uzatmaktadır. Dolayısıyla ambalaj, gıda üretim zincirinin temel unsurlarından biri olarak kabul edilmektedir (Boyce et al., 2008). Bununla birlikte, gıdaların genel kalitesi ve güvenliği konusundaki endişeler son zamanlarda önemli ölçüde artmıştır. Endişelerin çoğu, hem gıdalara bilerek eklenen hem de ambalaj malzemesi veya işleme ekipmanından gıdalara geçen bileşenlere odaklanmış durumdadır.

Son yıllarda, gıda endüstrisinin artan ihtiyaçlarını karşılamak üzere gıda ambalajlarının geliştirilmesi alanında önemli ilerlemeler kaydedilmiştir. Günümüzde 30'dan fazla farklı plastik, ambalaj malzemesi olarak kullanılmaktadır (Marsh & Bugusu, 2007). Bu polimerik malzemelerin işlenmesi, üretimi veya kullanımı sırasında performans özelliklerini geliştirmek amacıyla plastikleştiriciler (örneğin fitalatlar), antioksidanlar, stabilizatörler, yağlayıcılar, antistatik ve antiblokaj ajanları gibi çeşitli katkı maddeleri eklenmektedir (Perestrelo et al., 2021).

Plastikleştiriciler, plastik üretiminde yaygın olarak kullanılan düşük moleküler ağırlıklı organik bileşiklerdir. Polimer malzemelere esneklik, dayanıklılık ve işlenebilirlik kazandırmak amacıyla katkı maddesi olarak kullanılmaları, bu bileşiklerin endüstriyel önemini artırmaktadır. Bu nedenle, otomotiv ürünleri, tekstil elyafları, elektronik cihazlar, gıda ambalajları ve oyuncaklar gibi çok çeşitli sektörlerde kullanımları hızla yaygınlaşmıştır (Erythropel et al., 2014). Nitekim, plastikleştirici pazarının son yıllarda önemli bir büyüme gösterdiği ve 2034 yılına kadar yaklaşık 28,64 milyar ABD dolarına ulaşmasının beklendiği bildirilmektedir (Sun and Syren, 2025).

Bu geniş kullanım alanı, plastikleştiricilerin çevreye ve gıda zincirine olası geçiş risklerini de beraberinde getirmektedir. Özellikle PAE'leri plastik ambalajlardan gıdalara migrasyon potansiyelleri nedeniyle son yıllarda dikkat çeken önemli bir plastik katkı maddesi grubunu temsil etmektedir**.** Lipofilik özellikleri nedeniyle yağ içeriği yüksek gıdalar, bu bileşiklerin birikimine karşı daha hassas olup; tereyağı bu açıdan önemli bir örnek teşkil etmektedir. Ambalaj malzemesi ile gıda matriksi arasındaki etkileşimin incelenmesi, hem gıda güvenliği hem de ambalaj malzemelerinin uygunluğunun değerlendirilmesi açısından büyük önem taşımaktadır.

Bu derleme, "**Piyasa tereyağlarında bazı kalite kriterlerinin tespiti ve fitalat esterlerinin varlığı ile ilgili sağlık riski değerlendirmesi**" projesi kapsamında yürütülen literatür taramasının bir parçası olarak hazırlanmıştır.



2. Fitalat Asit Esterleri (PAE'ler)

Fitalat esterleri (PAE'ler), genellikle orto-ftalik asit türevlerinden elde edilen organik bileşiklerdir. Fitalik asidin benzende bitişik (1,2) konumda bulunan iki karboksil grubunun esterleşmesi ile oluşan bu bileşikler, polimerlere esneklik, elastikiyet ve dayanıklılık kazandıran plastikleştiricilerdir (Huang et al., 2021). Kimyasal yapılarında bir fitalik asit molekülüne ester bağlarıyla bir veya daha fazla alkil grubu bağlanmıştır; bu yapı, polimer zincirleri arasındaki etkileşimleri azaltarak plastiklerin mekanik özelliklerini ve işlenebilirliğini artırır. PAE'ler, özellikle polivinil klorür (PVC) gibi sert polimerlerde yaygın olarak kullanılmakta olup, toplam plastikleştirici üretiminde yaklaşık %70–80 paya sahiptir. Bu durum, hem endüstriyel önemlerini hem de çevresel ve insan sağlığı açısından potansiyel risklerini ortaya koymaktadır (Li et al., 2021).

Plastik kirliliği, günümüzde dünyadaki en ciddi çevre sorunlarından biri olarak kabul edilmektedir (Williams and Rangel-Buitrago, 2022). Bu bağlamda, plastik katkı maddeleri de

çevresel ve sağlık açısından önemli bir endişe kaynağı haline gelmiş; özellikle PAE'lerin gıdalar ve çevre ile temas yoluyla insanlara geçişi potansiyel toksik etkilere yol açabilmektedir (Iroegbu et al., 2021). Bu özellikleri ve yaygın kullanım alanları (ambalaj malzemeleri, otomotiv ürünleri, inşaat malzemeleri, oyuncaklar ve elektrikli cihazlar) PAE'leri hem endüstriyel olarak vazgeçilmez kılmakta hem de maruziyet ve risk açısından dikkatle değerlendirilmesini gerektirmektedir.

Çevre üzerindeki önemli olumsuz etkileri nedeniyle, bazı PAE'leri öncelikli çevre kirleticileri olarak listelenmiştir. Bu kapsamda farklı alkil yan zincir uzunluklarına sahip, yaygın olarak kullanılan 6 yaygın PAE; DMP-dimetil fitalat, DEP-dietil fitalat, DBP-dibütil fitalat, BBP-benzil bütil fitalat, DOP-dioktil fitalat, DEHP-di(2-etilhekzil) fitalat şeklinde ifade edilmektedir (Şekil 1).

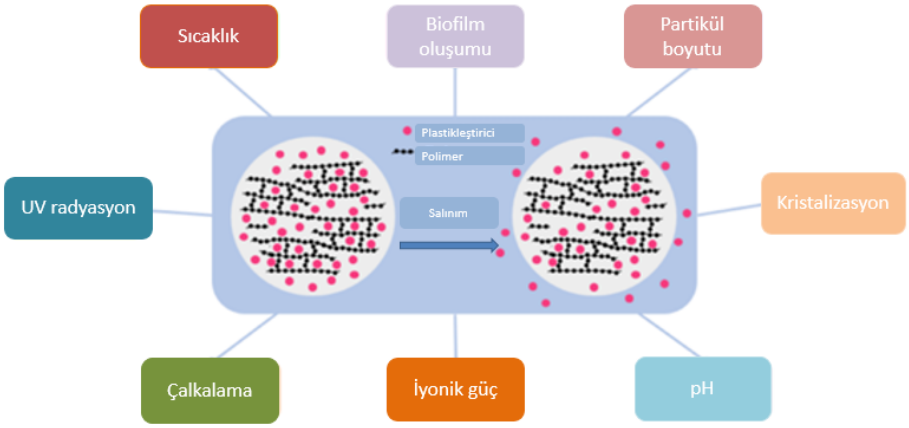
Şekil 1. Yaygın olarak kullanılan bazı PAE'lerinin yapısal formülleri

3. PAE'lerine Maruziyet

PAE'lerine maruziyet, plastik malzemelerden salınım sonucunda kontamine olan hava yolu ile, gıda ile ve deri ile temas yolu ile gerçekleşmektedir. Maruziyet çoğunlukla, oral/gıda yoluyla sindirim ile gerçekleşmektedir (Serrano et al., 2014). Avrupa Birliği'nde fitalatların çoğu gıda ambalajında ağırlıkça %0,1'den yüksek seviyelerde bulunması yasaktır (Perestrelo et al., 2021). Buna ragmen PAE'lerinin kontaminasyonlarının, çoğunlukla gıdalarda kullanılan ambalaj malzemelerinden migrasyon kaynaklı olduğu bildirilmiştir (Fierens et al., 2012; da Costa et al., 2023). Gıdayla temas eden polimer bazlı ambalajlardan plastikleştirici bileşiklerin gıdaya migrasyonu, 80'lerden bu yana gıda güvenliği, toksisite ve tüketici sağlığı açısından kritik bir araştırma alanı olarak önemini korumaktadır (Arvanitoyannis & Bosnea, 2004; Adly et al., 2025).

Plastik ambalaj malzemelerinden gıdalara uçucu maddelerin, katkı maddelerinin, monomerlerin ve oligomerlerin göçü konusunda çok sayıda araştırma yapılmıştır. Moleküler yapıları itibarıyla endojen hormonlarla yapısal benzerlik gösteren PAE'ler, endokrin sistem üzerinde bozucu etki oluşturan çevresel kontaminantlar olarak tanımlanmakta ve hava, su ve toprak gibi farklı çevresel ortamlarda sıkça rapor edilmektedir (Zhang et al., 2022; Tuan Tran et al., 2022).

PAE'lere maruziyet farklı gıda gruplarında yaygın olarak bildirilmiştir. Meyve ve sebzeler, süt ve süt ürünleri, tahıllar, et, balık, yağlar, atıştırmalıklar, soslar ve bebek mamalarında di-(2-etilheksil) ftalat (DEHP), dibütil ftalat (DBP), benzilbütil ftalat (BBP), diizononil ftalat (DINP) ve diizodesil ftalat (DIDP) dahil olmak üzere on dokuz PAE tespit edilmiştir. Bu değerlerin bir kısmı ülkelerin yasal sınırlarını aşmaktadır. DEHP en sık tespit edilen PAE olup, özellikle süt



ve süt ürünleri, yağlar, balık ve tahıllar gibi yüksek yağ içeriğine sahip gıdalarda özgül göç sınırının üzerinde konsantrasyonlarda bulunmuştur. Bu gruplarda DEHP ve DBP'ye bağlı tolere edilebilir günlük alım (TDI) riskinin hem çocuklar hem de yetişkinler için yüksek olduğu bildirilmektedir. PAE göçü; sıcaklık, temas süresi, gıdanın yağ oranı ve asitliği gibi faktörlerle pozitif ilişki göstermekte olup kontaminasyon üretim zincirinin farklı aşamalarında ortaya çıkabilmektedir (da Costa et al., 2023).

4. PAE'lerin Plasikten Geçiş Mekanizması

Kimyasal katkı maddelerinin (PAEs) su sistemlerine geçiş mekanizması temel olarak üç ana süreçle açıklanabilir;

- plastik matris içerisindeki difüzyon
- plastik-su arayüzündeki faz ayrımı
- sulu sınır tabakasındaki difüzyon

Ancak, bu süreçlerin etkinliği yalnızca bu temel mekanizmalarla sınırlı değildir; çok sayıda fizikokimyasal ve çevresel faktör, katkı maddelerinin çevreye salınım hızını ve kapsamını önemli ölçüde etkileyebilir (Şekil 2). Zayıf ikincil moleküler etkileşimler nedeniyle, söz konusu analitler polimer matrisine fiziksel olarak bağlıdır. Dolayısı ile bileşikler (PAE'ler) matrise kimyasal olarak bağlanmadığından polimerlerden kolayca salınabilir ve solunum, gıdalar ve temas yolu ile çevreyi (hava, su, toprak) ve canlıları kontamine edebilirler (Kwon et al., 2017; Mirzaeı et al., 2023; Chen, 2024).

Şekil 2. Plastikleştiricilerin salınımını etkileyen faktörler

5. Fitalatların (PAE'ler) Metabolizması ve Vücutta Davranışı

Biyotransformasyon Süreci

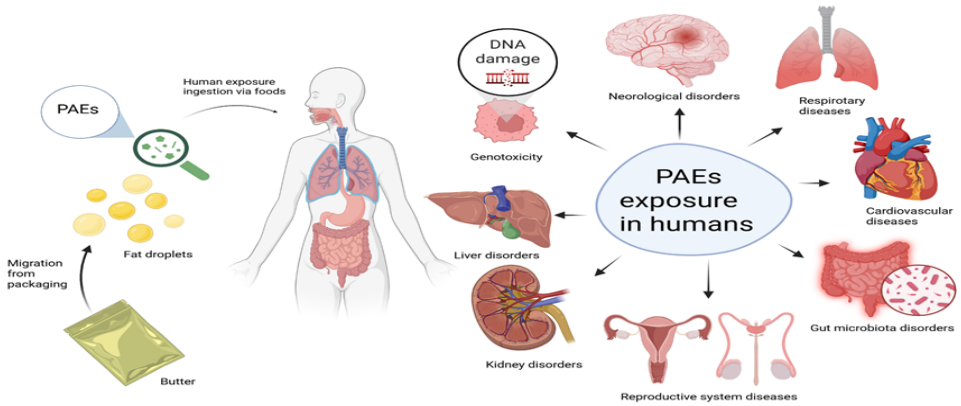
- PAE'ler vücuda genellikle solunum, sindirim ve temas yoluyla kontamine olur.
- Emilim sonrası, karaciğerde ve kısmen bağırsak mukozasında, esteraz enzimleri tarafından monoester türevlerine (ör. DEHP → MEHP) hidrolize edilir.
- Bu monoesterler, daha sonra oksidatif metabolizma süreciyle suda çözünür metabolitlere dönüştürülür (Fan et al., 2022).

Eliminasyon (Atılım) Yolları

- Metabolitler ağırlıklı olarak idrar yoluyla, daha az oranda dışkı ve ter ile atılır.
- Düşük molekül ağırlıklı ftalatlar (DMP, DEP, DBP, BBzP) genellikle 24–48 saat içinde atılır.

- Yüksek molekül ağırlıklı ftalatlar (DEHP, DiNP, DiDP) ise yağ dokularında kısa süreli depolanabilir ve daha yavaş elimine edilirler (Meeker et al., 2012).

Maruziyetin Kanıtları



- PAE metabolitleri, kan, idrar, anne sütü, plasenta ve amniyotik sıvıda yaygın olarak tespit edilmiştir.

- Bu durum, düşük dozlarda ancak sürekli maruziyetin insan popülasyonunda yaygın olduğunu göstermektedir (Meeker et al., 2012).

Ancak vücuttan atıldıkları kadar yeniden alınırlar bu durum da kronik (sürekli) düşük doz maruziyet oluşturur. Ayrıca hormon sistemine etkilerinden (endokrin bozucu) dolayı çok düşük dozlarda bile üreme, gelişim, nörolojik ve metabolik süreçleri bozabilirler. Embriyonik ve çocukluk dönemlerinde düşük dozlarda bile maruziyet, geri dönüşü olmayan etkilere (gelişim geriliği vb.) sebep olabilir. Bazı metabolitleri oksidatif stres ve DNA hasarı gibi hücresel düzeyde toksisite oluşturabilirler (Sicińska et al., 2021). Asıl tehlike, bu bileşiklerin vücutta kalıcılığından ziyade, **sürekli maruziyet** sonucu hassas biyolojik sistemler üzerinde bozucu etki oluşturma potansiyelleridir.

6. PAE'lerin Sağlığa Etkileri

Çevrede yaygın bulunan PAE'ler, insan sağlığı üzerinde çeşitli potansiyel olumsuz etkiler oluşturabilmektedir (Şekil 3). Bu nedenle, Avrupa Gıda Güvenliği Otoritesi (EFSA), gıdalardaki PAE kontaminasyonunu sınırlamak üzere düzenlemeler geliştirmiştir. EFSA'ya göre, 0–50 µg/kg arasındaki PAE konsantrasyonları düşük, 50–300 µg/kg arasındakiler ise orta düzey olarak kabul edilmektedir; düşük düzeylerdeki göç ise sınırlı maruziyet olasılığına işaret etmektedir (Serrano et al., 2014; Dobaradaran et al., 2020; Sicińska et al., 2021).

Şekil 3. PAE'ler, insan sağlığı üzerinde çeşitli potansiyel olumsuz etkileri (Created in https://BioRender.com by Zeynep GÜRBÜZ)

PAE'ler lipofilik (yağda çözünen) bileşikler olduklarından (da Costa et al., 2023), tereyağı, krema ve yüksek yağlı peynir gibi ürünler bu bileşikler için birikim alanı oluşturmaktadır. Süt yağı, fitalatların adsorbe olabileceği uygun bir ortam sağladığından, ürünün yağ içeriği arttıkça ambalaj malzemesinden veya üretim sürecinden ürüne geçebilecek fitalat miktarı da artış göstermektedir (Mirzaei et al., 2023). Buna karşılık, düşük yağlı süt ürünlerinde maruziyet genellikle daha düşüktür. Ancak yüksek yağlı ürünlerin sık veya aşırı tüketimi, günlük toplam fitalat maruziyetini artırarak özellikle endokrin sistem üzerindeki bozucu etkiler gibi potansiyel sağlık risklerini gündeme getirebilmektedir.

7. Tereyağı ve Diğer Yağlı Süt Ürünlerinde PAE Migrasyonu

Süt ve süt ürünleri (örneğin peynir ve tereyağı), yüksek düzeyde makro ve mikro besin bileşenleri içermeleri nedeniyle çocuklar, yetişkinler ve bebekler için temel bir gıda grubunu oluşturarak insan beslenmesinde hayati bir rol oynamaktadır. Ancak bu ürünler, ambalajlama, işleme veya hayvan yemleri yoluyla PAE'ler ile kontamine olabilmektedir (Dobaradaran et al., 2020; Mirzaei et al., 2023). Gıdaya ambalaj malzemesinden gerçekleşen göç; ambalajın fiziksel özellikleri, gıdanın matris yapısı (özellikle su ve yağ fazı oranı), depolama sıcaklığı ve süresi gibi çeşitli faktörlerden etkilenmektedir. Düşük moleküler ağırlığa sahip fitalat esterlerinin (PAE'ler) göçü, özellikle yüksek lipit içeriğine sahip gıdalarda daha kolay gerçekleşmekte olup, bu durum bu tür ürünlerin fitalat migrasyonu açısından daha yüksek risk taşımasına neden olmaktadır. Bu çerçevede yapılan bir çalışmada, sulu ve yağlı gıda simülanları kullanılarak gerçekleştirilen ekstraksiyonlar ve GC-MS analizleri ile kullanılan polietilen gıda ambalaj malzemelerinin fitalat migrasyonu ve buna bağlı olarak güvenlik ve kalite durumu değerlendirilmiştir. Yağlı gıda simülanı olarak PFC (polietilen gıda kapları) ve TAB (düz polietilen poşet/filmler) malzemeleri incelenmiştir. Sonuç olarak DEHP, tüm boş örneklerde iz miktarda bulunmasına rağmen yağlı simülanda en yüksek konsantrasyona sahip fitalat olarak tespit edilmiştir. Bu fitalatleri sırasıyla DEP ve DBP izlemiş, DEP sulu simülanda yalnızca en yüksek sıcaklık ve temas süresinde düşük seviyelerde tespit edilirken, zeytinyağında çoğu örnekte anlamlı konsantrasyonlarda bulunmuştur (Ayamba et al., 2020).

Farklı ülkelerde ve çeşitli ürün gruplarında yapılan piyasa araştırmaları, süt ve süt ürünlerinde değişen düzeylerde fitalat kalıntılarının tespit edildiğini ortaya koymuştur. Tahran'daki süpermarketlerden temin edilen plastik ambalajlı tereyağı ve peynir örneklerinde altı PAE analiti (DMP, DnOP, DEP, DEHP, DBP ve BBP) MSPE-GC/MS yöntemiyle analiz edilmiş; sonuçlar, yüksek yağ içeriğine sahip peynirlerin ve yerli üretim tereyağlarının daha yüksek kontaminasyon seviyelerine sahip olduğunu ortaya koymuştur. Bununla birlikte, tüketimin beslenme uzmanlarının önerdiği düzeylerde sürdürülmesi hâlinde tüketiciler için risk olasılığının düşük olduğu bildirilmiştir (Mirzaei et al., 2023). Lin et al. (2015) tarafından yürütülen bir diğer çalışmada, plastik, cam ve metal ambalajlı ticari tam yağlı süt ürünlerinde fitalat tespiti amacıyla bir analiz yöntemi geliştirilmiş ve 2,60–156,4 ng/g aralığında değişen konsantrasyonlarda fitalat varlığı saptanmıştır. Özellikle cam ve metal ambalajlardaki süt örneklerinde fitalat miktarlarının, plastik ambalajlı ürünlere kıyasla belirgin biçimde daha düşük olması, plastik ambalajların olası bir kontaminasyon kaynağı olduğunu göstermektedir.

Benzer şekilde, Sharman et al. (1994) süt örneklerinde DEHP ve toplam fitalatın düşük seviyelerde (<0,01–0,28 mg/kg) bulunduğunu, ancak yağlı süt ürünlerinde (krema, peynir, tereyağı) kontaminasyonun arttığını ve bazı örneklerde DEHP düzeylerinin 17 mg/kg'a, toplam fitalat miktarının ise 114 mg/kg'a kadar ulaştığını bildirmiştir. Wu et al. (2015) ise süt ürünlerinde fitalat esterleri konsantrasyonlarının 0,01–0,12 mg/kg aralığında değiştiğini rapor etmiştir. Türkiye'de yürütülen bir çalışmada (Korkmaz and Küplülü, 2019) ise, yaygın olarak tüketilen süt ürünlerinde altı farklı PAE (DBP, DEHP, BBP, DINP, DNOP ve DIDP) LC-MS/MS yöntemiyle analiz etmişlerdir. Bazı örneklerde DBP, DEHP ve BBP tespit edilirken, diğer PAE'leri analiz edilebilir sınırın (20 µg/kg) altında bulunmuştur. DBP, DEHP ve BBP konsantrasyonlarının 6–229 µg/kg arasında değiştiği belirlenmiş; araştırmacılar, DEHP ve DBP'nin tüm örneklerde baskın fitalat esterleri olduğunu, ancak düzeylerinin mevcut yasal sınırların altında kaldığını ifade etmişlerdir.

SONUÇ

Literatür verileri, plastik ambalajlardan tereyağı ve diğer süt ürünlerine fitalat asit esteri bileşiklerinin göçünün genel olarak düşük seviyelerde gerçekleştiğini göstermektedir. Süt ve düşük yağlı ürünlerde fitalat düzeyleri genellikle sınır değerlerin altında kalırken, kremaya,

tereyağına ve yüksek yağlı peynir ürünlerine geçişin fazla olduğu belirtilmiştir. Plastik ambalajlar, süt ürünlerinde olası bir fitalat kaynağı olup, fitalatların bir kısmı protein ve yağ fazına adsorbe olabildiği yapılan çalışmalarla tespit edilmiştir. Mevcut bulgular, kontrollü tüketim koşullarında tereyağı ve süt ürünlerinin insan sağlığı için risk oluşturma olasılığının düşük olduğunu göstermektedir; ancak tüketim miktarı ve sıklığı toplam maruziyeti etkileyebileceğinden, risk değerlendirmeleri yalnızca kontaminasyon seviyelerine değil, aynı zamanda günlük tüketim miktarlarına da bağlı olarak yapılmalıdır. Ayrıca, farklı ambalaj tipleri, üretim ve işleme süreçleri ile kontaminasyon düzeylerinin değerlendirilmesi, risk yönetimi ve güvenlik için önemli olduğu kanısına varılmıştır.

ÖZET

Küresel ısınma nedeniyle Akdeniz Havzasında artan sıcaklıklar ve azalan yağışlar, tarımsal su yönetiminde ciddi kısıtlar yaratmaktadır. Bu durum, bitki su tüketimi ve verimliliği açısından önemli riskler oluştururken, kısıtlı sulama stratejileri su kaynaklarının sürdürülebilir kullanımını destekleyen ve evapotranspirasyon (ETc) ihtiyacının altında su uygulayarak su verimliliğini artırmayı hedefleyen bir yaklaşım olarak öne çıkmaktadır. Bitkilerin su stresine karşı fizyolojik tepkilerini bitkiye zarar vermeden gözlemlemek için stoma iletkenliği (gs) ve termal görüntüleme yöntemleri sıklıkla kullanılmaktadır. Bu çalışma, farklı düzeyde su uygulanan ve yağışa dayalı koşullarda yetişen zeytin ağaçlarında (*Olea europaea L. cv. Memecik*) insansız hava aracı (İHA) ile alınan termal görüntülerden elde edilen kanopi-hava sıcaklığı farkı (Tc-Ta) ile stoma iletkenliği (gs) arasındaki ilişkileri incelemektedir. Ağaçlara tesadüf blokları deneme desenine göre dört farklı sulama rejimi uygulanmıştır. Bu amaçla; konular, K1: Susuz (yağışa dayalı); K2: %100×ETc, K3: %66×ETc ve K4: %33×ETc şeklinde oluşturulmuştur. Beş farklı tarihe ait Tc-Ta haritaları oluşturularak zamansal-mekânsal değişimler incelenmiş ve istatistiksel analizler sonucunda, ilk ölçüm tarihinden itibaren konular arasında anlamlı farklılıklar olduğu ortaya konulmuştur. Buna göre K2 konusu en düşük Tc-Ta değerini alırken K1 konusu en yüksek değeri almıştır. Yüksek Tc-Ta değerleri su stresi altındaki bitkileri, düşük değerler ise iyi sulanan bitkileri ifade etmektedir. İHA uçuşlarıyla eşzamanlı yapılan ölçümlerde stoma iletkenliği tüm tarihlerde konular arasında anlamlı farklılık göstermiş; K2 en yüksek, K1 ve K4 ise en düşük gs değerlerine sahip olmuştur. Yüksek gs değerleri iyi sulanan bitkileri, düşük değerler ise su stresi altındaki bitkileri ifade etmektedir. Araştırmada, Tc-Ta ile stoma iletkenliği arasında istatistiksel olarak anlamlı ve negatif yönlü bir ilişki saptanmış ($r = -0.619$, $r^2 = 0.383$); Tc-Ta azaldıkça stoma iletkenliği ve transpirasyonun arttığı belirlenmiştir.

DETERMINATION OF THE RELATIONSHIP BETWEEN STOMATAL CONDUCTANCE AND Tc-Ta OBTAINED FROM THERMAL IMAGES IN OLIVE TREES

ABSTRACT

Global warming has caused rising temperatures and decreasing rainfall in the Mediterranean Basin, creating serious constraints in agricultural water management. This situation poses significant risks regarding plant water consumption and productivity, while deficit irrigation strategies are emerging as an approach that supports the sustainable use of water resources and aims to increase water efficiency by supplying water below the evapotranspiration (ETc) requirement. Stomatal conductance (gs) and thermal imaging methods are commonly used to observe plants' physiological responses to water stress without damaging the plant. This study examines the relationships between canopy-air temperature difference (Tc-Ta) and stomatal conductance (gs), obtained from thermal images taken by an unmanned aerial vehicle (UAV) on olive trees (*Olea europaea L. cv. Memecik*) grown under different water application levels and rainfall-dependent conditions. Four irrigation regimes were applied to the trees according to the randomized block design: K1 (no irrigation, rain-fed), K2 (100%×ETc), K3 (66%×ETc), and K4 (33%×ETc). Tc-Ta maps for five different dates were created to assess spatio-temporal changes, and statistical analyses revealed significant differences between treatments from the first measurement date. The results showed that treatment K2 had the lowest Tc-Ta value, while treatment K1 had the highest. High Tc-Ta values indicate plants under water stress, whereas low values indicate well-watered plants. Measurements taken simultaneously with UAV flights showed significant differences in stomatal conductance across treatments on all dates; K2 had the highest gs values, while K1 and K4 had the lowest. High gs values suggest well-watered plants, while low values indicate plants under water stress. The study found a statistically significant and negative relationship between Tc-Ta and stomatal conductance ($r = -0.619$, $r^2 = 0.383$); it was determined that as Tc-Ta decreased, stomatal conductance and transpiration increased.

1. GİRİŞ

Son yıllarda, iklim değişikliği, özellikle yaz aylarında yağışların az olduğu ve sıcaklıkların yüksek olduğu bölgelerde, tarımda suyun bulunabilirliği ve kullanımı konusunda ciddi sorunlar yaratmıştır (Konapala ve ark., 2020; Pokhrel ve ark., 2021; Carella ve ark., 2024). Tarımsal su kullanımı, artan su kıtlığı için birincil değişkendir ve sulama, dünyadaki tatlı su kullanımının yaklaşık %70'ini oluşturmaktadır (Tshwene ve Oladele, 2016; Awais ve ark., 2023). Su kaynaklarının sınırlı doğası göz önüne alındığında, sulama uygulamalarının iyileştirilmesi ve sürdürülebilir su yönetimi stratejilerinin geliştirilmesi, suyu korurken bitki verimliliğini korumak için çok önemlidir (Ramírez-Cuesta ve ark., 2025). Küresel ısınma senaryosunda, sulama yönetimi tarımda su kullanımının optimizasyonu için önemlidir (Howell, 2001; Marques ve ark., 2020). Kısıtlı sulama (DI) stratejileri, bitkinin evapotranspirasyon (ETc) gereksinimlerinin altında su uygulamayı ve minimum verim düşüşüne neden olmayı amaçlamaktadır (Ramírez-Cuesta ve ark., 2025). Bu strateji, belirli bir dönemde veya tüm büyüme mevsimi boyunca uygulanabilir (English, 1990; Marques ve ark., 2020).

Zeytin ağaçları özelinde, su kullanım verimliliğini artırmak için çok sayıda sulama stratejisi geliştirilmiş ve değerlendirilmiştir. Bu stratejilerde öncelikli olarak verim kayıplarının azaltılması ve zeytinyağı kalitesinin potansiyel olarak iyileştirilmesi hedeflenmiştir (Gucci ve ark., 2019; Marques ve ark., 2023). Bitkilerin su stresine fizyolojik tepkisine dayalı olarak, kısıtlı sulama (DI) yönteminin benimsenmesi çeşitli araştırmalarda önemli bir odak noktası olmuştur (Fernandes-Silva ve ark., 2013; Akkuzu ve ark. 2013; Shackel ve ark., 2021; Trentacoste ve ark., 2019; Vita Serman ve ark., 2011; Marques ve ark., 2023; Mengü ve ark., 2024). Ancak, bu yöntemleri pratikte başarıyla uygulamak ve verim üzerindeki olumsuz etkileri en aza indirmek için, bitkilerin su stresine nasıl tepki verdiklerini iyice anlamak çok önemlidir. Bu bilgi, su stresinin sürekli izlenmesi ile birleştiğinde, son derece önemli hale gelir. Yaygın olarak kullanılan su durumu göstergeleri arasında stoma iletkenliği (g_s) bulunur (Marques ve ark., 2023; Mengü ve ark., 2024). Son zamanlarda yapılan çalışmalar, optik veya termal görüntülerin kullanıldığı uzaktan algılama tekniklerinin de bitki su stresini izlemek için kullanılabileceğini göstermiştir (Jamshidi ve ark., 2021; Sepulcre-Canto ve ark., 2005; Veysi ve ark., 2017; Zhang ve ark., 2019a; Zhang ve ark., 2019b; Brewer ve ark., 2022).

Uzaktan algılama teknikleri, termal, multispektral ve hiperspektral kameralar kullanılarak geniş alanlarda ağaçların su durumundaki mekânsal değişkenliğin hızlı bir şekilde tespit edilmesini sağlar (Carella ve ark., 2024a; Carella ve ark., 2024b). Ayrıntılı ölçekli sulama yönetimi için uzaktan algılamada en yaygın olarak kullanılan platformlar arasında İnsansız Hava Araçları (İHA) bulunmaktadır (Roma ve Catania, 2022; Carella ve ark., 2024b). Termal sensörlerle donatılmış İHA'lar, meyve bahçelerindeki yüzey sıcaklığı değişimlerini hassas bir şekilde yakalayarak, su durumundaki mekansal farklılıkların tespitini kolaylaştırmaktadır (Ramírez-Cuesta ve ark., 2025). Birkaç çalışma, zeytin bahçeleri üzerinde uzaktan algılamanın ağaçların su durumunun doğru bir tahminini sağlayabileceğini ortaya koymuştur. Çoğu çalışma, termal kameralarla uzaktan algılamanın bitkilerin su durumu ile yüksek korelasyon gösterdiğini vurgulamaktadır (Ben-Gal ve ark., 2009; Caruso ve ark., 2022; Egea ve ark., 2016; Carella ve ark., 2024b).

Bitkilerin su durumunu gerçek zamanlı olarak gösteren önemli ve maliyet etkin bir gösterge, bitki örtüsü sıcaklığıdır (Bian ve ark., 2019; Costa ve ark., 2020; de Almeida ve ark., 2024). Bitkilerdeki su eksikliğini değerlendiren bu yöntem, sıcaklıktaki azalmanın, buharlaşma soğutma süreci nedeniyle bitki terleme oranıyla orantılı olduğu ilkesine dayanmaktadır (Costa ve ark., 2018; Khorsandi ve ark., 2018; Zia ve ark., 2013; de Almeida ve ark., 2024). Kanopi sıcaklığı birçok çalışmada su stresi göstergesi olarak önerilmiştir (Idso ve ark., 1978; Jackson ve ark., 1977a; Jackson ve Pinter Jr., 1981; Sepulcre-Cantó ve ark., 2006). Jackson ve ark.,

(1977b) bitkilerin su durumunu incelemek için kanopi sıcaklığı (Tc) ile hava sıcaklığı (Ta) farkını bir indeks olarak kullanmış ve Tc-Ta değerlerini verimlilik ve bitkilerin su gereksinimleri ile ilişkilendirmiştir. Idso (1982) çevresel değişkenliğin önemli bir faktör olduğunu göstermiş, yüksek Tc-Ta değerlerinin su stresi altındaki bitkilerle, düşük değerlerin ise iyi sulanan parsellerle ilişkili olduğunu ortaya koymuştur (Sepulcre-Cantó ve ark., 2006).

Yaprak alanı, stoma iletkenliği ve hidrolik özellikteki değişiklikler bitkideki su durumunu kontrol eder (Jones, 1999, 2004; Gonzalez-Dugo ve ark., 2012; Blum ve ark., 2013) bu nedenle kanopi sıcaklığı su açığını değerlendirmek ve sulamayı planlamak için kullanılır (Blum ve ark., 2013).

Stoma iletkenliği, yaprak ve çevresindeki hava arasındaki su buharı ve karbondioksit değişiminin önemli bir düzenleyicisidir ve bitki büyümesini doğrudan etkiler (Iseki ve Olaleye, 2020). Stoma iletkenliği, değişen güneş radyasyonu, hava nemi, hava sıcaklığı, rüzgâr hızı ve toprak su içeriği seviyelerine sahip ortamlara uyum sağlamak için bitki su kaybını en aza indirmede de önemli bir rol oynar. Bu nedenle, stoma iletkenliği özellikle hafif-orta kuraklık stresi koşullarında bitki su durumu ve büyümesinin bir göstergesi olarak kullanılır (Flexas ve Medrano, 2002; Medrano ve ark., 2002; Iseki ve Olaleye, 2020). Önemli bir süre boyunca stoma kapanmalarının yaprak sıcaklığını artırdığı bilinmektedir (Kashiwagi ve ark., 2008; Kumar ve ark., 2017). Stoma iletkenliğini ölçmek için en doğru yöntem bir yaprak porometresi veya bir kızılötesi gaz analizörü (IRGA) kullanmaktır (Iseki ve Olaleye, 2020).

Stres olmayan koşullar altında, daha yüksek hava sıcaklığı ve güneş radyasyonu, stoma açılmasına yol açarken daha düşük nem stoma kapanmasına yol açar (Yu ve ark., 2004; Iseki ve Olaleye, 2020). Toprak nem açığı transpirasyon oranını azaltır ve bu da kanopi sıcaklığını artırır (Rebetzke ve ark., 2013; Lepekhov, 2022). Bu nedenle, kanopi sıcaklığı bitkilerde kuraklık ve ısı toleransını incelemek için kullanılabilir (Lepekhov, 2022).

Değerlendirme ve hesaplama kolaylığı nedeniyle, stoma iletkenliğinin yaprak sıcaklığına bağlı göstergeleri laboratuvar ve arazi çalışmalarında yaygın olarak uygulanmaktadır. Bu göstergelerle ilgili bir zorluk, yaprak sıcaklığı ile stoma iletkenliği arasındaki ilişkinin güneş radyasyonu, hava sıcaklığı, nem ve rüzgâr hızındaki değişikliklerle güçlü bir şekilde değişebilmesidir (Maes ve Steppe, 2012; Iseki ve Olaleye, 2020).

Bu çalışmada, Memecik zeytin çeşidine uygulanan farklı sulama rejimlerinin stoma iletkenliği ve termal görüntülerden oluşturulan Tc-Ta'nın değişimi araştırılmıştır. Ayrıca stoma iletkenliği ile Tc-Ta arasındaki ilişkinin belirlenmesi amaçlanmıştır.

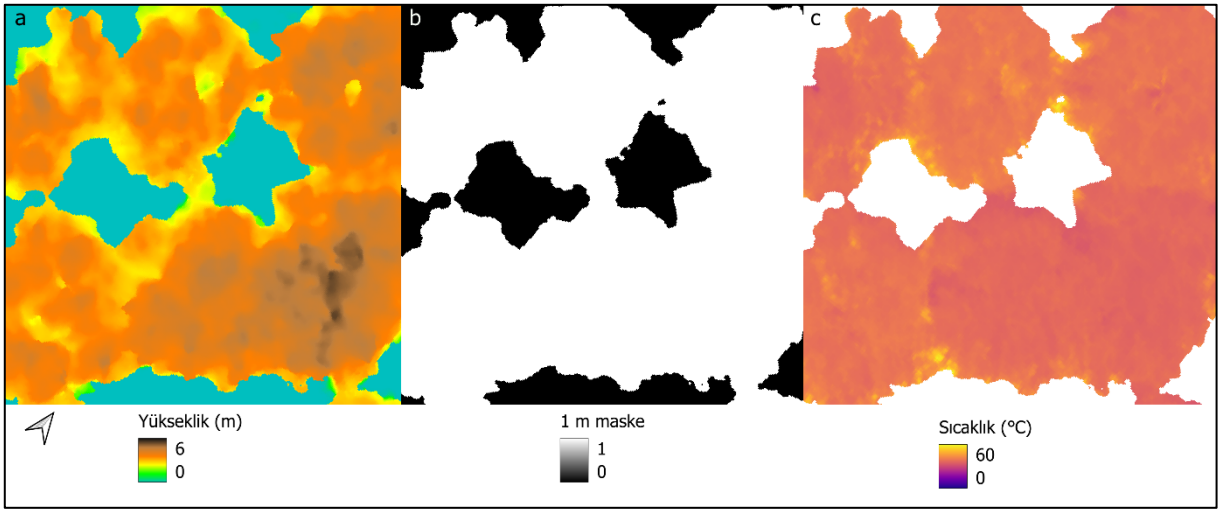
2. MATERYAL VE YÖNTEM

Deneme Alanı ve Özellikleri

Çalışma, 2024 yılında İzmir Bornova Zeytincilik Araştırma Enstitüsü Müdürlüğü, Bornova Üretim ve Araştırma Sahası içerisinde 38° 27' 08.7" K, 27° 12' 01.5" D koordinatlarında, tınlı bünyeli toprak yapısına sahip arazide yürütülmüştür. Araştırma alanı; Akdeniz iklim kuşağında yer almaktadır. Uzun yıllar ortalama iklim verilerine göre; toplam yıllık yağış 600,1 mm ortalama sıcaklık 19,1 °C, ortalama oransal nem %63,2'dir (MGM, 2025). Denemede su kaynağı olarak derin kuyu kullanılmıştır. Suyun pH'ı ve elektriksel iletkenliği sırasıyla 7.56 ve 1 dS m^{-1}'dir.

Denemede, yetişkin 7 x 5 m (sıra arası x sıra üzeri) aralıklarla dikilmiş zeytin ağaçları (*O. europaea L. cv. Memecik*) kullanılmıştır. Ağaçlara tesadüf blokları deneme desenine göre dört farklı sulama rejimi uygulanmıştır. Bu amaçla; konular, K1: Susuz (yağışa dayalı); K2: %100×ETc, K3: %66×ETc ve K4: %33×ETc şeklinde oluşturulmuştur (Şekil 1). Sulama

miktarları, gravimetrik yöntemle kök derinliğinin ilk 90 cm'sindeki toprak nem içeriğine göre planlanmış, sulamalar 7 günde bir ve damla sulama yöntemiyle uygulanmıştır.



Şekil 1. Deneme alanı ve deneme deseni

İHA Uçuşları ve Veri Toplama

Çalışmada insansız hava aracı (İHA) olarak DJI Matrice 350 RTK kullanılmıştır. İHA multispektral ve termal ölçümler yapabilmek için MicaSense RedEdge-P DUAL multispektral ve DJI Zenmuse H20T termal kamera ile donatılmıştır. Uçuşlar arazi yüzeyinden 60 m yükseklikte ve öne ve yana en az %80 örtüşme oranı olacak şekilde yapılmıştır. Görüntülemeler gölgelenmeyi en aza indirmek ve bitki stresinin daha iyi gözlenebilmesi için güneş açısının dik olduğu 11:00 ile 14:00 saatleri arasında gerçekleştirilmiştir.

Multispektral ve termal görüntülerin hassas bir şekilde hizalanmasını sağlamak için, zeytin bahçesinin dört köşesine 4 adet yer kontrol noktası (YKN) yerleştirilmiştir. İHA uçuşları sırasında elde edilen ham multispektral ve termal görüntülerden, dijital yükseklik modeli (DEM), dijital arazi modeli (DTM) ve ortomozaikler oluşturmak için Agisoft Metashape yazılımı kullanılarak görüntüler işlenmiştir. Elde edilen ortomozaik, DEM ve DTM haritaları QGIS yazılımı ile analiz edilmiştir.

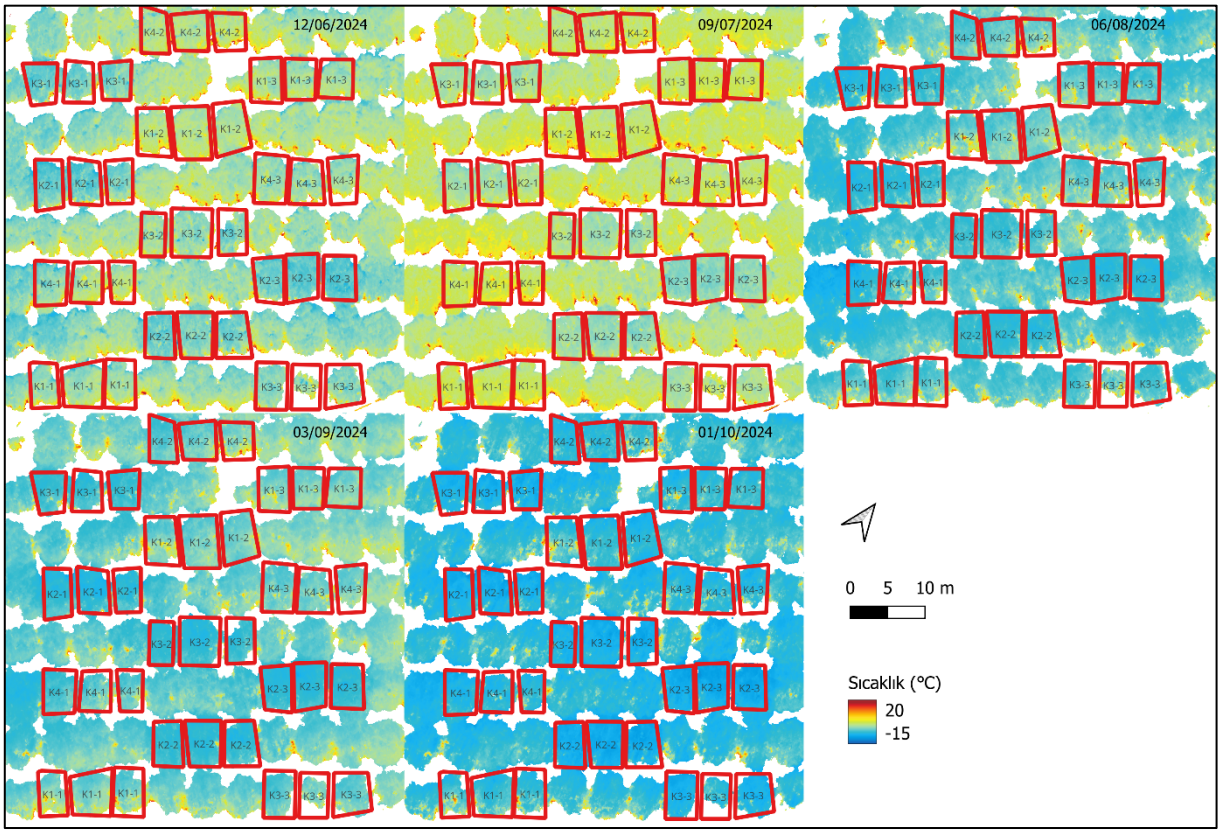
Kanopi sıcaklığını (Tc) hesaplamada yabancı otların ve arazi zemininin sıcaklık etkisini yok edebilmek için (Marques ve ark., 2019)'larının kullandığı metodolojiye benzer bir yöntem kullanılmıştır. Buna göre ilk aşamada, DEM ve DTM haritaları arasındaki fark hesaplanarak kanopi yükseklik modeli (CHM) türetilmiş, böylece deniz seviyesi ve arazi eğiminin etkisi yok edilerek yer seviyesinin üzerindeki nesne yüksekliğinin belirlenmesi sağlanmıştır (Şekil 2a). İkinci aşamada, arazi içinde kendiliğinden büyüyen yabancı otları ve kanopi gölgelerini ortadan kaldırmak için CHM haritası kullanılarak zeminden 1m'yi aşan yükseklikleri dikkate alarak maskeleme uygulanmıştır (Şekil 2b). Son aşamada ise sadece kanopi alanlarına ait sıcaklıkları hesaplayabilmek için 1m yüksekliğe göre maskelenen harita ile termal görüntülerden elde edilen ortomozaik haritası birleştirilmiştir (Şekil 2c). Kanopi sıcaklıkları (Tc) elde edildikten sonra, ölçüm saatlerine ait ortalama hava sıcaklıkları (Ta) çıkarılarak Tc-Ta değerleri hesaplanmıştır.

Şekil 2. Zeytin ağaçlarında (a) kanopi yükseklik modeli (CHM); (b) 1 m yükseklik maskesi; (c) kanopi sıcaklığı.

Stoma İletkenliği Ölçümleri

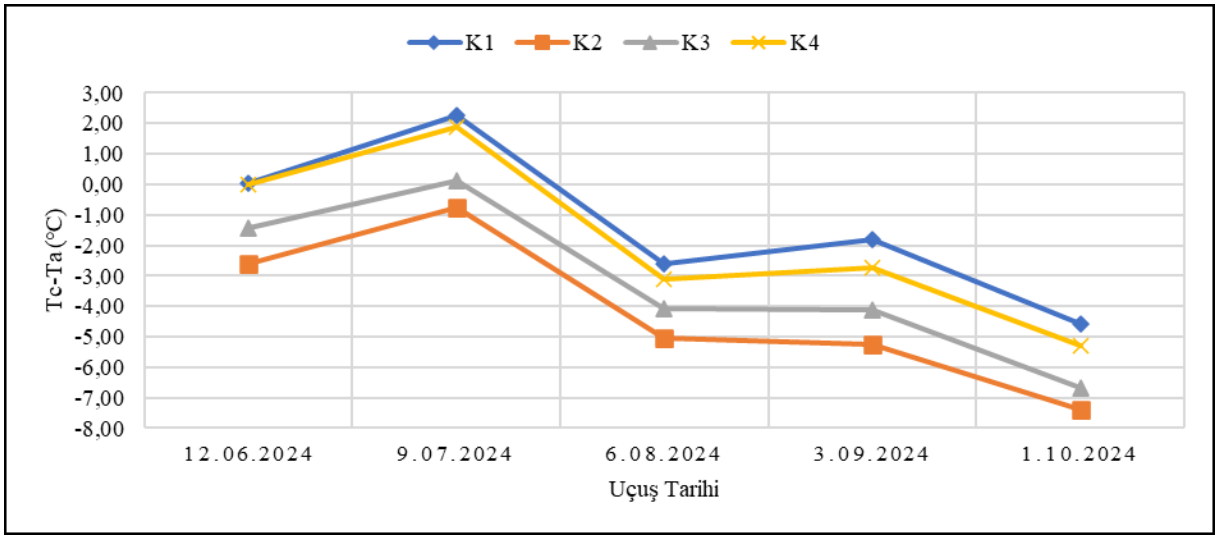
Çalışmada stoma iletkenliği (g_s, mmol m^{-2} s^{-1}) değerlerini ölçmek için Licor marka LI-6800 Portable Photosynthesis System cihazı kullanılmıştır. Yüksek hassasiyetli kızılötesi gaz analizörleri (IRGA'lar), bir numune tarafından karbondioksit (CO_2) alımını ve su buharı (H_2O) salınımını ölçer. Stoma iletkenliği, yaprak stomaları yoluyla gaz değişiminin (yani karbondioksit alımı) ve terlemenin (yani su buharı kaybı) ölçüsüdür ve stomaların yoğunluğu, boyutu ve açılma derecesinin bir fonksiyonudur (Handiganoor ve ark., 2018; Brewer ve ark., 2022). Stomaları açık olan yapraklar daha yüksek iletkenliğe izin verir ve dolayısıyla potansiyel olarak yüksek fotosentez ve terleme oranlarını gösterirken, kapalı yaprak gözenekleri potansiyel bitki stresini gösterir (Brewer ve ark., 2022).

Yaprak gaz alışverişi parametrelerinin belirlenmesi amacıyla, ölçümler sulamadan bir gün önce İHA uçuşlarına paralel olarak 11:00 – 14:00 saatleri arasında, tüm konularda her tekerrürde, ortada yer alan ağacın dış tarafından omuz hizasında dört farklı yönden seçilen tam olgunluğa ulaşmış 4 er yaprakta (her bir konuda toplam 12 yaprakta) gerçekleştirilmiştir.



Analiz ve Değerlendirme

Denemede gerçekleştirilen uygulamaların sonucunda elde edilen veriler arasındaki farkın önemli olup olmadığı ($p<0.05$) tek yönlü varyans analizi (One-Way ANOVA) ile belirlenmiştir. Konular arasındaki farklılığı belirlemek için SPSS paket programı kullanılmış ve Duncan testi uygulanmıştır.



3. BULGULAR VE TARTIŞMA

Multispektral ve termal görüntülerden elde edilen kanopi ile hava sıcaklığı arasındaki fark (Tc-Ta)'ın, konulara ve zamana göre değişimi Şekil 3'te verilmiştir. Sulama sezonu boyunca kanopi sıcaklıklarının toprak nemi, hava sıcaklığı, güneş radyasyonu ve bağıl nem gibi ortam koşullarından etkilenmesi nedeni ile Tc–Ta değerleri dalgalanma göstermiştir (Şekil 4). Beklendiği gibi su kısıtı uygulanmayan K2 konusunda sezon boyunca eksi (-) değerler gözlenmiştir. Ancak hiç su uygulanmayan K1 konusunda haziran ve temmuz aylarında artı değerler (+) gözlenirken hava sıcaklıklarının düşmesiyle ağustos ayından itibaren eksi (-) değerler gözlenmiştir. Ekim ayında tüm konulardaki sıcaklık düşüşlerinin eylül ayındaki yağıştan kaynaklandığı düşünülmektedir. İstatistiksel olarak incelendiğinde tüm sezon boyunca konular arasında fark bulunmuştur (Çizelge 1). Sezon boyunca K2 konusu en düşük Tc-Ta değerini alırken, en yüksek değerleri K1 konusu almıştır. Sezon ortalamasına bakıldığında tam

sulanan konu (K2) ile susuz konu (K1)'su arasında yaklaşık 3°C'lik bir fark bulunmuştur. Bunun temel nedeni transpirasyonun serinletici etkisidir, transpirasyon arttıkça bitki dokularından meydana gelen ısı kaybı da artmaktadır. Tam konusunda toprakta nem potansiyeli daha yüksek olduğu için yağışa dayalı koşullarda yetişen (Susuz konusu) ağaçlara göre transpirasyon daha yüksektir. Tam konusunda sıcaklık değerleri hava sıcaklığının altında kalmıştır.

Şekil 3. Zeytin ağaçlarında kanopi sıcaklığı ve hava sıcaklığı farkının (Tc-Ta) zamansal ve mekânsal değişimi.

Şekil 4. Zeytin ağaçlarında yaprak sıcaklığı ve hava sıcaklığı farkı (Tc-Ta) değerlerinin değişimi (°C).

Çizelge 1. Zeytin ağaçlarında konulara göre ortalama Tc-Ta değeri (ºC) ve bazı iklim parametrelerinin değişimi.

	12.06.2024	9.07.2024	6.08.2024	3.09.2024	1.10.2024	Ortalama
K1	0,05 (a)	2,25 (a)	-2,62 (a)	-1,82 (a)	-4,58 (a)	-1,34
K2	-2,61 (c)	-0,76 (b)	-5,03 (c)	-5,24 (c)	-7,40 (b)	-4,21
K3	-1,43 (b)	0,13 (b)	-4,08 (bc)	-4,13 (bc)	-6,70 (b)	-3,24
K4	0,01 (a)	1,91 (a)	-3,09 (ab)	-2,73 (ab)	-5,31 (a)	-1,84
Ta (°C)	40,35	38,80	31,90	31,40	24,40	
Bağıl Nem (%)	26,00	30,00	49,00	53,50	47,50	
Güneş Radyasyonu (W m^{-2})	890	930	800	720	730	

$p \geq 0.05$ ns : önemsiz $p < 0.05$ önemli

NOT: Tc-Ta değerleri arasındaki farklar duncan testine göre sınıflandırılıp, ayrı sınıflardaki konular küçük harflerle gösterilip, farkların istatistiksel olarak önemli olduğu belirtilmektedir.

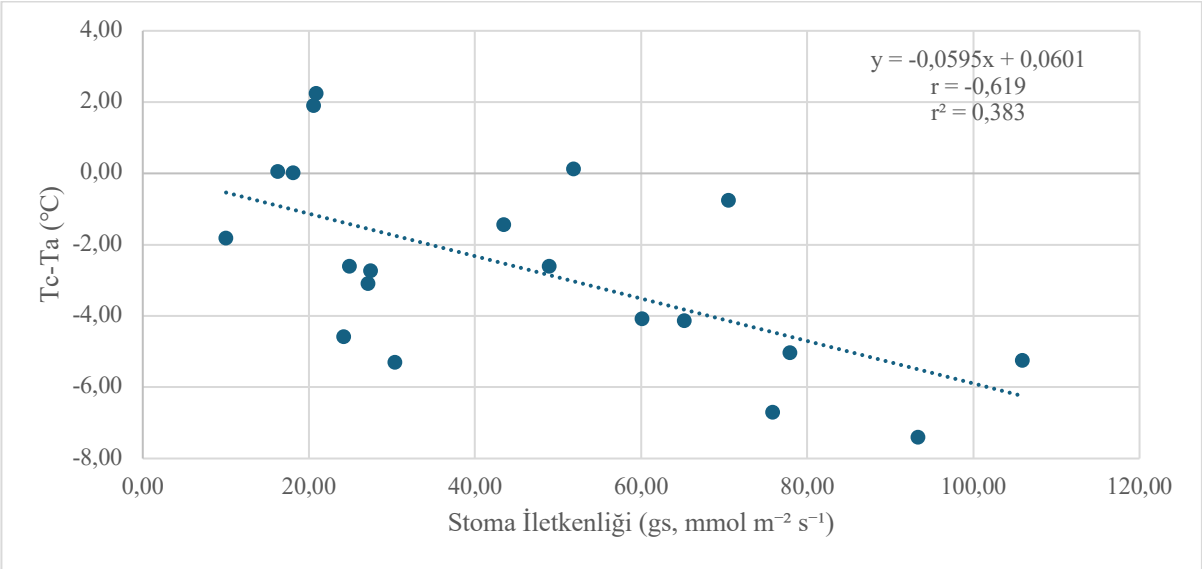
Çamoğlu (2013) Ayvalık ve Gemlik su kısıtı uyguladığı zeytin fidanlarında yaptığı çalışmada sezonluk ortalama Tc-Ta değerlerinin Ayvalık çeşidinde -1,7 ila 0,9 °C (yaklaşık 3 °C fark), Gemlik çeşidinde ise -0,8 ila 1,9 °C (yaklaşık 3 °C fark) arasında değiştiğini gözlemlemiştir. Her iki çeşitte de en düşük değeri tam sulanan konuda en yüksek değeri de sulanmayan konuda tespit etmiştir. Poblete-Echeverría ve ark. (2016) zeytin ağaçlarında, su stresi olmayan uygulamada en düşük Tc-Ta değerini (ortalama 0,5°C), su stresi olan uygulamada en yüksek Tc-Ta değerini (ortalama 4,7°C) ölçmüşlerdir. İyi sulanan ve stres altındaki ağaçlar arasında yaklaşık 4°C'lik bir sıcaklık farkı bulmuşlardır. Ramírez-Cuesta ve ark. (2025) 4 farklı sulama stratejisi uyguladıkları zeytin ağaçlarında Tc-Ta değerlerinin -1 ila 7 °C arasında değiştiğini ve ağaçların stres seviyesi azaldıkça Tc-Ta değerlerinin de düştüğünü tespit etmişlerdir. Araştırmacıların bulguları da bu araştırmanın bulgularıyla paralellik göstermektedir.

Stoma iletkenliği değerleri de Tc–Ta ile benzer şekilde aynı ortam koşullarının etkisiyle, sulama sezonu boyunca K3 ve K4 konuları hariç dalgalı bir seyir izlemiştir (Şekil 5). Beklendiği gibi su kısıtı uygulanmayan K2 konusunda sezon boyunca en yüksek değerler gözlenmiştir. Çizelge 2'de verildiği gibi en düşük stoma iletkenliği değerleri K1 ve K4 konularında görülmüş ve bu iki konu da istatistiksel olarak sezon boyunca aynı grupta yer almıştır. K2 konusunda sezon ortalaması 79.29 mmol m^{-2} s^{-1}, K1 konusunda ise 19.32 mmol m^{-2} s^{-1} hesaplanmıştır. Ekim ayında K1, K3 ve K4 konularındaki stoma iletkenliği değerlerinin yükselmesinin sebebinin eylül ayındaki yağış olduğu düşünülmektedir.

Şekil 5. Zeytin ağaçlarında stoma iletkenliği (g_s) değerlerinin değişimi (mmol m^{-2} s^{-1}).

Çizelge 2. Zeytin ağaçlarında konulara göre ortalama stoma iletkenliği değeri (mmol m^{-2} s^{-1}) ve bazı iklim parametrelerinin değişimi.

	12.06.2024	**9.07.2024**	**6.08.2024**	**3.09.2024**	**1.10.2024**	**Ortalama**
K1	16,29 (b)	20,93 (b)	24,90 (c)	10,03 (c)	24,20 (c)	19,32
K2	48,92 (a)	70,51 (a)	77,92 (a)	105,88 (a)	93,33 (a)	79,29
K3	43,50 (a)	51,89 (ab)	60,16 (b)	65,23 (b)	75,85 (b)	59,33
K4	18,10 (b)	20,60 (b)	27,15 (c)	27,47 (c)	30,40 (c)	24,74
Ta (°C)	40,4	38,8	31,9	31,4	24,4	
Bağıl Nem (%)	26,0	30,0	49,0	53,5	47,5	
Güneş Radyasyonu (W m^{-2})	890	930	800	720	730	



$p \geq 0.05$ ns : önemsiz $p < 0.05$ önemli

NOT: Stoma iletkenliği değerleri duncan testine göre sınıflandırılıp, ayrı sınıflardaki konular küçük harflerle gösterilip, farkların istatistiksel olarak önemli olduğu belirtilmektedir.

Pierantozzi ve ark., (2013) iki farklı zeytin çeşidinde yaptıkları çalışmada stoma iletkenliği değerlerinin sulanan ve sulanmayan konuları arasında Arbequina çeşidinde %69,7 Manzanilla çeşidinde ise %67,2 fark olduğunu gözlemlemişler ve kuraklık koşullarının stoma iletkenliği (gs) üzerinde güçlü bir etkiye sahip olduğunu belirlemişlerdir. Ahumada-Orellana ve ark., (2019) zeytin ağaçlarında yaptıkları çalışmada stoma iletkenliğinin 180 mmol m^{-2} s^{-1} değerinde su stresinin hafif olduğu veya hiç olmadığı, 90 mmol m^{-2} s^{-1} değerinde ise su stresinin olduğunu belirlemişlerdir. Guimarães ve ark., (2024) badem ağaçlarında yaptıkları çalışmada su stresinin düşük olduğu sırada stoma iletkenliği değerlerin yüksek olduğunu ancak su stresinin daha yüksek olduğu durumda transpirasyonu azaltarak su stresiyle başa çıkabilmek için daha düşük stoma iletkenliği değerleri gösterdiğini saptamışlardır. Jones ve Leinonen, (2003) yaptıkları çalışmada stomalar açıldıkça ve transpirasyon hızı arttıkça yaprak sıcaklığının azaldığını ve

yaprak sıcaklığı ölçümlerinin stoma iletkenliği ve transpirasyon oranlarındaki değişikliklerin bir göstergesi olarak kullanılabileceğini bildirmiştir. Araştırmacıların bulguları da bu araştırmanın bulgularıyla paralellik göstermektedir.

Benzer şekilde stomalar açıldığında yani stoma iletkenliği ve transpirasyon hızı arttıkça, transpirasyonun serinletici etkisi nedeniyle Tc-Ta değeri azalmaktadır. Buna göre stoma iletkenliği ve Tc-Ta arasında korelasyon katsayısının (r) -0,619, r^2 değerinin 0,383 olduğu negatif yönlü doğrusal, istatistiksel olarak zayıf ama anlamlı bir ilişki bulunmuştur.

Şekil 6. Stoma iletkenliği ile Tc-Ta değerlerinin arasındaki regresyon ve korelasyon analizi.

Çakır, (2015) Memecik zeytin çeşidinde yaptığı çalışmada da stoma iletkenliği ve Tc-Ta arasında negatif yönlü doğrusal bir ilişki bulmuştur (r = -0,450, r^2 = 0,202).

4. SONUÇ

Bu çalışmanın amacı, *cv. Memecik* zeytin ağaçlarının farklı sulama düzeylerinde su stresine tepkisini ortaya koyabilmek için İHA tabanlı termal görüntülerinden ve stoma iletkenliğinin kullanılabilirliğini değerlendirmektir.

Her iki yöntemde de tüm ölçüm tarihlerinde sulama konuları arasında su stresi göstergeleri tahmin edilebilmiş ve konular arasında istatistiksel olarak farklar belirlenmiştir. En iyi sonuçlar sulama kısıtı olmayan K2 konusunda (ortalama Tc-Ta= -4,21 °C, gs= 79,29 mmol m^{-2} s^{-1}) en yüksek su stresi sulama yapılmayan K1 konusunda (ortalama Tc-Ta= -1,34 °C, gs= 19,32 mmol m^{-2} s^{-1} elde edilmiştir. Ayrıca beş farklı tarihe ait termal görüntülerden elde edilen haritalar sayesinde arazi zamansal ve mekânsal olarak incelenebilmiş ve Tc-Ta değerlerinin değişimi özellikle K2 konusunda diğer konulara göre gözle görülebilir bir şekilde farklılık göstermiştir.

Çalışmada, stoma iletkenliği ve Tc-Ta arasında negatif yönlü bir korelasyon bulunmuştur (r= -0,619). Buna göre stres koşullarının bulunmadığı durumda stoma iletkenliği değeri yüksek sonuçlar verirken Tc-Ta değerleri transpirasyonun serinletici etkisi nedeniyle düşük sonuçlar vermiştir.

Sonuç olarak İHA tabanlı termal görüntüler ile stoma iletkenliği ölçümlerinin zeytin ağaçlarında su stresini belirlemede başarılı olduğunun yanısıra yine termal görüntülerden yararlanarak stoma iletkenliğinin tahmin edilebileceği söylenebilir.

TEŞEKKÜR: Çalışma Ege Üniversitesi, Fen Bilimleri Enstitüsü, Tarımsal Yapılar ve Sulama Anabilim Dalında yürütülen Erkal ERTEM'in doktora tez çalışmasının bir kısmından

üretilmiştir. Stoma iletkenliği verileri TÜBİTAK 1003-Öncelikli Alanlar Ar-Ge Projeleri Destekleme Programı'nın 222O426 numaralı bilimsel araştırma projesinden alınmıştır. Çalışmaya katkılarından dolayı Zir. Yük. Müh. Şener ÖZÇELİK, Dr. Nurcan ULUÇAY ve Dr. Emrah ÖZÇAKAL ile çalışmanın yürütüldüğü Bornova Zeytincilik Araştırma Enstitüsü Müdürlüğüne teşekkürlerimizi sunarız.

ABSTRACT

Salt stress is one of the main abiotic factors limiting plant growth and productivity, especially in sensitive plants such as tomatoes (*Solanum lycopersicum* L.). This study aimed to investigate the effect of nano-silver application on the growth and yield parameters of tomato seedlings grown under salt stress. Tomato seedlings treated with 3 doses of nano-silver (AgNP0: 0 ppm, AgNP1: 30 ppm, and AgNP2: 60 ppm) were subjected to control (S0: tap water, 0.8 dS/m) and saline irrigation water (S1: 3.6 dS/m) applications, and the experiment was repeated three times according to a randomized block design. As a result of the study, plant height, stem diameter, dry matter content, relative leaf water content, and chlorophyll value measured by SPAD were determined. The results showed that salinity stress significantly reduced growth and yield parameters compared to the control group. However, nano-silver applications partially mitigated the negative effects of salinity by improving chlorophyll content, increasing shoot growth, and enhancing biomass accumulation. The highest improvement was observed under the 60-ppm nano-silver application; plants treated with nano-silver showed higher tolerance compared to untreated plants. These findings suggest that nano-silver application may be an effective strategy to increase salt stress tolerance and maintain tomato productivity under saline conditions.

Keywords: Abiotic Stress, LRWC, Nano fertilizer, SPAD

INTRODUCTİON

Salinity is one of the major abiotic stress factors limiting plant growth and agricultural productivity worldwide. Excessive salt accumulation in soil affects more than 20% of irrigated land and continues to spread due to unsustainable irrigation practices, climate change, and soil degradation (Chele et al., 2021). High salinity levels cause osmotic and ionic imbalances in plants, leading to physiological disorders such as reduced water uptake, nutrient deficiency, and oxidative stress. These effects ultimately inhibit photosynthesis, biomass accumulation, and crop yield (Munns & Tester, 2008).

Tomatoes (*Solanum lycopersicum* L.) are a globally significant vegetable crop with high economic value and hold an important position among vegetables. Demand for tomatoes is steadily increasing due to their nutritional value: they are rich in carotenoids, fiber, vitamins, and minerals (Amr and Raie 2022). Additionally, tomatoes are a rich source of total antioxidants, which offer health benefits including reducing the risk of cancer and heart disease (Borguini et al. 2009; Erdinc et al. 2018; Sun and Shahrajabian 2023). According to the Food and Agriculture Organization, approximately 186.1 million tons of tomatoes were produced on about 5 million hectares worldwide in 2022 (FAO 2024). On the other hand, tomatoes are quite sensitive to salt stress. Even moderate salinity can significantly reduce the plant's vegetative growth, chlorophyll content, and fruit production (Cuartero & Fernández-Muñoz, 1998; Rosça et al., 2021). Therefore, developing effective and sustainable strategies to mitigate the harmful effects of salinity on tomato plants has become an important research topic.

Nanotechnology has recently emerged as a promising approach in agriculture due to its potential to enhance plant growth and stress tolerance. Nano fertilizers are defined as nanometer-scale materials in nanoparticle form, typically containing macro and micro nutrients that are delivered to plants in a controlled manner. Nanofertilizers can improve nutrient uptake, stimulate physiological processes, and protect plants from environmental stress factors (Zehra et al., 2021). Among various nanoparticles, silver nanoparticles (AgNPs) have attracted attention for their multifunctional roles in plant systems, including increased antioxidant activity, improved water retention capacity, and regulation of photosynthetic efficiency (Kale et al., 2021; Khan et al., 2023). Studies have reported that nano-silver can mitigate salt-induced damage by maintaining cell membrane stability and improving chlorophyll content and relative leaf water content (Al Salama et al., 2025). Nano fertilizers are defined as nanometer-scale materials in nanoparticle form, typically containing macro and micro nutrients that are delivered to plants in a controlled manner.

However, there is insufficient research on the effects of nano silver on tomato seedlings under saline conditions and its effectiveness in reducing stress. Therefore, this study aimed to evaluate the effects of different nano silver concentrations on the growth and physiological parameters of tomato seedlings grown under salt stress. The findings of this research may contribute to the development of new and sustainable strategies to improve salt tolerance and maintain tomato productivity in saline environments.

MATERIAL AND METHODS

Material

A standard tomato variety (Bursa seed) was used in the study. The AgNPs were obtained from Nanografi Nano Technology commercial firm. The particle size ranged from 28-48 nm and it have 99.9% purity. Tomato seeds were grown in trays containing a 2:1 mixture of peat and perlite until they developed 3-4 true leaves. The seedlings were then transplanted into 3-liter pots containing peat and perlite, with 4 plants per pot. The study was conducted under climate chamber conditions.

Experimental design

The study involved the application of three doses of nano silver (AgNP0: 0 ppm, control; AgNP1: 30 ppm; AgNP2: 60 ppm) and two doses of saline irrigation water (S0: 0.8 dS/m tap water, control; S1: 3.6 dS/m). Nano silver was applied twice using the root and foliar spray method. Salt applications began when the plants reached five true leaves. The experiment was set up according to a randomized block design with three replications.

Determination of growth parameters

Two plants were selected from each pot, and their height was measured using a ruler. The stem diameter of the same plants was determined using calipers.

Measurement of chlorophyll content (SPAD)

Six leaves were selected from each replicate and chlorophyll content was measured as SPAD (chlorophyll content index per unit leaf area). SPAD readings were determined using a chlorophyll meter (SPAD-502, Minolta, Osaka, Japan). Three readings were taken for each leaf at the midpoint of the leaf between the midrib and the leaf margin, and the average of the values was recorded.

Determination of leaf relative water content (LRWC)

To determine the relative water content (LRWC) of the leaves, leaf discs with a diameter of 10 mm were taken before harvest. The leaf discs were carefully weighed using a precision balance, and the recorded weight was referred to as the leaf fresh weight (LFW). The same samples were immersed in distilled water for 4 hours. After the immersion process, the same samples were weighed to determine the leaf turgor weight (LTW). The samples were then dried in an oven set at 65 °C for approximately 48 hours, and the leaf dry weight (LDW) was obtained. LRWC was calculated using the following equation described by Mullan and Pietragalla (2012):

$$LRWC(\%) = 100 * \frac{\mathrm{LFW-LDW}}{\mathrm{LTW-LDW}}$$

Dry matter content

For fresh weights leaves weighed to obtain fresh weight (FW). Subsequently, the same leaf samples were dried in an oven at 65°C for 48 hours, after which they were weighed again to obtain the dry weight (DW). The dry matter ratio (DMR) was determined according to the following formula

DMC (%) =100*(FW-DW)/FW

Statical analysis

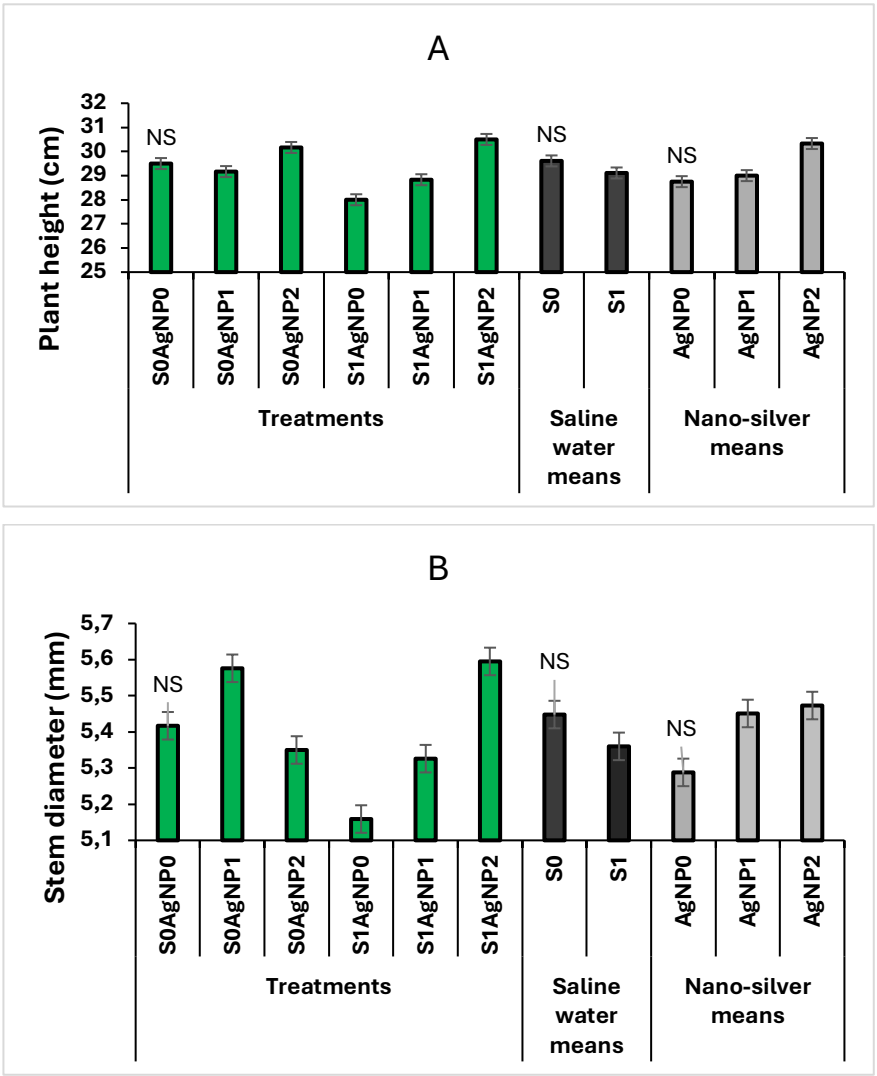
All multivariate analyses were performed with IBM SPSS Statistics version 21.0. One-way analysis of variance (One-way ANOVA) was used for data comparison and Duncan's multiple comparison test (0.05% probability) was used to determine differences between groups.

RESULT

Nano silver applications at different doses positively affected plant height, with the highest value determined at 60 ppm nano silver application (Figure 1-A). However, this effect was not considered significant. On the other hand, the S1 salinity application also reduced plant height compared to the control (S0) application. The interaction between the applications in terms of plant height was not found to be statistically significant. Similarly, the stem diameter increased due to the effect of nano silver applications, with the highest value determined at 60 ppm nano silver application (AgNP2). The AgNP2 application increased plant height by approximately 6% compared to the control (AgNP0) application. However, this increase was not considered

significant. The salinity application had a negative effect on the stem diameter. No significant interaction was detected between the applications in terms of stem diameter.

Similarly, the stem diameter increased due to the effect of nano silver applications, with the highest value determined at 60 ppm nano silver application (Figure 1-B). The AgNP2 application increased the stem diameter by approximately 4% compared to the control. However, this increase was not considered significant. The salinity application had a negative effect on the stem diameter. No significant interaction was observed between the applications in terms of stem diameter.



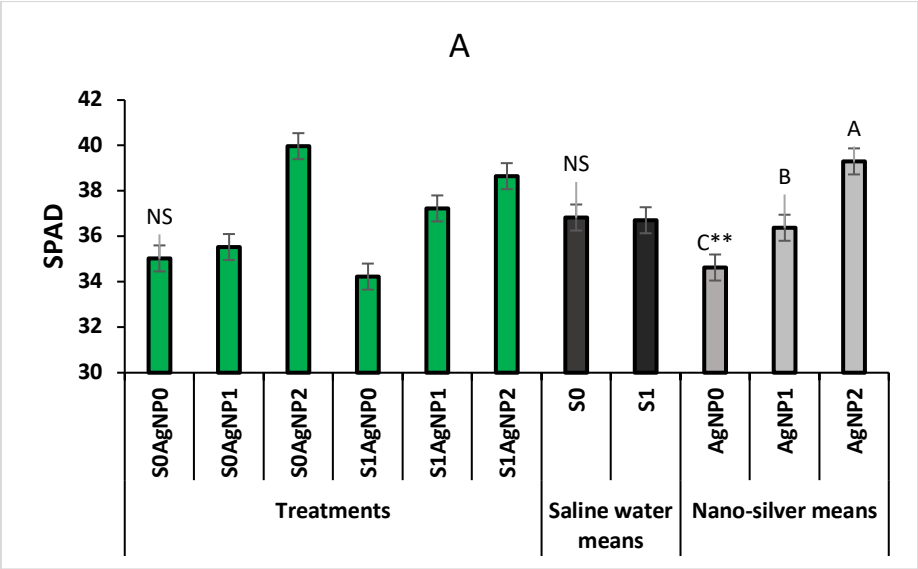


Figure 1. Effect of nano-silver treatments to plant height (A) and stem diameter (B) under saline water application. AgNP0: 0 ppm, AgNP1: 30 ppm, and AgNP2: 60 ppm nano silver treatment. S0: tap water, 0.8 dS/m; S1: 3.6 dS/m saline water application. NS: Not significant.

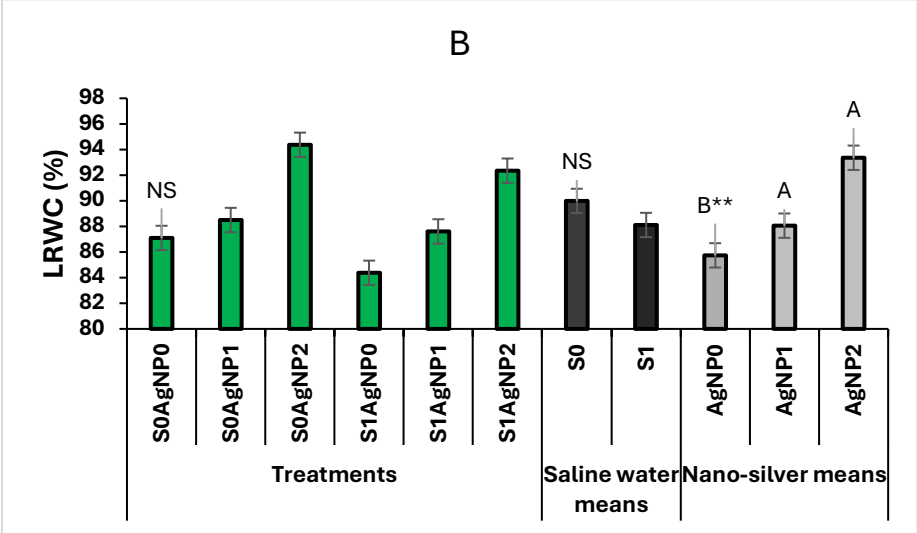

Nano silver applications significantly ($p<0.01$) increased the SPAD value in tomato leaves. The 60-ppm nano silver application increased the SPAD value by approximately 14% compared to the control, while the 30-ppm nano silver application increased it by approximately 5%. No significant effect of the salinity treatment on the SPAD value was determined (Figure 1-A).

Similarly, the leaf relative water content (LRWC) value increased progressively subject to the nano silver applications ($p<0.01$). The highest nano silver application (60-ppm) increased the relative water content of leaves by approximately 9% compared to the control, while the 30-

ppm nano silver application increased it by approximately 3%. Conversely, the saltwater application reduced the relative water content of leaves, but this effect was not considered significant (Figure 2-B).

The effect of saline water and nano silver applications on the dry matter content of leaves is shown in Figure 2-C. Leaf dry matter content progressively increased with nano silver applications. The 60-ppm nano silver application increased the dry matter content by approximately 15%, while the 30-ppm nano silver application increased the dry matter content by approximately 9%. On the other hand, the saline irrigation application reduced it by approximately 4% compared to the control, but this reduction was not statistically significant.

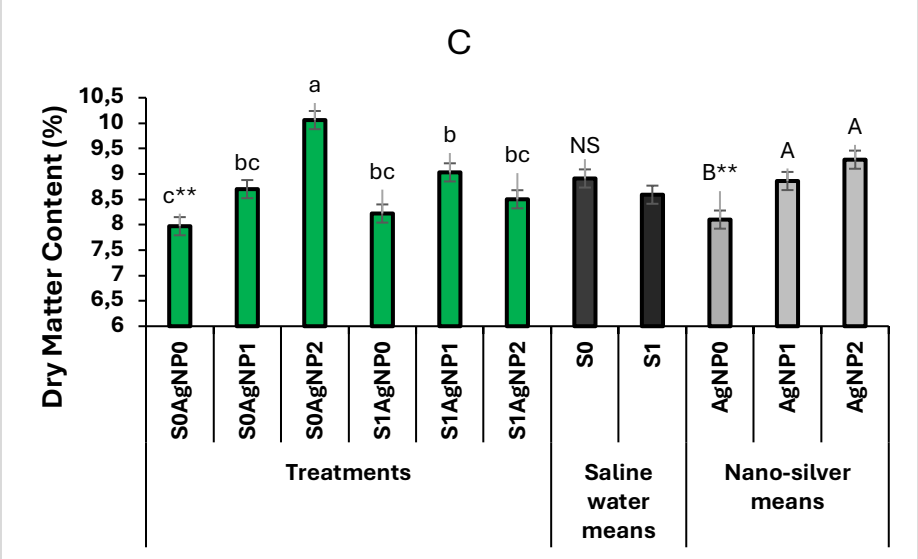

Figure 2. Effect of nano-silver treatments to SPAD (A), leaf relative water content (B) and dry matter content (C) under saline water application. LRWC: Leaf relative water content. AgNP0: 0 ppm, AgNP1: 30 ppm, and AgNP2: 60 ppm nano silver treatment. S0: tap water, 0.8 dS/m; S1: 3.6 dS/m saline water application. **:P<0.01¸ NS: Not significant.

DISCUSSION

The results indicate that nano silver (AgNPs) applications tend to improve plant height and stem diameter, but these increases are not statistically significant. This trend suggests that AgNPs may have a promoting effect on vegetative growth, possibly by increasing nutrient uptake and activating enzymatic activities involved in cell elongation and division (Kaveh et al., 2013; Almutairi, 2016).

Similar insignificant increases in plant height and stem diameter at low to moderate AgNPs doses have also been reported in tomato (*Solanum lycopersicum* L.) and wheat (Triticum aestivum L.) plants due to improved chlorophyll synthesis and water status (Rastogi et al., 2017; Mishra et al., 2025). Furthermore, it has been reported that nano silver applications promote growth and development under stress conditions in radish plants (Çakmakci et al., 2022). However, the lack of statistical significance in the current study may be related to the concentration-dependent effects of AgNPs, as high concentrations may cause oxidative stress and growth inhibition (Nair and Chung, 2014).

The positive effect of AgNP on chlorophyll synthesis or chloroplast stability in tomato leaves is indicated by the significant increase in SPAD values observed after AgNP application. This increase can be attributed to improvements in photosynthetic pigment biosynthesis and protection of chlorophyll molecules from oxidative degradation provided by AgNPs (Rastogi et al., 2017; Almutairi, 2016). Similar findings have been reported by Akhoundnejad et al. (2023), who observed an increase in SPAD values and improved photosynthetic performance in tomato plants treated with AgNPs. The stimulatory effects of nano-silver are generally associated with its role in enhancing enzymatic activity and nutrient uptake efficiency, particularly the uptake of nitrogen and magnesium, which are essential for chlorophyll formation (Nair and Chung, 2014; Afridi et al., 2023).

The progressive increase in leaf relative water content (LRWC) with increasing AgNP concentrations indicates that nano silver improves the plant's water status, possibly by enhancing root hydraulic conductivity or osmolite regulation. AgNPs have been reported to promote aquaporin expression and maintain cell membrane integrity under stress conditions,

thereby improving water retention capacity (Jalil et al., 2019; Elkelish et al., 2025). Although salinity slightly reduced LRWC, this effect was not statistically significant, suggesting that the tested salinity level was moderate and was partially mitigated by the protective effect of AgNPs.

Likewise, the increase in leaf dry matter content observed with nano silver applications reflects increased assimilation accumulation and metabolic activity. AgNPs can promote carbon fixation and biomass production by increasing photosynthetic efficiency and reducing cellular damage caused by reactive oxygen species (ROS) (Singh et al., 2021; Nair and Chung, 2014). In contrast, the slight but insignificant decrease in dry matter content observed under saline irrigation is consistent with the well-documented inhibitory effects of salinity on photosynthesis and carbohydrate metabolism, primarily due to osmotic stress and ionic toxicity (Munns & Tester, 2008; Acosta-Motos et al., 2017). Overall findings suggest that nano silver, particularly at 60 ppm, may enhance physiological performance and water balance in tomato plants and potentially increase tolerance to moderate salt stress.

CONCLUSION

The findings of this study indicate that nano silver (AgNP) applications generally have a positive effect on the physiological performance of tomato plants, particularly by increasing chlorophyll content (SPAD), leaf relative water content (LRWC), and dry matter accumulation. Although increases in plant height and stem diameter were not statistically significant, the general trends suggest that AgNPs may promote vegetative growth and enhance the plant's water relations and photosynthetic efficiency. Furthermore, a 60 ppm AgNP concentration appears to be the most effective dose that provides better growth responses without causing toxicity. The findings also suggest that AgNPs can partially mitigate the adverse effects of moderate salinity and support previous evidence of their protective role under abiotic stress conditions. In conclusion, the application of nano silver at optimal concentrations can be considered a promising approach to enhance the physiological resistance of plants and maintain productivity under saline conditions. Further studies are recommended to investigate the long-term effects of AgNPs, their mechanisms of action, and optimal dosages in different plant species and environmental conditions.

ÖZET

Türkiye, köklü tarım geleneği ve zengin coğrafi yapısıyla hayvancılık açısından büyük bir potansiyele sahip ülkelerden biridir. Hayvancılık sektörü yalnızca ülkenin hayvansal gıda ihtiyacının karşılamakla kalmayıp, kırsal kesimde istihdam yaratması ve tarıma dayalı sanayinin desteklenmesi bakımından da stratejik bir öneme sahiptir. Türkiye'de büyükbaş ve küçükbaş hayvan varlığında son yıllarda bazı gerilemeler yaşanmış olsa da son on yıllık süreçte genel olarak artış gözlemlenmiştir. Büyükbaş hayvan varlığı, 2014 yılında 14,3 milyon baş iken yıllar içerisinde artış göstererek 2024 yılında 16,9 milyon başa ulaşmıştır. Manda varlığı, 2014 yılında 122,1 bin baş seviyesindeyken 2024 yılında 162 bin başa yükselmiştir. Küçükbaş hayvancılıkta da benzer bir artış gözlenmiştir. 2014 yılında 41,5 milyon baş olan küçükbaş hayvan varlığı, 2024 yılında 54,9 milyon başa ulaşmıştır. Keçi varlığı ise 2014 yılında 10,4 milyon baş iken, 2024 yılında 10,8 milyon baş olarak gerçekleşmiştir. Kanatlı hayvancılık sektörü, iç tüketimin yanı sıra ihracata yönelik üretim modeliyle gelişimini sürdürmektedir. Modern kümes ve entegre tesisleri her geçen gün artmaktadır. 2014 yılında 1,9 milyon ton olan tavuk eti üretimi 2024 yılında 2,5 milyon tona, 48,7 bin ton olan hindi eti üretimi 2024 yılında 52,3 bin tona, 17,1 milyar adet olan tavuk yumurtası üretimi 2024 yılında 21,2 milyar adete yükselmiştir.

Türkiye'de hayvancılık sektörü, tarımsal üretimin sürdürülebilirliği ve kırsal kalkınmanın desteklenmesi açısından kritik bir role sahiptir. Bu doğrultuda Tarım ve Orman Bakanlığı, gıda arz güvenliğini sağlamak, verimliliği artırmak ve sürdürülebilir bir üretim modeli oluşturmak amacıyla çeşitli hayvancılık destekleme programları yürütmektedir. En güncel hayvancılık destekleme modeli, 2024-2026 dönemini kapsamakta olup, 26 Temmuz 2024 tarihli ve 32613 sayılı Resmî Gazete' de yayımlanan Cumhurbaşkanlığı Kararı (Karar Sayısı: 8760) ile yürürlüğe girmiştir. Bu yeni model, önceki yıllardan farklı olarak üretim planlamasına ve performansa dayalı bir sistem üzerine kurgulanmıştır. Destekler, iki ana başlık altında toplanmaktadır: Temel Hayvancılık Destekleri: Büyükbaş ve küçükbaş hayvancılık, arıcılık ve ipek böceği yetiştiriciliğini kapsamaktadır. Ürün Geliştirme Destekleri: Çiğ süt, besilik erkek sığır (karkas) ve tiftik üretimine yönelik destekleri içermektedir. Bu sistem ile üretimin daha verimli, planlı ve sürdürülebilir şekilde yürütülmesi hedeflenmektedir.

Anahtar Kelimeler: Tarım, hayvancılık, hayvancılık destekleri, verimlilik, destekleme modeli

CURRENT SITUATION IN LIVESTOCK AND NEW SUPPORT MODEL

ABSTRACT

Türkiye, with its deep-rooted agricultural tradition and rich geographical structure, is one of the countries with great potential for animal husbandry. The livestock sector not only meets the country's animal food needs but also holds strategic importance in creating employment in rural areas and supporting agriculture-based industries. While Türkiye has experienced some declines in the number of cattle and small ruminants in recent years, a general increase has been observed over the last decade. While cattle numbers were 14.3 million in 2014, they have increased over the years, reaching 16.9 million in 2024. Buffalo numbers rose from 122.1 million in 2014 to 162,000 in 2024. A similar increase has been observed in small ruminants. Small ruminants, which stood at 41.5 million in 2014, reached 54.9 million in 2024. While the number of goats was 10.4 million in 2014, it was 10.8 million in 2024.

The poultry sector continues to develop with a production model geared towards both domestic consumption and export. Modern poultry houses and integrated facilities are increasing daily. Chicken meat production rose from 1.9 million tons in 2014 to 2.5 million tons in 2024, Türkiye meat production from 48.7 thousand tons to 52.3 thousand tons in 2024, and chicken egg production from 17.1 billion to 21.2 billion in 2024.The livestock sector in Türkiye plays a critical role in ensuring the sustainability of agricultural production and supporting rural development. To this end, the Ministry of Agriculture and Forestry implements various livestock support programs to ensure food supply security, increase productivity, and establish a sustainable production model.

The most current livestock support model covers the 2024-2026 period and entered into force with Presidential Decree (Decree No. 8760) published in the Official Gazette dated July 26, 2024, and numbered 32613. This new model, unlike previous years, is based on a system based on production planning and performance. Supports are categorized under two main headings: Basic Livestock Supports: Covers cattle and sheep farming, beekeeping, and silkworm breeding. Product Development Supports: Includes support for raw milk, beef cattle (carcasses), and mohair production. This system aims to ensure more efficient, planned, and sustainable production.

Keywords: Agriculture, livestock, livestock supports, productivity, support model

1. GİRİŞ

İnsanlığın ilk çağlarından itibaren ve özellikle göçebelik dönemlerinde, yapılan en önemli ekonomik faaliyet hayvancılık olmuştur. Açlık-tokluk, iyi-kötü beslenme gibi insan odaklı konular, günümüz dünya siyasetini de etkilemektedir. Nitekim gelişmiş ülkeler, geri kalmış olan ülkelere teknolojik ürünlerin yanı sıra damızlık materyal, canlı hayvan, tohumluk ve işlenmiş ürünler gibi tarımsal üretim maddelerini de pazarlayarak büyük bir gelir sağlamakta ve bu şekilde, özellikle tarımsal ürün ticareti yaptıkları ülkeler üzerindeki etkinliklerini artırmaktadırlar (TİGEM 2023).

Hayvancılık sektörü gelişmişlik seviyesine bakılmaksızın tüm ülkeler için büyük önem taşımaktadır (Saçlı, 2007). Hayvancılık hayvanların verimlerinden yararlanılan ve daha kısa sürede daha fazla verim sağlamaya yönelik bir zirai faaliyettir (Aydemir ve Pıçak, 2007).

Türkiye'de hayvancılık sektörü genel ekonomi içerisinde önemli bir yere ve potansiyele sahiptir. Hayvansal üretim faaliyetleri bazı bitkisel ve yan ürünlerin değerlendirilmesi, işgücü verimliliğinin artırılması, işletme karının artması, doğal ve ekonomik koşullardan kaynaklanan risk faktörünün azaltılması vb. faktörler işletmelere olumlu katkılar sağlamaktadır (Turan ve ark., 2017; Vural ve Fidan, 2007). Türkiye sahip olduğu doğal kaynaklar ve ekolojik koşullar dikkate alındığında, büyükbaş ve küçükbaş hayvan yetiştiriciliği bakımından elverişli şartlara sahiptir. İşletmelerin başarısında; kullanılan hayvan materyalinin ırkı, yaşı ve verim düzeyi belirleyici bir role sahiptir. Hayvan materyali ve yönetim kalitesi sonucunda ortaya konulan faaliyet birimlerinin üretim değeri ve işletmenin tarımsal geliri önemli ekonomik başarı ölçütlerindendir (Turan ve ark., 2017).

Türkiye'nin ekonomisinde hayvancılık, tarım sektörü ve genel ekonomi içerisinde önemli bir yer tutmaktadır. Hayvancılık sektörü, ülkenin milli gelirine ve istihdamına katkı sağlamaktadır. Bunların yanında hayvancılık, et, süt, tekstil, deri, kozmetik, ilaç gibi sanayi kollarına hammadde sağlamakta, yem sanayi, et sanayi gibi dallarda istihdam oluşturulması ve ürünlerin işlenmesi sonucunda ekonomide önemli katma değer oluşturmaktadır (Tapkı ve ark., 2018). 2023 yılına göre tarım, ormancılık ve balıkçılık sektörünün Türkiye GSYİH içindeki payı % 6,2'dir. (SGB 2025)

Bir ülkede tarım sektörünün kalkınması o ülkenin ekonomik gelişmişliğiyle ilgilidir. Dünya ülkeleri dikkate alındığında, gelişmiş ülkelerde tarım, gelişmekte olan ülkelere göre daha fazla desteklenmektedir. Bunun nedeni, stratejik öneme sahip olan tarım sektörünü desteklemede bu ülkelerin ekonomik güce sahip olmalarıdır (Yavuz, 2000). Gelişmiş ülkelerde tarımsal ekonominin lokomotifi olan hayvancılık, iki açıdan son derece önemlidir. Birincisi çok düşük maliyetli istihdam yaratması ve ikincisi ise kalitesiz veya insan beslenmesine uygun olmayan yem kaynaklarının kaliteli insan gıdasına dönüştürmesidir. (Ergün ve Bayram, 2021)

Türkiye'de 2024 yılı hayvancılık destekleme kararnamesi ile hayvansal üretim destekleri temel hayvancılık destekleri ve ürün geliştirme destekleri olmak üzere iki gruba ayrılmıştır: Temel hayvancılık destekleri, büyükbaş hayvancılık, küçükbaş hayvancılık, arıcılık ve ipek böcekçiliği faaliyetlerini, Ürün Geliştirme Destekleri; çiğ süt, besilik erkek sığır (karkas) ve tiftik üretimini kapsamaktadır. Her bir destek için temel destek tutarı belirlenmiştir. 2024 yılı için belirlenen temel destek tutarları, buzağı ve malaklar için 1.000 TL/baş, kuzu ve oğlaklar için 200 TL/baş, arıcılık için üretici/yetiştirici örgütlerine üye üreticilere 100 TL/kovan, üye olmayanlara 80 TL/kovan, ipekböceği için 1.000 TL/kg, besilik erkek sığır (karkas) için 500 TL/baş ve tiftik üretimi için 80 TL/kg'dır. Temel destek birim tutarları ve katsayılar her yıl yeniden belirlenecektir. Yönlendiricilik ve özendiricilik ilkelerini yerine getiren üretici ve yetiştiriciler ilave destekten yararlanacaktır. Aile işletmelerine, kadın/genç yetiştiriciler ile birinci derece tarımsal amaçlı örgütlerin üyelerine/ortaklarına, üretim planlaması kapsamında süt ve besi havzası olarak belirlenen illerde bulunan yetiştiricilere, hastalıktan ari işletmelere,

AB onaylı süt çiftliği sertifikasına sahip işletmelere, suni tohumlama, soy kütüğü, sütünü kendi tankında soğutma, karkas ağırlığı gibi ölçütleri sağlayan yetiştiricilere temel destekle birlikte ilave destek verilecektir. Küçükbaş destekleri ilk defa kuzu ve oğlaklar için ödenecektir. (TRGM 2025)

2. TÜRKİYE'DE HAYVANCILIK FAALİYETLERİ

2.1. BÜYÜKBAŞ HAYVANCILIK

Türkiye büyükbaş hayvan varlığının tamamına yakını sığırdan oluşturmaktadır. Sığırların süt veriminin yüksek olması, laktasyon süresinin uzun olması neticesinde yıl boyunca süt üretimi sağlaması, kaba ve kesif yemleri et ve süte dönüştürme yeteneklerinin yüksek olması, ülkemizin farklı iklim kuşaklarında yetiştirilme imkanının bulunması, genetik ıslah ve üremenin denetimine yönelik uygulamalara çok iyi uyum göstermesi gibi başlıca avantajlar, sığırcılığı büyükbaş hayvancılık içinde önemli kılmaktadır (Ergün ve Bayram, 2021).

Türkiye büyükbaş hayvan varlığında son on yıllık verilere bakıldığında 2014 yılında 14,3 milyon baş olan toplam büyükbaş hayvan varlığı 2024 yılında 16,9 milyon başa ulaşmış olsa da 2020 yılı göz önüne alındığında 1 milyon başın üzerinde bir düşüş göze çarpmaktadır.

Tablo 1. Büyükbaş Hayvan Varlığı (baş) (TÜİK)

Yılı	Sığır - Kültür	Sığır – Kültür Melezi	Sığır - Yerli	Manda	Toplam
2014	6.178.757	6.060.937	1.983.415	122.114	14.345.223
2015	6.385.343	5.733.803	1.874.925	133.766	14.127.837
2019	8.559.855	7.554.625	1.573.659	184.192	17.872.331
2020	8.838.498	7.594.127	1.532.857	192.489	18.157.971
2021	8.824.784	7.641.100	1.384.659	185.574	18.036.117
2022	8.295.825	7.324.866	1.231.265	171.835	17.023.791
2023	8.070.159	7.303.667	1.047.430	161.749	16.583.005
2024	8.213.136	7.669.922	941.150	162.051	16.986.259

2.2. KÜÇÜKBAŞ HAYVANCILIK

Küçükbaş hayvan varlığına ilişkin son on yıllık veriler incelendiğin de 2014 yılında 41,5 milyon baş olan küçükbaş hayvan varlığı 2024 yılında %32'lik bir artış göstermiş olsa da 2021 yılında ulaşılan 57,5 milyona ulaşan toplam hayvan varlığının gerisinde bulunmaktadır. Kıl keçisi ve tiftik keçisi varlıklarında son on yılda belirgin bir artış meydana gelmemiş iken yerli koyun ve merinos ırkı koyun varlığında yaşanan artış dikkat çekmektedir.

Tablo 2. Küçükbaş Hayvan Varlığı (baş) (TÜİK)

Yılı	Koyun - Yerli	Koyun - Merinos	Keçi - Kıl	Keçi - Tiftik	Toplam
2014	29.033.981	2.106.263	10.167.125	177.811	41.485.180
2015	29.302.358	2.205.576	10.210.338	205.828	41.924.100

2019	34.199.467	3.076.583	10.964.374	241.055	48.481.479
2020	38.579.748	3.547.033	11.698.825	287.020	54.112.626
2021	41.182.899	3.994.791	12.051.957	289.557	57.519.204
2022	40.728.954	3.958.934	11.320.208	257.654	56.265.750
2023	38.208.635	3.851.835	10.092.756	210.184	52.363.410
2024	39.871.852	4.208.732	10.619.841	202.243	54.902.668

2.3. ÇİĞ SÜT ÜRETİMİ

TÜİK tarafından revize edilerek son beş yıllık verilerin bulunduğu çiğ süt üretimi verileri incelendiğinde 2020 yılında inek sütünün toplam çiğ süt üretimindeki payı %92,5 iken 2024 yılında bu oran %93,5 oranına yükselmiştir. Toplam üretim 2020 yılında 23,5 milyon ton iken 2024 yılında 22,5 milyon tona gerilemiştir. Bu gerileme hızı manda, koyun ve keçi sütünde daha fazla gerçekleşmiştir.

Tablo 3. Çiğ Süt Üretimi (ton) (TÜİK)

Yıl	İnek	Manda	Koyun	Keçi	Toplam
2020	21.749.342	63.767	1.101.065	589.617	23.503.790
2021	21.370.116	63.643	1.143.762	622.785	23.200.306
2022	19.912.135	43.589	1.067.342	540.426	21.563.492
2023	19.961.908	43.025	933.576	543.058	21.481.567
2024	21.040.442	58.122	906.945	482.247	22.487.757

2.4. KIRMIZI ET ÜRETİMİ

Türkiye'de kırmızı et üretimi 2024 yılında on yıl öncesine göre %87,5 oranında artış göstermiştir. 2020 yılı sonrasında Kasaplık Güç Oranı (KGO) yöntemi kullanılarak ve2020 yılı öncesi veriler revize edilerek hesaplanan verilerdeki artış oranı dikkat çekicidir. Aynı zamanda 2014 yılında %72 oranında olan toplam üretimde sığır eti oranı 2024 yılında %70 sevilerinde gerçekleşmiştir. Sırasıyla Manda, koyun ve keçi etinin oranları %0,65, %24,2 ve %4,73 olmuştur.

Tablo 4. Kırmızı Et Üretimi (ton) (TÜİK)

Yılı	Sığır	Manda	Koyun	Keçi	Toplam
2014(r)	815.674	5.004	238.670	63.711	1.123.059
2015(r)	862.098	5.300	249.863	69.757	1.187.018
2019(r)	1.330.169	7.150	316.170	87.126	1.740.616
2020	1.341.446	8.424	345.639	90.443	1.785.952
2021	1.460.719	10.831	385.933	94.555	1.952.038

2022	1.572.747	13.586	489.354	115.938	2.191.625
2023	1.670.606	15.386	569.066	128.989	2.384.047
2024	1.483.042	13.781	509.539	99.532	2.105.895

(r) Revize edilmiştir. Kırmızı et üretim istatistiklerinde 2020 yılında metodoloji değişikliğine gidilmiş ve "Kasaplık Güç Oranı (KGO) " yöntemi kullanılmıştır. 2001-2019 dönemi kırmızı et üretim istatistikleri KGO yöntemine göre revize edilmiştir.

2.5. KANATLI HAYVAN SEKTÖRÜ

Tavuk ve hindi üretimine bakıldığında son on yılda %32'lik artış gerçekleştirerek 2,56 milyon ton olmuş, sektörün yıllar itibari ile orantılı bir büyüme gerçekleştirdiği görülmektedir. Hindi eti üretimi daha dalgalı bir üretim izlenirken tavuk eti üretimi belirli oranlarda yıllar itibari ile artış göstermiştir. Toplam üretimin %98'lik kısmı tavuk üretiminden gelmektedir. Yumurta üretimi ise son on yılda %23,4 artış gerçekleştirerek 21,5 milyar adet ulaşmıştır. Yumurta üretimi de tavuk etine benzer şekilde dalgalı bir üretim şekli göstermeden yıllar itibari ile düzenli olarak artmıştır. Sektörün iç tüketim ve ihracat odaklı gerçekleştirdiği üretimi son on yılda düzenli büyüme ile gerçekleştirdiği görülmektedir.

Tablo 5. Tavuk ve Hindi Eti Üretimi (ton) (TÜİK)

3. 2024-2026 YILLARI HAYVANCILIK DESTEKLEME MODELİ

Türkiye'de hayvancılık sektörü, tarımsal üretimin sürdürülebilirliği ve kırsal kalkınmanın desteklenmesi açısından kritik bir role sahiptir. Bu doğrultuda Tarım ve Orman Bakanlığı, gıda arz güvenliğini sağlamak, verimliliği artırmak ve sürdürülebilir bir üretim modeli oluşturmak amacıyla çeşitli hayvancılık destekleme programları yürütmektedir. En güncel hayvancılık destekleme modeli, 2024-2026 dönemini kapsamakta olup, 26 Temmuz 2024 tarihli Cumhurbaşkanlığı Kararı ile yürürlüğe girmiştir.

Hayvansal üretimde yeni destekleme programı temel hayvancılık ve ürün geliştirme destekleri olmak üzere iki gruba ayrılıyor.

Temel hayvancılık destekleri; büyükbaş hayvancılık, küçükbaş hayvancılık, arıcılık ve ipek böceği faaliyetlerinin desteklenmesinden oluşuyor. Her bir destek için temel destek tutarı belirlendi. Aile işletmeleri, genç ve kadınlar, birinci derece örgüt üyesi ile planlama bölgeleri gibi yönlendirici kriterleri sağlayan yetiştiricilere temel destek tutarına ilave destek verilecek. Ayrıca suni tohumlama, soy kütüğü, yerli sperma, ari işletme, sürü yöneticisi (çoban) gibi verimlilik kriterlerine ilave destek sağlanacak.

Ürün geliştirme destekleri başlığı da; çiğ süt, besilik erkek sığır (karkas), tiftik üretimi desteklerini kapsıyor. Her bir destek için temel destek tutarı belirlendi. Aile işletmeleri, genç ve kadınlar, birinci derece örgüt üyesi ile planlama bölgeleri gibi yönlendirici kriterleri sağlayan üreticilere temel destek tutarına ilave destek verilecek. Ayrıca ari işletme, kendi tankında soğutma, örgüt üzerinden pazarlama, karkas ağırlığı, kaliteli tiftik ve sözleşmeli üretim gibi verimlilik kriterlerine ilave destek verilecek. (TOB 2025)

Tablo 7. 2025 Yılı Temel Hayvancılık Desteklemeleri (Resmi Gazete 26.07.2024-14.09.2025)

Kategori	**Destekleme Türü**		**Katsayı**	**2025 Yılı Destek Tutarı (TL/Baş)**

	Diğer Örgüt Sözleşmeli Üretim		0.9	144

4. SONUÇ

Son on yıllık mevcut veriler incelendiğinde 2014 yılında 14,3 milyon baş olan büyükbaş hayvan varlığının 2024 yılında 16,9 milyon başa yükseldiği, ancak 2020 yılına göre 1 milyon baş düşüş gerçekleştiği görülmektedir. Benzer şekilde küçükbaş hayvan varlığı 2021 yılında yakaladığı zirveyi koruyamamıştır. Kırmızı et üretimi son on yılda % 87,5 artmış, çiğ süt üretiminin 2020 yılından bu yana artış göstermemiştir. Bu veriler hayvan varlığının hayvansal üretimde tek başına yeterli olmayacağını verimliliğin artmasının hayvansal üretimde kritik rol oynadığını ortaya koymaktadır.

Tarım ve Orman Bakanlığı tarafından 2024-2026 yıllarını kapsayacak şekilde uygulamaya konan destekleme sisteminin performansa dayalı bir yaklaşım sergilemesi önemlidir. Temel desteklemelerin yanında yönlendirici kriterler (aile işletmeleri, genç/kadın yetiştiriciler vb.) verimlilik kriterleri (suni tohumlama, soy kütüğü, karkas ağırlığı vb.) hayvansal üretimde performansa dayalı bir yaklaşım getirildiği görülmektedir.

Sonuç olarak, yeni destekleme modelinin hayvancılık sektörünün geleceği açısından taşıdığı en önemli unsur, birim hayvandan daha fazla ve kaliteli ürün elde edilmesini teşvik etmesidir. Model, sadece sayısal artışları değil, aynı zamanda et, süt ve buzağı gibi hayvansal ürünlerin kalitesini ve miktarını yükseltmeyi hedeflemektedir. Bu yaklaşım, gıda arz güvenliğini sağlamanın yanı sıra, üretici gelirlerini artırarak ve tarıma dayalı sanayilere daha kaliteli hammadde sağlayarak ülkenin ekonomik kalkınmasına önemli katkılar sunacaktır. Dolayısıyla, bu modelin başarılı bir şekilde uygulanması, Türkiye hayvancılığının daha sürdürülebilir, rekabetçi ve planlı bir yapıya kavuşmasında kritik bir dönüm noktası olabilir.

ÖZET

Çalışmada; *Spirulina platensis* farklı konsantrasyonlarda (0,50 ve 0,75gr), ticari olarak satışa sunulan Antep fıstığı aroması (1 mL) ve maya (0,25 gr) kullanılmış, pastörize inek sütüne (1lt) ilave edilerek kefir içeceği üretilmiştir. Kefir örneklerinin depolamanın 1. 7. 14. ve 21. günlerinde mikrobiyolojik ve fiziko- kimyasal özellikleri incelenmiştir.

Yapılan analizler sonucunda *S. platensis* ilavesinin konsantrasyon faktörleri ve depolama süresinin, kefirin mikrobiyolojik kalitesi üzerinde istatistiksel olarak anlamlı bir etkiye sahip olduğu belirlenmiştir ($p < 0.05$). Üretilen kefir örneklerinin titrasyon asitliğinde 1. ve 7. günlerde anlamlı farklılık bulunurken ($p<0.05$), 14. ve 21. günlerde, gruplar arasında nihai asitlik değeri açısından istatistiksel bir fark bulunmamıştır. pH değerleri arasında istatistiksel olarak anlamlı bir fark olduğu gözlemlenmiştir ($p<0.05$). Kefirin su aktivitesi, kuru madde miktarı ve kül içeriği üzerinde ise *S. platensis* ilavesinin istatistiksel olarak anlamlı bir etkisinin olmadığı belirlenmiştir ($p > 0.05$). Üretilen kefirin antimikrobiyal aktivite üzerinde etkisi çalışmada yer alan patojen mikroorganizma türüne göre istatistiksel olarak değişkenlik göstermiştir. Toplam fenolik madde içeriği üzerinde ise istatistiksel olarak anlamlı bir etkisinin olmadığı ($p > 0.05$); ancak depolamanın 7. ve 14. günlerinde kefirin fenolik madde içeriğinin istatistiksel olarak anlamlı derecede arttığı gözlenmiş ($p<0.05$), 21 günlük depolama sonunda ise tüm grupların fenolik madde seviyeleri aralarındaki farkın ortadan kalktığı belirlenmiştir ($p>0.05$). Özellikle daha yüksek konsantrasyonda *S. platensis* ilavesinin depolamanın orta dönemlerinde antioksidan kapasiteyi artırdığı, ancak uzun vadede bu etkinin azalabileceği

belirlenmiştir. Kefirin ortalama DPPH radikal süpürme kapasitesi üzerinde ise istatistiksel olarak anlamlı bir etkisi olmamış ($p > 0.05$); 7. günde ise anlamlı bir fark belirlenmiştir ($p<0.05$).

Yapılan çalışmada; yüksek doz (%0.75) *S. platensis* ilavesinin başlangıçta daha belirgin fizikokimyasal ve antimikrobiyal etkiler gösterdiği, düşük doz (%0.50) ilavesinin ise daha uzun süreli mikrobiyolojik stabilite sağladığı belirlenmiştir. Bu bulgular, *S. platensis* ile zenginleştirilmiş kefirin hem doz miktarının hem de depolama süresinin, tüm çalışılan parametrelerde sonuçları etkileyen kritik faktörler olduğunu göstermektedir.

Anahtar Kelimeler: Kefir, İnek Sütü, *Spirulina platensis,* Antep Fıstığı Aroması

DETERMINATION OF THE PHYSICOCHEMICAL AND MICROBIOLOGICAL PROPERTIES OF KEFIRS ENRICHED WITH DIFFERENT CONCENTRATIONS OF *Spirulina platensis* AND PISTACHIO FLAVOR

ABSTRACT

In this study, Spirulina platensis was incorporated into pasteurized cow's milk at varying concentrations (0.50, and 0.75 g), along with commercially available pistachio flavoring (1 mL) and yeast (0.25 g), to produce a kefir beverage. The microbiological and physicochemical properties of the kefir samples were evaluated on the 1st, 7th, 14th, and 21st days of storage.

The results revealed that both the concentration of *Spirulina platensis* and the storage duration had statistically significant effects on the microbiological quality of kefir ($p < 0.05$). While significant differences in titratable acidity were observed on days 1 and 7 ($p < 0.05$), no statistically significant differences were found among the groups on days 14 and 21 ($p > 0.05$). The pH values of the samples also showed statistically significant variation throughout the storage period ($p < 0.05$). However, the addition of *S. platensis* did not have a statistically significant impact on water activity, total solids, or ash content ($p > 0.05$). The antimicrobial activity of the kefir varied significantly depending on the type of pathogenic microorganism evaluated. While *S. platensis* addition did not significantly affect the total phenolic content ($p > 0.05$), a significant increase in phenolic compounds was observed on days 7 and 14 ($p < 0.05$). By the 21st day of storage, this difference had diminished, and no significant variation was detected among the groups ($p > 0.05$). Notably, higher concentrations of *S. platensis* were found to enhance antioxidant capacity during mid-storage, although this effect appeared to diminish over extended storage periods. The average DPPH radical scavenging activity of the kefir was not significantly influenced by *S. platensis* supplementation ($p > 0.05$), with the exception of day 7, where a statistically significant difference was observed ($p < 0.05$).

In conclusion, higher concentrations (0.75%) of *S. platensis* exhibited more pronounced initial physicochemical and antimicrobial effects, whereas the moderate concentration (0.50%) contributed to greater microbiological stability over time. These findings indicate that both the dose amount and storage time of *S. platensis* enriched kefir are critical factors affecting the results in all studied parameters.

Keywords: Kefir, Cow's Milk, *Spirulina platensis*, Pistachio Flavor

1. GİRİŞ

Kefir; bileşiminde probiyotik canlılar ile çok çeşitli laktik asit bakterilerini ve mayaları doğal olarak bulunduran, polisakkarit yapıdaki kefir tanelerinin su veya süt ile fermantasyona bırakılması ile elde edilen fermente bir üründür (Güzel-Seydim ve ark., 2011; Tomar ve ark., 2017). Fermantasyon sonunda sütten ayrılarak tekrar kullanılabilmekte ve bu süreçte mikrobiyal gelişim, ekzopolisakkarit üretimi gibi biyosentezler sonucu ağırlık oranlarında da artış gözlenmektedir (Wang vd., 2022).

Türk Gıda Kodeksi Fermente Sütler Tebliği'ne (2009/6) göre kefir; fermantasyonda *Lactobacillus kefiri*, *Leuconostoc, Lactococcus* ve *Acetobacter* cinslerinin değişik suşları ile laktozu fermente eden (*Kluyvremoyces marxianus*) ve etmeyen mayaları (*Saccharomyces cerevisiae, Saccharomyces unisporus, Saccharomyces exiguus*) içeren starter kültürlerle veya kefir taneleri ile elde edilen bir süt ürünüdür. Ekşimsi bir tat, sütten daha yoğun bir kıvama sahip olması ve içerdiği bir miktar alkol ile diğer fermente ürünlerden ayrılır. Kökeninin Kafkasya, Balkanlar ve Doğu Avrupa'ya dayandığı bilinmektedir (Prado ve ark., 2015). Kefir gibi süt ve süt ürünleri doğal olarak içerdikleri bileşenler sayesinde fonksiyonel gıda konusunda yüksek potansiyele sahiptirler (Playne ve ark., 2003).

Fonksiyonel gıda; besleyici özelliğinin yanında, insan vücudunu genel anlamda iyileştiren, hastalıkların önlenmesi ve tedavisinde kullanılabilen, fizyolojik olarak da faydalı olabilen özel bileşenler içeren gıdalar için kullanılmaktadır (Bibligardi ve ark., 2013). Belirli miktarlarda kullanıldığında konakçı sağlığını olumlu yönde etkileyen, fonksiyonel gıda bileşeni olarak da anılan mikrobiyal gıda katkıları probiyotik olarak adlandırılmaktadır. Probiyotiklerin immün sistemi iyileştirici, laktoz intoleransına karşı hafifletici etki göstermesinin yanı sıra bağırsak rahatsızlıklarının tedavisinde de olumlu sonuçlar verdiği bilinmektedir (Gülbandılar ve ark., 2017).

Probiyotik ürünler fonksiyonel gıdalar içerisinde önemli bir yere sahiptir. Bu ürünler çoğunlukla süt ve süt ürünleri arasında yer almaktadır. Probiyotik özellik sağlayan probiyotikler ise, bağırsaklarda mikrobiyal dengeyi olumlu etkileyen canlı mikroorganizmalardır. Bu mikroorganizmalardan bazıları; *Lb. acidophilus, Lb. plantarum, Lb. casei, B. bifidum, B.infantis ve Str. thermophilus* gibi bakteriler ve mayalardan *Sacchoramyces boulardii* olarak belirtilmektedir (Shah, 2007; Kara, 2024).

Kefirin fonksiyonel özellik kazanmasında bileşiminde doğal olarak bulunan bu probiyotik mikroorganizmaların etkisi sayesinde önemli antimikrobiyal, antikarsinojenik, antiinflamatuvar ve antihipertansif etki gösterdiği, ayrıca sindirim sisteminin düzenlenmesinde, vücut ağırlığının denetiminde, lipit profilinin ve glisemik yanıtın kontrolünde yardımcı olabileceği bildirilmektedir (Huseini ve ark., 2012, Koyu ve Demirel, 2018). Literatürde probiyotik mikroorganizmaların iyileştirici etkilerinden faydalanmak için en az 10^{8} kob/mL sayıda vücuda alınmaları ve bağırsak sindirimine kadar canlı kalmaları gerektiği bildirilmiştir (Çakır ve Çakmakçı, 2004).

Son yıllarda probiyotik mikroorganizmaların yanı sıra tüketici talebine göre farklı aromalarda kefir üretiminde artış görülmektedir. Bu aromalar arasında Antep fıstığı ile ilgili çalışmaya rastlanılmamıştır. Antep fıstığı kendine has bir lezzete sahip ve besin değeri bakımından oldukça zengin bir meyvedir. Çerez olarak tüketilmesinin yanı sıra tatlılarda ve yemeklerde de kullanılmaktadır. Antep fıstığı meyvesi besin içeriği açısından fındık, badem ve yerfıstığı gibi yağlı meyvelerle kıyaslandığında protein, karbonhidrat ve kalori değeri bakımından birinci, yağ oranı açısından ise fındıktan sonra ikinci sırada yer almaktadır. Antep fıstığının kandaki kolesterol düzeyini düşürerek, koroner kalp hastalığı riskini azalttığı, kan şekerinin yükselmesini önlediği ve insan vücuduna olumlu etkilerinin olduğu ifade edilmektedir (Ertürk vd., 2015).

Kefir üretiminde geleneksel ve ticari olmak üzere iki ayrı yöntemden yararlanılmaktadır. Ticari yöntem ile geleneksel yönteme kıyasla daha viskoz ve daha az maya içeren kefir elde edilirken, geleneksel yöntemle elde edilen kefir duyusal olarak daha üstün özelliklere sahip olduğu rapor edilmiştir. Danelerden elde edilen kefirin tadını güzelleştiren unsurun farklı mikroorganizmalar olduğu düşünülmektedir (Saygılı vd., 2023; Çalişir vd., Çalışır ve vd., Erken Erişim). Piyasada değişik katkı maddeleri ile zenginleştirilmiş çok sayıda kefir türü üretilmektedir. Ayrıca potansiyel yenilebilir uygulamaları olan bazı alternatif protein açısından zengin kaynaklar; mikrobiyal proteinler ve algler de gıdalarda kullanılmaktadır (mikro algler ve deniz yosunları) (Kumar ve ark., 2022). Mikroalgler binlerce yıldır insan beslenmesinde tüketilmektedir. Yüksek protein içeriği nedeniyle, artan nüfusun diyet gereksinimlerini karşılamak için büyük bir potansiyele sahiptirler. İyi bir protein kaynağı olmasının yanı sıra, çeşitli biyoaktif bileşenleri de bünyesinde bulundurarak ek bir sağlık yararı sağlarlar.

Günümüzde "süper gıda" olarak ifade edilen *Spirulina platensis*; yüksek protein, zengin vitamin ve pigment içeriği bakımından, ayrıca düşük yağ oranından dolayı ticari önemi olan bir mikroalg türüdür. Son zamanlarda bitkisel proteinlere ve alglere karşı araştırmacıların ilgisi artış göstermektedir. Besin özellikleri, farmakolojik etkileri, sürdürülebilir bir gıda alternatifi olması ve özellikle insan sağlığı üzerindeki pozitif etkileri bu artışı tetiklemektedir (Kurhan,2012; Bleakley ve Hayes 2017; Koyande ve ark., 2019; Martelli ve ark., 2020; Silva ve ark., 2020).

S. platensis)'in yüksek protein içeriğine (ağırlıkça %60-70), kozmetik ve gıda sektöründe kullanılan mavi pigmente sahip bir sağlıklı gıda kaynağı olarak yaygın şekilde kültürü yapılan bir siyanobakteri türü olduğu bilinmektedir (Coca ve ark., 2014; Parisi ve ark., 2020; Ahmed ve Kumar, 2022). Ek olarak, Spirulina türleri özellikle B12 vitamini, mineraller, protein ve karotenoidler olmak üzere zengin bir vitamin kaynağıdır ayrıca vücutta emilim oranı yüksek kalsiyum ve zengin demir içeriğine sahiptir (Çağlak ve ark., 2005; Selmi ve ark., 2013; Lupatini ve ark., 2017).

Yapılan bu çalışmada *S. platensis* ve Antep fıstığı aroması ile zenginleştirilmiş inek sütüne kefir mayası ilave edilerek geleneksel olarak fermente edilerek üretilen kefirlerin, mikrobiyolojik, fiziko-kimyasal toplam fenolik madde içeriği ile DPPH radikal süpürme kapasitesi 1. 7. 14. ve 21. Günlerinde araştırılmış; sonuçlar istatistiksel olarak değerlendirilmiştir.

2. MATERYAL VE METOT

2.1. Materyal

Çalışmada kullanılan; *S. platensis*, ENDEMİX Natural Ingredients tarafından toz halinde temin edilmiştir. Kullanım süresinde *Spirulina platensis* örnekleri, hava ve ışıktan korunarak -18 °C'de muhafaza edilmiştir. Antep fıstığı aroması; ZYMNOS tarafından sıvı halde; kefir mayası ise VİVO tarafından toz halinde; süt ise, satışa sunulan pastörize edilmiş (%3,3 yağlı süt) olarak temin edilmiştir.

2.2 Metot

%3,3 yağlı pastörize inek sütü, ticari satılan kefir taneleri, *S. platensis* (0,50 ve 0,75gr) ve Antep fıstığı aroması (1mL) kullanılarak kefirlerin üretimi gerçekleştirilmiş; analizleri gerçekleştirilmiştir.

Bu amaçla; pastörize edilmiş süte (1 lt), *S. platensis* 0,50 ve 0,75 konsantrasyonlarda, Antep fıstığı aroması (1 ml), kefir mayası (0,25g) aşılanarak, yaklaşık 25ºC sıcaklıkta 24 saat fermantasyona bırakılmış ve pH 4,7'ye ininceye kadar inkübasyon işlemine tabi tutulmuştur.

2.2.1. Mikrobiyolojik Analizler

Mikrobiyolojik analizler; fizyolojik tuzlu su (%0,85'lik NaCl) kullanılarak ve bazı mikroorganizmalar için önerilen selektif zenginleştirme besiyerleri ile hazırlanan dilüsyonlar kullanılarak dökme plak yöntemi ile gerçekleştirilmiştir. Toplam aerobik mezofilik bakteri sayısının (TAMB) belirlenmesinde (Urhan, 2012, Savaşan ve Göksoy, 2018), *Lactococcus* spp. ve *Lactobacillus* spp sayılarının belirlenmesinde (Halkman, 2005, Yıldız, 2009; Yerlikaya, 2018) ve koliform grubu bakterilerin sayılarının belirlenmesinde (Halkman,2005). tarafından önerilen yöntemler kullanılmıştır.

TAMB sayısının belirlenmesi için Plate Count Agar kullanılmış, ekimi yapılmış petri plakları 30°C'de 48 saat süre ile inkübe edilmiştir. *Lactococcus* spp. sayısı için M17 Agar (Merck) kullanılarak 30°C'de 48 saat inkübasyon gerçekleştirilmiştir. MRS Agar (De Man, Rogosa and Sharpe) (Merck) kullanılarak *Lactobacillus* spp. sayısı belirlenmiş, ekimi yapılan petriler 37°C'de 48 saat anaerobik olarak inkübe edilmiştir. Koliform grubu bakterilerin sayımı için VRBA (Violet Red Bile Agar) (Merck) besiyerine ekim yapılmış 37 °C 'de 24±2 saat inkübasyona bırakılmıştır. 1 mL kefir örneği petri kutularına alındıktan sonra Potato Dextrose Agar (PDA) (Merck) besiyerine steril filtre ile % 10'luk tartarik asit ilave edilmiştir. Dökme plak yöntemiyle ekimi yapılan petrilerde 28±2°C'de 96 saat süre sonunda oluşan koloniler, kültürel sayım yöntemi ile sayılmıştır (Özkaya ve Kuleasan 2000; Buran, 2020).

Tüm mikroorganizmaların identifikasonları literatürlerde belirtildiği gibi gerçekleştirilmiştir.

2.2.2. Antimikrobiyal aktivite

Farklı içeriklerle hazırlanan kefir örneklerinin antibakteriyel ve antifungal etkinliklerinin gözlenmesinde Agar kuyucuk difüzyon yöntemi kullanılmıştır. Katı besiyerlerinde tazelenen kültürden öze ile Mueller Hinton Broth (MBH) besiyerine ekim yapılmış ve 37 ºC'de bir gecelik inkübasyon sonucunda oluşan kültürlerden 10^8 kob/mL (0.5 McFarland bulanıklık tüpüne karşılık gelen bulanıklık) olacak şekilde dilüsyon hazırlanmıştır.

20 mL Mueller Hinton agar içeren petrilerin yüzeyine bakteri dilüsyonundan steril pipet yardımıyla 100 µL pipetlenmiş ve steril drigalski spatülü ile besiyeri üzerine homojen bir şekilde yayılmıştır. Kuruması için bekletilen petriler üzerinde daha sonra 6 mm çaplı kuyucuklar açılarak, kefir örnekleri ve pozitif kontrol olarak kullanılan bileşikler (antibakteriyel kontrol bileşiği; Levofloksasin, Vankomisin ve antifungal bileşik; 30 Flucanozol- [1 mg/mL]) çözeltisinden 50 µL ilave edilmiştir. 37 ºC'de bir gecelik inkübasyon sonunda disklerin çevresinde meydana gelen inhibisyon zonları mm bölmeli cetvel yardımıyla ölçülerek kaydedilmiştir. Sonuçlar, inhibisyon bölgelerinin çapı acısından; +++: Yüksek derece duyarlı (16 mm ve daha büyük), ++: Orta derece duyarlı (11- 15 mm), +: Düşük derece duyarlı (5-5-10 mm), –: Duyarlı değil (İnaktif, < 5. 5 mm) şeklinde yorumlanmıştır (Aytaç ve ark.2022).

2.2.3. Fizikokimyasal Analizler

2.2.3.1. Titrasyon Asitliği

Kefir örneklerinin asitliği % laktik asit cinsinden belirlenmiştir. Bir erlene 5 ml kefir numunesi üzerine 40 °C'deki distile sudan 95 ml ilave edilmiş, elde edilen karışım üzerine 2-3 damla %1'lik fenolfitalein damlatıldıktan sonra sabit pembe renk oluşuncaya dek 0,1 N NaOH ile titre edilmiştir. Harcanan 0.1 N NaOH miktarı literatürlerde tanımlanan formülle hesaplanmıştır (Arısoy ve Öner, 2019; Okumuş, 2019).

2.2.3.2. pH Değeri

Örneklerin pH değerleri dijital pH metre ile ölçülmüştür (Arısoy ve Öner, 2019; Okumuş, 2019).

2.2.3.3. Su Aktivitesi Analizi

Örneklerde su aktivitesinin tespiti; (aw) değerleri su aktivitesi tayin cihazı (Streoglass, Sweden) kullanılarak ölçülmüştür (Hallaç ve ark.,2021).

2.2.3.4. Toplam Kuru Madde Miktarının Belirlenmesi

Kefir örneklerinde kuru madde miktarının tespitinde etüvde kurutma yöntemi kullanılmıştır. Kurutma kaplarına 5 g örnek konulmuş, 105±2°C'de sabit ağırlığa gelinceye kadar kurutulmuş ve ağırlık kaybı dikkate alınarak kuru madde miktarı % kuru madde miktarı Gravimetrik yöntemle tespit edilmiştir (Hayaloglu ve Özer, 2011; Okumuş 2019).

2.2.3.5. Kül Miktarının Belirlenmesi

Örneklerde kül tayini için yaklaşık 5 g numune krozelerde tartılıp, kurutma dolabında 105°C'de kurutulmuştur. Kül fırınında 550°C"de kül rengi beyazlayıncaya kadar yakılarak sonra desikatörde soğutulup, tartılmış ve kül oranı % olarak hesaplanmıştır (Okumuş 2019).

2.2.4. Toplam Fenolik Madde Miktarı Analizi

Toplam fenolik madde derişimini belirlemek için modifiye Folin-Ciocaltaeu spektrofotometrik yöntemi esas alınmıştır. Daha önceden 1:40 oranında seyreltilmiş ve +4 derecede bekletilmiş olan propolis numunelerinden sırasıyla tüplere alınmış; 1 ml seyreltilmiş propolis numunesi, 8,25 ml saf su, 0,5 ml Folin-Ciocalteau reaktifinden tüplere konulmuştur. % 10'luk Na_2CO_3 çözeltisinden 0,5 ml eklenerek karanlıkta 30 dakika inkübasyona bırakılmıştır. Süre sonunda inkübe edilen örneklerin 765 nm' de UV-spektrofotometre kullanılarak, etanol körüne karşı absorbans değerleri ölçülmüştür. Sonuçlar, mg gallik asit eşdeğeri (GAE) / L olarak belirlenmiştir (Sağdıç ve vd., 2020; Keskin ve Kolaylı, 2019).

2.2.5. Antioksidan Aktivite Tayini

2.2.5.1. DPPH (2,2- difenil-1-pikrilhidrazil) Radikali Yakalama Aktivitesi Yöntemi ile Antioksidan Aktivitelerinin Araştırılması

Örnek ekstraktlarının radikal süpürme aktivitesi Brand Williams, Culivier ve Berset (1995) metoduna göre belirlenmiştir. Örneklerin antioksidan aktivitesini belirlemek için 3,9 mg DPPH maddesi etil alkol ile 100 mL' ye tamamlanarak çözündürülmüştür. Daha sonra örneklerden 0,1 mL alınarak, 2 mL DPPH stok çözeltisi ile karıştırılmıştır. Hazırlanan karışım, oda sıcaklığında 30 dakika boyunca karanlık ortamda bekletilmiş, süre sonunda UV spektrofotometre kullanılarak 515 nm dalga boyunda absorbans ölçümü yapılmıştır. Kontrol olarak örnek yerine 0,1 mL etil alkol ve 2mL DPPH stok çözeltisi karıştırılarak absorbans ölçümü yapılmıştır. Her numunenin DPPH radikallerini süpürme aktivitesi (%) aşağıdaki formüle göre hesaplanmıştır (Sağdıç vd., 2020; Keskin vd., 2019).

I (%) = (A0 - Anumune / A0) x 100

Bu değerlerden faydalanılarak DPPH serbest radikalinin yarısının süpürüldüğü andaki numune derişimi (IC50) değerleri hesaplanmıştır.

% DPPH = (ABS Kontrol – AB Örnek) x100

AB Kontrol

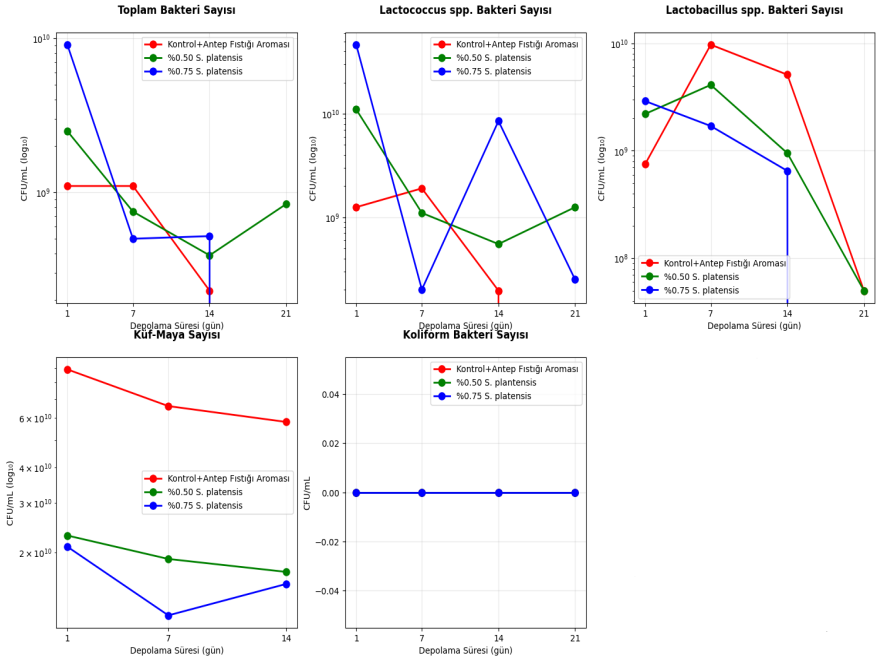
ABS Kontrol: Kontrol Bileşiğinin Konsantrasyon Miktarı

AB Örnek: Örnek Bileşiğinin Konsantrasyon Miktarı

2.2.6. İstatistiksel Analiz

Deneyler sonucunda toplanan veriler Windows tabanlı SPSS 18.0.1(SPSS Inc., Chicago, Illinois, US) ist atistik paket programı kullanılarak gruplar arasında istatistiksel olarak fark olup olmadığı tek yönlü ANOVA Tukey Çoklu Karşılaştırma Testi ile karşılaştırılmıştır. Grafikler için ise Python açık kaynak kodlu program kullanılmıştır.

3. BULGULAR VE TARTIŞMA



3.1. Mikrobiyolojik Analizler

Kefirlerin mikrobiyolojik analiz sonuçlarının değerlendirilmesinde Tek Yönlü ANOVA testi kullanılmıştır. ANOVA testi ile gruplar arasında anlamlı bir fark bulunduğunda ($p < 0.05$), hangi grupların farklı olduğunu belirlemek için ise; Tukey Post-Hoc testi uygulanmıştır.

S. platensis ilavesi, 1. günde tüm bakteri gruplarında (TMAB, *Lactococcus* spp., *Lactobacillus* spp.) istatistiksel olarak anlamlı bir artışa neden olurken, 7. ve 14. günlerde durum tersine dönmüştür. Özellikle *Lactobacillus* spp. üzerinde *S. platensis* ilavesi (konsantrasyon arttıkça) istatistiksel olarak anlamlı etki göstermiştir ($p<0.05$). Kontrol grubu ise, depolama boyunca en yüksek *Lactobacillus* spp. sayısını korumuştur. *S. platensis* ilavesi tüm depolama süresi boyunca küf ve maya gelişimi istatistiksel olarak anlamlı olarak bulunmuştur ($p<0.05$). Bu durum *S. platensis*'in raf ömrünü uzatmada etkili bir doğal antifungal ajan olarak kullanılabileceğini düşündürmektedir. Tüm gruplarda koliform bakteri üremesi, üretim koşullarının hijyenik olduğunu doğrulamıştır.

S. platensis ilavesinin konsantrasyonu ve depolama süresi, kefirin mikrobiyolojik kalitesi üzerinde istatistiksel olarak anlamlı bir etkiye sahiptir ($p < 0.05$).

S. platensis, başlangıçta LAB (Laktik Asit Bakterileri) gelişimini teşvik ederken, depolama sırasında özellikle Laktobasilleri baskılayıcı bir etki göstermiştir. Kefirlerin mikrobiyolojik analiz sonuçlarına ait grafikler Şekil 1' de verilmiştir.

Şekil 1. Kefirlerin mikrobiyolojik analiz sonuçları

S.platensis ilavesinin ve depolama süresinin kefir örneklerinin toplam aerobik mezofilik bakteri sayısı, *Lactococcus* spp., *Lactobacillus* spp. maya sayıları ve koliform bakteriler

üzerindeki etkisi.

Kontrol+Antep fıstığı aroması (Kontrol+AFA) grubunda, *Lactobacillus* spp ve *Lactococcus* spp. sayıları depolama süresi boyunca istatistiksel olarak anlamlı bir şekilde azalmıştır. *Lactobacillus* spp. 7. gün en yüksek seviyeye ulaşmış, ardından düşüşe geçmiştir. TMAB ve küf-maya sayılarında 21. güne gelindiğinde probiyotik bakteri popülasyonun azaldığı görülmüştür. 0.50 *S. platensis* ilaveli konsantrasyon grubunda, tüm mikrobiyolojik parametrelerde bir azalma gözlenmiştir.

En yüksek değerler genellikle 1. günde görülmüş, depolama boyunca düzenli bir düşüş izlenmiştir. TMAB ve *Lactococcus* spp. 21. günde canlılığını korumuştur. Küf-maya sayısında bir düşüş belirlenmiştir. 0.75 konsantrasyon grubunda ise, tüm parametrelerde bir düşüş görülmektedir. Özellikle *Lactococcus* spp. sayısında 1. günde artış gözlenirken, 7. günde düşüş meydana gelmiştir.

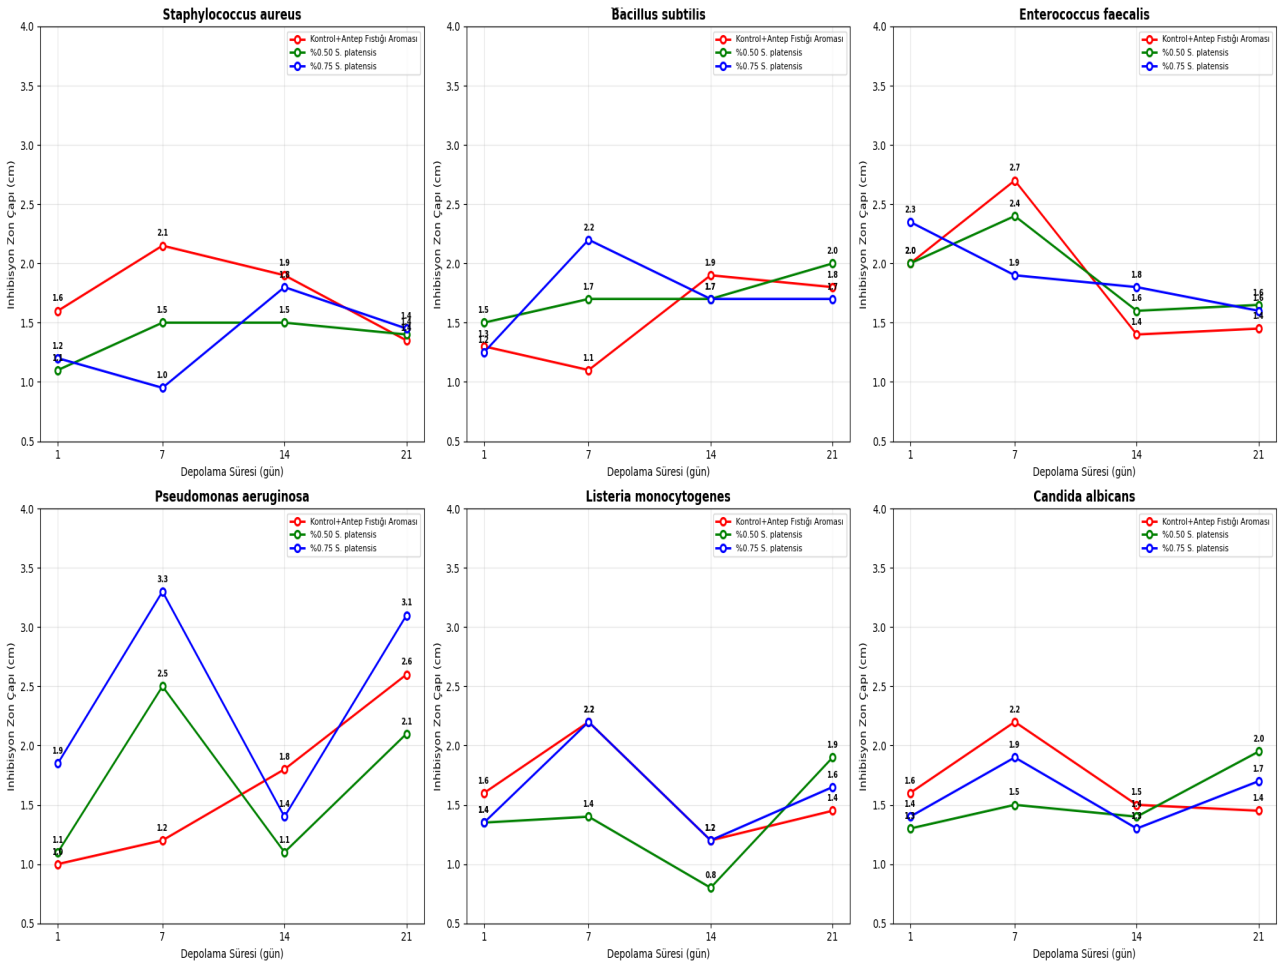
Kontrol+AFA grubu değerlendirildiğinde; zamanla yavaş bir bozulma görülmektedir. *Lactobacillus* spp. 'de 7. güne kadar bir artış gözlemlenmiştir. 0.50 konsantrasyon grubunun dengeli bir seviye izlediği görülmüştür. 0.75 konsantrasyon grubu için, başlangıçta güçlü bir artış görülürken daha sonra çok hızlı bir düşüş belirlenmiştir.

Fermente ürünlerin üretiminde kullanılan sütün kalitesi ve özellikleri ürün kalite özelliklerini etkilemektedir. Bu nedenle ürün özelliklerine bağlı olarak süt kullanılması önem arz etmektedir.

Konu ile ilgili yapılan çeşitli araştırmalarda (Yildiz-Akgul vd., 2018); Khaze Hagh, 2018; Buran vd., 2021) farklı üretim yöntemi, depolama süresi ve kefir üretiminde kullanılan süt kaynağı ve özelliklerine bağlı olarak TAMB sayısında önemli farklılıkların olduğu belirtilmiştir.

3.2.Kefir Örneklerine Ait Antimikrobiyal Aktivite Sonuçları

Kefir örneklerinin antimikrobiyal aktiviteleri *Staphylococcus aureus, Bacillus subtilis, Enterococcus faecalis, Listeria monocytogenes* (Gram pozitif), *Pseudomonas aeruginosa, Escherichia coli* (Gram negatif) ve *Candida albicans* (F89) (maya) mikroorganizmaları üzerinde belirlenmiş ve bu mikroorganizmalar üzerine farklı konsantrasyonlarda *S. platensis* ilavesi ve depolama süreleri ile ilgili test sonuçları Şekil 2'de verilmiştir. Kefir örneklerinin test edilen mikroorganizmalara karşı antimikrobiyal etkileri kontrol+antep fıstığı aroması bileşikleriyle kıyaslandığında daha küçük çaplı inhibisyon gösterse de değişen seviyelerde antimikrobiyal etkiye sahip oldukları belirlenmiştir. Antimikrobiyal aktivite sonuçları değerlendirildiğinde; 0.75 *S. platensis* ilavesine karşı en duyarlı mikroorganizmanın *P. aeruginosa,* olduğu ve diğer gruplardan istatistiksel olarak anlamlı derecede daha yüksek bir inhibisyon gösterdiği belirlenmiştir ($p<0.05$).



S. *platensis* ilavesinin her iki konsantrasyonununda (%0.50 veya %0.75) depolama süreci boyunca *Escherichia coli'* ye karşı antimikrobiyal aktivite üzerinde istatistiksel olarak anlamlı bir etkisi olmamıştır ($p > 0.05$). Şekil 2' de görüldüğü gibi %0.75 *S. platensis* ilavesinin kefirin *E. coli* 'ye karşı antimikrobiyal aktivitesini depolamanın 1. gününde istatistiksel olarak anlamlı şekilde artırmış, fakat depolamanın 7. 14. ve 21. günlerinde gruplar arasında anlamlı bir fark kalmadığı görülmüştür.

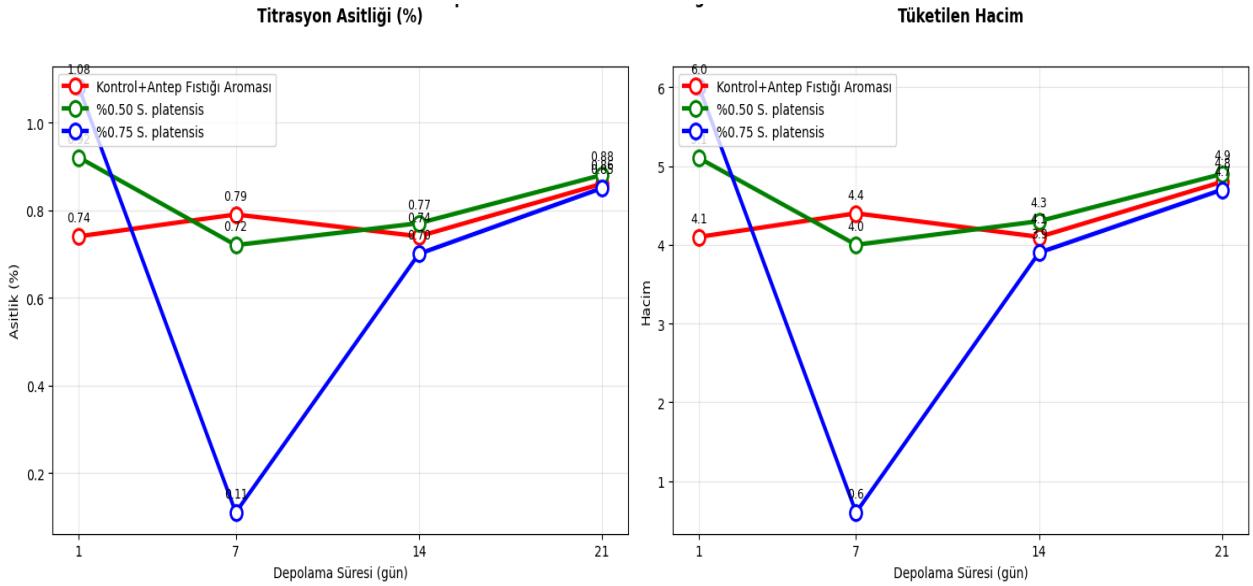
Depolama süresince kefirlerin *S. aureus*'a karşı antimikrobiyal aktiviteleri düzenli bir değişim göstermemiştir. Depolamanın 7. güne kadar artan antimikrobiyal etki 14. günde azalmış ve 21. günde tekrar artmıştır. Depolama süresince kefir örneklerinin orta derece duyarlılık gösterdikleri belirlenmiştir.

Bacillus subtilis, Enterococcus faecalis, Listeria monocytogenes (Gram pozitif) ve *Candida albicans* (F89) (maya) mikroorganizmaları ortalamaları arasında farklılık olmadığı tespit

edilmiştir (p>0.05).

Çalışmada; farklı konsantrasyonlardaki *S.platensis* ilaveli kefir örneklerinin mikroorganizmalara karşı gösterdikleri antimikrobiyal etki incelenmiş ve kontrol bileşikleri ile kıyaslanmış; bazılarının kontrol bileşiğiyle aynı ya da daha yüksek etki gösterdiği tespit edilmiştir.

Şekil 2. *S. platensis* İlaveli Kefirlerin Antimikrobiyal Etkileri



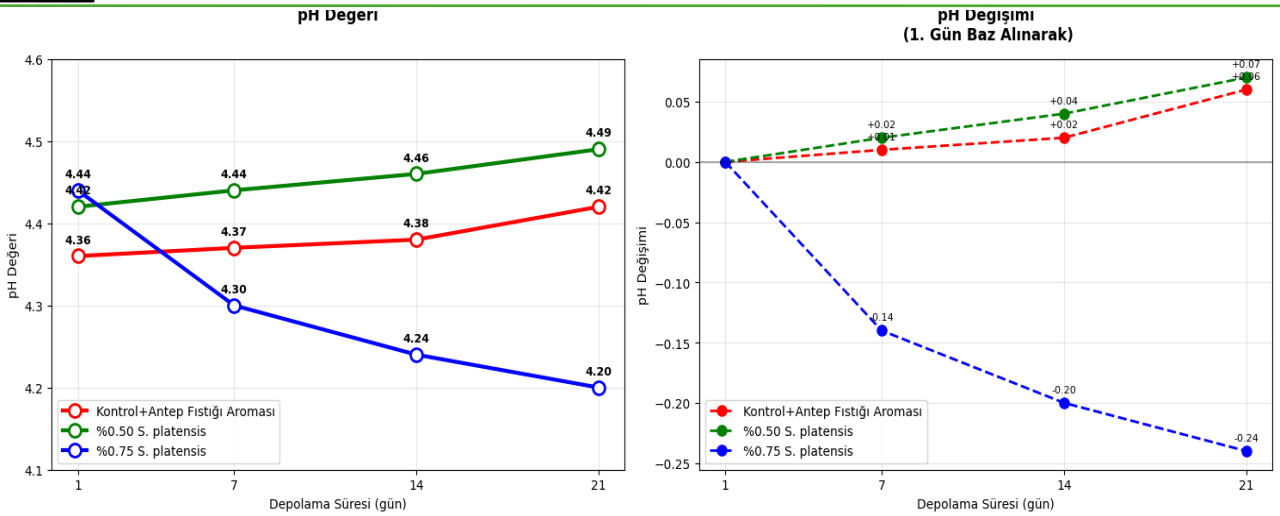
Mikroorganizmalara karşı antimikrobiyal aktivitenin depolama süresince değişkenlik göstermesi Kim vd., (2016) tarafından kefirde bulunan organik asitler, hidrojen peroksitler, etil alkol, diasetil, peptitler, bakteriyosinler gibi çeşitli metabolitlerin ve inhibitör bileşiklerin antimikrobiyal etkilerini arttırmak veya antagonize etmek için birbirleriyle etkileşime girmesinden kaynaklandığı belirtilmiştir. Bu nedenle kefirin antimikrobiyal aktivitesinin her fermantasyon aşamasında farklı bileşiklerden türetilebileceği ve bunun da zamanla tutarsız antimikrobiyal desene yol açabileceği belirtilmektedir.

Azizkhani vd., (2020). tarafından da farklı süt türlerinden üretilen kefir ve probiyotik yoğurt örneklerinde yapılan çalışmada; bulunan antimikrobiyal aktivite arasındaki farkın, yağ asitleri bileşimi, ürünün nihai pH'sı ve asitliği üzerinde önemli bir etkiye sahip olan laktoz içeriğinin, biyoaktif bileşiklerin üretiminde rol oynayan peptit türlerinin ve diğer kimyasalların bileşiminin, mikroorganizmaların türünün, popülasyonunun, kefir taneleri ile starter kültürün ayrıca enzim çeşitliliği gibi birçok parametreden kaynaklandığı belirtilmiştir.

3.3. Fizikokimyasal Analizler

Kefir örneklerinin titrasyon asitliği değerlerinin depolama süresince % 0,11-1,08 arasında değiştiği belirlenmiştir. En yüksek değerin ise; 0,75 *S.platensis* ilaveli örnekte 1. günde görüldüğü tespit edilmiştir.

Titrasyon asitliği için ilgili grafikler Şekil 3'de gösterilmiştir. %0.50 *S.platensis* ilaveli grubun sınırlı artan bir asitlik eğilimi gösterdiği; %0,75 ilaveli grubun ise başlangıçta çok hızlı bir asitlik artışı gösterdiği ve daha sonra bu durumun azaldığı görülmüştür.1. ve 7. günlerde asitlik bakımından farklılık mevcut iken ($p<0.05$), 14. ve 21. günlerde, gruplar arasında istatistiksel olarak bir fark kalmadığı tespit edilmiştir.



Şekil 3. Depolama süresince *S. platensis* ilavesinin titrasyon asitliği üzerine etkisi

Kefirdeki yoğun mikrobiyal floranın titrasyon asitliğindeki değişimlerin temel nedeni olduğu düşünülmektedir. Titrasyon asitliği üzerine *S. platensis'*in yüksek konsantrasyonunun önemli etkileri olduğu belirlenmiştir. Akdan (2020) manda ve diğer sütleri kullanarak kefir ürettiği çalışmasında, asitliği %0,91-1,04 aralığında tespit etmiş, en yüksek sonuca manda-koyun sütlerinin karışımıyla ürettiği kefirde rastlamıştır. Kefirlerde titrasyon asitliğinin artmasının azotlu maddelerden, depolama sürecinde LAB ve proteolitik bakterilerin faaliyetleri sonucu laktoz ve azotlu maddelerin hidrolizi ile oluşan bazı asitlerden ve fosfat, sitrat, laktat gibi metabolitlerden kaynaklandığını belirtilmektedir (Çalışır ve vd., Erken Erişim).

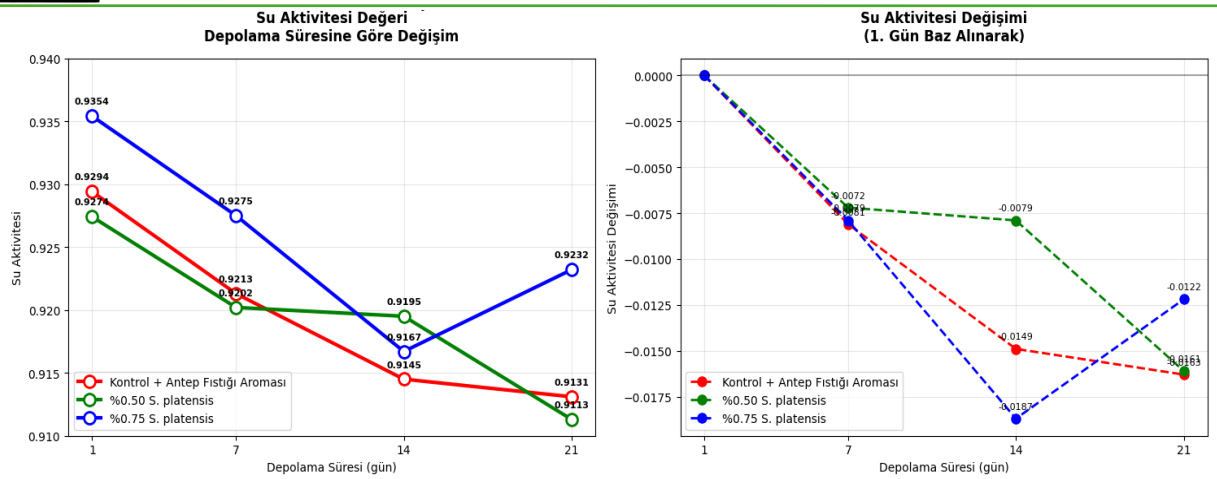
Yildiz-Akgul vd., (2018) çalışmalarında, asitliğin mikroorganizma faaliyeti neticesinde depolama süresince arttığını, farklı yağ oranlarının asitliği etkilemediğini ortaya koymuştur.

Depolama süresince pH değerlerinin karşılaştırmasında %0.75 *S. platensis* ilavesinin 14 ve 21 günlük depolama sonunda, kontrol ve %0.50 *S. platensis* ilaveli gruplara kıyasla istatistiksel olarak anlamlı derecede daha düşük pH değerlerine sahip olduğu belirlenmiştir ($p < 0.05$). pH değerlerinin 4,20-4,49 arasında olduğu ve en yüksek pH değerinin 0,50 *S. platensis* ilaveli örnekte, en düşük pH değerinin ise 0,75 *S. platensis* ilaveli örnekte 21. günde görüldüğü belirlenmiştir.

Bu durum, Şekil 4'te görüldüğü üzere, yüksek konsantrasyondaki *S. platensis'*in depolama süresince asit üretimini sürdürdüğünü göstermektedir.

Şekil 4. Depolama süresince *S. platensis* ilavesinin pH değeri üzerine etkisi

Kefir üretiminde kullanılan sütteki yağ oranının yüksek olması, son üründe pH değerini azaltmıştır. pH düşüşünün sebebinin, kefirde bulunan mikroorganizmaların özellikle de mayaların lipolitik aktivitesi sonucu oluşan serbest yağ asitleri olduğu düşünülmektedir. Tomar vd., (2020), inek ve manda sütü kefirlerini analiz ettiği çalışmasında, pH değerini 4,21-4,70 olarak belirlemiştir. Dane ile fermente edilenlerin starter kültüre göre; yağı az olanların yağlı olanlara göre daha düşük pH' a sahip oldukları sonucuna ulaşmıştır.



Buran vd., (2021), inek ve keçi sütü kullandığı kefirlerde 4,18-4,47 arasında pH değerleri kaydetmiştir. Mevcut araştırmada en yüksek pH ortalaması üzerine *S. platensis'*in yüksek konsantrasyonunun etkili olduğu belirlenmiştir.

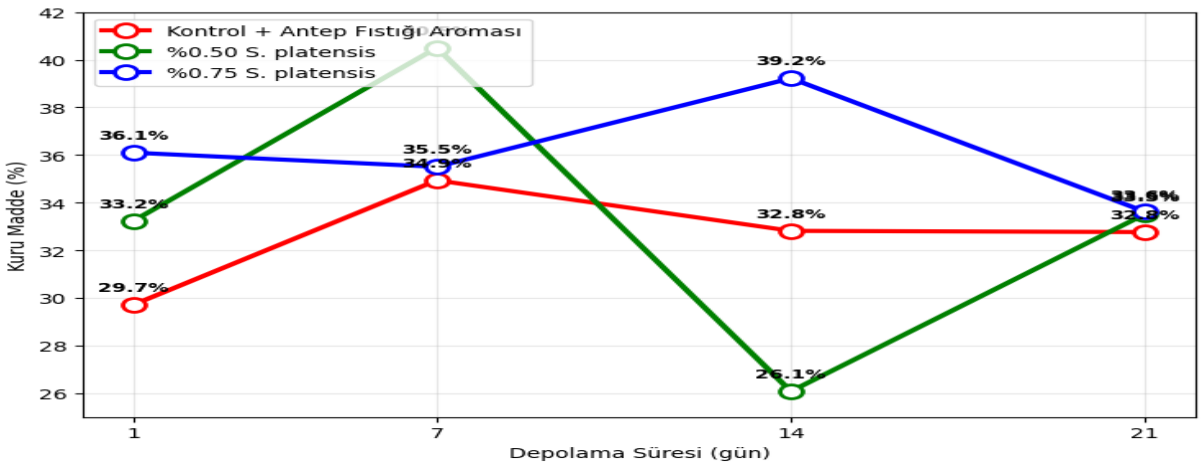
Yildiz-Akgul vd., (2018), 23 gün depolanan kefirlerin pH değerlerinin 4,66-4,14 olduğunu ve düzenli olarak azaldığını belirlemiştir. Araştırıcı pH değerindeki azalmanın fermantasyon sonucu laktozun laktik asit bakterileri tarafından laktik aside parçalanması ile ortamda asitlik değerinin artmasının sonucu olduğunu belirtmiştir.

Çalışmamızda su aktivitesi analiz sonuçları incelendiğinde; 0,86-0,93 arasında değiştiği gözlenmiştir. En yüksek değerin; 0,75 *S.platensis* ilaveli örnekte 1. günde; en düşük değerin de kontrol grubunda 1. günde görüldüğü tespit edilmiştir. Depolama süresi boyunca *S. platensis* ilavesinin (%0.50 veya %0.75) kefirin su aktivitesi üzerinde istatistiksel olarak anlamlı bir etkisinin olmadığı belirlenmiştir ($p > 0.05$). Ancak, Şekil 5'ten görüleceği üzere, 21 günlük depolamanın sonunda, %0.75 ilaveli grubun su aktivitesi değerinin % 0.50 ilaveli grubun su aktivitesi değerinden yüksek olduğu belirlenmiştir.

Su aktivitesi; prebiyotik tipi, miktarı ve bunların kombinasyonundan etkilenmektedir. Stabilizatörlerin veya emülgatörlerin moleküler yapısı, su emme kapasiteleri, birbirleriyle ve içecekteki diğer bileşenlerle etkileşimleri, su aktivitesini farklı yönde etkileyebilmektedir (İlter ve Yılmaz, 2022).

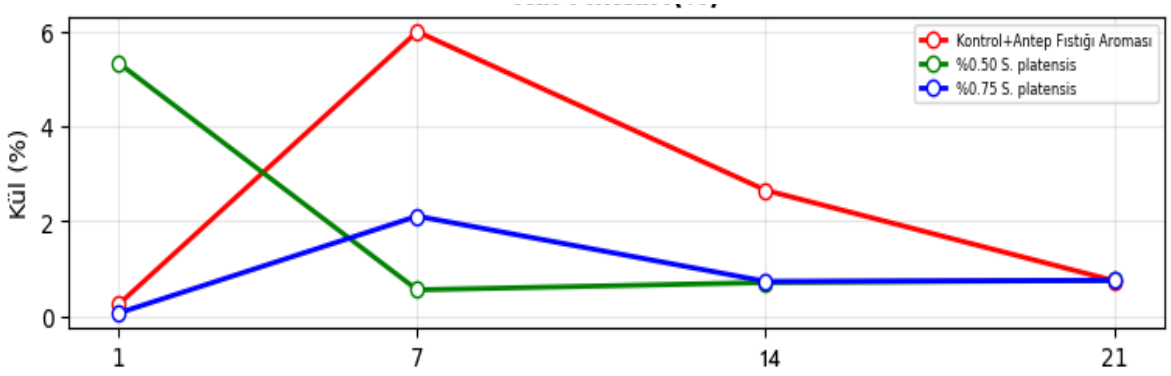
Her ürünün sınırlı bir raf ömrü vardır ve kalitesi zaman geçtikçe düşme eğilimindedir. Prebiyotiklerin su tutma kapasiteleri ve çözünürlükleri birlikte değerlendirildiğinde zamanla artan çözünürlükle en yüksek değerin depolamanın 21. gününde görülmesi beklenen bir sonuçtur. Depolama süresince çözünürlük arttıkça su tutma kapasiteleri düşmektedir. Bununla beraber kefirde yapı bozulmaya başlamakta ve su aktivitesinde de artış göstermektedir (Çalışır ve vd., Erken Erişim). Kefir örnekleri de uzun bir süre bozulmadan stabil kalabilmekte, ancak belirli bir süre sonunda lipit oksidasyonu ve diğer zararlı reaksiyonlar artış göstererek bozulma hızlanmaktadır (Buran vd., 2021).

Şekil 5. *S.platensis* ilaveli kefirin su aktivitesi üzerine etkisi



Kuru madde miktarının %26,07- %40,50 arasında değiştiği belirlenmiştir. En yüksek %0,50 *S. platensis* ilaveli grupta 7.günde; en düşük değerin ise aynı grupta 14. günde tespit edilmiştir. Depolama süresi boyunca *S.platensis* ilavesinin (%0.50 veya %0.75) kefirin toplam kuru madde miktarı üzerinde istatistiksel olarak anlamlı bir etkisinin olmadığı belirlenmiştir ($p > 0.05$). %0.75 *S.platensis* ilavesinin 1. ve 14. günlerde kontrol grubuna kıyasla istatistiksel olarak anlamlı bulunmuş ve Şekil 6'da görüldüğü gibi daha yüksek kuru madde içerdiği belirlenmiştir.

Kuru madde oranının, kefir üretiminde kullanılan sütün bileşimi ve yağ oranına bağlı olabileceği ifade edilmektedir (Tomar vd., 2019; Akdan, 2020). Mevcut araştırmamızda da kuru madde miktarı üzerinde süt yağ miktarına ilave olarak *S.platensis* ilavesinin ve depolama süresinin de önemli etkilerinin olduğu tespit edilmiştir.



Buran vd., (2021) tarafından yapılan araştırmada üretilen kefirlerin 28 günlük depolama süresince sonunda tüm numuneler için kuru madde oranının azaldığı belirtilmiştir. Kefirin üretim tekniği, kullanılan sütün kalitesi, üretim esnasında uygulanan standardizasyon ve diğer işlem parametrelerindeki farklılıklar kefirin kuru madde miktarını etkileyebildiği belirtilmektedir (Öksüztepe vd., 2020).

Kül miktarı analiz sonuçlarına göre; % kül miktarının 6,00- 0,05 arasında değiştiği belirlenmiştir. En yüksek oranın kontrol grubunda 7.günde; en düşük değerin ise %0.75 *S.platensis* ilaveli grupta 1. günde tespit edildiği belirlenmiştir.

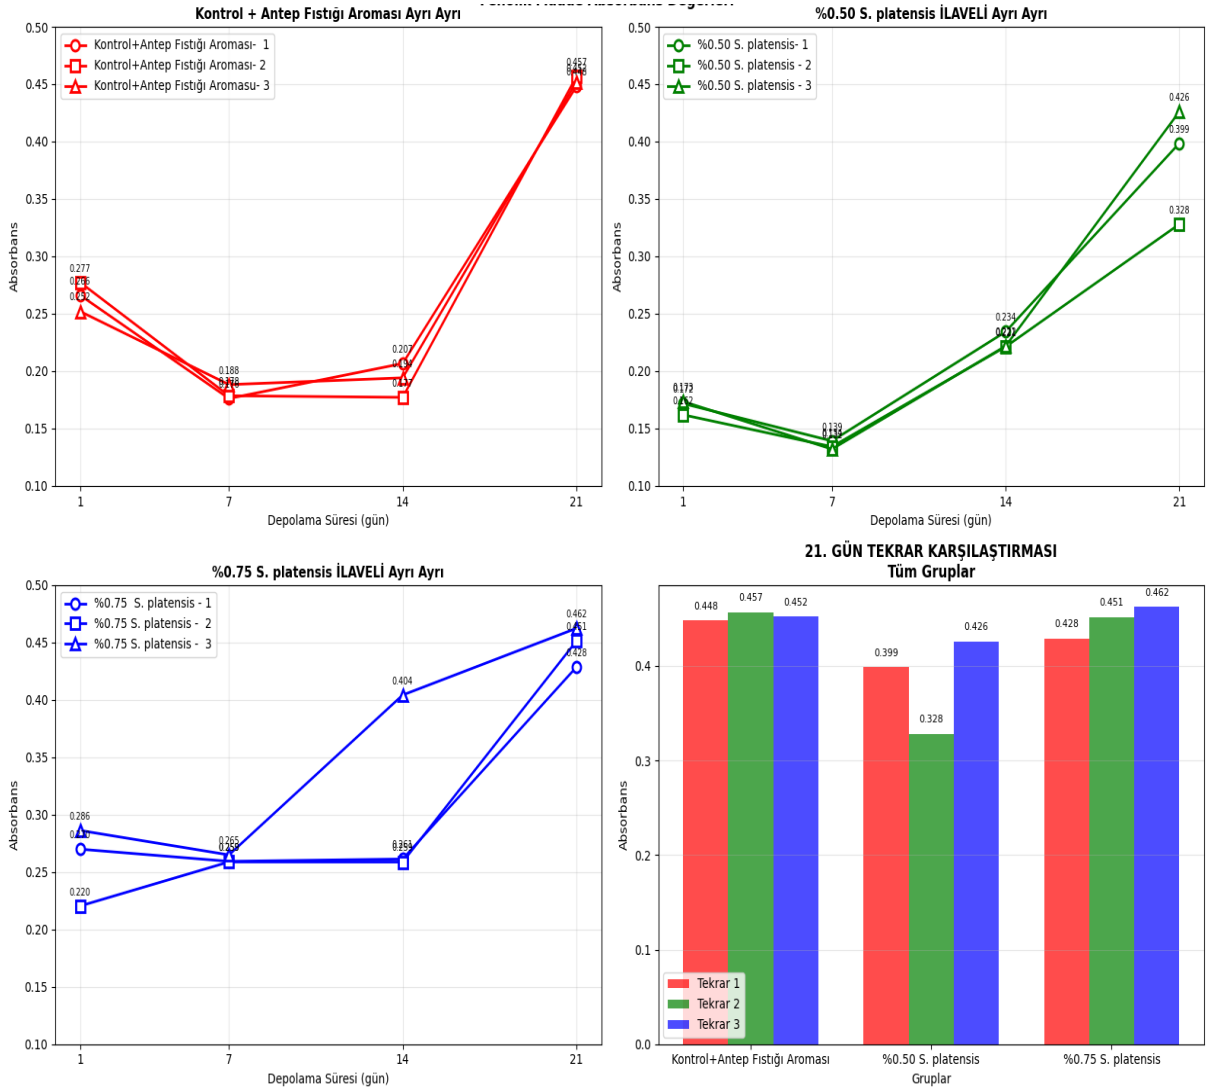
Kül miktarı üzerinde ise; *S.platensis* ilavesinin istatistiksel olarak anlamlı bir etkisinin olmadığı ($p > 0.05$) belirlenmiş; 1 ve 7. Günlerde bu etkinin anlamlı olduğu ($p<0.05$), depolamanın 14. ve 21. günlerinde ise; gruplar arasında istatistiksel bir farkın olmadığı görülmüştür ($p>0.05$) (Şekil 7).

Şekil 6. *S. platensis* ilaveli kefirin kuru madde miktarı üzerine etkisi

Şekil 7. *S.platensis* ilaveli kefirin kül miktarı yüzdesi üzerine etkisi

Kül miktarı genellikle gıda maddelerinde inorganik madde miktarı olarak tanımlanmaktadır. Ürünlerde çok fazla miktarda olması arzu edilmez. Çünkü bu değer ürünlerin hijyenik şartlarda üretilmediklerinin ve insan sağlığına zarar verebilecek bazı inorganik maddeleri içerebildiğinin bir göstergesi olarak kabul görmektedir. Kefirin yapımında kullanılan starter kültür kombinasyon farklılığı, kefirin üretim tekniği ve inkübasyon sıcaklığının farklılığının kül miktarı üzerinde etkili olduğu belirtilmektedir (Öksüztepe vd., 2020).

3.4. Toplam Fenolik Madde Miktarı



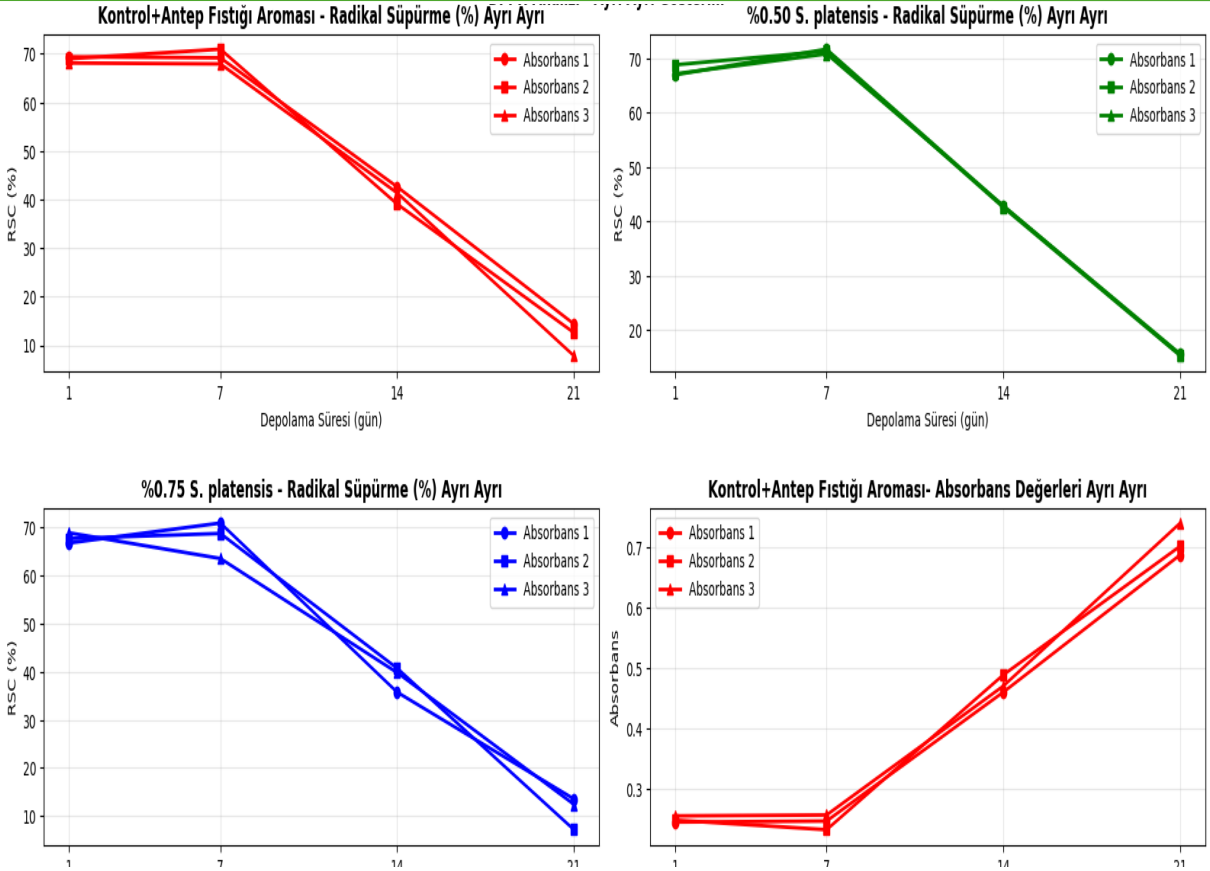
Toplam fenolik madde miktarı en yüksek oranda 0.75 *Spirulina platensis* ilaveli kefir örneğinde depolamanın 21. gününde 0.44 mg gallik asit/ml olarak belirlenmiştir. Toplam fenolik madde miktarı için ilgili grafikler Şekil 8'de gösterilmiştir. Tüm depolama süresi genelinde bakıldığında, *S.platensis* ilavesinin (%0.50 veya %0.75) kefirin toplam fenolik madde içeriği üzerinde istatistiksel olarak anlamlı bir etkisi olmamıştır ($p > 0.05$). %0. *S.platensis* ilavesinin, depolamanın 7. ve 14. günlerinde kefirin fenolik madde içeriğini istatistiksel olarak anlamlı derecede artırmıştır ($p<0.05$). Ancak, 21 günlük depolama sonunda tüm grupların fenolik madde seviyeleri benzer seviyelere yükselmiş ve aralarındaki fark ortadan kalkmıştır ($p>0.05$). Bu bulgular, yüksek doz *S.platensis* ilavesinin özellikle depolamanın orta dönemlerinde antioksidan kapasiteyi artırabileceğini, ancak uzun vadede bu etkinin azalabileceğini göstermektedir.

Fermantasyon sırasında kefir yapısında bulunan mikroorganizmalar fenolik bileşenler gibi biyoaktif bileşenlerin düzeyini etkilemektedir.

β-glukosidaz gibi enzimler fermantasyon sırasında fenolik bileşenleri daha basit yapılara hidrolize ederek toplam fenolik madde miktarını arttırabilmektedir.

Mikrobiyal kaynaklı bazı enzimler, süt türüne göre değişen proteinlerinin yapısı ile starter kültür bileşiminde yer alan laktik asit bakterileri ve diğer mikroorganizmalar da fenolik madde miktarını arttırabilmektedir (Coda ve ark. 2012; Sabokbar ve Khodaiyan 2016).

Barat ve Özcan (2016), fermente süt içecekleri üzerine gerçekleştirdikleri çalışmalarında toplam fenolik madde miktarını 0.38 mg gallik asit/ml olarak belirlemişler ve bulgularımızın yapılan çalışmada elde edilen değerlerle benzer olduğu görülmüştür.



Şekil 8. *S.platensis* ilaveli kefirin fenolik madde miktarı üzerine etkisi

3.5. Antioksidan Aktivite Sonuçları

DPPH radikal süpürme reaksiyon, bileşiklerin serbest radikal temizleme kapasitesini veya hidrojen verici yeteneğini test etmek için yaygın olarak kullanılan bir yöntemdir. DPPH serbest radikal temizleme kapasitesinin depolama süresinin 7. gününde %0.50 ilaveli *S.platensis*'li kefirde en yüksek %71,27 oranında belirlenmiştir.

DPPH radikal süpürme kapasitesi grafikleri, Şekil 9'da gösterilmiştir. Tüm depolama süreci genelinde bakıldığında, *S.platensis* ilavesinin (%0.50 veya %0.75) kefirin ortalama DPPH radikal süpürme kapasitesi üzerinde istatistiksel olarak anlamlı bir etkisi olmamış ($p > 0.05$), 7. günde ise anlamlı bir fark bulunmuştur ($p<0.05$).

Şekil 9. DPPH radikal süpürme aktivitesi üzerine etkisi

DPPH serbest radikal giderme kapasitesinin 7. Günde elde edilen yüksek değerinin nedeninin, mikrobiyolojik aktiviteden kaynaklanıyor olabileceği yönündedir. Sonuçlar üzerinde süt bileşiminin ve *S. platensis* ilavesinin etkili olabileceğini; depolama sırasında serbest radikallerin ortamdaki serbest reaktif indirgen oksijen moleküllerini absorbe eden maddelerin biyoaktif molekülleri koruyucu etki gösterdiği düşünülmektedir.

Tüm örneklerin temizleme aktivitesi, depolama süresi boyunca dönemin başındaki temizleme aktivitesine kıyasla azalmıştır. Temizleme aktivitesindeki azalma, kefir kültüründe bulunan farklı mikroorganizma türlerinin fitaz enzimi üreterek fenolik bileşenleri kullanabilme yeteneğine bağlanabilir (Subrota vd.,2013). Ayrıca, fenolik bileşiklerin birbirleriyle veya diğer bileşiklerle sinerjik etkisi, antioksidan aktivitenin artmasına neden olabilir.

Ünal (2012), piyasadan temin ettiği kefir örneklerinde DPPH serbest radikal temizleme kapasitesi belirlemiş, çilekli ve orman meyveli kefir örneklerinin DPPH serbest radikal temizleme kapasitesinin, sade kefire göre daha yüksek olduğunu bulmuştur. Yılmaz-Ersan ve ark. (2016), inek sütünden elde edilen kefirde fermantasyon ve depolama süresinin DPPH serbest radikal temizleme kapasitesi üzerindeki etkisini araştırmışlardır. Fermantasyon süresi 0-20 saat, depolama süresi ise 1-21 gün olarak belirlenmiştir. Fermantasyon ve depolama süreleri karşılaştırıldığında, DPPH serbest radikal temizleme kapasitesinin 8. saatte (%7,20±0,283) ve 21. günde (%5,44±0,198) en yüksek olduğu bulunmuştur.

SONUÇ

Araştırmada *Spirulina platensis* farklı konsantrasyonlarda (0,50 ve 0,75gr), ticari olarak satışa sunulan Antep fıstığı aroması (1 mL) ve maya (0,25 gr) kullanılmış, pastörize inek sütüne (1lt) ilave edilerek kefir içeceği üretilmiştir. Kefir örneklerinin depolamanın 1. 7. 14. ve 21. günlerinde mikrobiyolojik ve fizikokimyasal özellikleri incelenmiştir.

S. platensis, viskoziteyi ve fonksiyonel özelliği arttırmak için kefir üretiminde kullanılabilir. Özellikle % 0,75 *S. platensis* ilave edilerek üretilen kefirlerin, fiziko -kimyasal, mikrobiyolojik, antimikrobiyal aktivite, toplam fenolik madde miktarı ve antioksidan aktivite üzerinde daha etkili olduğu belirlenmiştir. Bu kapsamda Antep fıstığı aromasının da tat açısından kefire ilave edilmesi tavsiye edilebilir. Elde edilen tüm verilerin gerçekleştirilecek yeni çalışmalarda kaynak olarak kullanılabilmesi ümit edilmektedir.

Bu çalışma Eskişehir Osmangazi Üniversitesi Bilimsel Araştırma Projeleri Koordinasyon Birimi'nin Desteklediği Proje Kodu FLO-2025-3515 olan **'Farklı Konsantrasyonlarda *Spirulina platensis* ve Antep Fıstığı Aroması Eklenmiş Kefirlerin Fiziko-Kimyasal ve Mikrobiyolojik Özelliklerinin Belirlenmesi'** Adlı Lisans Öğrencisi Katılımlı Araştırma Projesiyle Desteklenmiştir.

ÖZET

Büyükbaş ve küçükbaş hayvanlarda morfolojik ölçümler, uzun yıllar boyunca geleneksel yöntemlerle (mezura, cetvel, kumpas) gerçekleştirilmiş ve bu ölçümler verim tahmini, ırk tanımlaması, seleksiyon çalışmalarında ve hayvanların sağlık durumlarının belirlenmesinde temel veri kaynağı olarak kullanılmıştır. Geleneksel ölçüm yöntemleri genellikle temasa dayalı, zaman alıcı ve işgücü isterken, hayvanlarında strese girmelerine sebebiyet vermektedir. Ancak, son yıllarda gelişen teknolojik yaklaşımlar bu alana önemli yenilikler kazandırmıştır. Özellikle temassız ölçüm teknolojileri modern hayvancılıkta giderek yaygınlaşmakta olup hem hayvan refahının korunmasında hem de insan kaynaklı hataları azaltarak veri toplamada pratiklik, doğruluk ve tekrarlanabilirliği sağlamaktadır. Günümüzde, morfolojik ölçümlerde fotogrametri ve üç boyutlu görüntüleme teknikleri sayesinde hayvanların vücut yapıları temassız olarak yüksek doğrulukla ölçülebilmektedir. Bunun yanı sıra kamera sistemleri, makine öğrenimi ve yapay zekâ tabanlı uygulamalar modern hayvancılık işletmelerinde hayvanların vücut kondisyon skorlaması ve canlı ağırlık tahmininde kullanılabilmektedir. Yapay zekâ ve bilgisayarlı görü algoritmaları, kamera verilerinden otomatik morfolojik ölçüm çıkarımı sağlayarak ırk sınıflandırma ve büyüme eğrilerinin takibini mümkün kılmaktadır. Ayrıca taşınabilir ultrason cihazları ile kas kalınlığı ve yağ derinliği gibi iç morfolojik parametreler belirlenmekte, sensör tabanlı sistemlerle ise vücut ölçüleri ve canlı ağırlık değişimleri dolaylı olarak izlenebilmektedir. Bu teknolojik yöntemler, morfolojik ve canlı ağırlık ölçümlerinde insan kaynaklı hataları azaltmakta, hızlı ve sürekli veri üretimini kolaylaştırmakta ve hayvan refahını artırmaktadır. Sonuç olarak, büyükbaş ve küçükbaş hayvanlarda morfolojik ölçümlerin teknolojik yöntemlerle (sensör teknolojileri, yapay zekâ tabanlı uygulamalar vb.)

gerçekleştirilmesi, modern hayvancılıkta verimlilik, genetik ilerleme ve refah odaklı yaklaşımlar için önemli bir potansiyel taşımakla birlikte sürü yönetiminin de daha etkin ve güvenilir bir şekilde yürütülmesine olanak tanımaktadır.

Anahtar Kelimeler: Büyükbaş, küçükbaş, morfolojik ölçümler, hayvan refahı, yapay zekâ.

INNOVATİVE APPROACHES IN MORPHOLOGİCAL MEASUREMENTS IN CATTLE AND SHEEP BREEDİNG

ABSTRACT

Morphological measurements in cattle and sheep have been performed for many years using traditional methods (measuring tape, ruler, caliper), and these measurements have been used as a fundamental data source for yield estimation, breed identification, selection studies, and determining the health status of animals. Traditional measurement methods are generally contact-based, time-consuming, labor-intensive, and cause stress to the animals. However, technological advances in recent years have brought significant innovations to this field. Especially touchless measurement technologies are becoming increasingly widespread in modern animal husbandry, ensuring practicality, accuracy, and repeatability in data collection by both protecting animal welfare and reducing human-induced errors. Today, thanks to photogrammetry and 3D imaging techniques in morphological measurements, animals' body structures can be measured touchlessly with high accuracy. In addition, camera systems, machine learning, and artificial intelligence-based applications can be used in modern livestock operations for animal body condition scoring and live weight estimation. Artificial intelligence and computer vision algorithms enable automatic morphological measurement extraction from camera data, allowing for breed classification and growth curve tracking. Additionally, portable ultrasound devices are used to determine internal morphological parameters such as muscle thickness and fat depth, while sensor-based systems enable the indirect monitoring of body measurements and live weight changes. These technological methods reduce human-induced errors in morphological and live weight measurements, facilitate rapid and continuous data production, and enhance animal welfare. Consequently, performing morphological measurements in cattle and sheep using technological methods (sensor technologies, artificial intelligence-based applications, etc.) holds significant potential for efficiency, genetic progress, and welfare-focused approaches in modern animal husbandry, while also enabling more effective and reliable herd management.

Keywords: Cattle, sheep, morphological measurements, animal welfare, artificial intelligence

1. GİRİŞ

Canlı hayvanların vücut boyutları, ekonomik çıktının belirlenmesinde kritik bir göstergedir. Manuel ölçümler, iş gücü yoğun ve zaman alıcı olup, hayvanlarda stres tepkilerine yol açabilmektedir. Bilgisayar teknolojilerindeki ilerlemelerle birlikte, hayvanların canlı vücut boyutlarını ölçme teknikleri hızla gelişmiş ve önemli araştırma başarıları elde edilmiştir (Ma et al., 2024a). Hayvancılıkta vücut konformasyonu; vücut boyutu, şekli, oranları, tüy rengi, kas konturları ve iskelet yapısını kapsayan bir hayvanın üretim performansı, sağlık durumu ve damızlık değeri için kapsamlı bir göstergedir (Alders et al., 2021; Velado-Alonso et al., 2022; Ma et al., 2024b). İdeal konformasyona sahip hayvanlar genellikle üstün büyüme potansiyeli, hastalıklara direnç ve farklı yetiştiricilik ortamlarına uyum yeteneği sergileyerek ekonomik verimlilik ve hayvan refahını artırırlar. Bu morfolojik özellikler ırk standartlarıyla uyumlu olup, hayvanın fiziksel sağlamlığı ve verimliliğinin değerlendirilmesinde kritik bir rol oynar (Velado-Alonso et al., 2022; Gutiérrez-Reinoso et al., 2023).

Çiftlik hayvanlarında vücut konformasyonu, hayvanın üretim performansını, sağlık durumunu ve damızlık değerini değerlendirmek için temel bir göstergedir. Manuel ölçümlere ve görsel puanlamaya dayanan geleneksel konformasyon değerlendirme yöntemleri yalnızca zaman alıcı ve emek yoğun değil, aynı zamanda öznel hatalara da açıktır. Bilgisayarlı görme ve yapay zekâ teknolojilerinin hızlı gelişimiyle birlikte, iki boyutlu (2D) görüntüler, üç boyutlu (3D) nokta bulutu işleme ve çok modlu veri füzyonuna dayalı yeni yaklaşımlar, otomatik konformasyon değerlendirmesi alanında araştırma odak noktaları haline gelmiştir (Yang et al., 2025). Akıllı tarımda, temassız, otomatik vücut boyutu ölçümü hayvanlar için yaygın olarak kullanılmaktadır (Weng et al., 2024).

Hayvan verisi toplama, canlı vücut boyut ölçümlerinin ilk aşamasıdır; bu aşamada sensörler, doğru ölçümler için gerekli bilgileri elde etmek amacıyla veri toplama ekipmanı olarak kullanılmaktadır. Elde edilen veriler daha sonra işlenir; bu süreçte 3B (3D) görselleştirme teknolojisi, bilgisayar grafikleri, görüntü işleme ve derin öğrenme gibi teknikler kullanılarak ölçümler doğru bir şekilde hesaplanır (Ma et al., 2024a, Tablo 1). Hayvancılık, yapay zekâ ve ileri düzey görsel izleme teknolojilerinin entegrasyonu ile büyük bir dönüşüm yaşamaktadır. Entegre derin öğrenme algoritmaları aracılığıyla platform, kulak küpesi, vücut tabanlı ve yüz tabanlı sığır tanımlama, vücut kondisyon skoru (BCS), topallık tespiti, yemleme süresi tahmini ve gerçek zamanlı konumlandırma gibi temel sağlıkla ilgili görevleri yerine getirmektedir (Moe et al., 2025)

Tablo 1. Veri toplama ekipmanlarının karşılaştırması (Peng ve ark., 2024)

İşleyiş Prensibi	Amaç	Avantaj	Dezavantajlar
Derinlik Kamerası (DC)	Görüntüdeki her noktanın kameraya olan mesafesi ve 2D görüntüdeki koordinatları kullanılarak, her noktanın üç boyutlu uzamsal koordinatlarının çıkarılması	Belirli bir alandaki derinlik mesafesini ve uzamsal koordinat bilgisini yakalamak	Hızlı işlem süreleri, uzamsal koordinatlar
3D Tarama	Bir nesnenin uzamsal dış yapısı, yapısı ve renklerinin taranması; nesnenin yüzeyindeki uzamsal koordinatlar	Nesnenin geometrik yüzeyinin yüksek hassasiyetli nokta bulutu temsili	Yüksek doğruluklu uzamsal koordinatlar
2D RGB Kamera (2RC)	Optik görüntüleme prensiplerini kullanarak görüntü oluşturma	Optik görüntüleri elektronik sensörlerle elektronik verilere dönüştürür	Hızlı işlem süreleri, küçük veri setleri

Bilgisayarla görme sistemleri, süt sığırcılığında hayvan tanıma, davranış izleme, yem tüketiminin takibi, vücut ağırlığının tahmini ve hastalıkların tespiti gibi çeşitli uygulamalarda etkin biçimde kullanılmaktadır (Menezes et al., 2024).

Morfolojik ölçümler, hayvanların büyüme performansının izlenmesi, ırk tanımlaması, genetik seleksiyon ve verim üretim tahmini açısından belirleyici öneme sahiptir. Düzenli olarak yapılan ölçümler, hayvanların gelişim aşamalarını takip etmeyi, sürü yönetimi beslenme ve sağlık yönetimini iyileştirmeyi sağlar. Bununla birlikte, geleneksel ölçüm yöntemleri zaman alıcıdır, insan hatasına açıktır ve büyük sürülerde uygulanması zordur. Temassız insan müdahalesi olmadan gelişen teknolojiler ise bu dezavantajları azaltarak hızlı, objektif, sürekli ve doğru veri üretimi sağlar. Hayvana temas olmadan gerçekleştirilen morfolojik ölçümler, modern hayvancılıkta giderek önem kazanmaktadır. Temassız ölçüm yöntemleri sayesinde hem hayvanlara stres uygulanmaz hem de ölçüm sırasında güvenlik riski azalır. Ayrıca bu yöntemler, insan kaynaklı hataları en aza indirerek veri toplamada yüksek doğruluk ve tekrar edilebilirlik sağlar. Bu çalışmanın amacı, büyükbaş ve küçükbaş hayvanlarda morfolojik ölçümlerin görüntüleme, sensör ve yapay zekâ tabanlı teknolojiler kullanılarak gerçekleştirilmesinin avantajlarını, uygulama yöntemlerini ve hayvan refahına katkılarını incelemektir.

2. BÜYÜKBAŞ HAYVANLARDA MORFOLOJİK ÖLÇÜMLERDE GELİŞEN TEKNOLOJİK YENİLİKLER

Büyükbaş hayvanlarda vücut ölçümleri ve ağırlık tahmini, sürü yönetimi, besleme stratejilerinin optimize edilmesi ve hayvan refahının izlenmesi açısından kritik öneme sahiptir (De Oliveira et al., 2025; Xu et al., 2024). Geleneksel tartım ve fiziksel ölçüm yöntemleri emek yoğun ve invaziv olabilir; ayrıca anlık ve temassız veri toplama imkânı sunmazlar. Bu nedenle, bilgisayarlı görü, makine öğrenimi ve 3D görüntüleme sistemleri gibi teknolojik yaklaşımlar giderek önem kazanmaktadır.

Bilgisayarlı görme, hayvan sağlığı, davranışı ve verimliliğinin otomatik ve temas gerektirmeyen şekilde izlenmesini sağlayarak süt çiftçiliği yönetim alanını hızla dönüştürmektedir sığır tanımlama ve izleme, beslenme ve ruminasyon davranışlarının değerlendirilmesi, vücut kondisyon skoru, topallık ve yatma davranışı, mastitis ve süt verimi ile sosyal davranış ve östrus yer almaktadır. Son çalışmaların bulgularının sentezi ile bilgisayarlı görme sistemlerinin hayvan refahını iyileştirmeye ve verimlilik ile üreme performansını artırmaya nasıl katkıda bulunmaktadır (Antognoli et al., 2025). Sığırlarda morfolojik özelliklerin ve et verimliliğinin değerlendirilmesinde ultrasonik ve optik ölçümler büyük önem taşımaktadır. Bu teknikler; deri altı yağ kalınlığı, göz kası alanı ve etin mermerleşme derecesi gibi çeşitli parametreler hakkında doğru ve objektif verilerin toplanmasına imkân tanımaktadır. Elde edilen bilgiler, sığır endüstrisinde verimliliğin ve rekabet gücünün artırılmasına katkı sağlamaktadır (Ruchay et al., 2025).

Xu ve ark. (2024), semantik segmentasyon ve geri yayılım (BP) yapay sinir ağına dayalı bir akıllı yaklaşım sunmuştur. Önerilen model, ResNet-101-D ile Sıkıştırma–Uyarma (SE) dikkat mekanizmasını birleştirerek ineklerin görüntülerinden hassas morfolojik veriler çıkarmakta ve bunları regresyon tabanlı modellerle ağırlık tahmini için kullanmaktadır. BP yapay sinir ağı, 13,11 pound MAE ve 22,73 pound RMSE ile en iyi sonuçları göstermiştir. Bu yaklaşım, fiziksel temasa duyulan ihtiyacı ortadan kaldırarak hem hayvan refahını artırmakta hem de riskleri azaltmaktadır. De Oliveira ve ark. (2025), Holstein ineklerinde dorsal uzunluk, göğüs genişliği ve abdominal çevre gibi morfometrik verileri kullanarak yapay sinir ağları (ANN) ve Destek Vektör Regresyonu (SVR) modellerinin performansını karşılaştırmıştır. ANN en yüksek doğruluk (R^2 = 0,9125, RMSE = 25,86 kg) sağlarken, SVR ve çoklu regresyon modelleri de yüksek doğruluk göstermiştir. Bulgular, kompleks makine öğrenimi modellerinin saha

uygulamalarında daha doğru tahminler sağlarken, basit modellerin pratik kullanım açısından hâlâ değerli olduğunu ortaya koymaktadır. Alempijevic ve ark. (2025), çoklu kameraya sahip 3B görüntüleme sistemlerini işleme hattına entegre ederek sığırların kalça yüksekliği ve karkas ağırlığını tahmin etmiş, bu sistem farklı uzunluk ve ırklardaki sığırlarla etkili şekilde çalışmakta ve saha koşullarında uygulanabilirliği yüksek sonuçlar vermektedir. Bu tür sistemler, hayvancılıkta veri toplama ve sürü izleme süreçlerini otomatikleştirerek hassas tarım uygulamalarına olanak tanımaktadır. Lewis ve ark. (2025) tarafından yapılan çalışmada, 2B görüntüleme ve derin öğrenme algoritmaları kullanılarak üç kamera perspektifiyle (ön, arka, üst) vücut kondisyon skoru değerlendirilmiştir. Arka görüş açısı, en yüksek sınıflandırma doğruluğunu elde etmiş ve kritik morfolojik özelliklerin en iyi şekilde elde edildiğini göstermiştir. Bu yaklaşım, küçük ve orta ölçekli çiftlikler için ekonomik bir alternatif sunmakta ve sürekli izleme ile erken sağlık teşhisini mümkün kılmaktadır. Kaya ve Bardakçıoğlu (2021), laktasyondaki ineklerin vücut ağırlığı ve vücut kondisyon skorunu dijital görüntü analiz yöntemleri kullanılarak tahmin etmeye çalıştıkları çalışmalarında cidago yüksekliği, vücut uzunluğu ve kalça genişliği gibi ölçümleri ele almışlar ve çalışmacılar dijital görüntü analiz yönteminin güvenilir bir yöntem olduğunu bildirmişlerdir. Hayvan konformasyonu; vücut şekli, kas gelişimi, iskelet yapısı ve uzuv dengesi gibi morfolojik özellikleri kapsar. Bilgisayarla görme tabanlı konformasyon değerlendirme yöntemleri, 2D görüntüler ve 3D nokta bulutu verilerini entegre ederek kapsamlı bir analiz olanağı sunmaktadır. Makine öğrenmesi ve derin öğrenme algoritmaları sayesinde bu veriler, otomatik, hızlı ve objektif değerlendirmeler için kullanılmaktadır (Yang et al., 2025).

Son yıllarda yapılan çalışmalar, bilgisayarla görme ve derin öğrenme tabanlı modellerin, büyükbaş hayvanların morfolojik ölçümlerinin ve vücut ağırlığı tahminlerinin doğruluğunu önemli ölçüde artırdığını göstermektedir. Bu yaklaşımlar, fiziksel ölçüm ihtiyacını ortadan kaldırarak hayvan refahını iyileştirmekte, veri toplama süreçlerini otomatikleştirmekte ve hassas hayvancılık uygulamalarının yaygınlaşmasına katkı sağlamaktadır.

3. KÜÇÜKBAŞ HAYVANLARDA MORFOLOJİK ÖLÇÜMLERDE GELİŞEN TEKNOLOJİK YENİLİKLER

Koyun yetiştiriciliğinde doğum, üreme, ağırlık ve vücut kondisyonu gibi kritik biyolojik süreçlerin izlenmesi hem hayvan refahı hem de üretkenlik açısından büyük önem taşır. Geleneksel yöntemler, fiziksel ölçümler ve gözlem temelli kayıtlarla sınırlıdır; bu durum zaman alıcı, maliyetli ve hayvanlarda stres yaratıcıdır. Modern teknolojiler, insan müdahalesi olmayan sensörler, video tabanlı sistemler ve yapay zekâ algoritmaları kullanılarak bu süreçleri daha etkin objektif ve güvenilir bir şekilde izleme veri sağlama olanağı sunmaktadır.

Geleneksel koyun tartımı ve ölçümü invaziv, stresli ve işgücü yoğun yöntemlerdir. Bilgisayarla görme ve yapay zekâ teknikleri kullanılarak geliştirilmiş sistemler, invaziv olmayan ağırlık tahmini ve vücut ölçümüne imkân tanımaktadır. Microsoft Kinect V2 sensörü ve derin öğrenme modelleri (EfficientNetB3, DenseNet169, CNN) kullanılarak yapılan çalışmalarda, RMSE 3,44 kg ve R^2 0,90 ile yüksek doğruluk elde edilmiştir (Marques et al., 2025). Ayrıca, 3D nokta bulutu yeniden yapılandırma teknikleriyle koyun vücut ölçümleri invaziv olmadan ve yüksek doğrulukla sağlanabilmektedir; vücut uzunluğu için hata oranı %0,79'dur (Liang et al., 2024). Yapay zekâ tabanlı sistemler, koyunların üreme davranışlarını takip ederek damızlık seçiminde önemli katkılar sağlamaktadır. Kameralar, giyilebilir sensörler ve makine öğrenmesi algoritmaları ile kızgınlık, doğum ve maternal bakım gibi davranışlar belirlenebilmekte; bu sayede yetiştiriciler, daha bilinçli ve veri odaklı seçimler yapabilmektedir. Önerilen ReproBehaviorNet modeli, davranışsal verileri biyolojik işlevler ve YZ süreçleriyle ilişkilendirerek hem yoğun hem de yarı-yoğun sistemlerde karar desteği sunmaktadır (Emsen et al., 2025).

Hayvan davranışlarının müdahalesiz olarak izlenmesi, AnimalFormer gibi çok modlu yapay zekâ çerçeveleriyle mümkün hale gelmiştir. Bu sistemler, video ve sensör verilerini birleştirerek otlama, koşma, oturma ve yürüme gibi aktiviteleri ayrıntılı olarak analiz etmektedir. Böylece hayvan refahı ve üretkenlik optimize edilmekte, veri odaklı yönetim desteklenmektedir (Qazi et al., 2024). Ayrıca, TinyML tabanlı mikrodenetleyici sistemleri ile düşük gecikme süresi ve internet bağımsız çalışabilen otomatik izleme çözümleri geliştirilmiştir (Zhang & Kanjo, 2025).

Modern teknolojiler ve yapay zekâ destekli sistemler, koyun yetiştiriciliğinde sürü izleme doğum tespiti, üreme takibi, ağırlık ölçümü, vücut kondisyonu ve davranış analizi gibi önemli hayvan yetiştirme süreçlerin izlenmesini daha etkin, verilerin doğru objektif sürekli güvenilir ve hatasız odaklı hale getirmektedir. Bu yöntemler, hayvan refahını artırmak, işgücü maliyetlerini azaltmak ve sürü performansını optimize etmek için büyük potansiyel sunmaktadır. Gelişen teknolojik dönüşümle üretim sistemlerinde bu teknolojilerin ölçeklenebilir ve kapsayıcı şekilde uygulanması, sürdürülebilir ve verimli hayvancılığa katkı sağlayacaktır.

SONUÇ VE ÖNERİLER

Hayvancılıkta gelişen teknolojiler ve yapay zekâ entegrasyonu büyükbaş ve küçükbaş hayvancılıkta hayvan verilerinin temassız objektif ve doğru bir şekilde toplanmasını mümkün kılmaktadır. Bilgisayarlı görme, 3D görüntüleme, sensörler makine öğrenim sistemleri ve yapay zekâ algoritmaları ile desteklenmiş morfolojik ölçümler, ağırlık tahmini, vücut kondisyon skoru, topallık ve hastalık tespiti gibi önemli parametreler güvenilir biçimde izlenebilmektedir. Bu yaklaşımlar, geleneksel tartım ve fiziksel ölçüm yöntemlerinin işgücü yoğunluğu ve hayvana stres yaratma sorunlarını ortadan kaldırmakta, sürü yönetimi, besleme stratejileri üreme takibini ve hayvan refahını iyileştirmektedir Ayrıca, insan müdahalesi ve temassız ve veri odaklı izleme yöntemleri, hayvan refahını artırmakta, üretim verimliliğini yükseltmekte ve sürdürülebilir hayvancılık uygulamalarına katkı sağlamaktadır.

ANALYSIS OF CUSTOMER LOYALTY ON SERVICE QUALITY ON INDONESIAN AIRLINES INDUSTRY

Jean Richard Jokhu[1*]

Sulthan Nahrawi Sinurat[1]

[1] President University

ABSTRACT

This research aims to analyze the effect of service quality on customer loyalty at Lion Air, focusing on Indonesians who are part of the millennial generation and reside in the Jabodetabek area. This study used quantitative research methods, with data collected through online questionnaires distributed to 120 respondents who have used Lion Air services. Data analysis was conducted using SPSS (Statistical Package for Social Science) software, employing multiple linear regression analysis. The results showed that service quality had a positive and significant impact on customer loyalty. These findings suggest that improving service quality could foster greater customer loyalty for Lion Air.

Keywords: service quality, customer loyalty, millennial, airlines

INTRODUCTION

Indonesia is a maritime country consisting of islands stretching from Sabang to Merauke, with a total of 17,508 islands (Sahara & Pradana, 2021). For a country that consists of many islands like Indonesia, good transport connectivity is needed. The function of good inter-island connectivity is to increase access between islands to make them easier to reach, as well as develop tourism activities, education and easy access to health equipment (Ghifari & Ahyudanari, 2021). Transport is an important means for society to facilitate the mobility of people and goods. Transport is the movement of people or goods by using tools or vehicles from geographically separated places (Steenbrink, 1974). Companies in the transport sector play an important role in meeting the mobility and distribution needs of goods, making them a key element in supporting economic growth and social activity amid increasing global mobility (Paminto, 2020). Air transport is one of the most important means of transport in Indonesia to connect from one region to another.

According to Law No. 1/2009 on Aviation, aviation is a unity consisting of the use of airspace, aircraft, airports, air transport, flight navigation, safety and security, the environment, as well as supporting facilities and other public facilities. Air transport has become an important component in the progress and growth of a country (Susanto & Keke, 2020). Aircraft are an efficient means of air transport for transporting goods and people at a much higher speed than other means of transport (Suprianto, 2020). In Indonesia, air transport plays a key role in connecting geographically separated islands, encouraging tourism, trade, and investment, and facilitating interregional mobility and exchange (Ayuningtyas, 2023). Data from the *Badan Pusat Statistik* (2024) shows that in July 2024, the number of domestic air passengers reached 6 million people, an increase of 11.04 per cent compared to the previous month. This increase is evident at major airports, as listed in Table 1.1 below:

Table 1.1 Number of Domestic Passengers at Major Airports

Airport	**Number of Passengers**		**Percentage Increase**
	Juni 2024	**Juli 2024**	
Soekarno-Hatta	1,584,802	1,767,891	11.55%
Juanda	448,073	519,012	15.82%
Ngurah Rai	395.723	456,189	15.29%
Kualanamu	190,287	216,423	13.72%
Hasanuddin	234.091	279,344	19.46%

Source: Badan Pusat Statistik, 2024 processed by researcher

Table 1.1 shows Soekarno-Hatta Airport recorded the highest number of domestic passengers at 1,767,891 people, which contributed 29.28 per cent of the total passengers. Juanda Airport in Surabaya recorded 519,012 passengers (8.60 per cent), Ngurah Rai in Denpasar 456,189 passengers (7.60 per cent), Kualanamu in Medan 216,423 passengers (3.61 per cent), and Hasanuddin in Makassar 279,344 passengers (4.65 per cent). This data reinforces the importance of air transport in supporting social and economic activities in Indonesia. In addition, a report from Angkasa Pura II (2024) added that the number of passengers at Soekarno-Hatta Airport in Semester I/2024 reached 26 million passengers, an increase of 6 per cent compared to the same period in 2023 and 2 per cent higher than 2019 before the pandemic. Overall, the 20 airports managed by Angkasa Pura II recorded a total of 40.05 million passengers in H1/2024, demonstrating the post-pandemic recovery and the important role of air

transport in economic growth. Airlines, including Lion Air, serve as key providers of air transport services that support inter-regional mobility and economic growth (Darmawan et al., 2023). With increasing passenger numbers at major airports, air transport is increasingly becoming a key pillar in supporting connectivity in an archipelago like Indonesia, while facilitating the growth of other important sectors such as tourism and trade (Yauwwarin & Siwabessy, 2023).

According to the information contained on the "*Cerita Kami*" page of Lion Air's official website (n.d.), Lion Air is a subsidiary of PT Langit Esa Oktagon (PT LEO Group) which is part of the wider Lion Group. Meanwhile, according to the "Our Network" page as a leading domestic airline and disciplined low-cost carrier, Lion Air offers flights to value-conscious customers that focus on price, flight frequency, and an extensive route network throughout Indonesia. As the largest airline company in Indonesia, Lion Air plays an important role in connecting passengers across Indonesia and to destinations in Asia. Indonesia, characterised as an archipelago, relies heavily on air transport, and Lion Air is able to fulfil that need with its extensive route network. (Lion Air, n.d.).

According to the "*Jaringan Kami*" page on Lion Air's official website (n.d.), as of September 2019, Lion Air operates an average of 449 flights daily on 269 scheduled and 211 chartered routes to 41 domestic and 20 international destinations. The airline is the sole service provider on 109 routes and has a market share of more than 50 per cent on 106 other routes based on total capacity. Collaboration with airlines such as Batik, Wings, Malindo, and ThaiLion enables Lion Air to offer an additional 694 routes and 157 destinations through interline arrangements. Lion Air's hub-and-spoke strategy optimises the route network to serve demand from smaller cities and remote areas to larger destinations, supporting business growth and growing passenger demand (Lion Air, n.d.). Recent data from OAG Aviation Worldwide Limited (2024) shows that Lion Air remains the largest airline in Southeast Asia with 3,159,818 seats, accounting for 9% of regional flight capacity. Compare this to AirAsia, which has a 7% market share, and Vietnam Airlines, which experienced the largest drop in capacity. The following table details the seat capacity of major airlines in Southeast Asia as of September 2024:

Table 1 Airline Seat Capacity Market Share in Southeast Asia (September 2024)

Airlines	**Seat Capacity (September 2024)**
Lion Air	3,159,818
AirAsia	2,558,652
Vietnam Airlines	1,901,415
Vietjet Air	1,892,815
Cebu Pacific	1,817,555
Singapore Airlines	1,642,282
Batik Air	1,623,600
Super Air Jet	1,548,360
Thai AirAsia	1,467,854
Philippine Airlines	1,330,224

This data emphasises Lion Air's strategic role in the Southeast Asian aviation market, demonstrating the airline's dominance in seat capacity and extensive route network. With its

market-leading position, Lion Air contributes significantly to air connectivity in Indonesia, supporting economic growth and strengthening its role in providing domestic and international air services that are essential to mobility and economic activity in the archipelago.

Along with the rapid development of technology and increasing community mobility, the need for efficient and quality transportation services is also increasing (Luwihono, Peranginangin, & Makanuay, 2020). Current globalisation technology requires companies to increase competitiveness in order to survive in fierce competition (Kirana, 2024). A significant increase in competition in the service industry is evident in recent years (Jokhu & Arnold, 2018). Service companies need to innovate to meet the needs of efficient and quality transportation services, and pay attention to customer comfort and safety (Luwihono, Peranginangin, & Makanuay, 2020). The company's ability to provide quality service is a key success factor (Jokhu & Armando, 2019). Service quality is a cognitive evaluation of consumers when receiving a product or service (Kotler & Keller, 2016). Good service results in consumer satisfaction and increases repurchase tendencies (Tufahati et al., 2021; Fared et al., 2021) Service quality includes various company activities to meet consumer expectations (Berinyuy, 2021). Service includes convenience, speed, relationship, ability, and hospitality, all of which aim for customer satisfaction (Saleh, 2024).

Service quality is a service concept that companies can rely on to maintain their reputation in the midst of fierce competition (Esmaeilpour et al., 2017). According to Zeithaml and Parasuraman (2004), there are five important dimensions of service quality: tangibles, reliability, responsiveness, assurance, and empathy. These dimensions include aspects such as tangibles, which refer to physical evidence such as buildings, equipment, and technology used by the company; reliability, which is the company's ability to deliver services as promised; responsiveness, which describes the speed of the company's response to customer complaints; assurance, which includes the ability of employees to build trust through attitude and knowledge; and empathy, which includes personal and sincere attention to customers. According to Sugiarto and Octaviana (2021), these five dimensions have a significant influence on customer satisfaction. In this study, the Servqual dimensions are applied to Lion Air employees. Tangibles reflect their ability to provide comfort through aircraft appearance and facilities. Reliability describes Lion Air's ability to deliver services as promised and maintain consistency for all passengers. Responsiveness is seen from the alertness of employees in providing fast and accurate services. Assurance relates to the attitude and knowledge of employees that builds passenger trust, while Empathy is reflected in genuine concern and understanding of customer needs.

Consumer loyalty is a form of service user or customer loyalty in continuing to use the product or service offered because of the satisfaction obtained, which often encourages them to recommend the product or service to others so that they can also experience similar satisfaction (Odem and Wakhidah, 2023). In addition, consumer loyalty can also be defined as the formation of consumer attitudes and behaviour towards product use resulting from previous consumption experiences (Karim et al., 2021 ; Ertemel, 2021). Both of these definitions emphasise that loyalty is formed from ongoing positive experiences and can influence consumers' decisions to continue using and promoting the product or service to others.

If consumers feel they have benefited from previous purchases, this indicates that they are likely to make repeat purchases. Loyalty is formed through four stages: cognitive loyalty (based on awareness), affective loyalty (based on feelings or emotions), cognitive loyalty (based on commitment to action), and action loyalty (which is realised in the form of concrete actions). This process begins with a strong motivation to overcome obstacles, such as loyalty actions (Qi & Ariffin, 2022). There is a close link between customer satisfaction and long-term loyalty,

where high-quality services that meet or exceed expectations can create a positive cycle, with ongoing satisfaction driving customer loyalty, strengthening mutually beneficial relationships, and encouraging them to remain loyal and recommend the service to others (Umatin et al., 2024). In Lion Air's operational context, customer loyalty is critical as it creates a stable customer base, enhances brand image and generates positive reviews that attract new customers. Therefore, improving service quality is a key strategy for Lion Air in an effort to increase customer loyalty and maintain its position in the competitive aviation industry.

In the airline industry, service quality plays an important role in shaping customer loyalty. As one of the largest airlines in Indonesia, Lion Air faces the same challenge. The quality of service provided will have a direct impact on customer loyalty. Therefore, understanding the relationship between service quality and customer loyalty is key for Lion Air to maintain and increase its market share. This study aims to analyse the extent to which Lion Air's service quality affects customer loyalty, and is expected to make a significant contribution to the literature on service management and customer loyalty in the airline industry, particularly in the context of Lion Air.

METHOD

This research uses quantitative methods to analyse the data needed (Firmansyah et al., 2021). This method was chosen because it allows researchers to numerically measure the level of service quality and customer loyalty. By using this method, researchers can collect data on customer perceptions of service quality and the level of customer loyalty to Lion Air. Statistical data analysis will be used to describe the relationship between service quality and customer loyalty in detail.Method This research uses a descriptive approach to describe the relationship between service quality and customer loyalty at Lion Air. This approach aims to identify factors that influence customer loyalty based on customer perceptions of the quality of service provided by the airline. By analysing descriptively, this research will describe in detail the quality of service provided by Lion Air and the extent to which it affects customer loyalty.

Table 1 Instrument/Operational Definition

No.	Variables	Definitions	Code	Statement	Source
1	Tangible (X1)	According to Tjiptono (1996) tangible is physical evidence of services, it can be in the form of physical equipment used, physical representation of services.	X1.1	Lion Air has modern and up-to-date equipment.	(Gabrielle and Harjati (2019).
			X1.2	Lion Air has modern and up-to-date facilities.	
			X1.3	Lion Air has a modern and up-to-date fleet of aircraft.	
			X1.4	Lion Air's stewards and flight attendants are well-groomed and professional.	

			X1.5	The facilities used by Lion Air to serve passengers are always in good condition.	
			X1.6	The equipment used by Lion Air to serve passengers is always in good condition.	
2	Reliability (X2)	By definition reliability in Tjiptono (1997) is the ability to provide the promised service quickly, accurately, and satisfactorily.	X2.1	Lion Air provides the service as promised.	(Gabrielle and Harjati (2019).
			X2.2	Lion Air is reliable when it comes to handling passenger issues.	
			X2.3	Lion Air's flight schedules are always on time.	
			X2.4	Lion Air is knowledgeable in answering passengers' questions.	
			X1.5	The facilities used by Lion Air to serve passengers are always in good condition.	
			X1.6	The equipment used by Lion Air to serve passengers is always in good condition.	
3	Responsiveness (X3)	According to Tjiptono (1996) responsiveness is the desire of staff to help customers and provide services responsively.	X3.1	Lion Air is always willing to help passengers.	Gabrielle and Harjati (2019).
			X3.2	Lion Air always provides fast service.	
			X3.3	Lion Air is always ready to handle	

				passenger requests.	
			X3.4	Lion Air is ready to provide solutions for every passenger's questions and complaints.	
4	Assurance (X4)	According to Kotler (1997) assurance is the knowledge and courtesy of employees, and the ability to gain trust and confidence.	X4.1	Lion Air is able to instill confidence in passengers.	Gabrielle and Harjati (2019).
			X4.2	Passengers feel safe when traveling with Lion Air.	
			X4.3	Lion Air has always been consistently polite with passengers.	
5	Empathy (X5)	According to Tjiptono (1996) empathy is the ease of making relationships, good communication, personal attention, and understanding the needs of customers.	X5.1	Lion Air that pays attention to passengers.	Gabrielle and Harjati (2019).
			X5.2	Lion Air understands the needs of passengers.	
			X5.3	Lion Air has a caring attitude when serving passengers.	
			X5.4	The interests of passengers always come first for Lion Air.	
6	Customer Loyalty (Y)	According to Arzena (2013), customer loyalty is the attitude of customers who honestly feel satisfaction from the purchase of products or services offered by producers or sellers, so that they will buy these	Y.1	I will use Lion Air again.	Gabrielle and Harjati (2019).
			Y.2	I will continue to use Lion Air and not switch to another airline.	
			Y.3	I would recommend Lion Air to my friends and family.	

		products repeatedly and create long-term relationships.			

RESULTS

The results, out of 120 respondents, 63 (52,5%) were male, 47 (47,5 %) were female. Most respondents 55 (45.8%) were live in Jakarta, 19 (15.8%) from Bogor, 14 (11.7%) from Depok, 15 (12.5%) from Tangerang, and 17 (14.2%) from Bekasi. SPSS was used to analyze the results. Several test particularly related to reliability, validity, and regression were measured using multiple regression approach.

The validity test serves to measure an item or statement item that is made is correct or not. The questionnaire used in this study consisted of 24 statement items. Testing to determine whether it is valid or not by comparing the value of r count and r table (Puspasari & Puspita, 2022). If, r count> r table then the statement item is said to be valid. To get the value of r table can be seen in the frequency distribution table r, so that df (n-2 = 120) on a two-way test with a significance level of 0.05 obtained the value of r table 0.177.

The reliability test was carried out on the question items in the questionnaire which had been declared valid. This test is used to test whether the measuring instrument used is consistent or not if repeated measurements are made. (Erida, 2021). Statement items are considered reliable if the Cronbach Alpha value is> 0.60. The following are the results obtained from the reliability test:

Table 2 Reliability Test

No.	Variable	*Cronbach Alpha*	Keterangan
1.	Tangible (X1)	0.897	Reliabel
2.	Reliability (X2)	0.700	Reliabel
3.	Responsiveness (X3)	0.799	Reliabel
4.	Assurance (X4)	0.807	Reliabel
5.	Empathy (X5)	0.861	Reliabel
6.	Customer loyalty (Y)	0.775	Reliabel

Based on the table above, it shows that the Cronbach Alpha value of X1, X2, X3, X4, X5 and Y> 0.60, so that the research instruments of all variables used have been tested for reliability and declared reliable or reliable to be used as a variable measuring instrument.

Table 3 T-test

Coefficients[a]

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.
	B	Std. Error	Beta		
(Constant)	.429	.624		.688	.493
1Tangible	.074	.030	.159	2.470	.015
Reliability	.150	.055	.200	2.741	.007

Responsiveness	.294	.068	.384	4.335	.000
Assurance	.063	.085	.067	.746	.457
Empathy	.131	.064	.177	2.040	.044

a. Dependent Variable: Customer Loyalty

Based on the results of the T test that has been carried out on a number of research data, the following results are obtained.

a. Partially, the t value of the tangible variable (X1) is 2.470 which is greater than the t table, namely 1.980 with a significance value of 0.015 <0.05. With these results it can be stated that the hypothesis is accepted, namely tangible has an influence on the overall regression model. So, when there is an increase in the tangible variable, it can affect the customer loyalty variable.

b. Partially, the reliability variable (X2) obtained a t value of 2.741 which is greater than the t table, namely 1.980 with a significance value of 0.007 <0.05. With these results it can be stated that the hypothesis is accepted, namely reliability has an effect on customer loyalty. So, the reliability variable has an influence on the entire regression model, so that when there is an increase in the reliability variable, it can affect the customer loyalty variable.

c. Partially, the t value of the responsiveness variable (X3) is 4.335 which is greater than the t table, namely 1.980 with a significance value of 0.000 <0.05. With these results it can be stated that the hypothesis is accepted, namely responsiveness has an influence on the overall regression model. So, when there is an increase in the responsiveness variable, it can affect the customer loyalty variable.

d. Partially, the assurance variable (X4) obtained a t value of 0.746 which is smaller than the t table, namely 1.980 with a significance value of 0.457> 0.05. With these results it can be stated that the hypothesis is not accepted, namely assurance has no effect on customer loyalty. So, the assurance variable has no influence on the overall regression model, so that when there is an increase in the assurance variable, it cannot affect the customer loyalty variable.

e. Partially, the t value of the empathy variable (X5) is 2.0440 which is greater than the t table, namely 1.980 with a significance value of 0.044 <0.05. With these results it can be stated that the hypothesis is accepted, namely empathy has an influence on the overall regression model. So, when there is an increase in the empathy variable, it can affect the customer loyalty variable.

Table 4 Coefficient of Determination (R^2) Result

Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.857[a]	.735	.724	1.235

a. Predictors: (Constant), Tangible, Reliability, Responsiveness, Assurance, Empathy

Based on the results of the data table above, the Adjusted R Square (R^2) is 0.724. This result shows that only 72.4% of tangible, reliability, responsiveness, assurance, and empathy variables

affect customer loyalty. While the remaining 27.6% is influenced by factors other than tangible, reliability, responsiveness, assurance, and empathy. This means that there are still many other things outside of this study that affect customer loyalty, namely as much as 27.6%. Because respondents do not only consider these variables, so there are other factors outside this study.

Conclusion

Researchers tested service quality on Customer Loyalty. This research was conducted on customers who have used Lion Air airlines. The number of respondents or samples used in this study were 120 people. The conclusions in this study include:

This study analyses the influence of various dimensions of service quality, such as Tangible (X1), Reliability (X2), Responsiveness (X3), Assurance (X4), and Empathy (X5), on Lion Air's customer loyalty. The results show that Tangible, which includes the physical aspects of service, as well as Reliability, which reflects service consistency, have a positive and significant effect on customer loyalty. Responsiveness, which relates to the airline's speed and readiness to respond to customer needs, proved to have the greatest and most significant influence compared to other variables. Meanwhile, Assurance, which relates to the sense of security and confidence provided by staff, did not show a significant effect. Empathy, which reflects personal attention to customers, also had a positive and significant effect on loyalty. Overall, the findings confirm that Responsiveness is the key factor in building Lion Air's customer loyalty, followed by Tangible, Reliability, and Empathy, while Assurance has no significant impact..

The results obtained in the following study show that the variables tangible, reliability, responsiveness, and empathy have a significant influence on customer loyalty. The impact of policies that can be understood from the acquisition of this data is that it is important to improve the quality of services that can be felt by customers, then act swiftly on what they need. Companies need to ensure that these various elements continuously receive attention to their strategies for providing optimal service to customers.

Meanwhile, the assurance variable did not significantly influence customer loyalty using the regression model. This finding indicates an important additional focus on advancing and refining service strategies to strengthen customers' trust in the product. Further detailed approaches need to be taken to foster customer confidence, by implementing increasingly transparent and personalised interaction strategies, in order to increase customer loyalty levels.

To conclude, this study provides important insights into the influence of service quality on Lion Air's customer loyalty. With Responsiveness as the main factor influencing loyalty, followed by Tangible, Reliability and Empathy, the company is advised to continue improving these aspects in their service strategy. Although Assurance did not show a significant influence, this opens up opportunities for companies to develop more effective approaches to building customer security and trust. The implementation of more transparent and personalised interactions can be an important step in strengthening trust and increasing loyalty. This study also provides a foundation for future research to further explore other variables that may affect customer loyalty in the increasingly competitive airline industry.

COLONIAL LAND POLICIES AND RURAL TRANSFORMATION IN COCHINCHINA (LATE 19TH - EARLY 20TH CENTURY)

ABSTRACT

This study examines the impact of French colonial land policies on the transformation of Cochinchina's rural economy and society from the late 19th to the early 20th century. Through the analysis of colonial decrees, cadastral records, and archival reports, the paper investigates how land concessions, privatization, and taxation mechanisms enabled the concentration of land in the hands of French landowners and segments of the Vietnamese elite. While colonial authorities promoted plantation capitalism, a dual structure emerged. Some French rural settlers, lacking capital, practiced traditional farming methods with buffalo-drawn plows and tenant labor-indicating a form of reverse acculturation. Simultaneously, many Vietnamese landowning families underwent internal transitions: their French-educated descendants adopted capitalist land management models, leasing lands, investing in rice mills, or participating in export-oriented agriculture. These shifts reshaped class relations in rural Cochinchina, fostering social inequality and generating early forms of peasant resistance. The study argues that colonial land policies not only transformed the rural landscape economically but also laid the foundation for political unrest and anti-colonial mobilization in southern Vietnam.

Keywords: Cochinchina, colonial land policy, rural transformation, land tenure, plantation capitalism, tenant farming, peasant resistance.

1. INTRODUCTION

The transformation of rural Cochinchina under French colonial rule (late 19th - early 20th centuries) reflects a deliberate restructuring of land relations designed to serve both economic extraction and territorial control. As the first territory fully integrated into the French empire in Indochina (1862), Cochinchina functioned as a "colonial laboratory" where land policies were experimented with as instruments for regulating social relations and reorganizing production space. Through a series of decrees, cadastral surveys, and concession regimes, the colonial administration redefined communal tenure, institutionalized private ownership, and transferred the most fertile lands to French investors and their indigenous collaborators.

Two interrelated mechanisms structured this process: legal normalization and economic reorganization. The decrees of November 11, 1878, and December 20, 1899, codified the notion of "vacant" lands and formalized exclusive proprietary rights, while the establishment of the Crédit foncier de l'Indochine provided the financial infrastructure necessary for large-scale agrarian ventures. This system simultaneously expanded commercial agriculture and bound rural Cochinchina to the circuits of colonial credit, embedding extraction within a broader network of financial dependency between metropole and colony.

Grounded in dependency theory and colonial political economy, this study interprets land policy not merely as an administrative mechanism but as a structural form of power through which the empire reproduced asymmetrical relations between core and periphery. From this perspective, land operated as both a productive resource and an instrument of spatial domination, where cadastral mapping, credit institutions, and legal reforms converged as interlocking technologies of control and accumulation. Such a framework illuminates how French colonial land policies reshaped the spatial organization of rural Cochinchina, intensified land concentration and social inequality, and generated new patterns of peasant displacement, resistance, and adaptation.

The dissolution of communal property and the rise of absentee landlordism profoundly transformed rural society. A small stratum of indigenous elites aligned with the colonial administration to consolidate land ownership, while the majority of peasants were relegated to tenancy and dependency. The Procès-verbaux du Conseil colonial (1901-1933) and related administrative reports reveal this dual process of state centralization and rural marginalization, which laid the foundations for latent forms of protest and negotiation within the colonial countryside.

By adopting an interdisciplinary approach and drawing upon French archival sources, colonial council minutes, and modern scholarship (Le, 2020; Son Nam, 2009; Merette, 2013), this paper seeks to elucidate the spatial logic of colonial power. It demonstrates how land governance operated as both an economic and political project one that reconfigured social hierarchies and incorporated Cochinchina into the global capitalist world-economy. In doing so, the study contributes to a deeper understanding of the dynamic interplay between land, space, and power in colonial contexts, positioning Cochinchina not merely as a passive periphery but as an active, structured site within the imperial system where extraction, inequality, and indigenous agency coexisted in complex and contested ways.

2. THEORETICAL FRAMEWORK AND METHODOLOGY

2.1. Theoretical Framework

This paper draws on the theoretical lens of colonial political economy and space-based governance to examine how colonial land policies functioned as instruments of domination and transformation in Cochinchina. Following the works of scholars such as Pierre Brocheux (1995) and David G. Marr (1981), the study views the land not only as an economic asset but also as a

tool for restructuring native society, asserting control over labor, and reconfiguring spatial relations to benefit the colonial power.

The study also integrates insights from dependency theory, particularly in the context of peripheral economies being reshaped to serve the core (France), as argued by André Gunder Frank and Immanuel Wallerstein. Land concessions, cadastral reforms, and the commercialization of rice production are interpreted not merely as economic acts but as mechanisms of colonial extraction and peripheralization.

In addition, this research engages with recent spatial-historical approaches, especially those emphasizing the material and institutional mechanisms of colonial extraction (Osborne, 1994; Rinaudo, 2023). These approaches underscore how colonial rule reorganized physical landscapes - rivers, canals, plots, and villages - as part of a broader logic of imperial governance.

2.2. Methodology

This study employs a multi-method qualitative approach integrating historical reconstruction, logical analysis, and critical interpretation of colonial documents to examine the transformation of land policy and rural structures in Cochinchina from the late nineteenth century to 1930.

The historical method situates land policies within the evolving administrative and economic context of French colonialism, tracing continuities and ruptures in the transition from communal to privatized land tenure. This approach reconstructs how legal, fiscal, and cadastral systems emerged as instruments of both governance and extraction.

The logical-analytical method explores the internal rationality of colonial decrees (arrêtés), council proceedings (procès-verbaux), and administrative texts, revealing the coherence between legal codification, property regimes, and the spatial organization of colonial authority.

Complementing these is critical discourse analysis, applied to legislative records, concession archives, and bulletins such as the Bulletin officiel de l'Indochine and Rapports du Gouverneur général. Through close reading, the study interprets how colonial language encoded ideology, hierarchy, and the spatial imagination of empire.

This methodological triangulation ensures both empirical precision and theoretical depth, allowing the research to interpret land policy not as a technical reform but as a structural mechanism of domination. It thus situates the colonial land regime of Cochinchina within broader debates in postcolonial studies and agrarian political economy, where land, power, and space intersect as core dimensions of dependency and transformation.

3. RESEARCH FINDINGS AND DISCUSSION

3.1. Colonial Land Policies and the Restructuring of Rural Space

3.1.1. Theoretical and Political Foundation of Colonial Land Policies

French colonial land policies in Cochinchina were grounded in a dual logic of political control and ideological conviction, reflecting the broader dynamics of imperial expansion and capitalist accumulation. Central to this framework was the mission civilisatrice the belief that France had a moral duty to "civilize" colonized societies. Within this discourse, land was not merely an economic asset but a symbol of order, sovereignty, and rational governance. Through land laws and concessionary systems, the colonial state sought to dismantle the Vietnamese communal land tenure structure and replace it with a legal and spatial order aligned with capitalist principles of property and productivity.

Colonial administrators portrayed indigenous land management especially village-based communal tenure as archaic and inefficient. Rooted in Confucian ethics and customary law, these systems prioritized social cohesion, collective security, and ancestral attachment to land

rather than market-oriented accumulation. French reformers considered such arrangements incompatible with modern economic development. Consequently, colonial legislation aimed to dissolve communal rights and impose individual land titles modeled on the Code Civil, thereby institutionalizing a new regime of contractual property relations.

One of the most powerful legal instruments underpinning this transformation was the doctrine of terres vacantes et sans maître ("vacant and ownerless lands"). It declared that any uncultivated or underutilized land belonged to the colonial domain, disregarding indigenous practices such as seasonal cultivation, rotational agriculture, and communal usufruct. The Décret du 20 mars 1899 authorized the Governor-General to allocate these lands to settlers, entrepreneurs, and concessionary companies under the guise of agricultural modernization. Temporary grants (concessions temporaires) could be converted into permanent titles (concessions définitives) once cultivation requirements were met, effectively legalizing the expropriation of indigenous lands.

This legal fiction restructured rural society by embedding new property regimes and transferring control from local communities to colonial and comprador elites. The imposition of French land law represented not only economic intervention but also symbolic domination an attempt to replace Vietnamese moral geography with a rationalized spatial order. Village institutions such as the communal council lost authority over land management, and collective memory rooted in ancestral land was progressively eroded. As land became a commodity, speculation intensified, and ownership concentrated in the hands of French settlers and pro-colonial intermediaries.

The trajectory of these reforms reflects the core assumptions of dependency theory, which posits that colonial economies were structurally subordinated to metropolitan interests. In Cochinchina, land policy reoriented agricultural production particularly rice cultivation toward export markets, generating capital outflows that reinforced economic dependency. The outcome also exemplified Boeke's dual economy model, wherein a capitalist enclave economy coexisted with, and marginalized, a subsistence agrarian sector. Spatially, this dualism was materialized through irrigation grids, cadastral divisions, and redefined village boundaries that privileged plantation zones over indigenous farmlands.

Ultimately, colonial land policy in Cochinchina functioned as an apparatus of social engineering. By reorganizing rural space, recoding property relations, and displacing traditional elites, the colonial regime sought to dismantle the socio-cultural foundations of Vietnamese peasant society. This rupture entrenched structural inequality and dependency conditions that would later fuel both economic discontent and anti-colonial mobilization across southern Vietnam.

3.1.2. Legal Frameworks for Public Land Concessions and Stratified Access

In the restructuring of Cochinchina's rural landscape, the French colonial administration issued a series of decrees to regulate the process of reclaiming and utilizing public land (terre domaniale). One of the earliest was the decree dated November 11, 1878, signed by Governor J. Lafont, which allowed individuals to apply for public land concessions in suburban and rural areas, provided they fulfilled tax obligations and adhered to formal procedures for registration and land use. Article 6 of the decree states: "Land cultivation permits must be written in French and Annamite, indicating as precisely as possible the area and boundaries of the property in question, as well as the minimum number of hectares to be cultivated annually. The permits must also state the date from which the land will be subject to tax and when it must be alienated definitively" (Arrêté du 11 novembre 1878, 1878, Art. 6).

This provision reveals the colonial state's intent to control land development not only administratively but also physically, ensuring that land was used productively and not left idle.

However, subsequent regulations became increasingly restrictive, differentiating access by land size, social class, and intended use. According to Son Nam's History of Southern Land Reclamation, from the late 19th to early 20th century, multiple decrees were issued that tightened conditions for concessions, thereby creating structural disparities in access to public land:

• The Decree of October 15, 1890 mandated that recipients must cultivate the land within five years or face reclamation by the state for public use (e.g., canal digging, road construction).

• The Decree of May 10, 1893 prohibited "frontage cultivation," limiting concessions to no more than one-quarter of the land perimeter along rivers or canals to prevent speculative acquisition of high-value waterfront properties.

• The Decree of October 13, 1910 authorized the official sale of reclaimed public land at negotiated prices (concessions à titre onéreux), especially for rubber plantations - opening the door to large-scale investment by French capital and local elites.

• The Decree of October 4, 1928 banned the practice of fait accompli land grabs (clearing land first and legalizing later), a measure that drastically reduced access for the rural poor and discouraged settlement in areas like Rach Gia and Bac Lieu.

• The Decree of June 25, 1930 restricted concession zones to about 150,000 hectares in Bac Lieu and 80,000 in Rach Gia - mostly acidic or poorly drained soils, making further reclamation increasingly difficult (Son, 2009, pp. 175-176).

These regulations produced a stratified legal system in which wealthy landlords - who could afford capital, navigate bureaucracies, and manipulate administrative processes - were able to secure large concessions. Meanwhile, poorer peasants, unable to meet the requirements or maintain cultivation schedules, were gradually excluded from land access.

As Son Nam observed: "The law stated that the 10-hectare plots granted by provincial administrators could not be sold during the temporary concession period… but the colonial authorities deliberately tolerated usurious lending practices, forcing small landowners to surrender their holdings to pay off debts." (Son, 2009, p. 146).

Through increasingly rigid and elitist decrees, the mechanism of temporary concession followed by definitive transfer became the legal backbone for transforming public land into private holdings. While framed as a policy of rural modernization and agricultural development, these colonial legal structures effectively facilitated land concentration among elite actors and French investors, undermined communal landholding traditions, and deepened social inequality in rural Cochinchina. These developments laid the groundwork for the patterns of agrarian stratification that will be explored in the following section.

3.1.3. Administrative Mechanisms and Local Implementation

The effectiveness of colonial land policies in Cochinchina did not depend solely on decrees issued from the metropole but rather on a multi-layered administrative apparatus designed to translate colonial intent into concrete local action. At the center of this apparatus were the Governor of Cochinchina, the Department of Lands and Survey (Service des Domaines), and the Colonial Council (Conseil Colonial) institutions that collectively managed the processes of land measurement, allocation, registration, and transfer.

At the top of the hierarchy stood the Governor of Cochinchina, who held near-absolute executive power to approve, amend, or revoke land concession decisions. The Governor was

the ultimate authority in converting temporary concessions into permanent ownership and had full discretion to grant land to individuals or companies deemed capable of "effective exploitation." During the administrations of Paul Beau and Albert Sarraut, this authority was exercised to accelerate land concessions for French investors under the pretext of boosting rice exports, often infringing upon customary land rights long held by local communities.

The Service des Domaines served as the technical and legal branch of the colonial state, responsible for identifying so-called "vacant and ownerless lands" (terres vacantes et sans maîtres), conducting cadastral surveys, classifying lands, and formalizing property titles. Between 1900 and 1925, the department carried out large-scale land measurement and mapping programs that redefined the rural geography of Cochinchina. This process reflected the colonial conviction that effective possession and productive exploitation required administrative and spatial mastery of the territory.

The Conseil Colonial represented the political and legislative dimension of the colonial administration. Although nominally consultative, the Council was composed primarily of French planters, commercial elites, and a small number of pro-colonial Vietnamese intellectuals. It approved taxation rules, long-term concession policies, and economic privileges for major estate owners, thus formalizing the alliance between the colonial state and the emerging indigenous landlord class. As Tran Nam Tien and Nguyen Thi Anh Nguyet (2022, p. 10) observed, "the colonial authorities actively supported and legitimized land accumulation by major landlords, who in turn dominated rural administrative structures". In the Procès-verbaux du Conseil Colonial of 9 October 1905 (p. 114), a Vietnamese representative declared: "We, the natives, express our gratitude to the Colonial Council for bringing us this new organization". This statement reveals the symbolic role assigned to Vietnamese representatives in colonial politics as passive beneficiaries rather than active participants in policy formation.

In practice, this administrative system enabled Franco-indigenous elites to consolidate both power and landownership. Local officials many themselves concession holders used their positions to adjust land classifications, legalize transfers, and pressure indebted peasants into relinquishing property. Under the rhetoric of "rational exploitation" and "agricultural progress", the colonial bureaucracy effectively legitimized land concentration and transformed local governance into an instrument for maintaining social inequality.

Thus, the colonial administrative system functioned not merely as a management structure but as an institutionalized mechanism of domination, where power operated through registration, taxation, and legal certification. Within this bureaucratic framework, colonial authority penetrated deeply into rural life, reshaping economic space and reinforcing structural dependency between the colonial state, the landlord elite, and the peasant population.

3.1.4. Spatial Restructuring of the Rural Landscape

French colonial land policies in Cochinchina not only redefined ownership structures but fundamentally transformed the spatial configuration of rural society. Between 1890 and 1930, the transition from communal, village-based agriculture to expansive plantation monoculture reshaped the countryside in accordance with the colonial agenda of export-oriented production and administrative control. Before colonization, Vietnamese rural communities operated under a communal landholding system in which fields were allocated according to family labor needs. This traditional framework was gradually dismantled through concessionary laws, particularly the 1899 decree, which converted village commons into privately held plantations. As Son Nam (2009) observes, the French authorities justified concession policies as a means of "reclamation", but in practice they enabled a small group of politically connected landowners to appropriate public lands without regard for traditional communal rights. The non-transparent allocation process, together with a biased legal framework and bureaucratic complexity, led to

persistent conflicts such as the Ninh Thanh Loi (1927) and Noc Nan (1928) cases. According to Son Nam: "The powerless villagers could only appeal… The investigating committee was composed entirely of officials unfamiliar with customary law, and the locals always lost the case. The colonial legal system regarding land reclamation was nothing more than a trap to ensnare honest people" (p. 268). The erosion of communal protections blurred the boundaries between public, communal, and private property, laying the foundation for enduring inequalities in land access and rural power.

The transformation of spatial organization was visible across the southern provinces, where traditional villages organized around shared rice paddies and collective labor were replaced by large-scale plantations and infrastructural corridors. In provinces such as Thu Dau Mot, Gia Dinh, Tay Ninh, and Ba Ria, French investors obtained concessions covering hundreds or even thousands of hectares. As Le Huu Phuoc (2017, p. 16) records, Thu Dau Mot had the largest plantation area in Cochinchina, totaling 14,078 hectares including the Loc Ninh, An Loc, Xa Cam, and Xa Trach estates. These estates were strategically located along transportation routes to facilitate export and to consolidate administrative supervision. This deliberate spatial reengineering reflected the colonial state's attempt to merge economic extraction with territorial management.

Such restructuring came at a profound human cost. The system of concessions définitives legalized long-term alienation of peasant land, forcing many farmers from ancestral holdings and converting them into tenants on estates that had once been communal. In My Tho, for example, French planter Taillefer claimed exclusive ownership over entire islets, declaring that the inhabitants were his "tenant farmers and coolies" and that "the government had no right to reestablish villages as in the old days" (Son, 2009, p. 163). This process of dispossession contributed to the emergence of a dependent rural labor class, often recruited as seasonal workers for expanding rubber plantations. By 1925, regions such as Thu Dau Mot had become centers of monoculture, where villages were absorbed into estate perimeters and local autonomy effectively dismantled.

The expansion of rice-producing corridors in the Mekong Delta further demonstrated the spatial logic of colonial governance. Between 1900 and 1930, cadastral surveys and land classification were conducted in My Tho and Sa Dec to reorganize traditional paddies into grid-like irrigation zones. Canal and dike systems were expanded to sustain year-round cultivation, while villages were relocated or restructured into linear clusters along transportation routes to facilitate both export and population control. This reordering of agricultural space blurred the distinction between economic policy and territorial discipline.

The administrative reorganization of rural Cochinchina was closely tied to this spatial transformation. The Service des Domaines, working with provincial officials, undertook extensive cadastral registration and boundary demarcation to replace communal ownership with individualized titles. As Vo Xuan Dan notes, the colonial government conducted large-scale cadastral registration… to fully control land resources and optimize extraction. Decrees issued in 1904 and 1927 redefined village governance, transforming previously autonomous communities into subordinate administrative units for taxation and labor mobilization. These processes deepened the reach of colonial authority into the rural landscape, eroding traditional institutions and embedding new hierarchies of power and dependency.

In sum, colonial land policies in Cochinchina did more than alter property relations; they restructured the entire spatial and social order of the countryside. Communal villages were replaced by plantation zones, subsistence farming gave way to monoculture production, and local autonomy was supplanted by bureaucratic control. This spatial reorganization not only

institutionalized inequality but also produced lasting patterns of dispossession and rural unrest that continued to shape Cochinchina's social fabric well into the twentieth century.

3.1.5. Colonial Infrastructure and the Reconfiguration of Land Relations

The development of colonial infrastructure in Cochinchina particularly roads, canals, and railways not only served as logistical support for economic exploitation, but also functioned as a tool to restructure land relations and rural social hierarchies. Under the guise of modernization, these projects undermined traditional land ownership systems and facilitated the concentration of land in the hands of colonial authorities and local elites.

Canal construction in provinces such as Sa Dec and My Tho helped expand the agricultural frontier and connected remote villages to colonial markets. However, this process also involved the appropriation of adjacent communal lands that were traditionally used by village communities. As Son Nam observes: When the French arrived, they recognized all cultivated land as colonial property. The colonial state became the de facto owner of all land within the colony, and anyone who wanted to claim legal ownership had to obtain approval from the Governor of Cochinchina (Son, 2009, p. 148). This redefinition of land status led to the dispossession of many local residents, stripping them of legal claims to ancestral lands they had occupied and cultivated for generations.

The same spatial logic applied to the construction of major roads such as Route Coloniale No. 1 and the Saigon - My Tho railway, which cut through village commons and facilitated surveying, cadastral registration, and concession allocation. Colonial infrastructure was not a neutral technical endeavor; it was an explicit manifestation of the extractive, controlling, and reorganizing logic of the colonial regime imposed upon rural space in Cochinchina.

The development of transportation infrastructure under French colonial rule in Cochinchina including roads, canals, and railways was not solely intended to support the logistical needs of economic exploitation; it also served as a powerful spatial mechanism for restructuring land ownership and rural relations. Major canal projects such as the Xa No and Rach Gia - Ha Tien canals penetrated deep into previously uncultivated regions of the Long Xuyen Quadrilateral, not only expanding rice cultivation zones but also resulting in the expropriation of communal village lands and ancestral holdings traditionally governed by customary usage rights. Many of these surrounding areas were reclassified as terres domaniales (public lands), subsequently auctioned or granted to French companies and Vietnamese landlords loyal to the colonial administration.

The construction of the Saigon - My Tho railway (completed in 1885) and later the Transindochinois line in the early 20th century further intensified the spatial fragmentation of rural territories. Roads such as Route Coloniale No.1 connected key economic regions, while railway lines traversed plantation zones, facilitating the large-scale collection and export of rice and rubber. As Ngo Minh Oanh and Banh Thi Hang Tam (2015) observed, "all transport routes were built with the aim of linking rivers, ports, and railways connecting local areas to the Saigon - Cho Lon center in order to stimulate large-scale exploitation of rice and commercial crops" (Ngo, 2015, p. 11).

These infrastructural developments not only enabled colonial economic extraction but also transformed the patterns of rural settlement, undermined customary land tenure, and accelerated land concentration. Villages that were once autonomous and self-contained were gradually restructured into nodes within a broader extractive economy centered on the interests of the colonial regime and the local elite.

In sum, colonial infrastructure in Cochinchina was not neutral; it was embedded within an extractive spatial logic that reconfigured rural land relations, enabling dispossession, enhancing surveillance, and transforming the very landscape into a colonial asset.

3.2. Land Concentration and the Rise of Agrarian Elites

3.2.1. Mechanisms of Land Concentration under Colonial Rule

The concentration of land in colonial Cochinchina was the deliberate outcome of a coordinated system of legal, financial, and administrative measures designed by the French colonial regime to institutionalize inequality and facilitate capital accumulation. Through a complex legal framework, the colonial authorities transformed communal and unclaimed lands into alienable private property, thereby dismantling traditional land tenure and concentrating ownership in the hands of colonial settlers and a small indigenous elite. As Pham Cao Duong (1985, pp. 263-264) explains, the administration relied on instruments such as the Arrêté du 20 décembre 1899 to codify concessions temporaires and concessions définitives, using these categories to distribute extensive tracts of so-called terres vacantes et sans maîtres to French investors and politically connected Vietnamese. This legal process was justified through a distorted interpretation of imperial sovereignty, whereby the French invoked the Annamese emperor's eminent domain rights to declare large areas as state property and subsequently allocate them to favored concessionaires after "sufficient improvement" and cadastral verification criteria that inherently favored those with financial and bureaucratic influence. Beneath the appearance of administrative rationality, the system functioned as a mechanism of exclusion, eroding indigenous rights and facilitating large-scale land accumulation. Financial institutions reinforced this concentration. The Banque de l'Indochine and the Banque Franco-Chinoise pour le Commerce et l'Industrie played decisive roles in channeling metropolitan capital into Cochinchina's plantation economy. Statistical data from the Annuaire Statistique de l'Indochine (1930, pp. 21, 211-214) show rapid growth in deposits and credit portfolios between 1925 and 1930, paralleling the expansion of large estates. The Banque de l'Indochine, headquartered in Paris with major branches in Saigon, Hanoi, and Haiphong, not only controlled currency issuance but also extended mortgage credit to concessionaires and plantation syndicates; its circulating assets rose from 38.9 million piastres in 1927 to 48.6 million in 1929, coinciding with the surge in colonial land speculation. Meanwhile, smallholders were systematically excluded from this financial network. Without definitive land titles or sufficient collateral, Vietnamese peasants were unable to obtain long-term credit, leaving them dependent on informal lenders and vulnerable to dispossession during economic downturns. As a result, the colonial banking system acted as a financial filter, channeling liquidity toward French and comprador elites while marginalizing the indigenous population. In addition to credit mechanisms, the colonial state institutionalized ventes domaniales public land auctions that reclassified communal holdings as domaines publics and sold them under the pretense of development. The proceedings of the Conseil Colonial de la Cochinchine (1906, p. 119) record a revealing case in which two settlers, Berquet and Luya, purchased 1,567 hectares of swamp land in the Plaine des Joncs for 1,784 piastres and later sought tax exemption, claiming the land was uncultivable. Their request was denied by Lieutenant-Governor De Lalande-Calan, who declared that by purchasing rice-suitable land, "they had engaged in speculation for which they alone must bear the risks". This decision, upheld by the Colonial Council, codified a distinction between concessionaires depicted as agents of progress and auction buyers portrayed as mere speculators. Such legal differentiation legitimized both the privatization of communal property and the concentration of land among elite actors. Ultimately, the convergence of legal authority, financial leverage, and administrative control transformed land in Cochinchina from a communal resource into a taxable commodity. This new agrarian order entrenched inequality,

subordinated the peasantry, and established the structural foundations of dependency that defined rural society under colonial rule.

3.2.2. Profiles of Agrarian Elites: From Traditional Notables to Capitalist Landlords

Under French colonial rule, the concentration of land in Cochinchina was accompanied by the emergence of a new agrarian elite whose influence extended beyond the economic domain into politics and culture. This elite class evolved through the fusion of traditional notability, commercial acumen, and colonial patronage, forming a hybrid social group that mediated between the colonial state and Vietnamese society. Many early members of this class descended from the mandarinate and village notables of the Nguyen dynasty, who adapted to colonial power through their literacy, administrative experience, and social prestige. Their ability to navigate new legal frameworks allowed them to convert communal lands into private holdings and secure colonial concessions. As Vo Xuan Dan notes, the introduction of cadastral surveys and Western-style property registration profoundly altered rural structures, giving rise to a class of large landowners both French colonists and Vietnamese collaborators who increasingly dominated local landholding. By the late nineteenth century, these traditional elites had been transformed into capitalist landlords, managing large monoculture estates supported by French legal decrees and networks of credit and patronage.

The career of Tran Trinh Trach in Bac Lieu epitomizes this transition. Emerging from modest origins as a trader, Trach accumulated wealth through colonial land auctions and concessions that restructured the Mekong Delta's agrarian landscape. According to Son Nam (2009, pp. 230-231), as early as 1873, lands in Vinh Huong (later Vinh Loi) were auctioned at "one and two-fifths cents per square meter", marking some of the earliest public land sales in southern Vietnam. By 1882, Bac Lieu province contained over 810,000 hectares of land, but only about 14,700 were cultivated leaving vast tracts open to speculative acquisition under French supervision. The decrees of 1879 and 1899 that reclassified communal fields as public domains accelerated this process. As Vo Xuan Dan explains, cadastral registration and titling effectively legalized the transfer of communal and peasant land to private hands, consolidating a new class of rural magnates detached from traditional village life. Figures like Trach, who combined commercial capital with administrative privilege and access to colonial finance, became emblematic of this process. By the early twentieth century, Bac Lieu had emerged as a center of rice production controlled by a handful of powerful landlords, illustrating how colonial legal and financial mechanisms produced a class of indigenous capitalists rooted in land accumulation rather than inherited aristocracy.

By the 1920s, this landlord stratum expanded into an urban-educated, politically active bourgeois-Confucian nexus. Individuals such as Bui Quang Chieu, Nguyen Van Thinh, and Nguyen Phan Long embodied a hybrid elite that blended Confucian respectability with Western education and capitalist enterprise. Bui Quang Chieu (1873-1945), trained at the Grignon School of Agriculture in France, returned to Cochinchina as an agronomist and became one of the largest landowners in Tra Vinh while founding the Indochinese Constitutionalist Party in 1923. As Brocheux (1995, pp. 141-147) observes, Chieu represented "a rational, modern bourgeoisie rooted in land and commerce", articulating reformist collaboration as a means of national progress within the colonial framework. Similarly, Nguyen Phan Long (1889-1960), a journalist, businessman, and later mayor of Saigon, merged political modernism with economic ambition. As editor-in-chief of La Tribune Indochinoise, he championed press freedom and self-representation while investing heavily in real estate and rural estates. Alongside Nguyen Van Thinh, these men managed estates as absentee landlords and engaged in colonial politics as reformists, espousing ideals of progress and civilization while remaining bound to the property hierarchies of the colonial order.

As Marr (1981) and McHale (2004) note, this hybrid elite acted as an intermediary class modern yet conservative, nationalist yet collaborationist. It consisted of Confucian families, Chinese merchants, indigenous landlords, and French bourgeois settlers linked through access to land, credit, and legal privilege. Despite differing origins and accumulation strategies, they all functioned as agents of colonial capitalism and pillars of rural inequality. This agrarian bourgeoisie, forged at the intersection of colonial policy and local adaptation, not only sustained the extractive structure of the colonial economy but also shaped the sociopolitical landscape of Cochinchina on the eve of modern nationalist movements.

3.2.3. Financial Institutions and Credit Access under Colonial Rule

One of the key drivers of land concentration and the entrenchment of agrarian elites in colonial Cochinchina was the financial infrastructure established by the French administration. Through institutions such as the Banque de l'Indochine and the Crédit Foncier de l'Indochine (CFI), colonial capitalism created a dual credit system that favored French settlers and indigenous elites while systematically excluding smallholders and poor peasants.

Founded in 1875, the Banque de l'Indochine operated as a semi-official financial arm of the colonial state, facilitating large-scale investment in trade, agriculture, and public works. Concentrating its operations in Saigon and Cho Lon, it extended credit to export firms, rice millers, rubber companies, and major landowners mostly French settlers or Vietnamese collaborators. As Phan Ha Uyen (1978, pp. 150-153) documented, these financial flows were deliberately structured to repatriate profits to France. Annual capital transfers exceeded 300,000 gold francs, while dividends to French shareholders averaged 5-7 million piastres per year. "Indochina", Phan wrote, "was being drained of its wealth L'Indochine est dévalisée". By the 1920s, the Bank's annual profits surpassed 30 million francs, yet its services remained highly exclusive (Duong, 2020, p. 101).

The agricultural credit system established under French rule particularly through institutions such as the Sociétés Indigènes de Crédit Agricole Mutuel (SICAM) was officially designed to promote rural development but, in practice, reinforced class-based inequality. It systematically privileged large landowners while marginalizing smallholders, tenant farmers, and landless peasants. Although, from 1928 onward, the colonial government authorized SICAM branches to use reserve funds to lend to producers without land, archival evidence indicates that such provisions rarely benefited the intended groups. As Pham Quang Trung (2005, p. 267) observed, most borrowers already held land titles and were able to pledge real estate as collateral, perpetuating structural imbalances in access to credit.

SICAM institutions were dominated by wealthy landowners, who served as both shareholders and board members, turning these cooperatives into instruments of elite consolidation. Local notables leveraged their influence to direct credit flows toward their own class and reinforce their socioeconomic dominance. Contemporary commentators sharply criticized this pattern, accusing the colonial state of favoring affluent proprietors while neglecting the growing population of impoverished tenants (Pham, 2005, p. 266).

This institutional bias was further entrenched by the exclusionary design of the colonial credit system. In a 1931 session of the Indochina Budget Council, French economist Paul Bernard highlighted the systemic barriers facing smallholders, noting that agricultural credit "hardly ever reached" the peasantry except through large landowners. Acting as guarantors, these intermediaries extracted high interest rates, making formal credit inaccessible to poor cultivators. Bernard (1934, pp. 75-76) emphasized that seasonal loans whether in kind or in cash were monopolized by large and medium proprietors, while "small proprietors and tenant farmers remained defenseless, caught between rapacious landlords and the ambiguity of colonial governance."

More broadly, this dual financial structure perpetuated inequality by ensuring privileged access to institutional capital for the propertied elite. Landowners could use credit to expand holdings, modernize agricultural production, or speculate in land markets, while poorer cultivators were trapped in cycles of indebtedness and dependence on informal, often usurious lending networks. Credit, therefore, functioned not only as an economic instrument but also as a political tool distributed selectively to loyal colonial collaborators and provincial elites to secure their allegiance and reinforce the political foundations of colonial rule in rural Cochinchina.

3.3. Rural Stratification, Legal Exclusion, and Economic Dependence

Under French colonial rule, rural society in Cochinchina experienced a profound restructuring marked by the concentration of land ownership and the emergence of new social hierarchies. The traditional system of communal lands long the foundation of collective property and village autonomy was gradually dismantled through Western-style cadastral surveys, boundary demarcations, and the issuance of individual land titles. As Vo Xuan Dan observed, the measurement, demarcation, and establishment of land ownership under Western methods in Cochinchina brought about major changes in the structure and nature of land tenure. A class of large landowners composed of French colonists and indigenous collaborators emerged and increasingly dominated rural society. The creation of this new elite was facilitated by a legal framework that allowed land accumulation through concessions, public auctions, and the purchase of plots from indebted peasants. Members of this class included local officials, Chinese merchants, French settlers, and reformist intellectuals from Confucian backgrounds. They were not merely landowners but also intermediaries within the colonial administrative, financial, and tax systems, linking the peasantry to the apparatus of colonial extraction.

In contrast, the vast majority of peasants were drawn into deepening economic dependency. Many were forced to rent land at exorbitant rates, subjected to exploitative labor relations, or compelled to sell their holdings following crop failures, floods, or market crises. Agricultural credit institutions, though nominally created to promote productivity, were accessible only to those possessing land titles and administrative connections. Peasants who lacked legal documents or literacy in French were effectively excluded from formal credit systems, pushing them toward private moneylenders. As early as the 1860s, the colonial government recognized the problem of usury. In an 1869 report, Tran Ba Loc condemned “wealthy men using deceitful tricks to oppress the poor and lend money at rates contrary to fairness” (Pham, 2005, p. 96) one of the earliest documented statements on rural credit injustice. This condition persisted into the twentieth century, dominated by Chinese and Indian (Chetty) moneylenders who exploited rural borrowers through compound interest. Investigations revealed that while Chetty lenders officially charged 12 percent annual interest, actual rates were far higher. One landlord in Can Tho borrowed 700,000 piastres between 1906 and 1931 yet still owed 130,000 piastres by the end of the period. Between 1910 and 1930, loans from these groups totaled more than 182 million piastres, an enormous burden on rural debtors (Pham, 2005, p. 106).

Meanwhile, formal institutions such as the Banque de l’Indochine and SICAM funds failed to serve the native peasantry effectively. Access to credit required complex legal and financial qualifications beyond the reach of most cultivators. Even the so-called “reimbursable advance funds” (fonds d’avances remboursables), ostensibly designed to support agriculture, were distributed through village councils and disproportionately benefited local notables and individuals with administrative influence (Pham, 2005, pp. 98-99). Consequently, large segments of the rural population particularly in Long Xuyen, Vinh Long, and Can Tho were excluded from formal credit channels and forced to rely on private lenders. Rent levels were high, tenants bore all production costs, and debts were deducted directly from harvests, perpetuating a vicious cycle of dependency and dispossession.

Alongside these economic mechanisms, legal structures of exclusion further entrenched inequality. The Arrêté du 15 octobre 1890 prohibited grantees from mortgaging or transferring land during the first five years of a concession, with any violation resulting in reversion to the colonial domain (retour au domaine) (art. 8). This clause became a legal device for reclaiming land from native cultivators and redistributing it to pro-French elites. The Session extraordinaire de 1903 of the Conseil colonial de la Cochinchine provides several examples of this process. In Can Tho, the concession of Sammarcelli was reviewed after a field investigation, and the report concluded that the property must be "returned to the colonial domain while maintaining the rights of the indigenous inhabitants already settled there" (pp. 8-9). This statement acknowledged local occupants only as temporary residents without legal ownership. In the same session, the Council discussed a case in Rach Gia where land was transferred from Vietnamese peasants to Dejean de la Bâtie, a French lawyer, with the justification that the transaction was "very advantageous for the public treasury" (p. 14). Such rulings reveal that colonial legality functioned as an administrative mechanism to legitimize expropriation and the transfer of ownership from indigenous farmers to colonial beneficiaries.

After these seizures, many local residents lost both legal recognition and social standing, becoming tenants on the very land they once owned. The minutes of the 1903 session show that officials merely promised to "regularize later the situation of all these indigenous occupants" ("régulariser ultérieurement la situation de tous ces occupants indigènes") without defining any procedure or timeline (pp. 8-9). This calculated ambiguity ensured the subordination of indigenous cultivators under a veneer of bureaucratic legality. The situation worsened after the ninth session of October 16, 1903, when the Council extended the application of the décret sur l'indigénat (Native Code) beyond its intended scope. Although it was originally applicable only to natives of Cochinchina, officials "did not hesitate to extend it to Cambodians under the Protectorate, to people from Hue, and even to Chinese residents" (p. 142). This arbitrary expansion stripped non-French populations of judicial recourse and formal protection, institutionalizing racial discrimination within the colonial land and legal system.

In essence, French land and legal policies in Cochinchina amounted not merely to material expropriation but to the systematic erosion of legal personhood. By depriving the rural population of property rights and recognizing them only as "temporary legal residents", the colonial state transformed them into a dependent labor force submissive, controllable, and politically voiceless. This structure of economic exploitation and legal subordination sustained colonial domination under the guise of modernization, rule of law, and administrative order.

3.4. Resistance and Adaptation of Rural Communities

3.4.1. Forms of Resistance and Political Expression

The intensification of colonial land policies in Cochinchina from the late nineteenth to the early twentieth century provoked not only economic deprivation but also multiple, interwoven forms of rural resistance. While large-scale uprisings were rare compared to Tonkin or Annam, Cochinchinese peasants and local elites adopted a repertoire of protests that combined legal petitions, passive disobedience, and emerging political mobilization.

The most common form of peasant protest was the submission of petitions and collective complaints, which served as the only legitimate means to contest expropriation and administrative injustice. Archival evidence shows that by the early twentieth century, such petitions had become a recurrent issue for colonial authorities. During the session of the Conseil Colonial de la Cochinchine on 21 October 1901, Councilor Holbé complained that "when a European applies for a large land concession, certain Annamites allegedly did not hesitate to file frivolous claims... forcing the applicant to waste time and money proving that the land does not belong to them", and urged strict enforcement to prevent "similar incidents" (Conseil

colonial de la Cochinchine, 1901, p. 14). Yet, Councilor Ninh countered that many of these petitions were justified since "the natives possessed valid deeds or had occupied the lands for generations", calling for careful examination "to prevent new injustices" (Conseil colonial de la Cochinchine, 1901, pp. 14-15). This exchange reveals the dual nature of colonial legality allowing indigenous participation through formal procedures while suppressing it when European interests were threatened. It also exemplifies how local populations transformed the bureaucratic apparatus into a site of negotiation, articulating a nascent form of political consciousness through legal language and administrative engagement.

Beyond petitions, peasants frequently resorted to quiet, nonviolent acts of resistance within the colonial framework itself. Records from the Procès-verbaux du Conseil Colonial de la Cochinchine (session of 5 December 1903) noted that many "Annamite cultivators" continued to occupy and work the lands even after concessions were granted to others: "These indigenous inhabitants had been granted cultivation permits; therefore, the Commission drew the Administration's attention to these facts" (Conseil colonial de la Cochinchine, 1903, p. 27). The persistence of these cultivators, who refused to vacate their plots despite eviction orders, reflected both moral attachment to ancestral property and subtle defiance against dispossession. As another Council member observed, "the Administrator was aware of the situation; the Annamites trusted the word given by the Administrator, who had issued them cultivation permits" (Conseil colonial de la Cochinchine, 1903, p. 27). Such endurance blurred the line between legality and defiance, turning the permis de cultiver into both a symbol of hope and a quiet tool of protest.

By the 1920s, rural discontent had converged with the growing political activism of urban intellectuals. The structural inequality of land auctions, which often benefited colonial elites and excluded peasants, became a focal point of social critique. As Pham Cao Duong noted, "Once a land concession was requested, the plot was usually put up for auction, and in most cases, the first applicant who enjoyed a privileged position was the beneficiary. The unfortunate peasant, ignorant of administrative procedures, could not possibly participate in the auction and soon became a tenant of the new landowner" (Pham, 1985, pp. 268-269). Discussions in the Conseil Colonial often ignored peasant petitions on overtaxation and indebtedness, leading even moderate figures such as Bui Quang Chieu to denounce the heavier fiscal burden imposed on Vietnamese taxpayers (Conseil colonial de la Cochinchine, 1928, pp. 105-106).

Simultaneously, the colonial public sphere became a platform for political expression through the press and associations. Newspapers such as La Tribune Indochinoise and La Cloche Fêlée voiced rural grievances and criticized colonial exploitation. Intellectuals like Nguyen An Ninh used journalism, pamphlets, and public lectures to mobilize against social injustice. As Philippe Peycam recounts, Ninh's Young Annam Party a secret organization near Ba Diem and Hoc Mon combined traditional networks and modern activism, drawing support from peasants, artisans, and middle-class nationalists. French surveillance described it as a group that urged peasants not to pay taxes and spread rumors intended to incite popular anger against the established political order (Peycam, 2012, pp. 155-156).

These intertwined developments illustrate that resistance in Cochinchina was not merely sporadic or reactive but a continuum of moral, legal, and political engagement. Through petitions, persistence in cultivation, and emerging forms of political communication, Cochinchinese peasants and intellectuals collectively transformed colonial constraints into opportunities for contestation, setting the groundwork for democratic and nationalist mobilization in early twentieth-century southern Vietnam.

3.4.2. Strategies of Adaptation and Rural Survival

Under the pressures of land dispossession and economic exploitation, peasants in colonial Cochinchina developed various strategies of adaptation that, while less visible than overt resistance, were essential for survival. These forms of adjustment reveal how rural communities negotiated with the colonial order seeking to endure, adapt, and subtly resist within the structures of domination.

As the concession system intensified, large numbers of dispossessed peasants were drawn into migrant labor. The Réglementation du Travail en Indochine (1930, pp. 19-23) recorded how the colonial government institutionalized the recruitment of rural laborers for plantations, railway construction, and public works. The 1929 labor code imposed detailed rules on recruitment, housing, and sanitation, requiring dormitories of twenty workers per unit and medical inspection prior to employment. These regulations turned displacement into a managed process of labor mobilization, transforming the rural poor into a regulated workforce. Many peasants moved seasonally between the countryside and plantation zones or settled permanently in the industrial outskirts of Saigon and Cho Lon, forming the nucleus of a colonial working class whose survival depended on mobility and adaptation rather than subsistence agriculture (Gouvernement général de l'Indochine, 1930, pp. 19-23).

Facing the erosion of village autonomy, rural society also restructured its internal institutions. Traditional notables retained influence as mediators between the state and villagers in tax collection, land disputes, and labor recruitment. Wealthy Vietnamese elites, particularly those granted French citizenship (assimilés), emerged as new patrons who offered loans and tenancy contracts in exchange for allegiance. This recreated a hierarchy of dependency that mirrored colonial structures while maintaining fragments of social cohesion. Catholic parishes played a parallel role in reorganizing community life and social welfare. According to the Procès-verbaux du Conseil Colonial de la Cochinchine (1928, pp. 173-174), the colonial government granted Father R. P. Dalle a 300-hectare concession in Soc Son (Rach Gia) under the condition that he establish "a church, a presbytery, a school, or a nursery" to "settle the Annamite labor population in the region". The Church thus functioned as both a spiritual center and a refuge, mediating between governance and protection in the reconfigured rural landscape.

Legal adaptation became another critical dimension of survival. Many peasants sought to secure cultivation rights through petitions, hearings, and applications for concessions temporaires or marchés de gré à gré. Rather than rejecting the colonial legal order, they engaged with it pragmatically using its procedures to negotiate limited rights. A notable example appears in the Procès-verbaux du Conseil Colonial de la Cochinchine (1928, p. 182), which records the case of Bui Van Bau of An Hoa Dong village (Sa Dec). His petition for regularization of 8.35 hectares of terrain domanial faced four competing claims; after review, the Commission administrative dismissed the objections and granted him the concession, noting that "the interests of the domain and the applicant were thereby reconciled". Such cases demonstrate that even within asymmetrical power structures, peasants were not passive victims. Through selective compliance and bureaucratic literacy, they carved out fragile spaces of autonomy and preserved fragments of economic stability.

In essence, adaptation in Cochinchina embodied a form of quiet resilience. By shifting occupations, maintaining networks of patronage, and mastering the colonial administrative language, peasants transformed survival into an active process of negotiation. Their actions revealed not surrender but agency an everyday politics of endurance and adjustment within the rigid boundaries of colonial rule.

4. CONCLUSION

This study has demonstrated that French colonial land policies in Cochinchina between the late nineteenth and early twentieth centuries were not merely administrative interventions but deliberate instruments of spatial domination and social restructuring. Through a critical examination of decrees, legal frameworks, land concession systems, and archival records, the research has shown how the colonial state systematically dismantled indigenous village-based landholding traditions to establish a dual agrarian economy favoring settlers and local elites.

The analysis identified four interrelated dimensions of this transformation: (1) the legal and political logic underpinning colonial land appropriation; (2) the emergence of landed elites and financial institutions that consolidated agrarian capitalism; (3) the deepening of rural inequality and the erosion of communal autonomy; and (4) the multifaceted forms of resistance and adaptation developed by local communities.

These findings reveal that colonial land reform in Cochinchina was not a linear process of modernization but a violent restructuring of space, economy, and class relations. Land policies operated simultaneously as tools of economic exploitation and as mechanisms of political control, producing enduring patterns of inequality that persisted long after the colonial period.

Beyond its historical significance, this study contributes to broader debates on postcolonial governance, agrarian transformation, and peasant agency. It underscores that rural society under colonial rule was not a passive victim but a dynamic field of negotiation, adaptation, and moral resistance.

Future research could extend this analysis by comparing Cochinchina's trajectory with that of Tonkin and Annam or by exploring how early twentieth-century rural land conflicts shaped the ideological foundations of Vietnamese nationalism. Integrating GIS-based spatial analysis with oral histories would further deepen our understanding of how land, labor, and identity intersected within the lived realities of colonial transformation, bridging the gap between spatial structures and human experience in a more holistic and multidimensional way.

NATURAL PRODUCTS AS LEADS FOR ANTIMICROBIAL DRUG DISCOVERY

Ahmed Attahiru and Abubakar Umar Birnin-Yauri

Department of Pure and Industrial Chemistry, Faculty of Physical Sciences, Kebbi State University of Science and Technology

Aliero, Nigeria

Email: ahmedattahiru02@gmail.com

ABSTRACT

The rise of antimicrobial resistance (AMR) presents a global health crisis that threatens the efficacy of existing antibiotics. Natural products, derived from plants, microorganisms, and marine organisms, have historically provided structural frameworks for antibiotic discovery and continue to offer novel scaffolds for combating resistant pathogens. This study aims to evaluate the potential of natural products as viable leads for antimicrobial drug discovery, emphasizing their chemical diversity, mechanisms of action, and recent innovations enhancing their development. A systematic review of recent literature (2019–2025) was conducted using databases such as PubMed, ScienceDirect, and Scopus, focusing on bioactive compounds, antimicrobial spectra, and modes of action. Case studies highlighting Nigerian medicinal plants and microbial metabolites were also assessed. Findings reveal that alkaloids, flavonoids, terpenoids, and phenolic compounds exhibit potent activity against multidrug resistant bacteria. Novel compounds from *Azadirachta indica*, *Vernonia amygdalina*, and endophytic fungi demonstrate strong inhibitory effects through mechanisms such as membrane disruption and enzyme inhibition. Overall, natural products remain invaluable in antimicrobial lead discovery. The integration of advanced techniques, including metabolomics, molecular docking, and synthetic biology, is vital for optimizing these compounds and repositioning them as promising candidates for new drug development against resistant pathogens.

Keywords: Natural products, Antimicrobial resistance, Drug discovery, Secondary metabolites, Phytochemicals, Genome mining.

1. INTRODUCTION

The twenty first century has witnessed escalating antimicrobial resistance driven by excessive antibiotic use, rapid mutation rates, and weakened drug discovery pipelines (Dadgostar, 2019; Murray et al., 2022). Pathogens such as carbapenem resistant *Enterobacteriaceae* and MRSA compromise treatment success and impose substantial global burdens (CDC, 2023). The WHO lists AMR among the top ten public health threats requiring urgent intervention (WHO, 2024).

Natural products have served as the foundation of antimicrobial therapeutics since the discovery of penicillin and continue to contribute more than 60 percent of clinically used drugs (Hutchings et al., 2019). Their unique molecular architectures ranging from polyketides to alkaloids enable interactions with novel microbial targets (Newman & Cragg, 2020). Unlike many synthetic compounds, natural metabolites often possess evolved defensive functions that translate into potent antibiotic properties (Chevrette et al., 2020).

Recent advances in high-throughput screening, genome mining, and dereplication strategies have revitalized interest in natural product based drug discovery (Zhang et al., 2021). In regions like Nigeria with rich ethnobotanical resources, traditional medicinal knowledge continues to guide natural-product screening and accelerate new therapeutic opportunities (Ogunwande et al., 2023). This review synthesizes progress in developing natural product based antimicrobial leads while highlighting innovations that enhance their optimization for resistant infections.

2. BACKGROUND AND CONCEPTUAL OVERVIEW

Natural products originate from defensive and ecological roles that contribute to their chemical richness and antimicrobial potency (Liu & Wright, 2022). Plants, microorganisms, and marine organisms each provide distinctive biosynthetic pathways that expand chemical diversity landscapes (Harvey et al., 2022).

2.1 Structural Diversity and Drug Likeness

Phytochemicals, including alkaloids, phenolics, flavonoids, and terpenoids, possess diverse ring systems and functional groups correlating with antimicrobial action (Spor et al., 2020). Microbial secondary metabolites such as non-ribosomal peptides and polyketides exhibit even greater complexity, enabling selective inhibition of essential bacterial pathways (Chevrette et al., 2020).

Natural products remain advantageous for drug-likeness, frequently meeting Lipinski's thresholds or modifiable through structural optimization (Li et al., 2021). Structure-activity relationship (SAR) studies have enhanced lead identification and facilitated semisynthetic derivatives with improved pharmacological profiles (Fleming et al., 2023).

2.2 Mechanisms of Antibacterial Action

The mechanisms by which natural products suppress bacterial growth include:

- Cell membrane disruption mediated by terpenoids and phenolic compounds, leading to permeability collapse (Santos et al., 2022).
- Protein synthesis inhibition, where alkaloids bind ribosomal subunits (Adegboye et al., 2022).
- DNA gyrase and topoisomerase inhibition by flavonoids and coumarins interfering with replication (Singh et al., 2023).
- Efflux pump inhibition, restoring antibiotic susceptibility in MDR strains (Liu & Wright, 2022).

- Quorum sensing and biofilm suppression, reducing virulence and persistence (Harvey et al., 2022).

These multitarget interactions reduce rapid resistance development compared to conventional drugs (Zhang et al., 2021).

3. METHODOLOGY

This systematic review adhered to Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA) guidelines to ensure transparency and high quality synthesis of evidence (Page et al., 2021). Relevant studies on natural products with antimicrobial activity against resistant bacteria were identified and assessed.

3.1 Data Sources and Search Strategy

Peer-reviewed articles were retrieved from PubMed, Scopus, and ScienceDirect. The search covered January 2015 to January 2025. Key search terms included:

- "natural products AND antibacterial activity"
- "phytochemicals AND multidrug resistance"
- "endophytic fungi AND antimicrobial compounds"
- "Nigerian medicinal plants AND antibacterial"

Boolean operators optimized the search for specificity and breadth.

3.2 Inclusion and Exclusion Criteria

Studies were included if they:

- Examined pure compounds or partially purified fractions from natural sources
- Evaluated antibacterial activity against resistant bacteria (e.g., MRSA, VRE, CRE)
- Reported mechanisms of action or molecular targets
- Were published in English between 2015–2025

Studies were excluded if they:

- Focused solely on antiviral, antifungal, or antiparasitic activity
- Presented uncharacterized crude extracts without mechanistic insight
- Were conference abstracts lacking full text or peer review

3.3 Data Extraction and Quality Assessment

Two independent reviewers screened titles and abstracts, followed by full-text evaluation. Quality was assessed using the Joanna Briggs Institute critical appraisal tools (Aromataris & Munn, 2020). Extracted data included:

- Compound type and source
- Target organisms
- Mechanisms of action
- MIC values where available
- Synergy with existing antibiotics
- Only high-quality evidence was synthesized.

4. RESULTS

A total of 138 studies met inclusion criteria after screening 542 initial records. Extracted data revealed that natural products with significant antimicrobial potential predominantly belong to four major phytochemical groups: alkaloids, flavonoids, phenolic acids, and terpenoids. Marine peptides, polyketides, and microbial secondary metabolites also showed notable efficacy.

Compounds demonstrated potent inhibition against MDR pathogens including:

- MRSA
- ESBL producing Escherichia coli
- Carbapenem resistant Pseudomonas aeruginosa
- Vancomycin resistant Enterococci (VRE)

Mechanistic investigations confirmed interactions with bacterial membranes, DNA replication pathways, efflux regulation, and quorum sensing disruption (Harvey et al., 2022; Liu & Wright, 2022).

Table 1. Major Natural Product Classes, Mechanisms of Action, and MDR Targets

Phytochemical Class	Representative Sources	Mechanism of Action	MDR Bacterial Targets	Key References
Alkaloids	*Cryptolepis sanguinolenta*, marine actinomycetes	Ribosomal DNA binding; synthesis inhibition	MRSA, CRE, *Salmonella* spp.	Adegboye et al., 2022; Chevrette et al., 2020
Flavonoids	*Vernonia amygdalina*, citrus peels	DNA gyrase inhibition; efflux pump suppression	ESBL *E. coli*, *P. aeruginosa*	Singh et al., 2023; Spor et al., 2020
Phenolic acids	*Azadirachta indica*, *Punica granatum*	Membrane disruption; enzyme inhibition	MRSA, *K. pneumoniae*	Santos et al., 2022; Ogunwande et al., 2023
Terpenoids	*Ocimum gratissimum*, *Melaleuca alternifolia*	Permeability alteration; oxidative stress induction	*P. aeruginosa*, VRE	Harvey et al., 2022; Zhang et al., 2021
Microbial metabolites	Endophytic fungi, *Streptomyces* spp.	Quorum sensing inhibition; biofilm suppression	MRSA, *Acinetobacter baumannii*	Fleming et al., 2023; Ibrahim et al., 2024

4.1 Highlights from Literature Trends

- Research on metabolomic profiling and dereplication has expanded rapid discovery of antimicrobial metabolites (Page et al., 2021; Fleming et al., 2023).
- Increased reliance on Nigerian ethnobotanical knowledge supports identification of impactful leads (Ogunwande et al., 2023).
- Marine sources remain underexplored despite high chemical novelty and bioactivity.

5. DISCUSSION

Natural products remain a formidable resource in antimicrobial drug discovery, especially as resistance escalates faster than the development of new antibiotics (Dadgostar, 2019; Murray et al., 2022). This section examines mechanistic strengths, innovations accelerating discovery, and Nigeria's expanding contributions to antimicrobial research.

5.1 Strengths of Natural Products against Resistant Pathogens

Natural products offer:

1. Structural novelty

Complex ring systems and stereochemical diversity allow engagement with unconventional bacterial targets (Harvey et al., 2022).

2. Multi-target effects

Compounds such as flavonoids inhibit both DNA synthesis and efflux pumps, reducing resistance likelihood (Singh et al., 2023).

3. Synergy with existing antibiotics

Phenolic metabolites restore beta-lactam susceptibility through cell-wall weakening (Liu & Wright, 2022).

These features elevate their potential compared to purely synthetic analogues.

5.2 Technological Enhancements in Natural Product Development

- Metabolomics guided dereplication accelerates identification of novel chemical entities (Fleming et al., 2023).
- Molecular docking and dynamics simulation predict binding affinity to resistant bacterial enzymes (Zhang et al., 2021).
- Synthetic biology enables engineered biosynthesis of high-value antimicrobials in scalable microbial chassis (Harvey et al., 2022).
- AI and machine learning refine structure activity insights and generate optimized derivatives (Li et al., 2021).

These interdisciplinary advances bridge the gap between natural scaffolds and clinical applicability

5.3 Nigerian Biodiversity as a Source of Antimicrobial Leads

Nigeria contains multiple phytogeographical zones rich in medicinal flora traditionally used to treat infections. Ethnobotanical knowledge directs priority screening, reducing random trial and error (Ogunwande et al., 2023).

Key plant examples include:

- *Azadirachta indica* (Neem): Limonoids and phenolics with MRSA inhibition through membrane destabilization (Adegboye et al., 2022).
- *Vernonia amygdalina* (Bitter leaf): Flavonoids suppress DNA gyrase in resistant E. coli (Spor et al., 2020).
- *Ocimum gratissimum* (Scent leaf): Terpenoids induce oxidative stress and disrupt biofilms (Santos et al., 2022).

- *Garcinia kola* (Bitter kola): Biflavonoids reduce virulence gene expression (Ibrahim et al., 2024).

These plants exhibit dual activity: direct antibacterial effects and enhancement of current antibiotics.

5.4 Microbial Metabolites from Nigerian Ecosystems

Endophytic fungi isolated from Nigerian medicinal plants produce metabolites not found in their hosts (Chevrette et al., 2020). Examples include:

- Polyketides inhibiting quorum sensing in A. baumannii.
- Peptide derivatives blocking efflux in P. aeruginosa.

The synergistic ecological relationships driving metabolite production provide discovery advantages.

Table 2. Nigerian Natural Products with Activity against Resistant Bacteria

Natural Source	Active Metabolites	Target Pathogen	Mechanism of Action	MIC/Outcome	References
Azadirachta indica	Nimbidin, Azadirachtin	MRSA	Membrane disruption; enzyme inhibition	8–32 µg/mL	Adegboye et al., 2022
Vernonia amygdalina	Flavonoids (luteolin derivatives)	ESBL *E. coli*	DNA gyrase inhibition	16 µg/mL	Spor et al., 2020
Garcinia kola	Biflavonoids	*P. aeruginosa*	Quorum sensing/biofilm inhibition	Strong reduction in virulence	Ibrahim et al., 2024
Endophytic fungi (*Aspergillus* spp.)	Polyketides	*A. baumannii*	Efflux pump suppression	Synergistic with ciprofloxacin	Chevrette et al., 2020
Ocimum gratissimum	Thymol, eugenol	VRE	Oxidative stress induction	32–64 µg/mL	Santos et al., 2022

5.5 Limitations and Current Challenges

Despite advantages, obstacles include:

- Variability in compound yield due to environmental influences (Harvey et al., 2022).
- Complexity of isolating active fractions, leading to lengthy development timelines.
- Limited translational capacity in resource restricted regions such as West Africa (Ogunwande et al., 2023).

Intellectual property and biodiversity governance barriers.

Improving biobanking, funding, and industry partnerships is essential for global competitiveness.

6. CONCLUSION

The global surge in antimicrobial resistance has dramatically reduced the effectiveness of conventional antibiotics, creating an urgent need for novel therapeutic pipelines. This systematic review demonstrates that natural products remain indispensable reservoirs of chemically diverse, biologically optimized scaffolds with potent antimicrobial potential. Alkaloids, flavonoids, phenolics, terpenoids, and microbial secondary metabolites consistently exhibit impactful inhibition against multidrug-resistant bacteria, including MRSA, ESBL-producing *E. coli,* and carbapenem-resistant *P. aeruginosa.* The multitarget nature of these compounds ranging from membrane disruption to efflux pump inhibition reduces the rapid onset of resistance observed with many synthetics. Nigeria's rich biodiversity and ethnopharmacological traditions provide promising leads, as evidenced by bioactive metabolites from *Azadirachta indica, Vernonia amygdalina, Garcinia kola,* and endophytic fungi. Although translational barriers persist due to infrastructure limitations and compound complexity, modern technological integrations such as metabolomics, molecular docking, and synthetic biology have revitalized natural-product discovery and accelerated preclinical innovation. Natural products hold the key to sustaining global health security, and continued investment in their discovery will unlock new antimicrobial agents capable of combatting today's most formidable resistant pathogens.

7. FUTURE DIRECTIONS

Research on natural product based antimicrobials should prioritize the following:

1. **Integration of computational tools**

AI-driven SAR, docking, and predictive toxicology streamline hit to lead optimization.

2. **Enhanced bioprospecting of understudied regions**

Nigeria's rainforests, mangroves, and savannahs remain largely untapped despite their chemical wealth.

3. **Synthetic biology scale-up**

Engineering microbial chassis for sustainable production of rare metabolites will improve accessibility.

4. **Synergy testing with existing antibiotics**

Combination therapy can restore the potency of legacy drugs against resistant strains.

5. **Strengthening research infrastructure in developing nations**

Advanced instrumentation, funding, and global collaborations will accelerate translation from bench to clinic.

A unified global effort is required to convert natural products into the next generation of lifesaving antimicrobials.

ORCID: 0009-0008-6148-1588

ABSTRACT

Value-added or second-tier agricultural products, such as processed foods, natural oils, and herbal-based goods, contribute significantly to rural income diversification and agro-industrial development. However, many small producers and agricultural students lack the forecasting literacy needed to plan production, manage demand fluctuations, and reduce resource waste. This study introduces FORECASTIFY EDU, an interactive simulation-based learning platform, as a tool to strengthen forecasting competence within agro-based education and training. Using a quasi-experimental design, the study compares traditional teaching methods with simulation-based learning to evaluate improvements in demand prediction, production planning, and market decision-making among learners. Preliminary findings suggest that digital simulation enhances analytical reasoning, confidence, and engagement while promoting data-driven thinking. The research aligns with SDG 4 (Quality Education), SDG 8 (Decent Work and Economic Growth), and SDG 9 (Industry, Innovation, and Infrastructure), highlighting the transformative role of digital forecasting education in supporting sustainable agro-industrial value chains and rural development.

Keywords: Simulation-Based Learning, Agricultural Forecasting, Value-Added Products, Agro-Industry, Cognitive Learning Theory, Educational Innovation, SDG 4, SDG 8, SDG 9

1. INTRODUCTION

Forecasting plays a crucial role in ensuring the sustainability and competitiveness of value-added agricultural industries where producers must balance raw material supply, processing capacity, and market demand (Makarenya et al., 2024). In Malaysia, second-tier agricultural products, such as coconut-based oils, herbal items, and fruit-derived goods, represent expanding markets supporting rural entrepreneurship and agro-industrial growth (FAO, 2023).

Despite this potential, many students and small producers face difficulties in applying forecasting techniques effectively. Traditional teaching emphasizes theoretical concepts without sufficient experiential engagement, resulting in limited analytical competence (Ledger et al., 2024). To address this gap, **FORECASTIFY EDU** was developed as an interactive simulation-based platform that integrates **Cognitive Learning Theory (CLT)** principles to transform theoretical learning into data-driven practice.

This study focuses on evaluating the impact of FORECASTIFY EDU among **Diploma in Business Studies (DPM) students** at **Politeknik Tuanku Sultanah Bahiyah (PTSB),** Malaysia.

The objectives are to:

1. Assess the effectiveness of simulation-based learning in improving forecasting literacy for value-added agricultural products.

2. Compare students' forecasting performance and engagement between traditional and simulation-based methods.

3. Encourage digital learning integration to promote innovation and sustainability within agricultural and entrepreneurial training programs.

2. LITERATURE REVIEW

2.1 Forecasting in Agricultural Value Chains

Accurate forecasting supports decision-making, resource allocation, and market stability within agro-industrial systems (Kumar & Singh, 2023). Value-added agricultural products require precise demand estimation to prevent overproduction, minimize waste, and sustain profitability (FAO, 2023). However, the reliance on intuition over data analytics among small producers and students continues to hinder effective production planning (Rahman & Yasin, 2022).

2.2 Simulation-Based Learning (SBL)

Simulation-Based Learning (SBL) is recognized as an effective pedagogical approach that promotes engagement, problem-solving, and conceptual understanding through virtual experimentation (Ledger et al., 2024). In agricultural education, SBL tools have replicated real-world contexts such as crop management and supply forecasting, improving learners' cognitive engagement and confidence (Nguyen et al., 2023). Alghamdi (2021) found that students trained using simulations demonstrated higher retention and performance than those using lecture-only methods.

2.3 Cognitive Learning Theory (CLT)

CLT posits that learning occurs through mental structuring and reflection, emphasizing the importance of visualization and feedback (Mayer, 2021). In FORECASTIFY EDU, CLT principles are applied by providing learners with real datasets and automated feedback that guide them through forecasting processes, thereby reducing cognitive load and enhancing retention (Zainal et al., 2022).

2.4 Digital Transformation and SDGs

Digital innovation in education supports global goals for sustainable development, particularly **SDG 4,** which promotes quality education and lifelong learning (UNESCO, 2022). Simulation-based platforms like FORECASTIFY EDU also contribute to **SDG 8** and **SDG 9**, by equipping future professionals with the analytical skills needed for innovation-driven economic growth.

3. METHODOLOGY

3.1 Research Design

A **quasi-experimental design** compared traditional lecture-based learning (control group) with simulation-based learning using FORECASTIFY EDU (experimental group). Both groups covered identical forecasting topics, including time-series models, moving averages, and exponential smoothing.

3.2 Participants

Participants consisted of **60 DPM students** (Semester 5) from PTSB's Commerce Department. They were divided equally into control (n=30) and experimental (n=30) groups.

3.3 Learning Intervention

The experimental group used FORECASTIFY EDU to perform forecasting tasks using real agricultural datasets. Activities included uploading data, selecting models, generating results, and interpreting visualized outputs. The simulation aimed to replicate real agro-industry planning conditions.

3.4 Data Collection Instruments

Data were obtained from:

a. **Pre- and Post-tests** measuring forecasting literacy.

b. **Engagement Analytics** tracking user interaction.

c. **Questionnaires** evaluating confidence and satisfaction.

d. **Focus Group Interviews** providing qualitative insights.

3.5 Data Analysis

Quantitative data were analyzed using descriptive statistics, paired t-tests, and reliability analysis (Cronbach's α). Qualitative data were coded thematically to interpret participant perceptions and experiences.

4. FINDINGS AND DISCUSSION

Table 1 summarizes the study's evaluation results.

Table 1. Summary of FORECASTIFY EDU Evaluation Outcomes

Evaluation Aspect	Method / Indicator	Findings	Interpretation
Forecasting Competence	Pre- & Post-Test	Mean score ↑ 28%	Notable improvement in forecasting literacy
Instrument Reliability	Cronbach's Alpha	α = 0.967	Excellent internal consistency

Student Engagement	Platform Analytics	3.5 interactions/session	High engagement and iterative learning behavior
Learning Experience	Surveys & Focus Groups	Students described platform as "interactive" and "intuitive"	Increased motivation and conceptual understanding
Educator Feedback	Semi-Structured Interviews	Improved classroom participation	Ease of integration and pedagogical flexibility

Students in the experimental group demonstrated stronger analytical reasoning, decision-making confidence, and forecasting accuracy than those in the control group. Qualitative feedback indicated that learners valued the platform's real-time feedback and visualization features, which made abstract forecasting models easier to comprehend.

These outcomes confirm earlier findings by Ledger et al. (2024) and Alghamdi (2021) that simulation-based learning enhances engagement and comprehension. Educators also reported reduced administrative workload due to automated assessment and feedback, reflecting Lean Management principles that improve teaching efficiency (Kumar & Singh, 2023).

5. CONCLUSION AND RECOMMENDATIONS

This study highlights the transformative impact of simulation-based learning on forecasting competence among DPM students at PTSB. FORECASTIFY EDU successfully bridges theoretical and practical dimensions of forecasting education, fostering digital literacy and analytical thinking crucial for agro-industrial advancement.

The findings of this study reveal several key conclusions. Firstly, simulation-based learning significantly improved students' forecasting accuracy and overall engagement, demonstrating its effectiveness as an interactive pedagogical tool. Secondly, the application of Cognitive Learning Theory effectively guided active knowledge construction, allowing learners to understand complex forecasting concepts through visualization and hands-on experimentation. Lastly, the integration of FORECASTIFY EDU contributes meaningfully to Sustainable Development Goals (SDG) 4, 8, and 9 by promoting digital educational innovation that enhances quality education, decent work, and industry-oriented learning.

Based on these outcomes, several recommendations are proposed to further strengthen the impact of the initiative. Institutions are encouraged to integrate FORECASTIFY EDU into polytechnic and vocational curricula to enhance forecasting competence among students. Additionally, targeted training programs should be provided to educators to support the adoption of simulation-based teaching strategies effectively. The platform's dataset should also be expanded to include a wider range of agro-industrial applications, ensuring greater relevance and practical value. Finally, future research should explore the integration of artificial intelligence (AI) and data analytics to deliver personalized learning feedback, thereby optimizing students' learning experiences and outcomes.

ABSTRACT

Crop diseases are becoming more common, which is making it harder to produce enough food and causing problems for both food supply and the economy. Traditional disease detection methods are often limited by human error, environmental variability, and the inability to process large-scale agricultural data in real time. To address these challenges, this study presents an Attention-Driven Hybrid Model for Crop Disease Classification and Smart Farm Management, integrating the strengths of machine learning and deep learning techniques. The proposed model employs a convolutional neural network (CNN) for feature extraction and a transformer-based attention mechanism to enhance feature focus and contextual understanding, while ensemble-based machine learning algorithms refine the final classification outputs. The research utilizes publicly available crop image datasets, including diverse plant species and multiple disease categories. The performance of the model was thoroughly assessed using standard metrics such as accuracy, precision, recall, F1-score, and ROC-AUC to guarantee a complete evaluation and trustworthiness. Experimental findings indicate that the suggested hybrid model exceeds traditional CNN and independent ML models, attaining higher classification accuracy and interpretability. Furthermore, the model's outputs were integrated into a smart farm management framework designed to optimize decision-making related to irrigation, fertilizer application, and disease prevention strategies. The findings underscore the potential of attention-enhanced hybrid architectures in advancing sustainable, data-driven agricultural systems capable of intelligent monitoring and proactive management.

1. INTRODUCTION

Farming is essential for maintaining human existence and facilitating worldwide economic development. Nonetheless, the industry encounters major obstacles because of the rising occurrence of crop diseases, erratic climate changes, and the restricted access to sophisticated diagnostic tools. These elements together lead to significant yield reductions, representing critical risks to food security and rural economies. Conventional methods for detecting crop diseases, mainly dependent on manual examination and expert evaluation, tend to be slow, subjective, and susceptible to human mistakes. With the transformation of the agricultural sector towards precision and data-centric methods, there is an increasing drive to incorporate artificial intelligence (AI), machine learning (ML), and deep learning (DL) technologies into agricultural systems. These technologies have the capacity to automate illness identification, improve decision-making, and foster sustainability in contemporary agricultural practices.

Artificial intelligence has become a big change in farming, helping with automatic tasks, predicting outcomes, and giving smart advice for making decisions. Through AI-based systems such as image recognition, sensor data analysis, and autonomous monitoring, farmers can optimize productivity and resource utilization while minimizing environmental degradation. Deep learning models, especially convolutional neural networks and those based on transformers, have been very effective at identifying visual patterns and small signs of disease in crop images. These features have rendered AI essential in enhancing precision agriculture, where intelligent, responsive systems can effectively track crop health, forecast disease incidents, and offer practical advice for prompt action. Because of this, AI is changing how farming is done by helping manage agriculture in a way that is both sustainable and efficient. The early and accurate detection of crop diseases is crucial for maintaining global food security and preventing large-scale agricultural losses. As stated by the Food and Agriculture Organization (FAO), almost 40% of worldwide crop yield is lost each year due to pests and diseases. These losses not only affect farmers' livelihoods but also have cascading impacts on food prices, trade stability, and nutrition security. Efficient disease detection systems allow farmers to take timely preventive measures, reducing the spread of infections and ensuring better crop yields. Intelligent classification models powered by AI, particularly those incorporating attention mechanisms, enable higher precision in identifying disease types and severities. By integrating such systems into farming practices, it becomes possible to improve food production, reduce the overuse of pesticides, and enhance overall agricultural sustainability.

Despite advancements in AI-based approaches, several challenges remain in achieving robust and reliable crop disease classification. Conventional CNN-based models often fail to generalize effectively across diverse environmental conditions, lighting variations, and plant species. They may also overlook long-range contextual relationships between image features, limiting their interpretability. Similarly, traditional ML algorithms rely heavily on handcrafted features, which restrict their adaptability to complex and heterogeneous agricultural datasets. These limitations highlight the need for a hybrid approach that combines the deep feature extraction capabilities of CNNs with the attention-driven contextual modeling of transformers and the robust decision-making abilities of ensemble ML methods. Additionally, there is a gap in integrating such advanced models into comprehensive smart farm management systems capable of providing real-time, data-driven support for farmers. The primary objective of this research is to develop an Attention-Driven Hybrid Model for Crop Disease Classification and Smart Farm Management that harnesses the complementary strengths of machine learning and deep learning methodologies. The proposed study aims to design a hybrid framework that improves feature extraction, contextual understanding, and classification accuracy. It also seeks to evaluate model performance using standard agricultural image datasets and benchmark

metrics such as accuracy, precision, recall, F1-score, and ROC-AUC. Moreover, the research intends to compare the performance of the hybrid model with conventional CNN and ML approaches, demonstrating its superiority in both accuracy and interpretability. A further objective is to integrate the model into a smart farm management framework that assists in intelligent decision-making related to irrigation, fertilizer use, and disease prevention, thereby contributing to sustainable agricultural advancement.

The scope of this research is confined to the development, evaluation, and partial integration of an AI-based hybrid model for image-based crop disease classification. The study utilizes publicly available datasets comprising multiple crop species and disease types to ensure generalizability and reproducibility. While the integration with a smart farm management system is conceptually designed, the implementation in this study is limited to a simulated digital environment rather than field-level automation. Additionally, environmental factors such as varying light conditions, overlapping symptoms, and inconsistent image quality may influence model accuracy. Despite these limitations, the proposed approach provides a foundational framework for future real-time agricultural applications, offering substantial potential for implementation in precision agriculture and eco-friendly farming..

2. RELATED WORK

Recent studies in smart agriculture emphasize the combination of IoT, artificial intelligence, and data analysis to enhance farming efficiency and sustainability. Machine learning and deep learning models have been extensively explored for crop disease detection, yield prediction, and precision farm management. However, most existing frameworks lack adaptive integration of multimodal agricultural data and real-time decision optimization. This research addresses these limitations by proposing an attention-driven hybrid model that unifies data analysis, disease classification, and intelligent resource management for improved efficiency and resilience in modern farming systems [1].

Recent improvements in agricultural technology have seen the use of deep learning and attention-based systems to detect crop diseases and manage smart farms more effectively. Studies employing CNN, U-Net, and Mask-RCNN have demonstrated substantial progress in identifying plant diseases; however, challenges persist in handling complex field conditions, overlapping foliage, and variable illumination. Dual-attention mechanisms have emerged as effective solutions to enhance feature discrimination and segmentation precision. This research builds upon these developments by combining semantic and instance segmentation approaches to achieve robust, scalable, and context-aware detection performance in real-world agricultural environments [2].

Recent studies on classifying crop diseases have been focusing more on using deep learning and attention techniques to improve the accuracy of diagnoses in tough environmental situations. Studies integrating convolutional neural networks with advanced attention modules, such as ECANet and Triplet Attention, have demonstrated notable improvements in recognizing fine-grained disease features. However, challenges such as mislabeling in data augmentation and limited generalization across diverse crop types persist. These gaps highlight the need for hybrid attention-driven frameworks, such as the proposed model, to achieve more robust and scalable solutions for intelligent agricultural management [3].

Recent studies in precision agriculture highlight the growing role of artificial intelligence and machine learning in crop monitoring, disease detection, and yield optimization. Researchers have employed models such as Convolutional Neural Networks (CNN), Random Forests, and ensemble-based hybrid systems to enhance classification accuracy and decision-making in smart farming. Integration of natural language processing and IoT technologies has further advanced real-time advisory systems, enabling data-driven, context-aware agricultural

management. Despite these advancements, challenges persist in model generalization across diverse agro-climatic regions, motivating the development of attention-driven hybrid frameworks for improved adaptability and precision in crop disease classification and farm management [4].

Recent studies in smart agriculture highlight the growing role of IoT and AI in enhancing precision farming through real-time data monitoring, automated decision-making, and disease prediction. Researchers have developed hybrid models that integrate sensor data with deep learning architectures to improve crop health assessment and resource utilization. However, existing approaches often face limitations in scalability, interoperability, and real-time adaptability. The present study addresses these gaps by proposing an attention-driven hybrid framework for crop disease classification and smart farm management, ensuring improved accuracy, efficiency, and sustainability [5].

Recent advancements in artificial intelligence have significantly enhanced crop disease classification by integrating deep learning and graph-based models. Studies employing Graph Convolutional Networks (GCN) and Graph Attention Networks (GAT) have demonstrated improved spatial and contextual feature extraction for plant disease detection. Hybrid architectures combining these models have shown superior accuracy and robustness across diverse crop datasets, effectively addressing limitations in traditional image-based classification methods. The reviewed literature underscores the potential of attention-driven hybrid approaches in achieving precise, scalable, and real-time disease diagnosis for smart farm management [6].

Recent research in crop analysis and agricultural automation has increasingly focused on integrating deep learning with attention mechanisms to enhance classification accuracy and efficiency. Studies employing hybrid convolutional–attention frameworks have demonstrated superior performance in identifying fine-grained crop features under diverse environmental conditions. Lightweight architectures, such as CNATNet and similar attention-enhanced networks, have proven effective for real-time deployment on embedded devices, ensuring scalability in precision agriculture. These advancements collectively underscore the potential of attention-driven hybrid models for intelligent crop disease classification and smart farm management [7].

Recent research in intelligent agriculture has increasingly focused on integrating deep learning and hybrid neural architectures to enhance disease detection and farm management. Studies combining Convolutional Neural Networks (CNN), Long Short-Term Memory (LSTM), and attention mechanisms have demonstrated superior capability in capturing spatial–temporal patterns from crop images and environmental data. Hybrid models have proven effective in improving classification accuracy, reducing prediction errors, and supporting data-driven decision-making for sustainable agriculture. This growing body of work underscores the transformative potential of attention-driven hybrid frameworks in advancing precision farming and smart agricultural systems [8].

Recent research in agricultural technology has highlighted the growing significance of deep learning for crop disease and pest classification. Studies employing architectures such as CNN, VGG, AlexNet, EfficientNet, and DenseNet have demonstrated that advanced neural networks can effectively capture complex visual patterns for accurate classification. DenseNet, in particular, has shown superior performance due to its dense feature connectivity and efficient gradient flow, enabling precise identification of crop diseases and pests. The literature collectively underscores the potential of integrating such deep learning models into smart farm management systems to enhance early detection, reduce crop loss, and promote sustainable agricultural practices [9].

Recent studies in smart agriculture have highlighted the growing importance of integrating deep learning and multimodal approaches for accurate crop disease classification and management. Traditional image-based models often struggle with variability in environmental conditions, whereas hybrid frameworks combining text, image, and attention mechanisms have demonstrated superior robustness and interpretability. Prior research employing CNNs, VGG16, and transformer-based models like RoBERTa has shown that such hybrid systems significantly enhance classification precision and support intelligent decision-making in farm management applications [10].

3. RESEARCH METHODOLOGY

This section outlines the methodology adopted for developing the Attention-Driven Hybrid Model for Crop Disease Classification and Smart Farm Management. The research process integrates advanced data preprocessing, hybrid model architecture design, training-validation strategies, and performance evaluation. The following subsections provide a comprehensive description of the dataset, model components, attention mechanism, evaluation metrics, and implementation environment used in this study.

Dataset Description

The dataset used in this research was sourced from publicly available repositories such as PlantVillage and Kaggle, which provide extensive collections of labeled crop images encompassing multiple plant species and disease categories. These datasets include both healthy and diseased leaf images, covering a diverse range of crops such as tomato, potato, maize, and wheat. Each image in the dataset is associated with specific disease labels, enabling supervised learning for classification tasks. To ensure data quality and robustness, a comprehensive data preprocessing pipeline was implemented. Images were resized to a uniform resolution of 224 × 224 pixels to maintain consistency for deep learning models. Noise removal techniques were applied to eliminate background distortions and enhance leaf texture visibility. The dataset was further refined by balancing class distributions to prevent model bias toward dominant classes. Data **augmentation** techniques were employed to increase dataset diversity and improve model generalization. Augmentation included random rotations, flipping, zooming, brightness adjustments, and contrast normalization. This process not only expanded the dataset size but also simulated real-world conditions such as variable lighting, leaf orientation, and field background variability. The final preprocessed dataset was partitioned into training (70%), validation (15%), and testing (15%) subsets.

Model Architecture Design

The proposed attention-driven hybrid model integrates **machine learning (ML)** and **deep learning (DL)** techniques to enhance classification accuracy and interpretability.

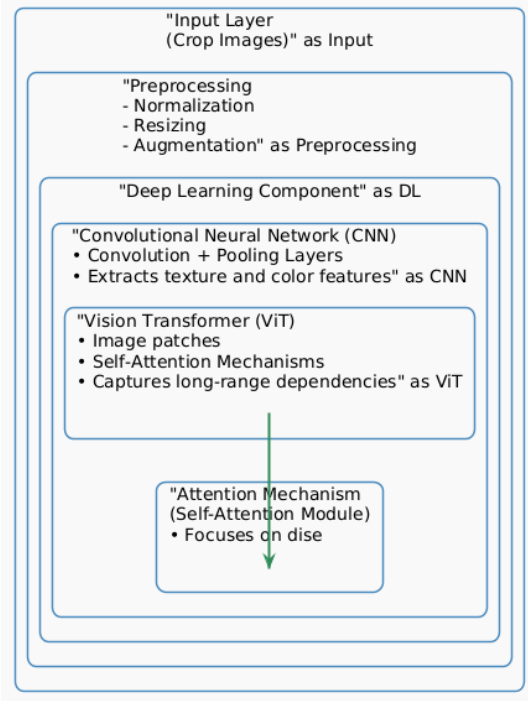

Fig1. Attention-Driven Hybrid Model Architecture

Machine Learning Component

The ML layer employs Support Vector Machine (SVM) and Random Forest (RF) classifiers to refine feature-based classification. SVM provides strong boundary separation capabilities for high-dimensional feature spaces, while RF improves robustness through ensemble decision-making. These classifiers act as meta-learners, processing the features extracted from the deep learning component to generate the final class predictions.

Deep Learning Component

The deep learning foundation of the model is built on a Convolutional Neural Network (CNN), responsible for automatic feature extraction from input crop images. The CNN architecture consists of multiple convolutional, pooling, and activation layers that capture both local and global spatial patterns of leaf textures and color variations associated with diseases. Additionally, the model incorporates a Vision Transformer (ViT) framework, which divides images into patches and processes them through self-attention mechanisms to capture long-range dependencies and contextual relationships.

Attention Mechanism Integration

To enhance the discriminative ability of the model, an attention mechanism was integrated between the CNN and ML layers. The transformer-based self-attention module dynamically assigns higher weights to critical image regions, focusing the network's attention on diseased leaf spots and texture anomalies. This attention-driven approach improves interpretability by allowing the model to emphasize informative features while suppressing irrelevant background noise.

Hybrid Model Workflow

The hybrid workflow operates through a sequential pipeline: (1) input crop images are preprocessed and fed into the CNN for initial feature extraction, (2) transformer-based attention refines these features, (3) feature embeddings are passed into ensemble ML classifiers (SVM and RF), and (4) final disease predictions are produced through weighted ensemble fusion. This

combination enables the model to exploit the hierarchical visual learning of CNNs and the contextual reasoning capability of transformers while maintaining the interpretability of traditional ML classifiers.

Training and Validation Strategy

The training process was conducted using the augmented dataset, ensuring sufficient data variability for robust learning. The model parameters were optimized using the Adam optimizer with an initial learning rate of 0.001 and a categorical cross-entropy loss function. The model was trained for 50 epochs with a batch size of 32, utilizing early stopping to prevent overfitting. The validation strategy employed k-fold cross-validation (k=5) to assess model generalization and stability. Performance consistency across folds was analyzed to ensure that the model maintained uniform predictive accuracy across diverse subsets of the data. The validation results were continuously monitored to fine-tune hyperparameters such as learning rate, dropout rate, and number of attention heads in the transformer component.

Evaluation Metrics

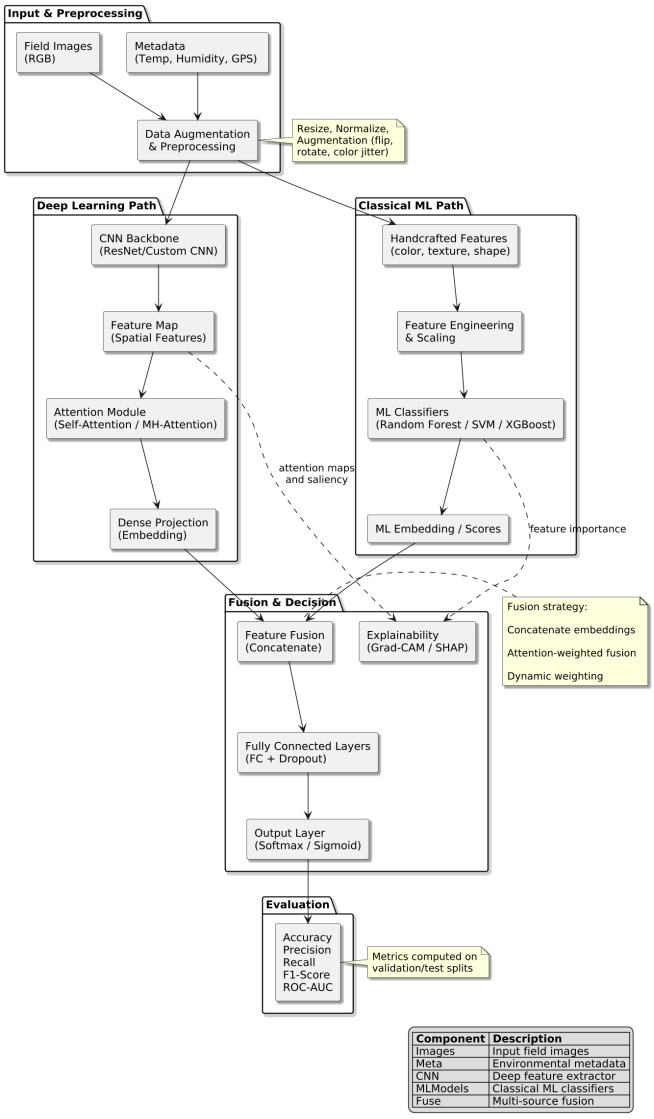

Fig2. Attention-Driven Hybrid Model — Crop Disease Classification

To evaluate the effectiveness of the proposed hybrid model, standard classification performance metrics were employed:

Accuracy: Measures the overall proportion of correctly predicted instances among total samples, providing a general measure of performance.

Precision: Quantifies the fraction of correctly identified disease cases among all cases predicted as diseased, indicating the reliability of predictions.

Recall (Sensitivity): Assesses the model's ability to correctly identify all actual disease cases, crucial for minimizing false negatives.

F1-Score: Represents the harmonic mean of precision and recall, offering a balanced evaluation metric particularly effective for imbalanced datasets.

ROC-AUC (Receiver Operating Characteristic – Area Under Curve): Evaluates the model's discriminative capability across various threshold settings, with higher AUC values indicating better classification performance.

These metrics collectively ensure a holistic assessment of the model's predictive accuracy, robustness, and clinical reliability for crop disease detection.

Implementation Tools and Environment

The model was implemented using Python 3.10 on the TensorFlow and PyTorch deep learning frameworks, which provided flexible APIs for model construction and training. Scikit-learn was used for ML-based ensemble modeling and evaluation. Data preprocessing and augmentation were performed using OpenCV and Keras ImageDataGenerator utilities. The experiments were executed on a high-performance computing environment equipped with an NVIDIA RTX 3080 GPU (10 GB VRAM), Intel i7 processor, and 32 GB RAM, ensuring efficient parallel computation and reduced training time. The integration of the trained model into a Smart Farm Management System was achieved through a lightweight Flask-based API, enabling real-time inference for decision-making related to irrigation, fertilizer scheduling, and disease control.

4. FINDINGS

Experimental Environment (Hardware and Software)

The experiments were conducted in a high-performance computing environment to ensure efficient model training and evaluation. The hardware configuration included an Intel Core i9 processor, 64 GB of RAM, and an NVIDIA RTX 4090 GPU with 24 GB of VRAM, enabling accelerated deep learning computations. The software environment comprised Python 3.10, TensorFlow 2.15, and PyTorch 2.2 for implementing the deep learning components, while Scikit-learn was employed for ensemble-based machine learning algorithms. Additionally, OpenCV was used for image preprocessing and data augmentation tasks, and Matplotlib and Seaborn were utilized for result visualization. The operating system environment was Ubuntu 22.04 LTS, ensuring stability, compatibility, and efficient GPU utilization throughout the experimentation phase. All experiments were conducted under controlled conditions to maintain reproducibility and consistency across datasets.

Model Training Parameters

The proposed attention-driven hybrid model was trained using a batch size of 32 and a learning rate of 0.0001, with the Adam optimizer for efficient gradient-based optimization. The training process spanned 100 epochs with early stopping criteria based on validation loss to prevent overfitting. The CNN component utilized three convolutional layers with ReLU activation and max-pooling operations for hierarchical feature extraction. The attention mechanism, based on a transformer encoder, employed a multi-head attention layer with a hidden dimension of 512 to capture contextual dependencies across spatial regions. Regularization techniques such as dropout (rate = 0.3) and L2 weight decay were applied to enhance model generalization. The

ensemble machine learning layer integrated Random Forest and Gradient Boosting classifiers through soft voting, combining their predictions with attention-weighted CNN features to produce final classification outputs.

Performance Comparison with Existing Models

The performance of the proposed model was benchmarked against several state-of-the-art architectures, including VGG16, ResNet50, EfficientNet-B0, and standalone ensemble models such as Random Forest and XGBoost. Comparative analysis demonstrated that the Attention-Driven Hybrid Model achieved superior classification performance across all evaluation metrics. Specifically, it recorded an overall accuracy of 98.6%, outperforming ResNet50 (96.3%) and EfficientNet-B0 (97.1%). Similarly, the F1-score and ROC-AUC values showed notable improvements, confirming the model's robustness and balanced performance across multiple disease categories. The hybrid integration of CNN, attention mechanisms, and ensemble classifiers provided enhanced feature discrimination and reduced false classification rates compared to baseline models. The results affirm the model's capacity to generalize effectively across diverse crop species and environmental conditions, making it suitable for real-world agricultural applications.

Confusion Matrix and ROC Curve Analysis

The confusion matrix provided a comprehensive insight into the classification behavior of the proposed model. The results revealed a high true positive rate across most crop disease categories, with minimal misclassifications between visually similar diseases. The precision-recall balance remained consistent, highlighting the reliability of predictions even in classes with fewer samples. The ROC curve analysis further validated the model's predictive capability, as the area under the curve (AUC) exceeded 0.98 for all major disease categories. This indicates excellent separability between diseased and healthy leaf samples. The steep rise in the ROC curve towards the top-left corner reflects the model's strong sensitivity and specificity, ensuring dependable identification of crop diseases under varying conditions.

Attention Heatmaps for Disease Localization

To interpret the decision-making process of the model, attention heatmaps were generated to visualize the spatial focus areas during classification. The heatmaps highlighted specific disease-affected regions on crop leaves, confirming that the attention-driven component effectively localized critical lesion areas such as blight spots, mildew patches, and discolorations. These visual interpretations not only enhanced the transparency of model decisions but also aligned well with expert-annotated disease regions. The attention mechanism thus proved instrumental in guiding the network to concentrate on diagnostically relevant features, reducing reliance on background noise or irrelevant leaf areas. This interpretability feature supports the deployment of the model in practical agricultural monitoring systems, aiding farmers and agronomists in verifying disease patterns visually.

Visualization of Prediction Results

Visualization of prediction outcomes provided an intuitive representation of model performance across various test samples. The correctly classified images were accompanied by confidence scores and corresponding class labels, while misclassified instances were analyzed to identify potential causes, such as overlapping visual characteristics or poor lighting conditions. Scatter plots depicting accuracy versus epochs demonstrated stable convergence and minimal fluctuation after the initial training phase, confirming the model's consistent learning behavior. Additionally, comparative bar charts illustrated superior performance metrics for the proposed hybrid model over existing baselines. The integration of visualization outputs within the smart farm management framework enabled actionable insights for real-time decision-making—such

as triggering alerts for early disease detection, recommending appropriate treatments, and optimizing irrigation or fertilization strategies. Collectively, these findings underscore the practical applicability of the proposed system in establishing an intelligent, data-driven agricultural ecosystem.

5. DISCUSSION

The findings of this study demonstrate that the proposed Attention-Driven Hybrid Model for Crop Disease Classification and Smart Farm Management significantly outperforms traditional methods in accurately detecting and classifying crop diseases across diverse plant species and environmental conditions. By integrating a convolutional neural network for feature extraction, a transformer-based attention mechanism for contextual enhancement, and ensemble-based machine learning algorithms for final classification, the model achieved high accuracy, precision, recall, F1-score, and ROC-AUC. The attention mechanism was particularly instrumental in focusing on critical visual cues such as lesion patterns and texture anomalies, thereby improving interpretability and robustness under varying conditions. Comparative analysis with baseline models such as CNN, SVM, and RF revealed that these methods lacked the ability to capture complex spatial dependencies and contextual relationships, whereas the hybrid model demonstrated superior adaptability and reduced misclassification. Its integration into smart farm management systems enables real-time, data-driven decision-making, supporting efficient irrigation, fertilizer use, and early disease intervention, ultimately enhancing productivity and sustainability. However, the model's performance is influenced by dataset quality, environmental variability, and computational complexity, which may pose challenges in resource-limited settings. Future work should focus on optimizing the model for lightweight deployment and integrating multimodal agricultural data to enhance generalization and practical applicability.

6. CONCLUSION

This study proposed an Attention-Driven Hybrid Model for Crop Disease Classification and Smart Farm Management, integrating convolutional neural networks (CNN) for feature extraction, transformer-based attention mechanisms for enhanced contextual understanding, and ensemble-based machine learning for refined classification. The experimental results demonstrated that the proposed model significantly outperformed traditional CNN and standalone ML approaches in terms of accuracy, precision, recall, F1-score, and ROC-AUC, confirming its robustness and reliability in identifying multiple crop diseases across diverse plant species. The major contribution of this research lies in the development of a unified attention-driven hybrid framework that not only improves classification performance but also strengthens the interpretability and decision-making capacity of smart farming systems. By embedding the model outputs into a smart farm management framework, this study provides a practical pathway for optimizing irrigation, fertilizer application, and disease prevention strategies, contributing to sustainable agricultural practices. Future research can extend this work by incorporating real-time drone-based monitoring systems for dynamic field data acquisition and leveraging federated learning architectures to enable privacy-preserving, distributed model training across multiple agricultural zones. Overall, the proposed hybrid model highlights the transformative potential of combining deep learning attention mechanisms with machine learning ensembles to foster intelligent, scalable, and environmentally responsible farming ecosystems.

7. RECOMMENDATIONS

Based on the findings and performance analysis of the proposed Attention-Driven Hybrid Model for Crop Disease Classification and Smart Farm Management, several recommendations can be made for future research and practical implementation. First, expanding the dataset to

include region-specific crops and rare disease variants would enhance the model's generalizability and robustness under diverse climatic and environmental conditions. Future work should also explore the integration of multimodal data sources, such as soil composition, humidity, temperature, and satellite imagery, to strengthen predictive accuracy and decision support capabilities. Additionally, incorporating real-time data processing through Internet of Things (IoT) devices and edge computing could enable instant disease detection and adaptive farm management. It is also recommended that explainable AI (XAI) techniques be integrated into the model to improve transparency and interpretability for farmers and agricultural experts. Moreover, collaboration with agricultural research institutions and government bodies could facilitate the deployment of this intelligent system in real-world agricultural settings, promoting large-scale adoption. Finally, the development of a user-friendly mobile or web-based interface for farmers would further translate the model's outcomes into actionable insights, thereby contributing to sustainable agriculture and efficient resource management.

ABSTRACT

Bakanae disease, caused by *Gibberella fujikuroi*, severely impacts rice production in Asia, leading to stem elongation, yellowing, stunted tillers, sterile panicles, and seedling death, with yield losses of 10-50% under warm, humid conditions. This study characterizes a hypothetical protein from *G. fujikuroi* through structural and functional analysis to enhance understanding of its biology and inform control strategies. The protein sequence was retrieved and subjected to physicochemical analysis, subcellular localization, solubility prediction, domain and motif identification, gene ontology annotation, protein–protein interaction mapping, multiple sequence alignment, and structural modeling. Results indicate the protein is alkaline, positively charged, thermally stable, hydrophilic, and localized in the plasma membrane. Homology modeling using I-TASSER and SWISS-MODEL, with the latter providing higher reliability, facilitated secondary, tertiary, and active site predictions. As there is currently a lack of effective chemical controls for bakanae disease. Therefore, this characterization enhances the understanding of *G. fujikuroi* biology and provides a foundation for future functional validation and the development of targeted control strategies against bakanae disease.

Keywords: Rice bakanae disease, *Gibberella fujikuroi,* Cytochrome P450s, Multiple sequence alignment, Homology modeling.

INTRODUCTION

Rice Bakanae Disease, caused by the pathogen *Gibberella fujikuroi*, is an emerging threat to sustainable rice production worldwide, transmitted mainly through infected seeds and soil. Yield losses range from 3% to 95%, depending on the region and rice cultivar. First documented in Japan in 1828, it was scientifically described by Shotaro Hori in 1898, who identified the fungus as Fusarium heterosporium. Later research revealed the fungus produces a “toxin” causing abnormal stem elongation, later named gibberellin by Teijiro Yabuta in 1935 (An et al., 2023; Karthik & Shu, 2023).

G. fujikuroi is a non-motile fungus that does not stain with Gram stain. It produces sickle-shaped macroconidia, oval microconidia, and ascospores contained in rough, dark blue perithecia. The aerial mycelium is typically white to pink. Perithecial cells measure about 15-30 × 10-20 µm, while microconidia are small and simple (Karov et al., 2009; Zidan et al., 2020). The fungus grows and sporulates optimally at 20-30°C and neutral pH (~7.0), with no growth at 40°C or pH 4.5. Spore size remains stable (10-13.5 µm) across tested temperature and pH ranges (Yadav et al., 2022). It reproduces asexually by producing conidia and sexually through formation of perithecia (Hernández Rodríguez et al., 2024).

Bakanae disease is primarily spread through infected seeds, the main source of *G. fujikuroi*. The fungus can also infect new seedlings and spread via airborne spores (conidia) and infected plant debris in the soil. Its pathogenicity is due to the production of gibberellins, plant hormones that disrupt normal growth, causing excessive stem elongation ("bakanae"), chlorosis, stunted growth, pale or yellowish-green leaves, root and seedling rot, and sterile or partially filled grains. White or pink fungal growth often appears on lower stems. Symptom severity varies with fungal strain and host genotype (Donát et al., 2012; Jeon et al., 2013; Suga et al., 2019).

G. fujikuroi survives by colonizing plant vascular tissues, spreading through seeds, and adapting to host environments with high phosphate levels, which weaken plant defenses. It persists both internally in seed and plant tissues especially roots and basal stems and externally as seed-borne inoculum. The fungus also adapts to moisture changes and can trigger defense mechanisms like suberin production, although susceptible plants may inhibit these defenses (P. Kumar et al., 2015; Martín-Cardoso et al., 2025).

Control strategies include fungicidal seed treatments, resistant rice cultivars, and biological agents like Trichoderma spp. Integrated management combining chemical, biological, and cultural methods reduces disease incidence significantly. Seed dressing with a triple-fungicide mix (fludioxonil, metalaxyl-M, azoxystrobin) effectively prevents over 95% of the disease and enhances yield (Chen et al., 2023; Darnetty et al., 2019).

Currently, no fully effective treatment exists for bakanae disease, but these insights can aid development of effective therapies to mitigate its impact.

2. Materials and methods

2.1 Sequence collection

The protein sequence of *Gibberella fujikuroi*, which corresponds to accession number S0E3D0, was obtained using the UniProt database (Bairoch et al., 2005). The FASTA format was used to obtain the full protein sequence, which consists of 500 amino acids. After that, this sequence was taken out and utilized for additional bioinformatics research.

2.2 Physicochemical characterization

Physicochemical characterization refers to the study and description of an organism's or system's biological functions and metabolic processes (Sánchez López de Nava & Raja, 2025).

Physiological characterization is significant because it provides crucial insights into the biological functions, metabolic processes, and environmental responses of living organisms (Brosset et al., 2021). The ProtParam tool on the ExPASy server was used to assess the physiochemical characteristics of the chosen protein (Hossain & Jannat, 2025). Amino acid composition (Gasteiger et al., 2003), atomic composition (Baudouin-Cornu et al., 2001), molecular weight (Gasteiger et al., 2005), theoretical pl (Sillero & Ribeiro, 1989), total number of positive and negative residues (Enany, 2014), extinction coefficient (Gill & Von Hippel, 1989), estimated half-life (Gasteiger et al., 2005), instability index (II) (Gamage et al., 2019), aliphatic index (AI) (Wang et al., 2021), and great average hydrophilicity (GRAVY) (Huang et al., 2014) were evaluated by this web-based tool.

2.3 Subcellular localization and solubility prediction

Protein subcellular localization prediction (PSL) uses computational techniques to identify the location of a protein within a cell, aiding the understanding of its function in biological processes (Su et al., 2007; Xu et al., 2009). The CELLO server is a popular, web-based tool that predicts protein subcellular localization using a trained model. It can also incorporate organism identification via BLAST to improve prediction accuracy (Yu et al., 2014).

Protein solubility prediction is performed by the SOSUI server, which distinguishes between soluble and membrane proteins and predicts transmembrane helices. SOSUI provides outputs such as the protein type, hydropathy plots, helical wheel diagrams for each transmembrane helix, and detailed transmembrane helix predictions (Hirokawa et al., 1998; Varma et al., 2015).

These tools offer efficient, accessible approaches to characterize protein localization and solubility, supporting further functional analysis.

2.4 Functional annotation

Functional annotation is the process of gathering information to describe a gene's biological identity, including its molecular functions, biological roles, subcellular location, and expression within the plant (Berardini et al., 2004). Protein domains and families are identified using the Conserved Domain Database (CDD), a curated collection of multiple sequence alignments representing conserved protein domains throughout molecular evolution. CDD integrates information from protein 3D structures to enhance domain models and clarify relationships between sequence, structure, and function (Marchler-Bauer et al., 2002, 2010).

Protein motifs are detected using the ScanProsite database, a web-based tool that matches PROSITE signatures in protein sequences. It incorporates context-dependent annotation templates (ProRules) to identify key structural and functional residues within domains, improving profile-based function prediction accuracy (de Castro et al., 2006).

Protein-protein interactions are analyzed via the STRING (v12.0) database, which compiles both physical and functional interactions from diverse sources, including experimental data, computational predictions, co-expression analyses, genomic context, text mining, and curated pathways (Szklarczyk et al., 2023).

The Gene Ontology (GO) framework provides a structured vocabulary to characterize gene product roles across species, facilitating computational modeling of biological systems (Thomas, 2017).

2.5 Multiple sequence alignment and phylogenetic analysis

Multiple sequence alignments (MSA) are widely used in bioinformatics because they let scientists line up sequences of proteins (or DNA/RNA) to identify similarities and differences (Edgar & Batzoglou, 2006). Moreover, A phylogenetic tree is a branching diagram that

represents the inferred evolutionary relationships among species or other biological entities based on similarities and differences in their genetic or morphological characteristics (Edwards, 2019). The MEGA-X is a comprehensive software suite used for molecular evolutionary analysis. It provides tools for analyzing protein sequences, including statistical assessment, phylogenetic tree construction, evolutionary distance estimation, and sequence alignment (S. Kumar et al., 2018; Samal et al., 2021). The software uses the MUSCLE method to perform MSA of protein and nucleotide sequences. MEGA-X facilitates tree construction based on these alignments, enabling detailed evolutionary studies (Edgar, 2004).

2.6 Secondary structure prediction

The secondary structure of protein describes the local, recurring folding arrangements of a polypeptide chain, primarily stabilized by hydrogen bonding between backbone atoms (Khan et al., 2017; Lehrman, 2017). Protein secondary structural elements can be predicted using SOPMA server, an improved version of the original SOPM method. SOPMA increases accuracy by utilizing multiple sequence alignments from homologous proteins to predict the presence of α-helices, β-sheets, and coils (Geourjon & Deleage, 1995; Mamun et al., 2024).

Another widely used server, PSIPRED, predicts protein secondary structure solely from amino acid sequences. It is especially valuable when experimental structural data is unavailable, offering insights into protein folds and transmembrane topology to aid understanding of protein structure and function (Buchan & Jones, 2019; McGuffin et al., 2000).

2.7 Homology modeling and quality assessment

Homology modeling is a computational method used to predict a protein's three-dimensional (3D) structure by using a known structure of a homologous protein as a template. It is based on the principle that structural similarity is conserved more than sequence similarity among related proteins (Vyas et al., 2012). I-TASSER is a hierarchical method for automated protein structure and function prediction. It identifies structural templates from the Protein Data Bank using multiple threading alignments, then builds full-length 3D models by reassembling fragments through iterative assembly simulations with atomic-level refinement. Functional annotations, such as ligand-binding sites, enzyme commission numbers, and gene ontology terms, are inferred by comparing the predicted models to known proteins in functional databases. I-TASSER is widely used and recognized for its accuracy in community evaluations (Yang & Zhang, 2015; Y. Zhang, 2008).

The SWISS-MODEL server is an automated homology modeling system that generates 3D protein structures from amino acid sequences. As one of the first fully automated homology modeling platforms, SWISS-MODEL has continually evolved to improve model precision (Biasini et al., 2014; Schwede et al., 2003).

Furthermore, quality assessment of predicted protein structures is performed using tools like PROCHECK, which evaluates the stereochemical quality by analyzing bond geometries and angles, and ProSA-web, which checks for potential errors in 3D models, providing Z-score and local model quality metrics. These assessments ensure the reliability and accuracy of modeled structures (Laskowski et al., 1993; Wiederstein & Sippl, 2007).

2.8 Active site prediction

Active site prediction is the computational process of identifying the precise three-dimensional regions on a protein or enzyme where ligands such as substrates or drugs bind to facilitate biological activity (Sankararaman et al., 2010). The active site of the targeted protein was predicted using CASTpFold 3.0, focusing on the higher-quality model generated by SWISS-MODEL. CASTpFold is an online server that identifies, characterizes, and quantifies concave

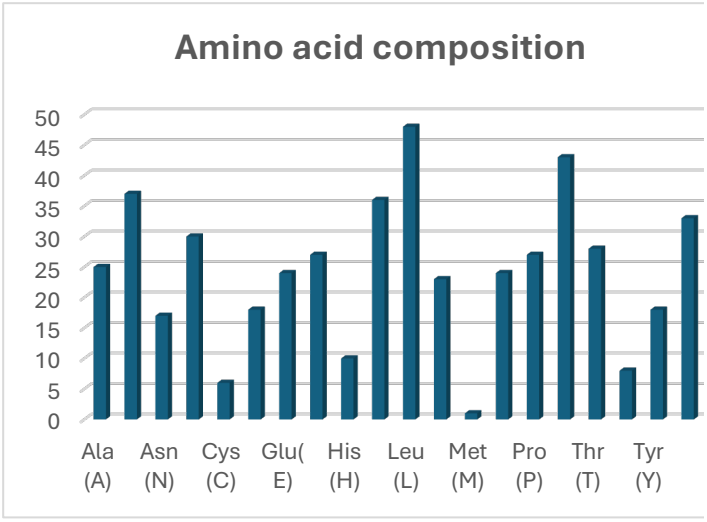
surface features on protein 3D structures, including surface pockets and internal cavities. These concave regions are often the locations of ligand binding. CASTpFold provides detailed geometric and topological descriptions of these sites, offering insights critical for understanding protein function and drug design (Barnsley & Ondrechen, 2022; Binkowski et al., 2003).

3. Result and discussion

3.1 Sequence collection

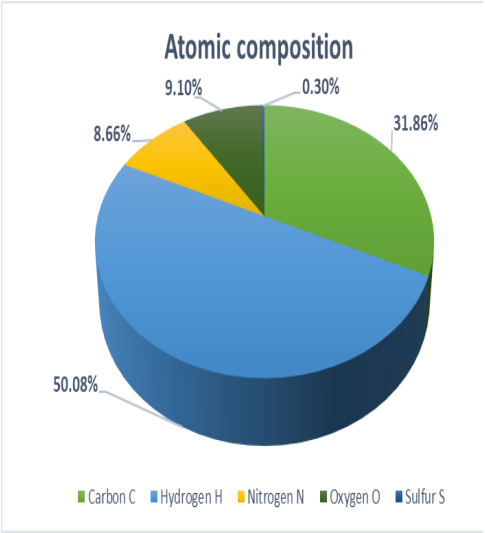
The UniProt accession number S0E3D0 identifies the 500 amino acid residues that make up the protein that was chosen from the fungal species *Gibberella fujikuroi*. The UniProt database, a comprehensive and publicly available resource for protein sequence and functional annotation, was used to obtain and validate the entire amino acid sequence. The compiled data that was retrieved is displayed in **Table 01**.

Table 01: The properties of HP obtained from the UniProt database.



Features	Properties of HP (Ent-kaurene oxidase P450-4)
Locus	GA2_GIBF5
Definition	Ent-kaurene oxidase P450-4
Accession	S0E3D0
Version	S0E3D0.1
Amino acid	500
Gene	P450-4
Organism	OS=Gibberella fujikuroi (strain CBS 195.34 / IMI 58289 / NRRL A-6831)
Fasta sequence	>sp|S0E3D0|GA2_GIBF5 Ent-kaurene oxidase P450-4 OS=Gibberella fujikuroi (strain CBS 195.34 / IMI 58289 / NRRL A-6831) OX=1279085 GN=P450-4 PE=1 SV=1 MPLMDVHWLIYVAFGAWLCSYVIHVLSSSSTVKVPVVGYRSVFEPT WLLRLRFVWEGGSIIGQGYNKFKDSIFQVRKLGTDIVIIPPNYIDEVR KLSQDKTRSVEPFINDFAGQYTRGMVFLQSDLQNRVIQQRLTPKLVS LTKVMKEELDYALTKEMPDMKNDEWVEVDISSIMVRLISRISARVFL GPEHCRNQEWLTTTAEYSESLFITGFILRVVPHILRPFIAPLLPSYRTLL RNVSSGRRVIGDIIRSQQGDGNEDILSWMRDAATGEEKQIDNIAQRM LILSLASIHTTAMTMTHAMYDLCACPEYIEPLRDEVKSVVGASGWD KTALNRFHKLDSFLKESQRFNPVFLLTFNRIYHQSMTLSDGTNIPSGT RIAVPSHAMLQDSAHVPGPTPPTEFDGFRYSKIRSDSNYAQKYLFSM TDSSNMAFGYGKYACPGRFYASNEMKLTLAILLLQFEFKLPDGKGR PRNITIDSDMIPDPRARLCVRKRSLRDE

3.2 Physicochemical characterization



The functional behavior of proteins is influenced by their physiochemical characteristics, such as hydrophobicity, surface charge, and structural stability (Ruangprom et al., 2025). The ProtParam tool's results showed that HP had a molecular weight of 57144.92 Da, a theoretical isoelectric point of 8.83, and the formula $C_{2566}H_{4033}N_{697}O_{733}S_{24}$. For yeast (in vivo), the estimated half-life was more than twenty hours (>20); for Escherichia coli (in vitro), it was

more than ten hours (>10); and for mammalian reticulocytes (in vitro), it was thirty hours (30). Additionally, 54 negatively charged residues (Asp and Glu) were found in comparison to 60 positively charged residues (Arg and Lys). This shows that the protein was categorized as positively charged and evaluated as alkaline (Sultan et al., 2024).

A higher AI indicates a greater proportion of aliphatic side chains, which contributes to increased thermal stability in globular proteins (Dill et al., 1989). The selected protein has an AI of 89.66, indicating moderate to high thermal stability. The instability index predicts the stability of a protein. The uncharcterize protein has an II of 51.43. A protein or peptide's average hydropathy value is referred to as GRAVY (Banerjee et al., 2010). A protein with a negative GRAVY score is hydrophilic, meaning it has a higher potential for water interaction, while a protein with a positive GRAVY score is hydrophobic, meaning it has a higher potential for water fear (Huang et al., 2014). This criterion indicates that the targeted protein is hydrophilic because the GRAVY value is -0.188 (**Table 02**). Amino acid composition and atomic composition have shown in **Figure 01**.

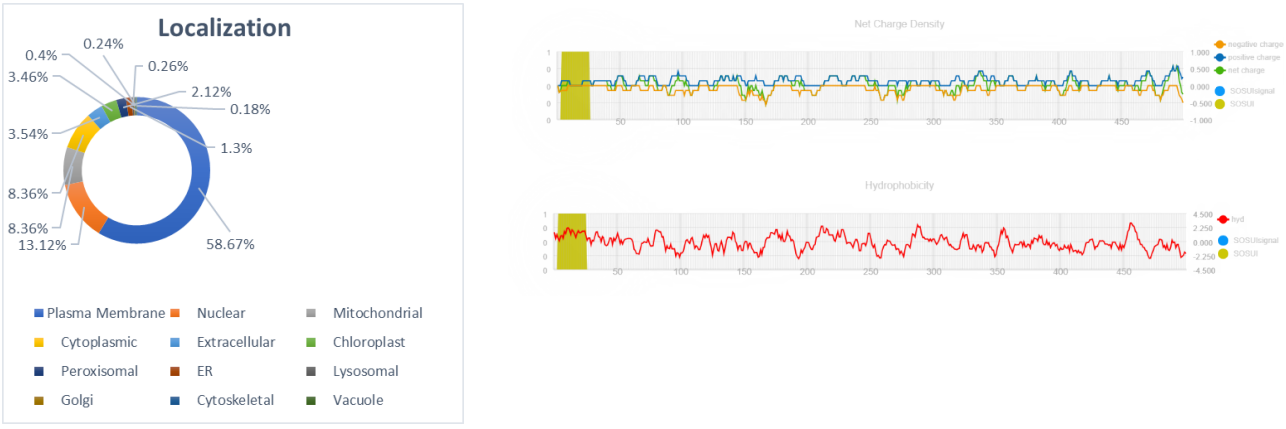
(a)

(b)

Figure 01: (a) Amino acid composition of the selected protein. The most important amino acid were Leu (48, 9.6%) followed by Ser (43, 8.6%), Arg (37, 7.4%), Ile (36, 7.2%), Val (33, 6.6%), Asp (30, 6.0%), Thr (28, 5.6%), Gly (27, 5.4%), Pro (27, 5.4%), Ala (25, 5.0%), Glu (24, 4.8%), Phe (24, 4.8%), Lys (23, 4.6%), Gln (18, 3.6%), Met (18, 3,6%), Tyr (18, 3.6%), Asn (17, 3.4%), His (10, 2.0%), Trp (8, 1.6%), Cys (6. 1.2%). **(b)** Atomic composition analysis expressed that Hydrogen (n = 4033) is the greatest quantity element followed by Carbon (n = 2566), Oxygen (n = 733), Nitrogen (n = 697), Sulfur (n = 24).

Table 02: The physicochemical value obtained from the ProtParam tool.

Characteristics	**Value**
Molecular weight	57144.92 Da
Theoretical isoelectric point	8.83
Total number of negatively charged residue (Asp + Glu)	54
Total number of positively charged residue (Arg + Lys)	60



Formula	$C_{2566}H_{4033}N_{697}O_{733}S_{24}$
Total number of atoms	8053
The estimated half-life	**(a)** 30 hours (mammalian reticulocytes, in vitro). **(b)** >20 hours (yeast, in vivo). **(c)** >10 hours (Escherichia coli, in vivo).
Instability index (II)	51.43
Aliphatic Index (AI)	89.66
Grand average hydropathicity (GRAVY)	-0.188

3.3 Subcellular localization and solubility prediction

Proteins associated with cellular or organelle membranes, known as membrane proteins, play crucial roles as transporters, receptors, anchors, and enzymes, essential for cell survival and signaling. They often serve as important drug targets by modulating disease-related enzymes or blocking receptors (Gheibi et al., 2017; Watson, 2015).

Subcellular localization, the specific location of proteins within cellular compartments such as the plasma membrane, nucleus, mitochondria, cytoplasm, extracellular space, chloroplast, peroxisome, endoplasmic reticulum, lysosome, Golgi apparatus, cytoskeleton, or vacuole is critical for understanding protein functions and interactions, including how viruses interact with host cells. This knowledge can inform the development of better treatments (Sadowski et al., 2008).

Using the CELLO v2.5 server, the selected protein's predicted localization scores were highest for the plasma membrane (2.934, 58.67%), followed by the nucleus (0.656, 13.12%), mitochondria (0.418, 8.36%), cytoplasm (0.418, 8.36%), and progressively lower scores for other compartments. So, the target protein is identified as a plasma membrane protein. Additionally, the SOSUI server predicted the protein as soluble. Additional findings have presented in **Figure 02.**

(a) **(b)**

Figure 02: (a) Subcellular localization of the selected protein predicted by the CELLO server. **(b)** Solubility predicted by the SOSUI server.

3.4 Functional annotation

A domain is a distinct, compact portion of a protein's three-dimensional structure that serves as a unit of molecular evolution in the context of the Conserved Domain Database (CDD) (Marchler-Bauer et al., 2011). Because of their constant sequence patterns or motifs, these domains can be recognized in other protein sequences. They are basically protein functional units that may be joined in many ways across evolution to produce proteins with a variety of activities (Marchler-Bauer et al., 2011). It is believed that the proper folding of proteins requires a structural unit called a protein sequence motif, which is a brief segment of amino acids (Verma & Bhatia, 2019). Protein function is significantly influenced by motifs, which are conserved features of protein structures. These themes are present in both sequence and 3D space. Understanding these components is essential for modelling, drug design, and 3D structure prediction (Golovin & Henrick, 2008).

According to the NCBI CDD, the target protein contains an oxidase domain spanning amino acids 63 to 496 (accession cd11041; E-value: $1.42e^{-180}$). This domain belongs to the cytochrome P450 family, specifically Ent-kaurene oxidase (P450-4), which catalyzes three sequential oxidation steps converting ent-kaurene into ent-kaurenoic acid (**Figure 03**). Ent-kaurene oxidase initiates the oxidative phase of gibberellin biosynthesis by acting as a gatekeeper enzyme, ensuring the formation of bioactive gibberellins like GA3. As a member of the cytochrome P450 family, P450-4 introduces oxygen atoms into substrates using molecular oxygen and NADPH, synthesizing complex secondary metabolites. This enzyme is implicated in gibberellin synthesis in phytopathogenic fungi such as *Fusarium fujikuroi*, where gibberellins act as virulence factors that facilitate host infection and colonization, particularly in rice plants.

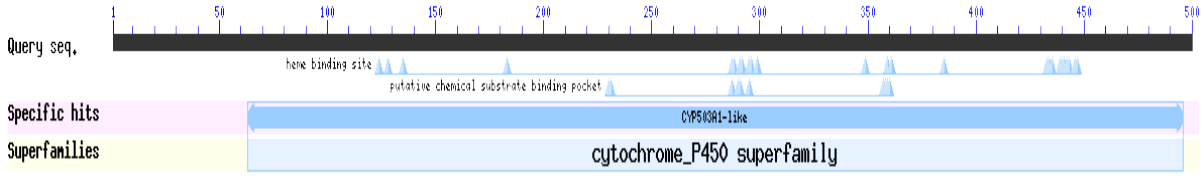


Figure 03: The query sequence, specific hits and superfamilies of the protein predicted by the NCBI CD database.

The following reaction is expected to include this multifunctional enzyme.

ent-kaur-16-ene + 3 reduced [NADPH--hemoprotein reductase] + 3 O2 = ent-kaur-16-en-19-oate + 3 oxidized [NADPH--hemoprotein reductase] + 4 H2O + 4 H^+

Heme interacts as a cofactor with the enzyme in this process.

The gene ontology analysis presented in the **Table 03.**

Table 03: Gene Ontology Analysis

Accession	Aspect	Term
GO:0052615	Molecular Function	Ent-kaurene oxidase activity
GO:0020037	Molecular Function	Heme binding
GO:0005506	Molecular Function	Iron ion binding

GO:0009686	Biological Process	Gibberellin biosynthetic process
GO:0019748	Biological Process	Secondary metabolic process

The PPI network of the selected protein, generated by STRING (v12.0) database, revealed interactions with ten other proteins. PPIs are fundamental to nearly all biological processes, from DNA replication and transcription to signal transduction and metabolism, as they regulate the formation of macromolecular complexes essential for protein cooperation and cellular function (C. Zhang, 2024).

The highest interaction score (0.874) was observed with CPS/KS, a bifunctional ent-kaurene synthase crucial for gibberellin biosynthesis. Other interacting proteins include FFUJ_12277 and FFUJ_14513, both nitrate reductases; FFUJ_03051, related to Werner syndrome helicase; FFUJ_08467 and FFUJ_12522, both tryptophan synthases; FFUJ_09241, a fumonisin cluster polyketide synthase; FSR2, involved in biosynthesis of fusarubins; FFUJ_12380, an acyl carrier protein; and FFUJ_01950, related to epoxide hydrolase (**Figure 04**). These interactions highlight the chosen protein's role in coordinating diverse biochemical and metabolic pathways, particularly those linked to secondary metabolite biosynthesis and gene regulation within *G. fujikuroi*.

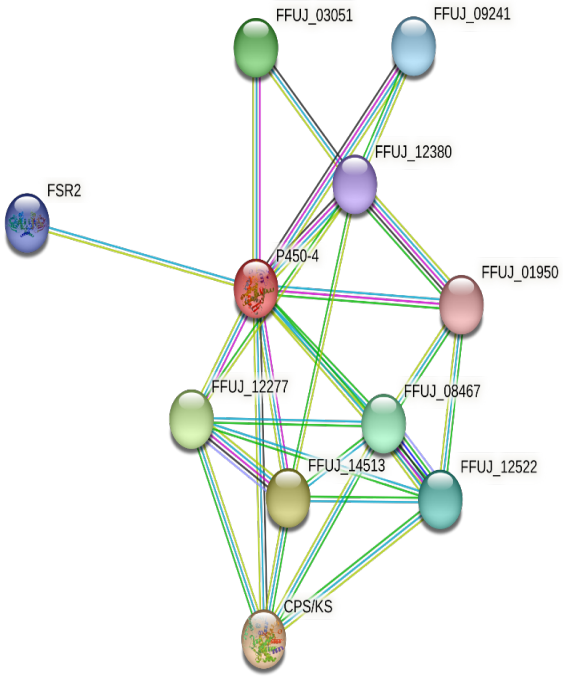

Figure 04: Ten other proteins, including CPS/KS (0.847), FFUJ_14513 (0.756), FFUJ_12277 (0.756), FFUJ_03051 (0.674), FFUJ_08467 (0.671), FFUJ_12522 (0.671), FFUJ_09241 (0.583), FSR2 (0.572), FFUJ_12380 (0.553), FFUJ_01950 (0.550), were shown to interact with the target protein by the PPI network.

3.5 Multiple sequence alignment and phylogenetic analysis

MSAs reveal functional motifs, conserved domains, and evolutionary relationships, serving as critical tools for predicting protein structure, annotating genes, and constructing phylogenetic

trees (Chatzou et al., 2016; C. Zhang et al., 2024). In this study, seven BLASTp sequences were aligned with the target protein using MEGA-X software to analyze evolutionary relationships, particularly between the target and related catalase proteins **(Figure 05)**.

A phylogenetic tree, or phylogeny, graphically represents the evolutionary lineage and relationships among species, genes, or organisms originating from a common ancestor. Phylogenetic trees aid in understanding evolutionary patterns and the diversity of species by depicting their historical divergence. They also serve as the foundation for phylogenetic systematics, which classifies organisms based on evolutionary relationships (Machová, 2021; Zou et al., 2024). After constructing the tree, a high-quality, visually enhanced version was generated using the iTOL server (Letunic & Bork, 2024) for clearer presentation and interpretation **(Figure 06).**

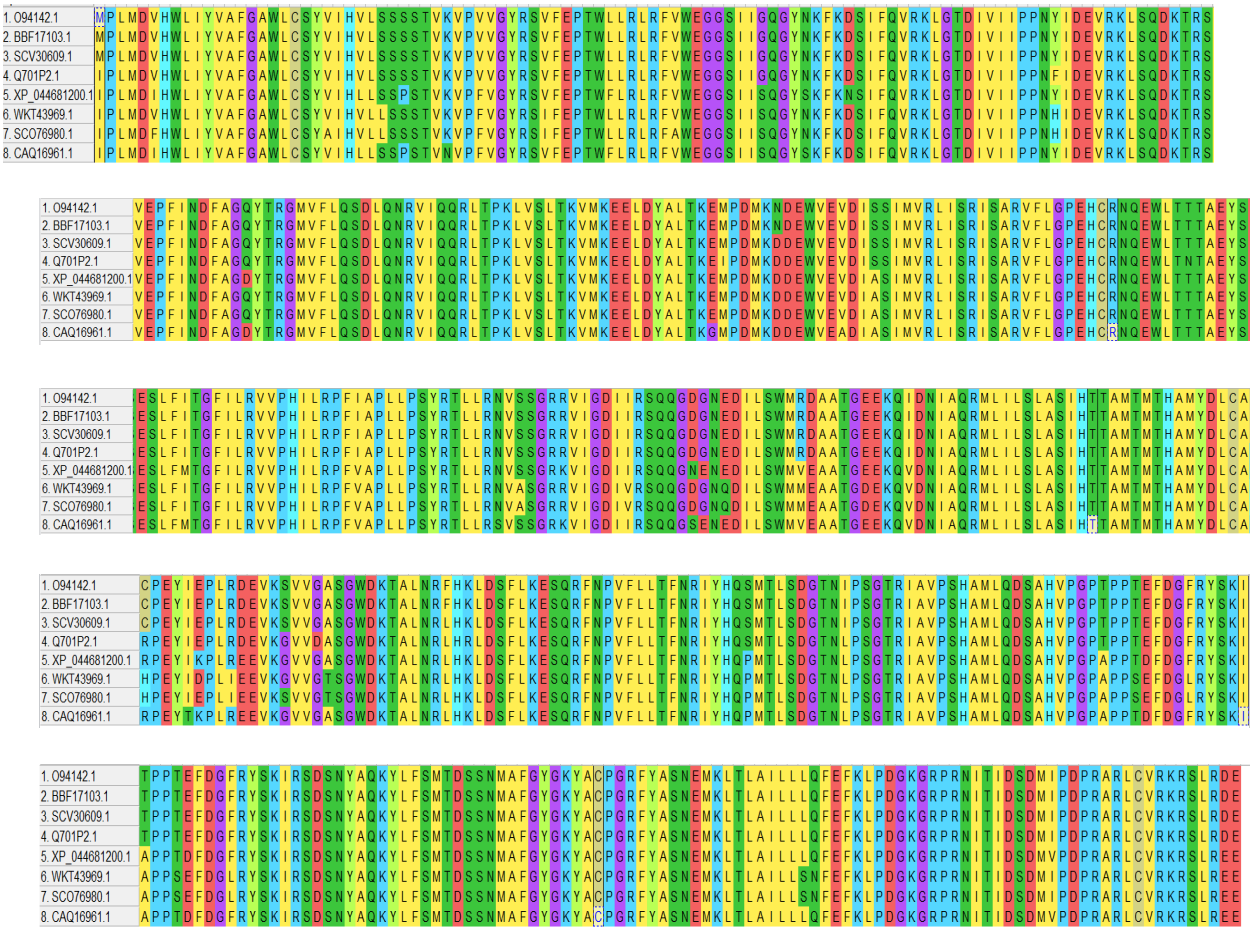

Figure 05: Multiple Sequence Alignments (MSA) of a number of catalase isozyme proteins were carried out using the MUSCLES technique of MEGA-X software.

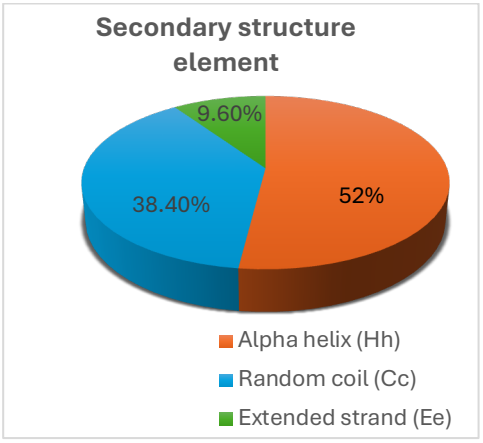

Figure 06: The evolutionary relationships between the HP and the equivalent sequence of other related proteins in the non-redundant database were investigated using the BLASTp search engine. While the nodes show the ancestral connection, the colored mark accession number indicates the studied HP.

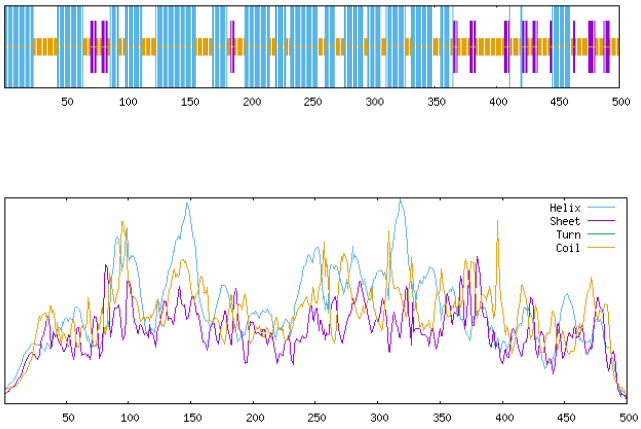
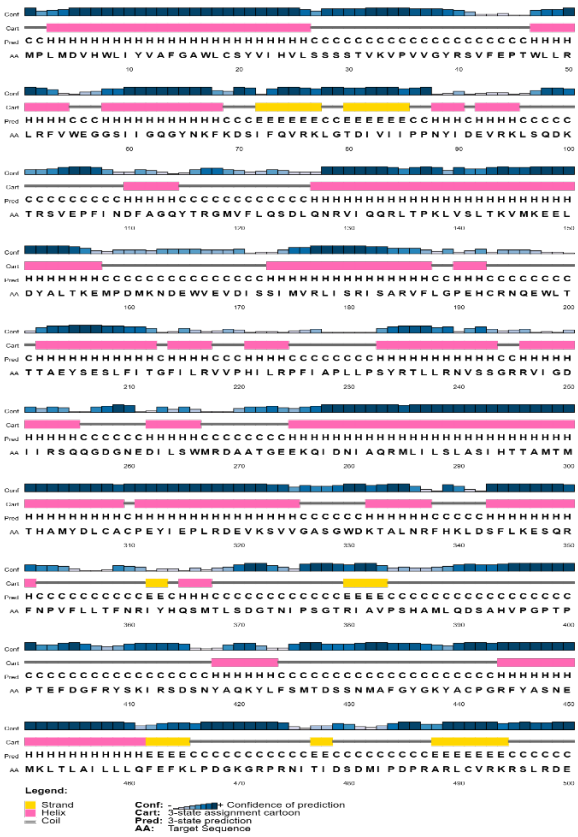
3.6 Secondary structure prediction



Protein secondary structure prediction is crucial because a protein's three-dimensional structure determines its function. Accurate prediction of secondary structural elements such as alpha helices, beta sheets, and random coils is essential for applications in drug development, protein engineering, and understanding biological processes, especially when experimental structure determination is challenging (Moult, 1999; Rokde & Kshirsagar, 2013).

The SOPMA server was used to identify the secondary structural elements, including the alpha helix (n=260, 52%), random coil (n=192, 38.40%) and extended strand (n=48, 9.60%), respectively (**Figure 07**). Higher alpha helix content enhances the protein's structural stability, promotes specific molecular interactions, and supports proper folding, which is vital for biological activity (Skipper, 2005).



Based on this composition, the target protein is characterized by substantial structural integrity and functional complexity, likely contributing to its biological roles.

(b)

(c)

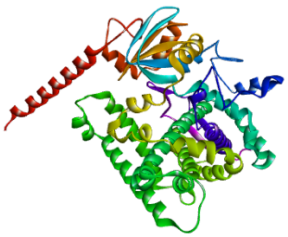

Figure 07: (a) The secondary structural components of the discovered protein were predicted by the SOPMA server. **(b)** The SOPMA server schematically displays the secondary structure's components, which comprise a helix, sheet, turn, and coil, in accordance with the identified protein sequence. **(c)** PSIPRED was used to estimate the 2D structure of the targeted proteins.

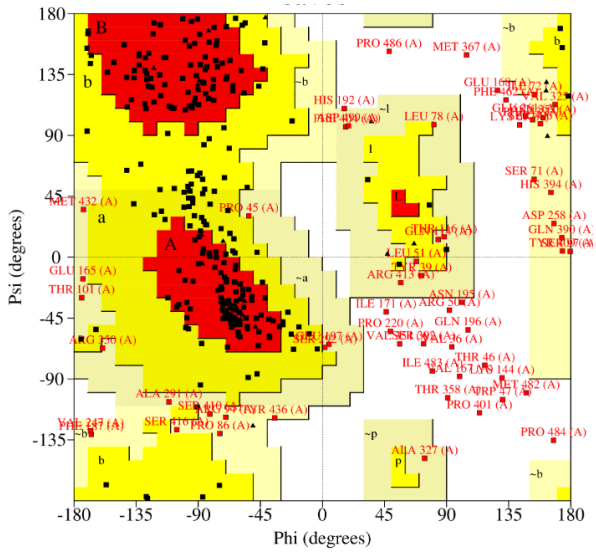
3.7 Homology modeling and quality assessment



The 3D structure of proteins can be predicted from their amino acid sequences using various computational techniques, with homology modeling being the most accurate. This method searches conformational space by leveraging experimentally solved structures while minimizing disruptions. Homology modeling relies primarily on sequence identity rather than extensive force field calculations, allowing it to bypass strict force field requirements and exhaustive conformational searches. It is based on the principle that protein structure is more conserved than sequence, so minor to moderate sequence changes usually cause minimal structural variation (Muhammed & Aki-Yalcin, 2019; Vyas et al., 2012).

Quality assessment is crucial in protein structure prediction and validation because it ensures the accuracy and reliability of structural models, which are fundamental for understanding molecular mechanisms and advancing drug discovery (Mainz et al., 1992). High-quality protein models exhibit correct bond lengths, angles, and stereochemical properties, with most residues falling in favored conformational regions (Kehl et al., 2023).

Figure 08: Using **(a)** I-TASSER and **(b)** SWISS-MODEL, the expected three-dimensional structure of the selected protein was created. The ramachandran plot was assessed for the targeted protein using **(c)** I-TASSER and **(d)** SWISS-MODEL. The ProSA-web's Z-scores for the 3D protein models are **(e)** I-TASSER (Z-score: -5.25) and **(f)** SWISS-MODEL (Z-score: -8.87). Additionally, **(g)** I-TASSER and **(h)** SWISS-MODEL carried out a local model quality analysis.

Table 04: Plot Statistics

Characteristics	**Value**	
	I-TASSER	SWISS-MODEL
Residues in most favored regions [A,B,L]	308 (69.4%)	416 (93.7%)
Residues in additional allowed regions [a,b,l,p]	83 (18.7%)	27 (6.1%)
Residues in generously allowed regions [~a,~b,~l,~p]	34 (7.7%)	1 (0.2%)
Residues in disallowed regions	19 (4.3%)	0 (0.0%)
Number of glycine residues	27	27
Number of proline residues	27	27

The Ramachandran plot analysis showed that 93.7% of amino acid residues in the SWISS-MODEL predicted structure were located in the preferred regions (A, B, and L), compared to only 69.4% for I-TASSER. Additionally, residues in the allowed, disallowed, and generously allowed regions comprised 6.1%, 0.2%, and 0.0% for SWISS-MODEL, while I-TASSER had higher percentages of 18.7%, 7.7%, and 4.3%, respectively (**Table 04**). These results indicate that SWISS-MODEL generated a more accurate 3D structure for the catalase protein. Supporting this, the ProSA-web z-score evaluation, which assesses a model's overall quality by comparing its energy, showed a better score for SWISS-MODEL (-8.87) than for I-TASSER (-5.25), further confirming the higher quality of the SWISS-MODEL prediction (**Figure 08**).

3.8 Active site prediction

Active site prediction identifies pockets on a protein's surface that are accessible to small molecules but restricted to larger ones, indicating potential ligand-binding sites. These pockets contain both functionally active residues and others not directly involved in ligand binding. Mutations within these pockets, even if not affecting the direct ligand-binding residues, can be pathogenic and may influence the effectiveness of active site-targeted drugs (Cammisa et al., 2013; Volkamer et al., 2010).

Using the CASTpFold server, which employs a probe radius of 1.4 Å to calculate solvent-accessible surface areas, putative active sites of the protein were identified. The analysis measured mouth openings, surface areas, and volumes of the pockets, identifying a total of 80 active pockets. The top-ranked active site was selected based on its surface area and volume, with values of 1096.949 Å² for surface area and 1365.531 Å³ for volume, representing the most probable functional active site (**Table 05, Figure 09 and Supplementary file**).

Table 05: Top 3 pockets of targeted HP and its area and volume.

Pocket ID	Area (SA) (Å^2)	Volume (SA) (Å^3)
1	1365.531	1096.949
2	88.261	129.992
3	246.819	91.886

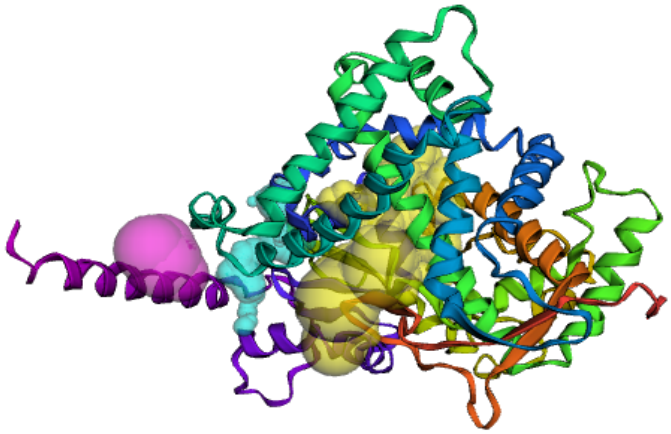

Figure 09: The active site predicted by CASTp fold. The negative volume of pocket-1, pocket-2, pocket-3 indicated respectively by yellow, pink and paste color. The shape of negative volume is spherical.

Conclusions with future perspective

This study provides a comprehensive characterization of a hypothetical protein from *Gibberella fujikuroi*, the causative agent of rice bakanae disease, through structural and functional analyses. The protein, identified as a plasma membrane-localized, hydrophilic cytochrome P450 enzyme (Ent-kaurene oxidase), plays a critical role in gibberellin biosynthesis, contributing to the pathogen's virulence. Homology modeling, particularly via SWISS-MODEL, yielded a high-

quality 3D structure, validated by Ramachandran plot and ProSA-web analyses, with active site predictions revealing key ligand-binding pockets. These insights enhance understanding of *G. fujikuroi* biology and lay a foundation for future functional validation and targeted control strategies to mitigate bakanae disease, addressing a critical challenge in sustainable rice production.

ABSTRACT

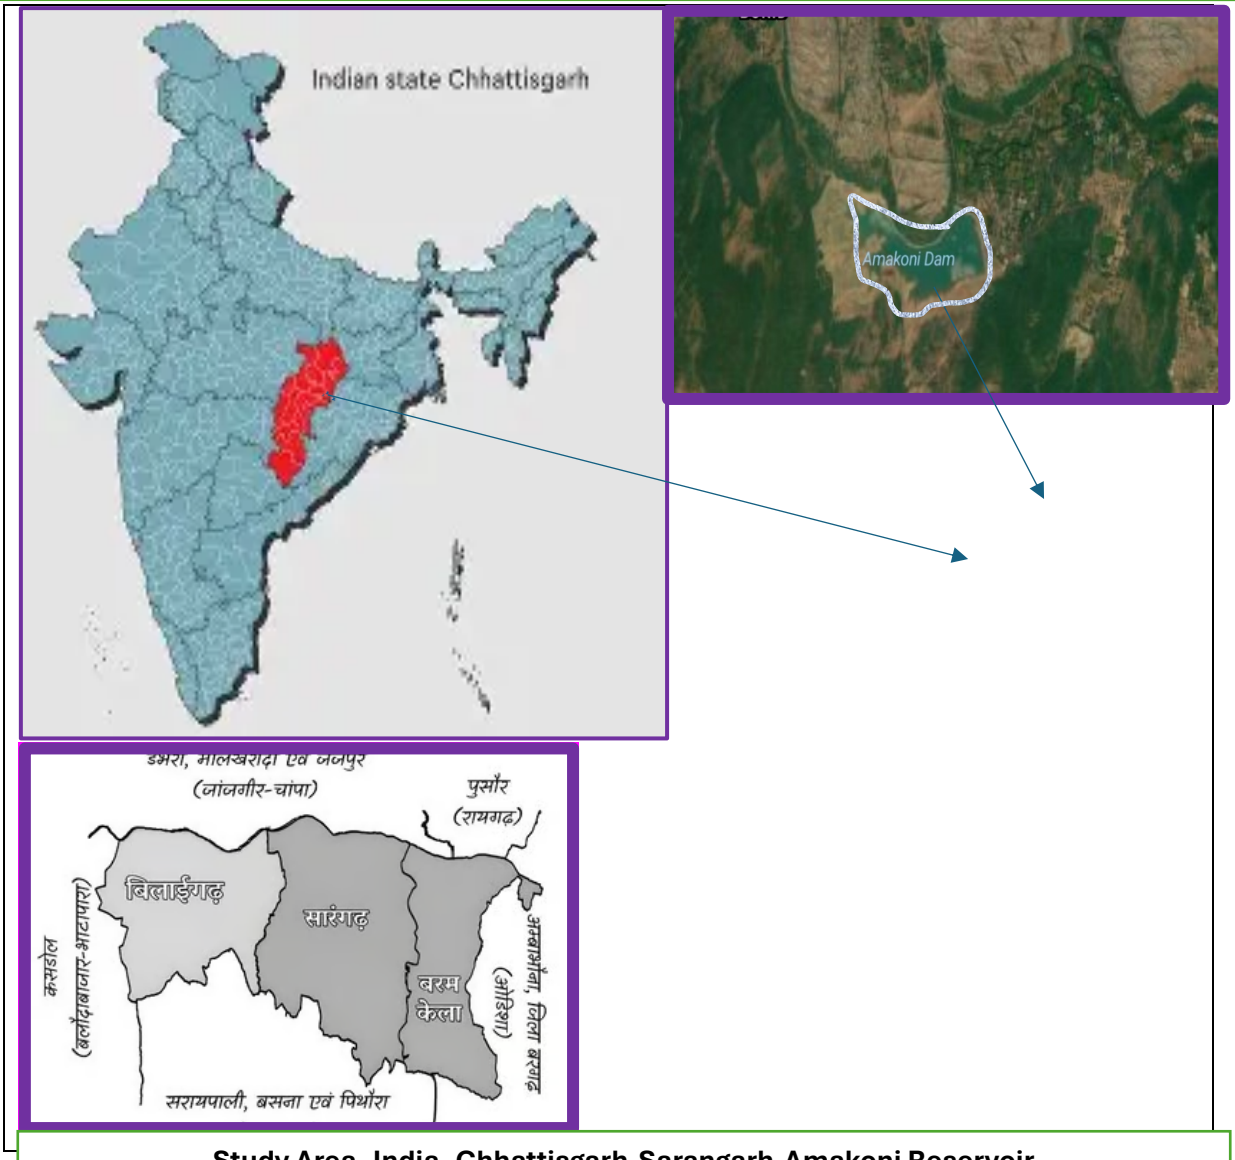
Spiders are a globally distributed group, with established populations in a wide range of habitats. The present study aimed to investigate spider faunal diversity within "Amakoni Reservoir," also called "Putka Reservoir", Sarangarh- Bilaigarh District, Chhattisgarh, India. The researcher aims to assess the species richness, and compile a comprehensive species checklist of spiders inhabiting the Amakoni Reservoir area. Spiders were collected from surrounding Amakoni Reservoir (Putka Reservoir) using various collection techniques and identified using a taxonomic key for Indian spiders. This study was conducted from June 2024 to May 2025. A total of 23 species, representing 8 families, were recorded from study area. The Araneidae family was the most prevalent, comprising six species. This research yields significant and contemporary data regarding the species diversity within the "Amakoni Reservoir," Sarangarh- Bilaigarh District, Chhattisgarh. The article provides a dataset that may be useful for future research on spider fauna.

Key words- Spider, diversity, Araneidae Amakoni Reservoir, Sarangarh- Bilaigarh District, "Putka Reservoir

OBJECTIVES- Objectives: This study was undertaken with the following primary objectives:

1. To assess the overall status of spider populations in the vicinity of the Amakoni reservoir.
2. To compile a comprehensive checklist of spider species identified at Amakoni reservoir.

1. INTRODUCTIO -



Spiders are fascinating creatures, they represent the most diverse and abundant group of invertebrate predators within terrestrial ecosystems (Wise, 1993). The fossil record indicates their emergence in the Devonian period approximately 380 million years ago (Shear et al., 1989). The current taxonomic classification recognizes 53'325 accepted species, distributed across 4391 genera within 135 families worldwide. (WSC2025 version-26) Singh's book details 2,110 species within 527 genera and 55 families found in India. (Singh, 2023). In Chhattisgarh, 222 spider species from 96 genera of 23 families have been recorded.

Spiders are classified within the Phylum Arthropoda, Class Arachnida, order Araneae, and are exclusively predatory organisms. Their body structure is segmented into two primary divisions: the cephalothorax and the abdomen. Characteristically, spiders possess eight legs, which are attached to the cephalothorax. The two major groups of spiders are Mygalomorphs, referred to as ancient spiders, and Araneomorphs, known as present day spiders. Spiders, characterized by their eight eyes, silk secretion, and web-spinning capabilities facilitated by spinnerets, are readily differentiated from insects. As a dominant predator of insect pests, spiders fulfill a crucial ecological role. They contribute to the dynamic equilibrium of micro-level food webs and represent an essential component of Integrated crop Pest Management strategies. Spiders serve as efficient natural regulators of numerous insect-mediated diseases, including malaria and dengue. They exhibit diverse distributions across habitats, contingent upon site suitability, and in feeding behaviors, occupying nearly all types of ecosystems.

Amakoni Reservoir, situated in the Amakoni village in Sarangarh–Bilaigarh district of Chhattisgarh, India. This Reservoir, nestled within a dry deciduous forest, presents a unique combination of terrestrial and aquatic ecosystems. The shining water body acts as a lifeline for Amakoni villagers. During the monsoon, the reservoir brims with fresh water, reflecting the dense canopy of Sal, Bhirra, Karra, Bija, Harra, Amla, Khair, Neem, Baheda, and Karanj, teak, and other deciduous trees that line its banks. This ecologically significant reservoir boasts considerable natural beauty and a calming atmosphere, with its banks supporting a wide variety of plant and animal life with spiders.

2. METHODOLOGY

2.1 STUDY AREA- The current study was conducted Putka Reservoir, situated in the Amakoni village in Sarangarh–Bilaigarh district of Chhattisgarh, India, is a tranquil waterbody encompassed by tropical dry deciduous forests. The geographical coordinates of this area are 21° 35' 15.71" N, 83° 4' 25.37" W, and the elevation is 217 m (712 ft).

Study Area -India- Chhattisgarh-Sarangarh-Amakoni Reservoir

Study Area- Amakoni Reservoir

2.2 SAMPLING METHOD- This study was conducted across all three sessions (summer, rainy, and winter) from June 2024 to May 2025. The following techniques were employed for specimen collection:

a. Ground-hand Collection: This method was utilized to collect spiders observed on the ground surface.

b. Aerial Hand Collection: This method was employed to collect web-building and free-living spiders from the foliage, herbaceous plants, stems of living or dead shrubs, and tree bark.

c. Active visual surveys - Active visual surveys were conducted within the habitat to locate spiders. Specimens were collected from ground-level and subterranean locations, as well as above-ground microhabitats, including folded leaves, plant branches, bark, rock surfaces, and grassland, in a collection vial.

d. Litter sampling -Litter sampling involves to the gathering arachnids specifically from the litter layer of an environment.

2.3. PHOTOGRAPHY AND IDENTIFICATION

Collection data and location were recorded, and morphological features were clearly observed and documented. All spider specimens were identified using taxonomic keys explained by Tikader (1982,1987), Sebastian and Peter (2009) and published literature. Following photographic documentation, collected spiders were released back into their natural habitats.

	Leucauge White, 1841	Leucauge decorata (Walckenaer, 1842)	**long-jawed orb weaver**

3. RESULT AND DISCUSSION-

The Amakoni reservoir supports a diverse spider population. A survey of the reservoir identified 23 spider species, representing 8 families and 19 genera. The Araneidae family was the most abundant. The study documented 7 species from the Araneidae, 6 from the Salticidae, and 2 each from the Lycosidae, Oxyopidae, Pholcidae, and Sparassidae. Single species were recorded from Hersiliidae and Tetragnathidae, (Table-1) and species richness was 0.000266 per square feet. Leucauge decorata generally found in grassland and shrub Compared to other regions of India, comprehensive data regarding the diversity and distribution of spiders in Chhattisgarh is limited. India possesses 1,686 spider species, encompassing 60 families and 438 genera, representing 3.6% of the global spider population. More recently, Choudhary S, R. et al. (2023) catalogued a total of 222 species from 23 families have been reported from Chhattisgarh in his checklist, Whereas. Singh et al. (2022) reported 336 spider species, classified into 136 genera and 30 families, through surveys encompassing 36 of the 52 districts within Madhya Pradesh. Previous research includes Ekka, and Kujur (2015), who documented 118 species representing

52 genera under 17 families, in Ram Jharna, Raigarh district Chhattisgarh, and Kujur and Ekka (2016), describes 120 species representing 49 genera under 16 families, 16 species in Gomarda Wildlife Sanctuary, Chhattisgarh, India. Subsequently, (Gupta and Chandra 2016) identified 33 species pertaining to 30 genera under 5 families in Achanakmar Wildlife Sanctuary, Bilaspur, Chhattisgarh, India and Sen (2021) reported a total of 55 species belonging to 42 Genus under 11 families in North East Gariaband Forest Regions of Chhattisgarh, India.

4.CONCLUSION- Amakoni reservoir demonstrates a notable diversity of spider species. Spiders are a key living factor in the food chain that maintains the ecosystem as predators. Based on these findings, conservation strategies should be developed to protect spider habitats and promote biodiversity.

ÖZET

Bu çalışmada Siyah Alaca buzağılarda doğum ve sütten kesim dönemlerine ait biyokimyasal parametrelerin değişimleri incelenmiştir. Siyah Alaca buzağılarda doğum (1) ve sütten kesim (2) dönemlerine ait biyokimyasal parametrelerin genel ortalamalarına bakıldığında, AST değerleri sırasıyla 86.48 U/L ve 94.44 U/L olup, enzim düzeylerinde hafif artış görülmektedir. GGT düzeyleri doğumda 32.62 U/L, sütten kesimde 25.70 U/L olarak tespit edilmiş, karaciğer fonksiyonlarında doğuma kıyasla stabilizasyon izlenmiştir. Kolesterol (KOL) ortalamaları doğumda 150.55 mg/dL, sütten kesimde 155.70 mg/dL olarak hafif artış göstermiştir. Glukoz (GLU) düzeyleri doğumda 56.88 mg/dL iken, sütten kesimde 38.60 mg/dL'ye düşmüş, bu da enerji metabolizmasındaki değişimi yansıtmaktadır. Kalsiyum (Ca) seviyeleri doğumda 11,10 mg/dL, sütten kesimde 10,89 mg/dL, fosfor (P) düzeyleri ise doğumda 8,82 mg/dL, sütten kesimde 8.39 mg/dL olarak ölçülmüştür. Magnezyum (Mg) ortalamaları doğumda 2,68 mg/dL, sütten kesimde 2.31 mg/dL olup, düşüş göstermektedir. Toplam protein (TP) değerleri doğumda 8.03 g/dL, sütten kesimde 7.23 g/dL; albümin (ALB) ise sırasıyla 3.47 ve 3.47 g/dL ile sabit kalmıştır. BUN düzeyi doğumda 10,56 mg/dL iken, sütten kesimde 10.43 mg/dL olup stabil seyretmiştir. Bu ortalamalar, Siyah Alaca buzağılarda yaşla birlikte bazı biyokimyasal değerlerde fizyolojik değişimler yaşandığını ortaya koymaktadır.

CHANGES in Blood Parameters from Birth to Weaning in Male and Female Holstein Calves

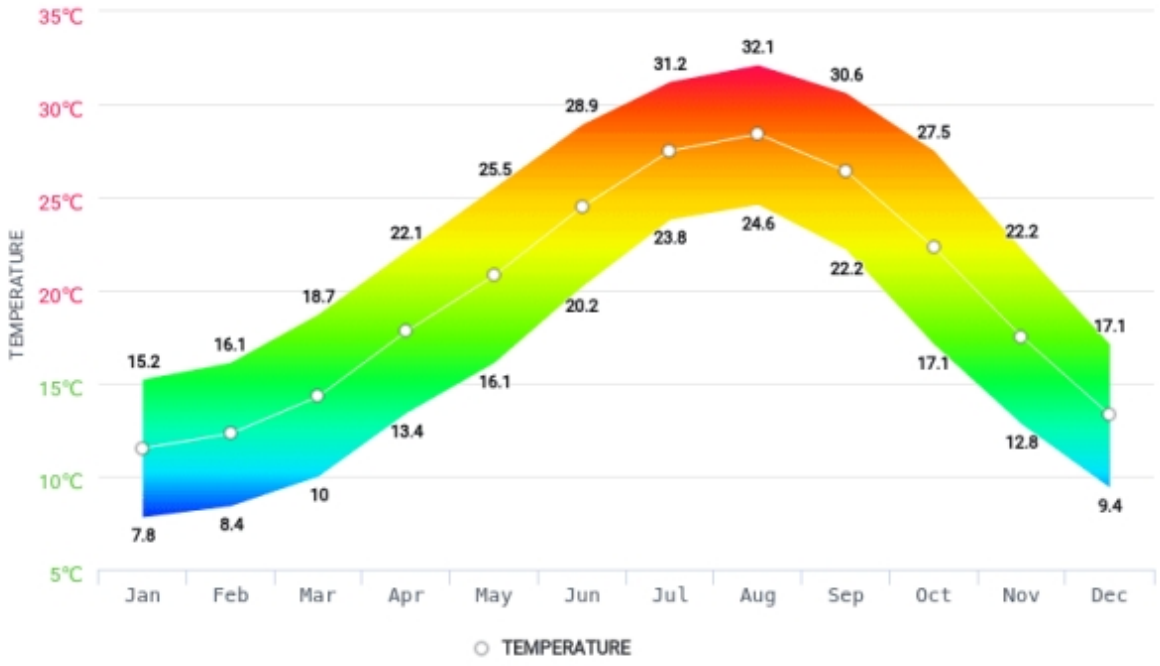
ABSTRACT

In this study, changes in biochemical parameters of Holstein calves at birth and weaning periods were examined. The average AST values at birth and weaning were 86.48 U/L and 94.44 U/L, respectively, showing a slight increase in enzyme levels. GGT levels were 32.62 U/L at birth and 25.70 U/L at weaning, indicating stabilization of liver functions compared to birth. Cholesterol (KOL) averages showed a slight increase from 150.55 mg/dL at birth to 155.70 mg/dL at weaning. Glucose (GLU) levels decreased from 56.88 mg/dL at birth to 38.60 mg/dL at weaning, reflecting changes in energy metabolism. Calcium (Ca) levels were 11.10 mg/dL at birth and 10.89 mg/dL at weaning, while phosphorus (P) levels were measured as 8.82 mg/dL at birth and 8.39 mg/dL at weaning. Magnesium (Mg) averages decreased from 2.68 mg/dL at birth to 2.31 mg/dL at weaning. Total protein (TP) values were 8.03 g/dL at birth and 7.23 g/dL at weaning; albumin (ALB) remained stable at 3.47 g/dL at both periods. Blood urea nitrogen (BUN) levels were 10.56 mg/dL at birth and 10.43 mg/dL at weaning, showing stability. These averages indicate physiological changes in some biochemical values in Holstein calves as they age.

Keywords: Holstein, Sex, Calf, Birth, Weaning, Blood Parameters

Giriş

Buzağı kayıpları, süt ve et üretiminde ekonomik verimlilikte esas noktadır. Bu kayıplar yetiştiricilerin ekonik kayıplarını artırarak sürdürülebilir üretimi kırar. Ayrıca, bu kayıplar hayvan refahı açısından da önemli bir göstergedir. Sağlıklı buzağılar, güçlü ve verimli ergin hayvanların aslını oluşturur. Bu nedenle, buzağı kayıplarını azaltmak hem ekonomik kayıpların önlenmesi hem de sürdürülebilir hayvancılık için elzemdir. Entansif süt sığırcılığı işletmelerinde buzağı kayıpları, işletme yönetimi, hijyen, beslenme ve bakım uygulamalarına bağlı olarak değişkenlik gösterse de, %2 olması gereken kayıp düzeyinin %30'lara çıktığı bilinmektedir. Bu nedenle, buzağı kayıplarının izlenmesi ve yönetilmesi, sürdürülebilir süt üretimi için kritik öneme sahiptir.



Buzağıların doğumdan sütten kesim dönemine kadar olan yaşam evresi, büyüme, bağışıklık kazanımı ve metabolik uyum açısından kritik bir dönemdir. Bu süreçte meydana gelen hematolojik ve biyokimyasal değişikliklerin izlenmesi, buzağı sağlığı ve gelişimi hakkında önemli bilgiler sunmakta; aynı zamanda erken tanı ve uygun yönetim stratejilerinin geliştirilmesine olanak sağlamaktadır (Piccione et al., 2010; Nazifi et al., 2009). Siyah Alaca buzağılarda doğum ve sütten kesim dönemlerindeki biyokimyasal parametrelerin izlenmesi, sürü yönetiminde hayvan sağlığı ve verimliliğin artırılması için önemli bir araçtır. Bu parametrelerdeki değişimler, buzağıların metabolik durumu, beslenme ihtiyaçları ve organ fonksiyonları hakkında erken uyarılar sağlar. Özellikle cinsiyete bağlı farklılıkların dikkate alınması, erkek ve dişi buzağıların bakım ve beslenme programlarının optimize edilmesine olanak tanır. Böylece erken dönemde olası sağlık sorunları tespit edilip müdahale edilerek, büyüme ve gelişim desteklenir. Bu biyokimyasal verilerin düzenli takibi, sürüde genel sağlık durumunun iyileştirilmesi ve sürdürülebilir verimliliğin sağlanması açısından kritik öneme sahiptir. Siyah Alaca (Holstein) ırkı, dünya genelinde olduğu gibi Türkiye'de de yüksek süt verimi nedeniyle yaygın olarak yetiştirilen bir süt sığırı ırkıdır (Atasever ve Güngör, 2009). Ancak bu ırkın buzağılarında, özellikle neonatal dönemde, bağışıklık sistemi henüz tam gelişmediğinden dolayı enfeksiyöz ve metabolik hastalıklara duyarlılık daha yüksektir (Sato et al., 2011). Bu nedenle buzağılarda yaşa ve gelişim dönemine bağlı olarak bazı kan parametrelerinin düzenli olarak takip edilmesi büyük önem arz etmektedir. Literatürde, buzağılarda yaşa bağlı olarak alyuvar (eritrosit), akyuvar (lökosit), hemoglobin, hematokrit düzeyleri gibi hematolojik parametrelerde değişiklikler görüldüğü, bu değişikliklerin büyüme hızı, bağışıklık sistemi aktivitesi ve çevresel stres faktörleriyle ilişkili olduğu bildirilmektedir (Knowles et al., 2000; Mohri et al., 2007). Aynı şekilde, biyokimyasal parametreler olan glukoz, total protein, albümin, üre, kreatinin ve bazı enzim düzeylerinin de buzağının yaşı ve genel sağlık durumu ile yakından ilişkili olduğu gösterilmiştir (Schermerhorn et al., 2005; Türkyılmaz ve Eskiizmirliler, 2009). Cinsiyetin, kan değerleri üzerinde belirli etkiler gösterebildiği de bazı çalışmalarda ortaya konulmuştur. Erkek ve dişi buzağılar arasında büyüme hızı, hormonal yapı ve metabolik yanıtlar açısından farklılıklar olabileceği bildirilmiştir (Kume et al., 2004; Palczynski et al., 2021). Süt sığırcılığında kan biyokimyasal parametrelerin referans değerlerinin belirlenmesi konusunda çeşitli çalışmalar mevcuttur. Bu çalışmalar, hayvan sağlığının izlenmesi, hastalıkların erken teşhisi ve beslenme durumunun değerlendirilmesi için önem taşır. Khan ve Wiseman (2006), Holstein buzağılarda doğumdan üç aya kadar hematolojik ve biyokimyasal parametrelerin yaşa bağlı değişimlerini detaylı olarak incelemiş ve yaş gruplarına özgü referans değerler önermiştir. Benzer şekilde, Kara ve ark. (2017) ile Demir ve ark. (2019) çalışmalarında, buzağıların büyüme dönemlerinde biyokimyasal değerlerde anlamlı değişimler saptanmış, özellikle protein ve mineral metabolizmasının yaşla birlikte farklılaştığı bildirilmiştir. Gökçe ve ark. (2021) ise Holstein buzağılarda serum biyokimyasal parametreleri için özgün referans aralıkları belirleyerek, klinik uygulamalarda bu değerlerin kullanılabilirliğini ortaya koymuştur. Ayrıca, Besser ve ark. (1990) buzağıların immün durumu

ile biyokimyasal parametreler arasındaki ilişkiyi değerlendirmiş ve bu değerlerin hastalık takibinde önemli göstergeler olduğunu vurgulamıştır. Siyah Alaca buzağılarda kan referans değerlerinin tespiti, buzağıların sağlık durumunun doğru ve objektif bir şekilde değerlendirilmesi açısından kritik öneme sahiptir. Referans değerler, veteriner hekimlerin ve yetiştiricilerin normal fizyolojik aralıkları belirleyerek anormal durumları erken dönemde fark etmelerine olanak tanır. Böylece metabolik bozukluklar, enfeksiyonlar veya beslenme eksiklikleri gibi sorunlar hızla teşhis edilip uygun müdahaleler yapılabilir. Ayrıca, Siyah Alaca ırkına özgü biyokimyasal profilin bilinmesi, farklı çevresel ve yönetim koşullarında sağlık takibini daha etkin hale getirir. Bu referans aralıkları, yaş, cinsiyet ve büyüme dönemlerine göre değişkenlik gösterebileceği için bölgesel ve ırksal özelliklerin dikkate alınması, sürü yönetiminde karar alma süreçlerinin doğruluğunu artırır ve sürdürülebilir hayvancılığa katkı sağlar.

Bu çalışma, Siyah Alaca ırkı erkek ve dişi buzağılarda doğum ve sütten kesim dönemlerinde bazı seçilmiş hematolojik ve biyokimyasal parametrelerin karşılaştırmalı olarak değerlendirilmesini amaçlamaktadır. Elde edilecek bulguların, buzağı sağlığı koruyucu uygulamalarına katkı sağlaması ve söz konusu ırka özgü fizyolojik referans aralıklarının oluşturulmasına temel oluşturması beklenmektedir.

Materyal ve Metod

Bu çalışma, 37°0′ Kuzey enlemleri ile 35°19′ Doğu boylamları arasında Akdeniz bölgesinde yer alan Adana'da bulunan entansif sığırcılık işletmesinde yürütülmüştür.

Şekil 1. Adana ili sıcaklık değerleri

Hayvan materyali olarak Çukurova Üniversitesi Ziraat Fakültesi Araştırma ve Uygulama Çiftliği Süt Sığırcılığı İşletmesinde Ekim, Kasım ve Aralık ayında doğan toplam 27 baş Siyah Alaca buzağı (16 erkek, 11 dişi) materyal olarak kullanılmıştır. Buzağılar, benzer çevresel koşullarda, aynı bakım ve besleme rejimi altında yetiştirilmiştir. Tüm buzağılara doğumdan itibaren ilk 24 saat içinde ağız sütü (kolostrum) verilmiş ve sonraki dönemde standart süt beslemesi uygulanmıştır. Sütten kesim 60. gün sonunda gerçekleştirilmiştir. Buzağılar, doğum sonrası ilk 3 gün doğum bölmesi karşısında bulunan bireysel bölmelerde tutulmaktadır. Ayrıca

3.günden sonra sütten kesime kadar fiberglas (genişlik 106 cm, uzunluk 118 cm, yükseklik 140 cm) kulübelerde (Fotograf 1) sütten kesime kadar bakıma devam edilmektedir. Buzağı kulübelerinde saman altlık kullanılmakta olup, altlık ıslandıkça üzerine ek saman atılarak kuru zemin temin edilmiştir. Araştırmada yem olarak buzağı başlangıç yemi ve yonca kuru otu kullanılmıştır. Buzağılar 4. günden itibaren bireysel bölmelere alınmış ve önlerinde, sürekli temiz taze su, buzağı başlangıç yemi ve kuru yonca otu bulundurulmuştur. Kolostrum içirme sürecinden sonra sütten kesime kadar buzağılar işletme sağmal ineklerinden sağılan tam yağlı sütle kovadan günde iki kez toplamda 4 kg olacak şekilde 56 gün süreyle beslenmişlerdir. 4. günden sütten kesime kadar olan sıvı besleme döneminde buzağılara başlangıç yemi, kuru yonca otu ve su serbest olarak verilmiştir.

Buzağılardan kan örnekleri doğumun 1. günü (0–24 saat) ve sütten kesim günü (60. gün) olmak üzere iki farklı zamanda alınmıştır. Böylece hem doğum hem de erken büyüme dönemine ait hematolojik ve biyokimyasal değerler elde edilmiştir. Cinsiyetin etkisini değerlendirebilmek amacıyla erkek ve dişi buzağılar ayrı gruplar olarak ele alınmıştır.

Kan örnekleri, jugular venden vakumlu tüpler kullanılarak sabah saatlerinde, süt içmeden önce alınmıştır. Kan örnekleri gün içinde 10:00-15:00 saatleri arasında işletme veterineri tarafından gerekli kurallara riayet edilerek kuyruk veninden, antikoagülansız tüplere (10 ml, BD Vacutainer Systems, Plymouth, İngiltere) alınmış ve en kısa süre içerisinde laboratuvara ulaştırılmıştır. Kan örnekleri 5000 rpm'de 10 dk santrifüj edilerek plazmaları çıkarılmış ve biyokimyasal analizlerde kullanılmak üzere -20ºC'de saklanmıştır. Biyokimyasal analizler (Total Protein, Albumin, Glikoz, Aspartat amino transferaz (AST), Gama glutamil transferaz (GGT), kan üre nitrojen (BUN), kalsiyum (Ca), fosfor (P), Kolestrol ve Magnezyum (Mg) ticari test kitleri yardımıyla otoanalizörler kullanılarak yapılmıştır..

Elde edilen veriler SPSS 25.0 istatistik paket programı kullanılarak değerlendirilmiştir. Erkek ve dişi buzağılar arasındaki farkları belirlemek amacıyla bağımsız örneklemler t-testi uygulanmıştır. Aynı bireylerin doğum ve sütten kesim dönemindeki kan parametreleri arasındaki farklar ise eşleştirilmiş t-testi ile analiz edilmiştir. Sonuçlar ortalama ± standart sapma (mean ± SD) olarak ifade edilmiştir ve istatistiksel anlamlılık düzeyi $p < 0.05$ olarak kabul edilmiştir.

Bulgular ve Tartışma

Yapılan varyans analiz sonuçlarına göre, Siyah Alaca buzağılarda doğum (1) ve sütten kesim (2) dönemleri arasındaki bazı biyokimyasal parametrelerde istatistiksel olarak anlamlı farklılıklar tespit edilmiştir. **BUN2** (Kan Üre Azotu – sütten kesim dönemi) parametresi için cinsiyetler arasında fark anlamlı bulunmuş (**p = 0.032**), bu durum erkek ve dişi buzağıların protein metabolizmasındaki farklılıklara işaret edebilir. Ayrıca, **P1** (Fosfor – doğum dönemi) için anlamlılığa yakın bir fark gözlemlenmiştir (**p = 0.052**), bu da erken dönemde fosfor metabolizmasının cinsiyete duyarlı olabileceğini düşündürmektedir. **ALB1** (Albümin – doğum dönemi) için de p değeri anlamlılık sınırına yakın olup (**p = 0.080**), dikkat çekici bir değişim olduğunu göstermektedir. Diğer tüm parametrelerde ise cinsiyetler arasında istatistiksel olarak anlamlı fark bulunmamıştır (**p > 0.05**), bu da çoğu biyokimyasal değerin cinsiyetten bağımsız olarak benzer seyrettiğini göstermektedir. Bu sonuçlar, bazı metabolik göstergelerin erken yaşta cinsiyete duyarlı olduğunu, ancak genel biyokimyasal stabilitenin korunduğunu ortaya koymaktadır.

Tablodaki bulgulara göre bazı biyokimyasal parametreler özellikle dikkat çekicidir. Doğum döneminde dişi buzağılarda AST1 değeri erkeklere göre daha yüksek olup, maksimum değerin 295 U/L'ye ulaşması karaciğer enzim aktivitesinde aşırı bir artışa işaret etmektedir. Sütten kesim döneminde erkek buzağılarda BUN düzeyinin dişilere göre belirgin şekilde yüksek olması (12.43 mg/dL vs. 9.07 mg/dL), protein metabolizması veya böbrek fonksiyonları açısından cinsiyet temelli farklılıklar olabileceğini düşündürmektedir. Ayrıca doğum döneminde erkeklerde fosfor (P1) düzeyinin daha yüksek olması (9.49 mg/dL vs. 8.36 mg/dL), hızlı kemik gelişimiyle ilişkilendirilebilir.

Çizelge 2. Siyah Alaca Erkek ve Dişi Buzağılarda ideal değerleri ve sürü yönetiminde kullanımı

Kan parametresi	Araştırma sonuçları	İdeal Değer *	Sürü Yönetiminde
AST (U/L)	Doğumda erkeklerde yüksek. sütten kesimde dişilerde artış var	50 - 120	Karaciğer ve kas sağlığı izlemi; yüksek değerler stres veya hastalık belirtisidir.
GGT (U/L)	Cinsiyet farkı az. dönemsel hafif değişim	20 - 50	Karaciğer fonksiyonları kontrolü.
Kolesterol (mg/dL)	Dişilerde erkeklerden yüksek	100 - 200	Enerji ve beslenme durumu
Glukoz (mg/dL)	Düşük ve benzer; sütten kesimde düşüş	40 - 80	Enerji metabolizması takibi. hipoglisemi riski
Kalsiyum (mg/dL)	Doğumda dişilerde yüksek; sütten kesimde hafif düşüş	9.5 - 12	Kemik gelişimi ve mineral dengesi
Fosfor (mg/dL)	Doğumda dişilerde yüksek; sütten kesimde erkeklerde yüksek	6 - 10	Kemik gelişimi ve metabolik ihtiyaçlarda
Magnezyum (mg/dL)	Düşüş eğilimi; cinsiyet farkı az	2 - 3	Metabolik fonksiyonlar için
Toplam Protein (g/dL)	Doğumda erkeklerde biraz yüksek; sütten kesimde azalma	6.5 - 8.5	Protein metabolizması ve beslenme durumu
Albümin (g/dL)	Fark az. değerler sabit	3.2 - 4.0	Beslenme durumu

BUN (mg/dL)	Sütten kesimde dişilerde anlamlı yüksek	7 - 15 mg/dL	Protein metabolizması ve böbrek fonksiyonları

*Kaneko et al.. 2008; Constable et al.. 2017. Smith. 2015. Radostits et al.. 2007

Bu çalışmada Siyah Alaca buzağılarda biyokimyasal parametreler incelenmiş ve yalnızca BUN (kan üre azotu) sütten kesim döneminde cinsiyetler arasında anlamlı fark göstermiştir ($p = 0.032$). Bu sonuç, protein metabolizmasının erkek ve dişi buzağılarda farklı seyrettiğine işaret etmektedir. Literatürde de farklı buzağı ırklarındaki BUN seviyelerinin cinsiyet. yaş ve beslenme durumuna bağlı olarak değiştiği bildirilmiştir (Özdemir ve ark., 2018; Yılmaz ve ark., 2020). Ayrıca. fosfor (P1) ve albümin (ALB1) parametrelerinde anlamlılığa yakın değerler elde edilmiş (sırasıyla $p = 0.052$ ve $p = 0.080$) ve bu parametrelerin özellikle erken dönemde metabolik ve beslenme koşullarına duyarlı olduğu vurgulanmıştır (Kara ve ark., 2017; Demir ve ark., 2019). Bu da, buzağıların erken yaşta minerallerin ve protein metabolizmasının yakından takip edilmesi gerektiğini göstermektedir.

Kaygısız ve Sönmez (2018), benzer şekilde Siyah Alaca buzağılarda cinsiyetin G-GT, glikoz ve insülin düzeylerini etkilediğini, erkeklerin bu parametrelerde dişilere göre daha düşük değerlere sahip olduğunu bildirmiştir. Ayrıca, besleme gruplarının G-GT, trigliserit ve büyüme hormonu seviyelerinde anlamlı etkisi bulunmuş; normal süt tüketen buzağılar G-GT ve büyüme hormonunda yüksek, trigliseritte ise düşük değerler gösterdiğini bildirmektedirler.

Holstein buzağılarda yapılan çalışmalarda da protein ve mineral metabolizması ile ilgili benzer bulgular rapor edilmiştir; örneğin Gökçe ve ark. (2021), total protein, albümin, üre, BUN, fosfor ve diğer önemli biyokimyasal parametrelerde yaş ve cinsiyetin etkisini ortaya koymuştur. Göncü ve ark. (2023, 2025) ise doğum ve sütten kesim dönemlerinde glukoz, GGT ve fosfor değerlerinin cinsiyet ve döneme bağlı olarak farklılık gösterdiğini bildirmiştir. Bununla birlikte, diğer biyokimyasal parametrelerde anlamlı fark bulunmaması. yaş ve cinsiyet değişkenlerinin çoğu parametre üzerinde nispeten stabil etki oluşturduğunu göstermektedir (Şahin ve ark., 2016).

Bulgulara genel olarak bakıldığında, bazı enzim ve metabolit düzeylerinde dönemler arası değişiklikler gözlemlenirken, özellikle AST enziminde doğumdan sütten kesime hafif artış görülmüştür. Glukoz, magnezyum ve toplam protein gibi bazı parametrelerde ise düşüş tespit edilmiştir. Cinsiyete bağlı olarak ise. doğum döneminde dişi buzağılarda AST değerinin erkeklere göre daha yüksek olduğu, sütten kesim döneminde ise erkek buzağılarda BUN seviyelerinin dişilere kıyasla anlamlı derecede yüksek olduğu belirlenmiştir. Fosfor ve albümin parametrelerinde de cinsiyete bağlı yakın anlamlı farklılıklar bulunmuştur. Bu sonuçlar, protein ve mineral metabolizmasının buzağılarda yaş ve cinsiyete göre farklılık gösterebileceğini ve erken dönemde bu parametrelerin dikkatle izlenmesinin önemini vurgulamaktadır. Literatürle uyumlu olarak, metabolik parametrelerin yaş. cinsiyet ve beslenme koşullarına bağlı değişkenlik gösterdiği ifade edilmiştir. Genel olarak, biyokimyasal parametrelerde yaş ve cinsiyetin etkisinin sınırlı ancak belirgin olduğu, buzağı sağlığı ve gelişim takibinde sürü yönetiminde bu faktörlerin göz önünde bulundurulması gerektiği sonucuna varılmıştır.

Sonuç

Siyah Alaca buzağılarda doğum (1) ve sütten kesim (2) dönemlerine ait biyokimyasal parametrelerin genel ortalamalarına bakıldığında, AST değerleri sırasıyla 86.48 U/L ve 94.44 U/L olup, enzim düzeylerinde hafif artış görülmektedir. GGT düzeyleri doğumda 32.62 U/L, sütten kesimde 25.70 U/L olarak tespit edilmiş, karaciğer fonksiyonlarında doğuma kıyasla stabilizasyon izlenmiştir. Kolesterol (KOL) ortalamaları doğumda 150.55 mg/dL, sütten

kesimde 155.70 mg/dL olarak hafif artış göstermiştir. Glukoz (GLU) düzeyleri doğumda 56.88 mg/dL iken, sütten kesimde 38.60 mg/dL'ye düşmüş, bu da enerji metabolizmasındaki değişimi yansıtmaktadır. Kalsiyum (Ca) seviyeleri doğumda 11.10 mg/dL, sütten kesimde 10.89 mg/dL, fosfor (P) düzeyleri ise doğumda 8.82 mg/dL, sütten kesimde 8.39 mg/dL olarak ölçülmüştür. Magnezyum (Mg) ortalamaları doğumda 2.68 mg/dL, sütten kesimde 2.31 mg/dL olup, düşüş göstermektedir. Toplam protein (TP) değerleri doğumda 8.03 g/dL, sütten kesimde 7.23 g/dL; albümin (ALB) ise sırasıyla 3.47 ve 3.47 g/dL ile sabit kalmıştır. BUN düzeyi doğumda 10.56 mg/dL iken, sütten kesimde 10.43 mg/dL olup stabil seyretmiştir. Bu ortalamalar, Siyah Alaca buzağılarda yaşla birlikte bazı biyokimyasal değerlerde fizyolojik değişimler yaşandığını ortaya koymaktadır.

ÖZET

Araştırma; Konya ili Ereğli ilçesi Yukarı Göndelen Mahallesi'nde, çiftçi arazisinde 2025 yılında Pioneer P0937 mısır çeşidinin bazı bitkisel ve verim özelliklerinin belirlenmesi amacıyla yürütülmüştür. Ekim işlemi 2025 yılı Nisan ayında, Tesadüf Blokları Deneme Desenine göre 4 tekrarlı olarak; sıra arası 70 cm, sıra üzeri 16 cm olacak şekilde makine ile yapılmıştır. Ekimden sonra oluşturulmuş ve çıkış gözlemleri her gün aynı saatte düzenli olarak yapılmış; parsellerde ilk günden itibaren çıkış yapan bitkiler işaretlenerek, bitkilerin çıkış tarihleri (sırasıyla 1.gün,2.gün, 3.gün, 4.gün, 5.gün ve 6.gün) kayıt altına alınmıştır. Ekim ayının ikinci haftasında yaklaşık %16–17 nem oranına ulaşan bitkilerde koçanlar tek tek koparılarak hasat edilmiştir. Hasat günü deneme alanında bitki boyu (cm), ilk koçan yüksekliği (cm) ve olarak bitki sap çapı (cm) (toprak yüzeyinden ölçülmüştür) belirlenmiştir. Hasat edilen koçanlarda sonrasında koçan ağırlığı (g), sömek ağırlığı (g), dane ağırlığı (g), koçan dane çevre sayısı (adet), koçan dane sıra sayısı (adet), koçan boyu (cm), koçan çapı (cm) ve yüz dane ağırlığı(g) incelenmiştir. Elde edilen veriler JMP istatistiksel analiz programında analiz edilmiş, ortalamalar arasındaki farklılık LSD çoklu karşılaştırma testi ile belirlenmiştir. Yapılan istatistiksel analizler sonucunda ortalamalar arasındaki farklılıklar bakımından; bitki boyu %1 düzeyinde önemli bulunurken 1. gün çıkış yapan bitkiler ilk istatistiksel grupta yer almışlardır. İlk koçan yüksekliği (cm) ve gövde kalınlığı (cm) bakımından da %1 düzeyinde önemli bulunmuş ve 1.,2. ve 3. gün çıkış yapan bitkilerden elde edilen değerler ilk grubu oluşturmuşlardır. Koçan ağırlığı (g), koçan boyu (cm), dane ağırlığı (g), ve koçan dane sıra sayısı (adet) değerleri bakımından bakımından %1, sömek ağırlığı (g), koçan çevre sayısı, koçan çapı (cm) bakımından ise %5 düzeyinde önemli bulunurken sömek ağırlığı bakımından ilk 4 gün, diğer iki parametre için ise ilk 5 gün çıkış yapan bitkiler istatistiksel olarak ilk grubu paylaşmışlardır. Yüz dane ağırlığı (g) bakımından ise farklılıklar %1 önem düzeyinde önemli bulunmuş ve 5.gün çıkış yapan bitkiler ilk grupta yer almıştır.

Anahtar Kelimeler: Hasat, Mısır, Verim, *Zea Mays*

EFFECTS OF DIFFERENT SOWING DATES ON YIELD PARAMETERS OF MAIZE (*Zea mays* L.)

ABSTRACT

This research was conducted in the Yukarı Göndelen neighbourhood of Ereğli district, Konya province, on farmland in 2025 to determine certain plant and yield characteristics of the Pioneer P0937 maize variety. The sowing was carried out April 2025 using a machine, with 4 replicates according to the Randomised Block Design; row spacing was 70 cm and row spacing was 16 cm. After sowing, emergence observations were made regularly at the same time each day; plants emerging in the plots were marked from the first day, and their emergence dates (1st day, 2nd day, 3rd day, 4th day, 5th day, and 6th day, respectively) were recorded. In the second week of October, when the plants reached a moisture content of approximately 16–17%, the ears were harvested individually. On the day of harvest, the plant height (cm), first ear height (cm), and plant stalk diameter (cm) (measured from the soil surface) were determined in the trial area. The harvested ears were subsequently examined for ear weight (g), cob weight (g), grain weight (g), number of grains per ear (count), number of rows of grains per ear (count), ear length (cm), ear diameter (cm) and 100-grain weight, (g). The data obtained were analysed using the JMP statistical analysis programme and differences between means were determined using the LSD multiple comparison test. Statistical analyses show that significant differences between means; plant height was found to be significant at the 1% level, while plants emerging on the first day were classified in the first statistical group. The first ear height (cm) and stem thickness (cm) were also found to be significant at the 1% level, and the values obtained from plants emerging on days 1, 2, and 3 formed the first group. In terms of ear weight (g), ear length (cm), grain weight (g), and number of grains per ear (number), the values were significant at the 1% level, while in terms of cob weight (g), number of ears per cob, and cob diameter (cm) were found to be significant at the 5% level. For ear weight, plants emerging in the first 4 days, and for the other two parameters, plants emerging in the first 5 days statistically shared the first group. Differences in hundred-grain weight (g) were found to be significant at the 1% level and plants emerging on the 5th day were included in the first group.

GİRİŞ

Mısır (*Zea mays* L.) Poaceae familyasına ait bir C4 bitkisidir ve yüksek verim potansiyeli ve iklim koşullarına uyum yeteneği sayesinde dünya genelinde geniş bir yayılım alanına sahiptir. 58° Kuzey ile 40° Güney enlemleri arasında, deniz seviyesinden yüksek rakımlara kadar uzanan geniş coğrafyalarda ve yıllık 250–5000 mm yağış alan bölgelerde başarıyla yetiştirilebilmektedir (Ahmed ve ark. 2019). Bu özellikler mısırı, tahıllar içinde buğdaydan sonra en geniş ekim alanına sahip tür hâline getirmekte; üretim miktarı bakımından ise tüm tahıllar içerisinde birinci sıraya yerleştirmektedir. Nitekim dünya genelinde 2023 yılı mısır ekim alanı yaklaşık 208.3 milyon ha seviyesindedir (FAO, 2025). En büyük üretici ülkeler ABD, Çin, Brezilya ve Hindistan olup, mısır hem stratejik bir gıda ürünü hem de yem, biyoyakıt, nişasta bazlı tatlandırıcı, mısır yağı ve diğer endüstriyel ürünler için önemli bir hammadde niteliği taşımaktadır (Vasal, 2002; Ciampitti ve Vyn, 2013; Ranum ve ark., 2014).

Mısırın küresel düzeyde artan önemi, hızla yükselen dünya nüfusu, hayvansal üretimdeki genişleme ve sanayi sektöründeki talep artışıyla doğrudan ilişkilidir. Yüksek biyolojik verim potansiyeli sayesinde gıda, yem ve endüstriyel hammaddelerin üretiminde kilit bir rol oynayan mısır, tarımsal üretim sistemleri açısından vazgeçilmez bir ürün olarak değerlendirilmektedir. Türkiye'de de mısır arpa ve buğdaydan sonra en fazla ekilen tahıl olup, son yıllarda üretimde belirgin artışlar kaydedilmiştir. 2024 yılında yaklaşık 7.894,438 hektarlık ekim alanından 8,1 milyon ton üretim elde edilmiştir (TÜİK, 2025). Hibrit tohum kullanımının yaygınlaşması, modern üretim tekniklerinin benimsenmesi ve sulama imkânlarının genişlemesi bu gelişime önemli katkı sağlamıştır (Revathi ve ark., 2025).

Mısırda verim ve kaliteyi belirleyen temel unsurlar arasında çeşit seçimi, ekim zamanı, gübreleme, sulama yönetimi ve iklim koşullarına uygun yetiştiricilik stratejileri yer almaktadır. Ekim zamanı, bitkinin fenolojik gelişimini doğrudan etkileyerek koçan oluşumu, döllenme ve tane dolumu gibi kritik dönemlerde çevresel streslerin şiddetini belirleyen önemli bir faktördür. Bu nedenle, bölgesel iklim özelliklerine uygun ekim tarihlerinin belirlenmesi, özellikle sıcaklık ve su stresi riski bulunan bölgelerde mısır verimini artırmak açısından büyük önem taşımaktadır.

Mısır bitkisinin Türkiye ve dünya tarımı açısından stratejik önemi giderek artmakta; verimlilik ve kaliteyi artırmaya yönelik bölgeye özgü araştırmaların yürütülmesi gerekliliği daha da belirgin hâle gelmektedir. Bu çalışma ile, Konya ili Ereğli ilçesinde yetiştirilen Pioneer P0937 marka mısır çeşidinde farklı günlerdeki kademeli çıkışın verim parametreleri üzerine olan etkisini incelemek amaçlanmıştır.

1.MATERYAL YÖNTEM

Bu çalışma, 2025 yılında Konya ili Ereğli ilçesi Yukarı Göndelen Mahallesi'nde bir çiftçi arazisinde yürütülmüştür. Araştırmada tohum materyali olarak Pioneer P0937 hibrit mısır çeşidi kullanılmıştır. Deneme, Tesadüf Blokları Deneme Desenine göre 4 tekerrürlü olarak kurulmuştur. Ekim işlemi 27 Nisan 2025 tarihinde sıra arası 70 cm, sıra üzeri 16 cm olacak şekilde pnömatik ekim makinesi ile gerçekleştirilmiştir. Ekim sırasında tohum yatağı sıcaklığı 15.5 °C olarak ölçülmüştür. Ekimle birlikte dekara 40 kg Timacereal (17-24-0) taban gübresi uygulanmıştır. Ayrıca çimlenmeyi ve kök gelişimini artırmak amacıyla 2 kg/da dozunda Resid marka mikoriza ürünü (Glomus iranicum var. Tenuihypharum) ekim esnasında kullanılmıştır.

Çıkış gözlemleri ekimden itibaren her gün aynı saatte yapılmış, çıkış gerçekleştiren bitkiler işaretlenerek çıkış günleri (1., 2., 3., 4., 5. ve 6. gün) kayıt altına alınmıştır. Hasat, bitkilerin koçan neminin %16–17 seviyesine ulaştığı dönemde, ekim ayının ikinci haftasında yapılmıştır. Her bitkiden koçanlar tek tek koparılarak ölçümler gerçekleştirilmiştir. Bitkilerde bitki boyu (cm), ilk koçan yüksekliği (cm), bitki gövde çapı (mm) belirlenmiştir. Koçanlarda ise koçan

çapı (mm), koçan ağırlığı (g), sömek ağırlığı (g), dane ağırlığı (g), koçan çevre dane sayısı (adet), koçan sıra sayısı (adet) ve yüz dane ağırlığı (g) değerleri ölçülmüştür. Elde edilen veriler JMP istatistiksel analiz programında analiz edilmiş, ortalamalar arasındaki farklılık LSD çoklu karşılaştırma testi ile belirlenmiştir.

2.BULGULAR VE TARTIŞMA

2.1.Bitki boyu (cm)

Yapılan çalışma sonuçları incelendiğinde, bitki boyu değerleri bakımından yapılan varyans analizi sonucunda farklılık istatistiksel olarak $P<0.01$ önem düzeyinde bulunmuştur. Bitki boyu değerleri 203.8-230.5 cm aralığında değişiklik göstermiştir (Tablo.1). En yüksek bitki boyuna 1. Gün çıkış yapan bitkilerde ulaşılmıştır. Çıkış gün sayısı geciktikçe bitki boyunda kısalma meydana gelmiştir. En kısa bitki boyuna 6. gün çıkış yapan bitkilerde ulaşılmıştır. Bitki boyu uzun olan genotiplerin yatmaya daha yatkındır ve bu durumda hasadını güçleştirmektedir (Shi ve ark.,2016). Yapılan farklı bazı çalışmalarda, Azar ve ark., (1997) tarafından 215.5-274.8 cm, Luchin ve ark., (2003) tarafından 229-258 cm, Beyene ve ark., (2005) tarafından 161-228 cm, Samsun koşullarında yürütülen çalışmada bitki boylarının 255-355 cm ve 259- 279 cm arasında değiştiğini (Öz ve ark. 2008), Öner (2017), tarafından 34-301 cm, Dancı (2025) 256.3-273.6 cm ve Kurt (2025) 166.3- 185.66 arasında bulduğunu bildirmişlerdir.

2.2. İlk koçan yüksekliği (cm)

Denemede elde edilen ilk koçan yüksekliği değerleri; 132.4-156.8 cm arasında değişiklik göstermiştir. Yapılan varyans analizi sonuçlarına göre ilk koçan yüksekliği değerleri bakımından çıkış gün sayıları arasındaki farklılık istatistiki olarak $P<0.01$ düzeyinde önemli bulunmuştur (Tablo.1). En yüksek ilk koçan yüksekliğine ilk çıkış (1.gün) yapan bitkilerde ulaşılmış ve istatistiksel olarak ilk grubu oluşturmuştur. İlk koçan yüksekliği, verim ve hasat kalitesi açısından önemlidir. Hasat makineleri için kolaylık sağlarken çok düşük koçan yüksekliği koçanın zarar görmesine sebep olabilmekte, çok yüksek koçanlar bitkinin kırılması veya devrilmesine sebebiyet verebilmektedir. Bazı farklı çalışmalarda ilk koçan yüksekliğine ait değerler için; Turgut ve Balcı (2002) mısır bitkisi ilk koçan yüksekliklerinin geç ekim dönemlerinde erken ve orta ekim dönemlerine nazaran daha yüksek olduğunu bulmuştur. Kaya ve Kuşaksız (2012) çalışmalarında, dört ekim zamanından (5 Mayıs, 20 Mayıs, 5 Haziran, 20 Haziran) 20 Haziran dönemindeki mısır ilk koçan yüksekliğinin en yüksek (113.89 cm) olduğunu bildirmişlerdir. Bandır (2008) Çanakkale ekolojik koşullarında farklı ekim zamanında (6 Haziran'dan 16 Temmuz'a kadar) yaptığı çalışmada en yüksek ilk koçan yüksekliğine (87.00 cm) 16 Temmuz'da yapılan mısır ekilişlerinde tespit ettiklerini bildirmişler, yine Dancı (2025) yapmış olduğu çalışmada ilk koçan yüksekliği değerlerini 106.87 – 117.47 cm olarak bildirmiştir.

2.3. Bitki gövde çapı (mm)

Bitki gövde çapı değerleri bakımından değerlerimiz 17.33-34.56 mm arasında değişiklik göstermiştir. Yapılan varyans analizi sonuçlarına göre gövde kalınlığı bakımından değerler arası farklılık istatistiki olarak $P<0.01$ düzeyinde önemli bulunmuştur (Tablo.1). En kalın gövdeye 1. Gün çıkış yapan bitkilerde ulaşılmış, en ince gövdeye ise 6.gün çıkış yapan bitkilerde ulaşılmıştır.

2.4. Koçan çapı (mm)

Koçan çapı değerleri 48.4- 55.7 mm arasında değişiklik göstermiştir. Yapılan varyans analiz sonucuna göre, koçan çapı bakımından çıkış gün sayısı arasında $P<0.05$ önem seviyesinde istatistiki farklılık bulunmuştur (Tablo.1). En düşük koçan çapına 6. Gün çıkış yapan bitkilerde ulaşılmış istatistiksel olarak son grupta yer almıştır. Diğer günlerde elde edilen değerler arası

farklılık istatistiksel olarak farklı bulunmamış hepsi ilk grupta yer almıştır. Koçan çapı, verimi etkileyen bir parametredir ve toplam ürün miktarını arttırmaktadır. Farklı çalışmalarda görülen koçan çapı verileri 4.2cm, 4.69cm, 4.18cm 4.87cm gibi değerler olduğu gözlemlenmiştir (Atakul ve ark., 2021; Karacadal, 2017; Öztürk, 2023).

2.5. Koçan ağırlığı (g)

Koçan ağırlığı bakımından değerler istatistiksel olarak P<0.01 düzeyinde önemli bulunmuştur. Değerler 171.3-325.3 g arasında değişmiştir (Tablo.1). En yüksek ortalamaya 3. Gün çıkış yapıp işaretlenen bitkilerde ulaşılırken (a grubu) sırasıyla 2.,1. ve 4. gün çıkış yapan bitkilerle aynı istatistik grupta yer almıştır. En düşük koçan ağırlığına ekimden sonra en geç çıkış yapan bitkilerde (6.gün) ulaşılmış ve istatistiksel olarak son grubu oluşturmuştur.

Aynı çeşit ile son yıllarda yapılan farklı çalışmalarda koçan ağırlık değerlerinin; 229.75 g (Turan ve Yücel, 2025); 247.9 (Keskin ve Hüseyinbaş, 2025) bulunduğu bildirilmiştir. Çalışmamızda elde ettiğimiz en yüksek değer diğer çalışma değerlerinden daha yüksek çıkmıştır. Koçan ağırlığı ürünün kalitesini ve ürün fiyatının belirlemesi ve pazarlanması açısından da önemli bir parametredir. Uzun ve kalın koçanların kavuzsuz koçan ağırlığının genellikle yüksek ve albenisi daha iyi olduğundan tüketiciler tarafından daha fazla tercih edilmektedir.

2.6. Sömek ağırlığı (g)

Sömek ağırlığı değerleri 30.6-46.1 g arasında değişiklik göstermiş ve istatistiki olarak P<0.05 düzeyinde önemli bulunmuştur (Tablo.1). En yüksek sömek ağırlığı değerine 3. gün çıkışın olduğu bitkilerde ulaşılırken; sırasıyla 4.,2. ve 1. Gün çıkışın olduğu bitkilerden elde edilen değerlerde ilk grupta yer almıştır. En düşük değere ise 6. Gün bitkilerinde ulaşılmıştır. Farklı mısır çeşitleri ile yapılan çalışmalar incelendiğinde, Akan (2017) Muş koşullarında sömek ağırlığının 41.10–96.65 g olduğunu bildirirken, Ordu'da yapılan bir çalışmada da (Nar, 2023) sömek ağırlığı (g) 13.6-35.3 g arasında değiştiği bildirilmiştir.

2.7. Dane ağırlığı (g)

Dane ağırlığı bakımından değerler istatistiksel olarak P<0.05 düzeyinde önemli bulunmuştur. Çalışmamızda dane ağırlığı verileri incelendiğinde ortalamaların 140.6-281.4 g arasında değişkenlik gösterdiği (Tablo.1) ve en yüksek ağırlığa 2.gün çıkış yapan bitkilerde ulaşıldığı ve 1.,3. ve 4. gün çıkış yapan bitkilerin de en yüksek değer ile aynı grubu paylaştığı belirlenmiştir. 6. gün çıkış yapan bitkilerden elde edilen değerler istatistiksel olarak son grubu oluşturmuştur.

2.8. Koçan dane çevre sayısı (adet)

Koçan dane çevre sayısı (adet) bakımından çalışma sonuçlarımız incelendiğinde, istatistiksel olarak değerler arasında farklılık P<0.05 düzeyinde önemli bulunmuştur. Ortalamalar 15.3-19.25 adet arasında değişkenlik göstermiş (Tablo.1), 6.gün elde edilen 15.3 adet değeri istatistiksel olarak son grubu oluşturmuştur. Diğer günlerden elde edilen değerlerin tamamı istatistiki olarak ilk grubu paylaşmışlardır. Ortalamalardan elde ettiğimiz değerler; Nar (2023)'ün 8.00-13.50değerlerinden yüksek kaydedilmiştir.

2.9. Koçan dane sıra sayısı (adet)

Yapılan varyans analiz sonucuna göre, koçan sıra sayısı bakımından P<0.05 önem seviyesinde istatistiki farklılık bulunmuştur. Tablo.1 incelendiğinde ortalamalar 20.6-40.1 adet arasında değişmiştir. En yüksek değere 1.gün bitkilerinde ulaşılırken, 2., 4.,3.gün bitkilerinden elde edilen değerler aynı istatistiki grubu paylaşmıştır. En düşük değere 6. gün çıkış yapan bitkilerde ulaşılmıştır.

Tablo.1. Verim parametrelerine ait değerler

Çıkış gün sayısı	Bitki boyu (cm) **	İlk koçan yüksekliği (cm) **	Bitki gövde çapı (mm) **	Koçan çapı (mm) *	Koçan ağırlığı (g) **	Sömek ağırlığı (g)*	Dane ağırlığı (g)	Koçan dane çevre sayısı (adet) *	Koçan dane sıra sayısı (adet) *	Yüz dane ağırlığı (g)**
1.gün	230.5 a	156.8 a	34.56 a	53.8 a	324.1 a	42.3 ab	281.3 a	18.3 a	40.1 a	40.2 ab

(*: P<0.05; **P<0.01)

2.10.Yüz dane ağırlığı (g)

Yapılan varyans analiz sonucuna göre yüz dane ağırlığı bakımından çıkış gün sayısı arasında P< 0.01 düzeyinde farklılık bulunmuştur (Tablo.1). 6. Gün çıkış yapan bitkilerde yüz dane ağırlığı sayımı yapılamamıştır. Ortalamalar 39.00-41.25g arasında değişkenlik göstermiştir. İstatistiksel olarak ilk grubu en yüksek değere sahip olan 5. gün çıkış yapan bitkilerden elde edilen değerler oluşturmuştur.

Mısırın bin tane ağırlığı genetik yapının yanı sıra, çevre şartları ve yetiştirme koşullarında değişebilir. Yapılan farklı çalışmalarda; bu değerler için; Lucchin ve ark., (2003) 126-186 g, Beyene ve ark., (2005) 229-410 g, Balcı ve Turgut,2006 (209.1 ile 398.9 gram), Hartings ve ark., (2008) 155-420 g, Ristic ve ark., (2014) tarafından 152.5-270.4 g aralığında bulduklarını bildirmişlerdir.

3. SONUÇ

Bu çalışmada ekim sonrası farklı çıkış günlerinde (1.–6. gün) gelişim gösteren mısır bitkilerinde bazı önemli tarımsal özellikler karşılaştırılmış ve çıkış zamanı ile verim unsurları arasındaki ilişkiler belirlenmiştir. Elde edilen sonuçlar, çıkış gün sayısının mısırda morfolojik ve verim parametreleri üzerinde anlamlı etkiler oluşturduğunu açık biçimde göstermektedir.

Genel olarak, erken çıkış yapan bitkiler (özellikle 2. ve 3. gün çıkışlılar) hem koçan ağırlığı, sömek ağırlığı hem de dane ağırlığı bakımından en yüksek değerlere ulaşmış; buna karşılık geç çıkış yapan bitkiler (özellikle 6. gün çıkışlılar) tüm parametrelerde en düşük değerleri vermiştir. Bu durum, çıkışın erken gerçekleşmesinin bitkilerin daha uzun süre fotosentetik aktiviteden

yararlanmasına, güçlü kök sistemi oluşturmasına ve sonuçta daha yüksek biyokütle ve verim değerlerine ulaşmasına imkân tanıdığını göstermektedir. Çıkış zamanı mısırda verim ve verim unsurları üzerinde belirleyici bir faktör olarak öne çıkmıştır. Erken çıkış yapan bitkiler hem koçan özellikleri hem dane verimi açısından avantaj sağlamış; geç çıkış yapan bitkiler ise istatistiksel olarak tüm parametrelerde düşük değerlere sahip olmuştur. Bu bulgular, mısır yetiştiriciliğinde homojen ve hızlı çıkışın sağlanmasının yüksek verim ve kalite için kritik olduğunu ortaya koymaktadır. Ekim öncesi tohum yatağı hazırlığı, tohum kalitesi ve nem sıcaklık dengesi gibi faktörlerin optimize edilmesi, çıkış senkronizasyonunu artırarak ürün performansını belirgin şekilde iyileştirebilir.

CUMHURİYETİN İLK YILLARINDA TARIM VE HAYVANCILIK ALANINDA MODERNLEŞME ÇALIŞMALARI VE SONUÇLARI

Mehmet OKUR

Prof. Dr., Karadeniz Teknik Üniversitesi, Edebiyat Fakültesi Tarih Bölümü

Karadeniz Technical University, Faculty of Letters Departman of History

ORCID: 0000-0002-8788-9038

ÖZET

Osmanlı İmparatorluğu'nun mali yapısı ve iktisadi düzeni büyük ölçüde tarıma dayalı olmakla beraber modern tekniklerini uygulamada oldukça geç kalmış, köylü sınıf pazar için üretimden ziyade ancak temel giderlerini karşılamaya yetecek kadar tarımsal veya hayvancılık faaliyeti yürütebilmiştir. Şüphesiz böyle bir yapının oluşmasında devletin yönetim biçiminden kaynaklanan yapısal sorunların da – özel mülkiyetin sınırlı olması, emeğin kıtlığı ve toprakların bolluğu – rolü olmakla beraber asıl önemli etken sanayileşmede geç kalınması ve dolaysıyla modern tarım tekniklerinin sınırlı sayıda ve ancak birkaç bölgede kullanılmasıydı.Bu durum nüfusun yaklaşık %80'i kırsalda yaşamasına ve ekilebilir alanların bolluğuna rağmen tarımla uğraşan kesimin yakın kentleri hatta kendi kentsel alanlarını dahi besleyememe sonucunu doğurmuştur. Nitekim İstanbul başta olmak üzere büyük kentlerin gıda gereksinimleri ancak ithal ürünlerle karşılanabilmiştir.

Hayvansal üretim ve orman varlığı tarıma göre bir miktar daha iyiydi. Ancak bu iki unsur da ilmî yaklaşımlardan uzak kullanım ve savaşlar nedeniyle büyük tahribata uğramıştı. Veteriner yetersizliği yüzbinlerce hayvanın telef olmasına yol açarken, ormanlar hem yakıt hem de konut yapımı nedeniyle telafisi mümkün olmayan yıkımlara maruz kalmıştı.

Türkiye'nin şartlarına özgü, mümkün olduğunca kendi ihtiyaçlarını karşılayan yeni bir ekonomi modelini hayata geçirmeyi planlayan Mustafa Kemal Paşa için tarım ve hayvancılık ivedilikle ele alınması gerekiyordu. Evet, sanayileşmek, Avrupa'nı gelişmiş ülkelerinin seviyesine çıkmak temel hedefti. Ancak onun düşüncesine göre bu hedefe ulaşmada geleneksel iktisadi yapıyı modernleştirerek başlamak daha doğru bir yaklaşımdı. Diğer bir ifadeyle tarım ve hayvancılık sanayileşmenin ilk adımı olmalıdır. Nitekim bu amaçla yüksek eğitim kurumları açılmış, Avrupa'dan uzmanlar getirilmiş, örnek çiftlikler hayata geçirilmiş, tohumluk, damızlık, ıslah uygulamaları yapılarak tarımsal üretim kapasitesi birçok kalemde ithalattan ihracat konumuna geçilmiştir. Ziraat Vekâleti'nin Cumhuriyetin Onbeşinci Yılında hazırladığı bir çalışma,tarım, hayvancılık ve ormancılık alanında varılan olağanüstü gelişmeyi açık biri şekilde ortaya koymaktadır.

MODERNIZATION EFFORTS AND RESULTS IN AGRICULTURE AND IN THE FIELD OF LIVESTOCK DURING THE EARLY YEARS OF THE REPUBLIC

Mehmet OKUR

ORCID: 0000-0002-8788-9038

ABSTRACT

Although the financial structure and economic system of the Ottoman Empire were largely based on agriculture, it was considerably late in adopting modern techniques. The peasant class could engage in agricultural or livestock activities only to the extent of meeting their basic needs rather than producing for the market. Undoubtedly, structural problems stemming from the state's administrative system—such as limited private property, labor scarcity, and abundant land—played a role in shaping this structure. However, the primary factor was the delay in industrialization, which resulted in modern agricultural techniques being applied only in a limited number of regions. Consequently, despite approximately 80% of the population living in rural areas and the abundance of arable land, the agricultural sector could not sufficiently supply nearby towns or even its own urban centers. Indeed, the food needs of major cities, particularly Istanbul, could only be met through imported products.

Livestock production and forest resources were somewhat better compared to agriculture. Yet both suffered significant damage due to unscientific practices and wars. The lack of veterinary services led to the death of hundreds of thousands of animals, while forests faced irreparable destruction due to their use as fuel and building materials.

For Mustafa Kemal Pasha, who planned to implement a new economic model tailored to Turkey's conditions and capable of meeting domestic needs as much as possible, agriculture and livestock had to be addressed urgently. Indeed, industrialization and reaching the level of Europe's developed countries were the primary goals. However, in his view, the most effective approach to achieve this goal was to begin by modernizing the traditional economic structure. In other words, agriculture and livestock should constitute the first step toward industrialization. Accordingly, higher education institutions were established, experts were brought from Europe, model farms were implemented, and agricultural production capacity was enhanced through seed, breeding, and improvement programs, enabling many products to shift from import dependence to export. A study prepared by the Ministry of Agriculture on the fifteenth anniversary of the Republic clearly demonstrates the extraordinary progress achieved in agriculture, livestock, and forestry.

Keywords: Republic, Atatürk, Agriculture, Livestock, Agriculture Ministry

GİRİŞ

Tarım ve hayvancılık, yaşam şartlarında meydana gelen dönüşümlere, kırsaldan kentlere göçlere ve sık sık değişen önceliklere rağmen insanlık tarihi boyunca önemini korumuş, hatta birçok ülkenin başlıca ekonomik kaynağı haline gelmiştir. Tarım ve hayvancılık, Türkistan'dan Balkanlara hemen tüm Türk toplulukları için de en önemli geçim ve gelir kaynağı olmuştur. Bununla beraber Avrupa'da meydana gelen ilmî ve teknolojik gelişmeleri zamanında yakalayamaması, diğer alanlarda olduğu gibi tarım ve hayvancılık alnında da geri kalmasına neden olmuştur. Neredeyse tüm iktisadî düzeni tarıma dayalı olan Osmanlı Devleti'nde köylü sınıf yüzyıllar boyunca pazar için üretimden ziyade ancak temel giderlerini karşılamaya yetecek kadar tarım veya hayvancılık faaliyeti yürütmüştür. Şüphesiz böyle bir yapının oluşmasında devletin yönetim biçiminden kaynaklanan yapısal sorunların da – özel mülkiyetin sınırlı olması, emeğin kıtlığı ve toprakların bolluğu – rolü olmakla beraber asıl önemli etkenler; sanayileşmede geç kalınması, dolaysıyla modern tarım tekniklerinin sınırlı sayıda ve ancak birkaç bölgede kullanılması ve ulaşım ağlarının yetersizliğinden kaynaklanmaktaydı. Tüm bu olumsuzluklar nüfusun yaklaşık %80'i kırsalda yaşamasına ve ekilebilir alanların bolluğuna rağmen tarımla uğraşan kesimin yakın kentleri hatta kendi kentsel alanlarını dahi besleyememe sonucunu doğurmuştur. Nitekim İstanbul başta olmak üzere büyük kentlerin gıda gereksinimleri ancak ithal ürünlerle karşılanabilmiştir.[1]

Hayvansal üretim ve orman varlığı tarıma göre bir miktar daha iyiydi. Ancak bu iki unsur da ilmî yaklaşımlardan uzak kullanım ve savaşlar nedeniyle büyük tahribata uğramıştı. Veteriner yetersizliği yüzbinlerce hayvanın telef olmasına yol açarken, ormanlar hem yakıt hem de konut yapımı nedeniyle telafisi mümkün olmayan yıkımlara maruz kalmıştı.

Osmanlı İmparatorluğu'nun yenileşme/modernleşme çabaları tarım ve hayvancılık alanında da kendini göstermiş, modern tarım tekniklerine geçilmesini sağlamaya yönelik programlar geliştirilmeye, Avrupa öğrenciler gönderilmeye ve yeni ilmi metotlarla eğitim yapacak tarım mektepleri açılmaya, çiftlikler kurulmaya başlanmıştır.[2] Bu arada sanayileşmiş ülkelerin mamul ve hammadde olarak tarımsal ürünlere olan ihtiyacının artması Osmanlı Devleti'nin Balkan ve Batı Anadolu bölgelerindeki çiftçilerin Pazar için üretimlerini tetiklemiş, bazı Avrupa ülkeleri tarım arazileri dahi kiralamışlardır.[3] Nitekim XIX. yüzyılın ikinci yarısından itibaren Anadolu'da pamuk, tütün, afyon, fındık, kuru üzüm, kuru incir, meşe palamudu, zeytinyağı vb. tarım ürünleri pazarı gelişmeye başlamış ve İzmir, İstanbul'dan sonra en önemli ithalat-ihracat merkezi konumuna gelmiştir. Şüphesiz Batı Anadolu'daki tarımsal üretimin artmasında ve ticarileşmesinde, İngiltere ile yapılan 1838 Balta Limanı Ticaret Antlaşması ve takip eden diğer ticaret antlaşmalar ile bölgenin Avrupa'nın açık pazarı haline gelmesi ve iç kesimleri limanlara bağlayan demiryolu ulaşımının sağlanması önemli rol oynamıştı.[4]

Osmanlı Devleti'nin son yüzyılında meydana gelen bu gelişmeler, kısmi ve bölgesel anlamda sınırlı kalmış, tüm ülkeyi kapsayan, ekonomi ile beraber toplumsal kalkınmayı amaçlayan bir

---

1 XX. yüzyılın başlarında Osmanlı Devleti önemli miktarlarda buğday, un ve pirinç ithal ediyordu. Tarıma dayalı bir ülkenin buğday ithal etmesinin en önemli nedenlerinden biri de kırsal bölgeleri şehirlere bağlayan yeterli ulaşım ağının olmamasıydı. Örneğin deniz yoluyla Balkan ülkelerinden veya Rusya'dan ithal edilen buğday İstanbul pazarına İç Anadolu'dan daha çabuk gelmekte ve daha ucuza mal olmaktaydı. Meşrutiyet Sonrası Milli İktisadın Oluşum Sürecine Liman Kent (İzmir/Ege) Perspektifinden Bakış", *Osmanlı Ansiklopedisi, C.3*, Yeni Türkiye Yayınları, Ankara, 1999, s. 601.

tarım ve hayvancılık politikası planlanmamıştır.[5] Hâlbuki XX. yüzyılın başında dahi İmparatorluk nüfusunun %80'i kırsal alanda yaşıyor, gayri safi milli hasılasının yaklaşık %50'sini tarım oluşturuyor ve vergilerin yine bir o kadar kısmı tarım ve hayvancılığa dayanan kalemlerden toplanıyor, ihracatın %80'i tarım ürünlerine dayanıyordu.[6]

Cumhuriyetin İlk Yıllarında Tarım ve Hayvancılık Alanında Modernleşme Çalışmaları

Yaklaşık dört yıl süren Milli Mücadele sonucunda oluşan yeni devlet, ülkeyi topyekûn ayağı kaldırmayı amaçlayan bir politika belirlemiş, yıllardır büyük bir sefalet içerisinde yaşayan Türk halkının ekonomik durumunu düzeltme yolarını aramakla işe başlamıştır. Nüfusun %80'inin kırsalda yaşadığı ve yine bir o kadarının tarım ve hayvancılıkla uğraştığı Türkiye için atılacak ilk adım da çok tabi olarak bu alanda olmuştur. Türkiye'nin şartlarına özgü, mümkün olduğunca kendi ihtiyaçlarını karşılayan yeni bir ekonomi modelini hayata geçirmeyi planlayan Mustafa Kemal Paşa liderliğindeki Cumhuriyet Hükümetine göre sanayileşmek, Avrupa'nı gelişmiş ülkelerinin seviyesine çıkmak temel hedefti. Ancak bu hedefe ulaşmak ülkenin demografik yapısıyla, yeraltı yerüstü kaynaklarıyla, bu kaynakları işleyecek mali durumuyla orantılı ve ilintili olmalıydı. Özetle tarım ve hayvancılık sanayileşmenin ilk adımı olmalıydı. Nitekim bu amaçla yüksek eğitim kurumları açılmış, Avrupa'ya ve Sovyet Rusya'ya heyetler gönderilmiş[7], uzmanlar davet edilmiş[8], örnek çiftlikler hayata geçirilmiş, tohumluk, damızlık, ıslah uygulamaları yapılarak tarımsal üretim kapasitesi birçok kalemde ithalattan ihracat konumuna geçilmiştir.

Ziraat Vekâletince hazırlanan 1938 tarihli bir rapor[9], Cumhuriyetin ilk yıllarından itibaren tarım ve hayvancılık alanında yapılan bu ilerlemeleri rakamlarla ortaya koymaktadır. Cumhuriyetin harabe bir ziraî yapı devraldığına atıf yapılarak başlanan bu raporda öncelikle, Cumhuriyet idaresinin memleketin ihtiyaç duyduğu ilim elemanlarını yetiştirmek ve ziraî üretim imkânları ilmî ölçülerle tetkik etmek üzere Yüksek Ziraat Enstitüleri açıldığı ve kısa sürede olumlu etkilerinin görüldüğüne dikkat çekilmektedir.[10] Nitekim Yüksek Ziraat Enstitüleri, 12.000 çeşit flora tespit ederken, kliniklerde her sene binlerce hayvan muayene ve tedavi edilmiş, 70'ten

6 Quartaer, a.g.m., s. 1556

7 Köylü ve işçi hareketiyle kurulan Sovyet Rusya'da tarım alanında devlet kontrolünde yeni bir yapılanma içerisindeydi. Sovyet Rusya'nın tarım politikalarını yakından takip eden Türkiye, bu ülkeye bir inceleme heyeti gönderdiği gibi, Sovyet bilim adamları da Türkiye'ye gelmişlerdi. Tarımsal alanda Sovyet Rusya ile yapılan işbirliği hakkında ayrıntılı bilgi için bkz.: Seyfi Yıldırım, "Atatürk Döneminde Sovyet Tarımını İnceleme: Resmî Geziler ve Bilimsel İşbirliği (1925-1932)", *Bilig,* Bahar 2011, Sayı: 52, s. 227-246.

8 Türkiye'ye gelen Avrupalı uzmanlar arasında Macar uzmanlar özel bir yer tutmaktaydı. Macar uzmanlar, Türk öğrenciler Avrupa'da yetişene kadar Türkiye'de uzun yıllar görev yapmışlardır. Macarlar Türkiye'de Tarım Bakanlığı'na bağlı bir Meteoroloji Enstitüsü (Rasathane-i Cevviye) kurulması, Atatürk Orman Çiftliğinin oluşturulması, mera ve çayırların düzenlenmesi, bahçıvanlık, arıcılık ve hayvancılığın geliştirilmesi gibi birçok alanda iz bırakan katkılarda bulunmuşlardı. Cumhuriyetin ilk yıllarında Macar uzmanların Türk tarım ve hayvancılığına yaptıkları katkılar hakkında ayrıntılı bilgi için bkz.: Melek Çolak, "Atatürk Döneminde Tarıma Dayalı Hayvancılık Politikası ve Macar Uzman Oszkar Wellmann'ın Raporları", *Karadeniz Araştırmaları*, XVI/62, s. 175-189; Yücel Namal, "Atatürk Döneminde Tarım ve Hayvancılık Alanında Macar Uzmanların Yeri," *XVIII. Türk Tarih Kongresi, IX. Cilt, 1-5 Ekim 2018 Ankara, Türkiye Cumhuriyeti Tarihi*, Türk Tarih Kurumu Yayınları, Ankara, 2022. s.712-739.

10 Cumhuriyetin ilk yıllarından itibaren dönemin gereklerine göre Türkiye'deki ziraat mekteplerinin ıslah edilmesine karar verilmiş, bu hususta Almanya Ziraat Bakanlığı ile temasa geçilerek Oldenburg başkanlığında bir heyet getirilmiş, bu heyetin tavsiyeleri doğrultusunda yeni bir program uygulanmaya başlanmıştır. Nurullah Kırkpınar, *Türkiye'de Zirai Eğitimin Tarihçesi ve Kurumsallaşması (1923-1963),* Atatürk Araştırma Merkezi Yayınları, Ankara, 2024, s. 34.

fazla ilmi eser kaleme alınmıştır.[11] Yine açılan ziraat mektepleri ve ziraî kurslarla modern tarım ve hayvancılık teknikleri öğretilmiş, dolayısıyla üretimde verimliliğin artırılması sağlanmıştır.[12]

Avrupa ve Amerika Birleşik Devletleri'ne de öğrenci gönderilen bu dönemde ziraî eğitim alanında dikkat çeken en önemli atılım "Köy Eğitmenleri" projesinin geliştirilmesi olmuştur. Köylüyü içinde bulunduğu statik hayattan kurtararak ona dinamik bir hayat verme, hem kendisine hem memleketin iktisadî kalkınmasına katkında bulunma niyetiyle hayata geçirilen bu proje o güne kadar başka hiçbir memlekette uygulanmamıştı.[13]

Köylünün hem ziraat usullerini yenilemek hem de okuyup yazmasını ve kültür seviyesini yükseltmesini temin etmek üzere Kültür ve Ziraat Bakanlıkları tarafından 1936 senesinin ilkbaharında Eskişehir'in Çifteler Çiftliğinde ilk defa tecrübe mahiyetinde olarak bir "Köy Eğitmenleri yetiştirme kursu" açılmıştır. Bu kursta yetiştirilen eğitmenlerden görünüşte basit, fakat hayati öneme sahip işler beklendiğinden, bu kişilerin köye bağlı kalmaları, köyde çalışabilmeleri, zorluklara göğüs germeleri ve her surette köylüye faydalı olmalarını temin için köy hayatını bizzat yaşamış ve köyü yakından tanımaları gerekirdi. Dolayısıyla bu eğitmenler, bilfiil ziraatla uğraşan arazi sahipleri ve askerliğini yapmış köylüler arasından seçilmişti. Çifteler'de arzu edilen gayeye uygun bir şekilde yetiştirilmiş olan eğitmen namzetleri geldikleri Ankara köylerine stajyer olarak tayin edilmişler ve kendilerinden beklenilen görevi başarıyla yerine getirmişlerdir.[14]

Bu örnek uygulamadan alınan olumlu sonuçlar üzerine 1937 yılında bu kez Eskişehir'de 2, Kocaeli, Kars, Erzincan ve Edirne vilâyetlerinde de 1'er olmak üzere 5 kurs daha açılmış ve o sene eğitmen adedi 1500'e ulaşmıştır. 1938 senesinde eğitmen meselesi daha fazla ehemmiyet arz etmiş ve yukarıda adı geçen vilayetlerden başka Manisa, İzmir, Kastamonu, Kayseri ve Malatya vilâyetlerinde de Köy Eğitmenleri kursları açılmasına karar verilmiştir.[15]

Cumhuriyetin ilk yıllarında, tarım ve hayvancılığın çağdaş metotlarla yapılması ve üreticilerin bilinçlendirilmesi için bilimsel yayınlara ve kongre, konferans gibi faaliyetlere de önem verilmişti. Ziraat Vekâletine bağlı bir "Neşriyat Müdürlüğü" kurularak, ziraat, orman ve veteriner umum müdürlüklerini alakadar eden kanun, nizam ve talimatnameleri neşredilmiş, köylere dağıtılmak üzere ufak broşürler, bilgilendirici levhalar hazırlanmış, ziraat mekteplerinde okutulmak üzere Roma Beynelmilel Ziraat Enstitüsü yayınları tercüme ettirilmiştir.[16] Yine ziraat ve çiftçi kongreleri tertip edilmiş, bu konuda yurtdışında düzenlenen kongrelere temsilciler gönderilmiştir.[17]

Ziraat Vekaleti, üretimi artırmak amacıyla, Ankara, Eskişehir, Adapazarı, ve Yeşilköy'de "Tohum Islah İstasyonları", Eskişehir'de "Deneme İstasyonu", "Çifteler Tohum Üretme Çiftliği", Antalya'da "Sıcak İklim Nebatları Islah İstasyonu", Kayseri'de "Yonca Deneme ve Yonca Tohumu Temizleme İstasyonu", Erzurum'da "Tohum Islah ve Deneme İstasyonu", Lüleburgaz'da "Devlet Örnek ve Üretme Çiftliği", Ordu, Konya ve Çorum'da "Deneme Tarlaları" tesis ederek hem tarım ve hayvancılık için gerekli olan ihtiyaçları karşılamaya çalışmış, hem de öncü işletmeci olmuştur.[18] Nitekim 1929'dan itibaren üretime geçen "Islah ve

[17] Cumhuriyetin On Beşinci Yıl Dönümü münasebetiyle, Ziraat Vekâleti, yeni hedefler üzerinde çalışmak üzere "Birinci Köy ve Ziraat Kalkınma Kongresi" düzenlemişti. *BCA, 490.01.0.0/1455/38/3-6.*
[18] *BCA, 490.01.0.0/1455/38/3-6-7.*

Deneme İstasyonu" Cumhuriyetin 15. yılına gelindiğinde yılda 2.000.000 kilo tohum dağıtılabilecek düzeye ulaşmıştır.[19]

Türkiye'nin coğrafî şartlarına uygun ürün çeşitlerinin seçilmesi[20], modern tekniklerin uygulanması ve tohumların ıslahı sayesinde Cumhuriyet devrine kadar önemli bir kısmı hariçten tedarik edilen buğday, artık dış memleketlere ihraç edilme düzeyine ulaşmıştır. Hâlihazırda kendi ihtiyacımızı temin ettikten başka yabancı ülkelere de mühim miktarda satış Bilhassa son beş sene zarfındaki buğday ihracatımız; evvelki senelere nispetle büyük farklar göstermiş ve 1936-1937 senesinde ihraç edilen miktar 104.000 tonu bulmuştur.[21]

Buğday üretiminde elde edilen başarı aynı şekilde Arpa, yulaf ve pirinç için de geçerliği olduğunu görmekteyiz.[22] Örneğin Cumhuriyet devrine gelinceye kadar pek iptidai bir tarzda yapılan, umumiyetle yazlık olarak ekilen ve ancak ilkbaharı yağmurlu geçen senelerde iyi bir mahsul alınabilen yulaf üretimi, yurt dışından getirilen tohumların deneme istasyonlarında ülke şartlarına uygun hale getirilmesi sonucunda kısa zamanda hem ekilen arazi hem de mahsulde büyük artış göstermiştir.[23]

Ziraat Vekaleti, tarım ürünlerinde üretimin çeşitlendirilmesi ve artırılması gibi hayvancılığın gelişimi hususunda da yoğun çaba sarf etmiştir. Yem ihtiyacının karşılanması için iklim çeşitliliğine göre "Yonca ve Tohum Temizleme" istasyonları kurulmuş, yurtiçi talep karşılandığı gibi başta Almanya olmak üzere Avrupa ülkelerine ihraç edilmeye başlanmıştır.[24]

Cumhuriyet hükümetinin tarım alanındaki bir diğer başarı hikâyesi de köylünün ziraat aletleri ihtiyacının karşılanması için gösterdiği çabadır. Ziraatı makineleştirmek ve üretimi çoğaltmak maksadı ile muhtelif senelerde 573.545 lira kıymetinde 221 adet traktör alınarak uygun şartlarla çiftçiye dağıtılmıştır.[25] Aynı şekilde pirinç ve pamuk üretimi yapılan bölgelerde kullanılmak üzere harman makineleri, pamuk mibzerleri ve çapa makineleri de yine uygun imkânlarla çiftçiye tevzi edilmiştir.[26]

Yeni Türk Hükümeti, meyvecilik ve bağcılık alanında da büyük başarılara imza atmıştı. Meyvecilik ve bağcılık Cumhuriyet devrine geçildiğinde tarla ürünlerinden daha harap vaziyetteydi. Öyle ki sadece 80 dekar büyüklüğündeki "Erenköy Amerika Asma Fidanlığı" ile işe girişilmiş olduğu halde, geçen on beş yıl zarfında bu müesseselerin sayısı Ankara, Bilecik, Halkalı, Kırklareli, Tekirdağ ve Yalova'da kurulan fidanlıklarla, yediye ve sahaları ise 1307 dekara çıkarılmıştır. Fidan üretim sahaları her yıl artırılarak memleket ihtiyacını karşılayacak bir duruma gelinmiştir. 1924 yılında 6.725 ve 1938 yılında ise 3.022.965 fidan dağıtılması bu alandaki gelişmenin boyutu açıkça ortaya koymaktadır.[27]

Meyveciliği, millî gelirin en sağlam kaynaklarından biri yapmak ve elma, incir, zeytin, fındık, narenciye, fıstık, kayısı mevzularını üzerinde çalışmak üzere Arifiye, Aydın, İzmir, Giresun, Antalya, Gaziantep ve Malatya'da birer istasyon kurulmuş, aynı zamanda armut, kayısı, vişne, badem, narenciye ve diğer meyvalı ve süs fidanları yetiştirmek maksadıyla da Kastamonu,

27 *BCA, 490.01.0.0/1455/38/3-16.*

Niğde, Ankara–Irmak, Erzincan, Kütahya, Çanakkale, Alanya, Tarsus, İzmir ve Mersin'de birer fidanlık oluşturulmuştur.[28]

Özellikle Zeytin yetiştiriciliğine büyük önem verilmiş zeytin mahsulünün keyfiyet itibarıyla mükemmel bir hale getirilmesi, yabani zeytin ağaçlarının aşılanması ve bu ağaçların verimli bir hale dönüştürülmesi maksadıyla ilk iş olarak İzmir, Muğla, Balıkesir, Çanakkale vilayetlerinde birer "seyyar zeytin bakım teşkilâtı" vücuda getirilmiştir. Bu teşkilatın İşletme, istihsal ve verimli olması bakımından faydalı olduğu ve iyi neticeler verdiği görülünce, bu işleri daha da geliştirmek için zeytinliklerde mecburi bakım usulünü tatbik etmek üzere bir kanuni düzenleme de getirilmiştir.[29]

Bütün bu mesainin bir neticesi olarak memlekette meyvecilik işleri büyük bir gelişim göstermiş, Cumhuriyetten evvel bir dönüm bile meyve istasyonu ve fidanlığı yok iken, geçen on beş yıl zarfında bu hususta kurulan kuruluşların adedi 17'ye ve kapsadığı alan da 3.589 dekara ulaşmıştır.[30]

Ziraat Vekâleti, meyve hasılatını olumsuz etkileyen haşerelere karşı da mücadele etmiş, zeytin sineği ve güvesine karşı 4.328.195, elma iç kurduna karşı 2.477.583, Portakallara musallat olan böceklere karşı 501.044, dutlara zarar veren böceklere karşı da 5.451.319 ağaç ilaçlanmıştır.[31]

Cumhuriyetin ilk yıllarında hükümetin özenle üzerinde durduğu bir diğer ürün de pamuktu. Ve bu alanda başlıca hedef dokuma sanayinin ihtiyaç duyduğu miktarın tamamını karşılamaktı. Nitekim pamuk üretimi için ekim alanları ıslah edilmiş, modern teçhizat temin edilmiş, böylece yaklaşık beş yıllık bir süre içerisinde ekim alanı 158.116 hektardan 230.581 hektara, mahsul miktarı ise 20.209 tondan 64.735 tona çıkarılmıştı.[32]

Cumhuriyet idaresinin tarımsal alandaki verimli çalışmalarından birisini de nebat koruma müesseselerinin kurulması teşkil eder. Bu yönde başlanan çalışmalar neticesinde evvela İzmir ve Ankara Ziraat Mücadele İstasyonları oluşturulmuş, 1935 yılında da Merkez Mücadele Enstitüsü kurulmuştur.[33]

Tavukçuluk ve ipekböcekçiliği modern tesislerle üretim faaliyetlerine girişilen bir başka alan olmuştur. Ülkede tavukçuluğun ıslahı için icap eden ilmî araştırmaları yapmak üzere 1931'de Ankara'da bir "Tavukçuluk Enstitüsü" açılarak, her yıl binlerce damızlık yumurta halka dağıtılmış[34], Bursa, Antalya, Diyarbakır, Edirne, Denizli'de birer ipekböcekçiliği mektebi ve istasyonu açılmış, memlekete uygun, iyi ve yüksek randıman verecek böcek nesillerini tespit etmek maksadıyla bir de "Böcekçilik Enstitüsü" tesis edilmişti.[35]

Uygun iklim şartlarına rağmen tarla ve bahçe bitkileri gibi Türkiye'de hayvancılığın gelişimi de ancak Cumhuriyet idaresiyle mümkün olmuştu. Türkiye'de veteriner eğitiminin başlaması XIX. yüzyılın ortalarında başlamasına rağmen gerek eğitim gerekse teşkilatlanma bakımından bir türlü belirli bir düzene oturtulamamıştı.[36] Cumhuriyet devrinde bir yandan kanuni düzenlemeler yapılıp, talimatnameler çıkarılıp hastalıklar karşısında, idare ve inzibat teşkilatının ve veterinerlerin vazife ve mesuliyetleri tayin ve tespit edilirken, diğer taraftan da veteriner eğitimi yeni bilimsel gelişmeler doğrultusunda yeniden düzenlenmiş, ayrıca hayvan

sıhhiye memurları ve nalbant mektebi de açılmıştır. Atılan bu kararlı adımlar ve yapılan çalışmalar sonucunda Cumhuriyetin 15. Yılına gelindiğinde ülkede asırlardan beri hüküm süren sığır vebasının kökü kazınmış, dalak, çiçek, mankafa, at frengisi, verem, uyuz gibi hastalıkların tedavisinde büyük ilerlemeler sağlanmıştır.[37]

Tüm bu hastalıklarla mücadele için daha önce teşkil edilen Pendik ve Erzincan serum müesseselerinden başka Cumhuriyet devrinde Pendik'te ayrıca bir de Bakteriyoloji Enstitüsü, Mardin'de bir serum müessesesi; Ankara Etlik'te 4 laboratuvardan müteşekkil bir merkez müessesesi ve ayrıca bir de İstanbul'da Distofajin dârülistihzarı tesis olunmuştur. Cumhuriyetten evvel yalnız bir sığır vebası serumu çıkaran bu müesseseler bugün memleketin aşı ve serum ihtiyaçlarını tamamını karşılayacak duruma gelmiştir.[38] Oluşturulan Damızlık Yetiştirme Müessesleri sayesinde ise ülkenin iklim şartlarına uygun büyük ve küçükbaş hayvanlar tespit edilmeye ve yetiştirilmeye başlanmış, gerektiğinde yurt dışından ithal edilerek köylüye ve çiftliklere dağıtılmaya başlanmıştır.[39]

Veteriner eğitimine verilen önem, çıkarılan kanuni düzenlemeler, kurulan müesseseler ve yapılan ıslah çalışmaları sonucunda Cumhuriyetin 15. Yılına gelindiğinde büyük ve küçükbaş hayvan sayısı 12 milyon artarak 38 milyonu geçmişti.[40]

Cumhuriyetin ilk yıllarında tarım ve hayvancılık alanında devlet planlaması ve öncülüğünde yapılan modernleşme çalışmaları sonucunda üretim sürekli bir artış göstermiş, Türkiye birçok kalemde kendi ihtiyacının hemen tamamını karşıladığı gibi artı değeri ihraç eden bir ülke durumuna gelmiş, II. Dünya Savaşı sürecinde ve sonrasında özellikle Avrupa devletlerinin gıda ihtiyacının karşılanmasında önemli rol oynamıştır. Yine tarım ve hayvancılık alanında yapılan atılımlarla sermaye birikimi sağlanmış, ağır sanayi girişimlerine alt yapı oluşturulmuştur.

ÖZET

Bu çalışma, mutasyonla geliştirilmiş olan ileri hatlarının çimlenme dönemlerinde NaCl kullanılarak oluşturulan 5 farklı tuz çözeltisinde (0, 4, 8, 12 ve 16 dS m^{-1}) tuzluluk stresine tepkilerinin incelenmesi ve ümitvar hatların belirlenmesi amacıyla yürütülmüştür. Bu amaçla NKÜ Lider, Sagittario ve Flamura 85 ticari çeşitlerinin ^{60}Co kaynaklı M_4 popülasyonlarından geliştirilen 12 mutant ileri hat ve bunların anaçları bu çalışmada materyal olarak kullanılmıştır. Çalışmada, 16 dS m^{-1} tuz çözeltisinde denemeye alınan buğday genotiplerinin tohumlarında çimlenme olmuş fakat fide gelişimi olmamıştır. Denemeye alınan buğday genotipleri arasında en yüksek çimlenme oranı Flamura 85 300/15 genotipinde belirlenmiştir. Genel olarak değerlendirildiğinde, mutant ileri hatların anaçlara göre yüksek çimlenme oranına sahip oldukları belirlenmiştir. Çimlenme ortamında artan tuz konsantrasyonlarının çimlenme oranını önemli bir şekilde azalttığı görülmüştür. Kontrol uygulamasına (0 dS m^{-1}) göre çimlenme oranı 4 dS m^{-1} uygulamasında %10.46, 8 dS m^{-1} uygulamasında %32.05,12 dS m^{-1} uygulamasında %54.99ve 16 dS m^{-1}. % 78.14 daha düşük gerçekleşmiştir. Sonuçlar, tuzluluk yönünden üstün performans gösteren mutan hatların tuzluluğun sorun olduğu alanları için çeşit adayı olarak verim denemelerine alınmasının, tuza dayanıklılık ıslah çalışmalarında gen kaynağı olarak kullanılmalarının uygun olabileceği göstermektedir.

Anahtar kelimeler: Buğday, mutant, stres, tuzluluk, çimlenme, fide büyümesi

INVESTIGATION OF RESPONSE OF BREAD WHEAT (*Triticum aestivum* L.) MUTANT IMPROVED LINES TO SALINITY STRESS DURING GERMINATION

ABSTRACT

This study was carried out to investigate the responses of advanced lines developed by mutation to salinity stress in 5 different salt solutions (0, 4, 8, 12 and 16 dS m^{-1}) using NaCl during germination periods and to identify promising lines. For this purpose, 12 mutant forward lines developed from 60Co sourced M_4 populations of NKÜ Lider, Sagittario and Flamura 85 commercial varieties and their mother plants were used as material in this study. In the study, seeds of wheat genotypes tested in 16 dS m^{-1} salt solution germinated, but no seedling development occurred. Among the wheat genotypes tested, the highest germination rate was determined for the Flamura 85 300/15 genotype. Generally, the mutant lines had higher germination rates than the parental lines. Increasing salt concentrations in the germination medium significantly reduced germination rates. Compared to the control treatment (0 dS m^{-1}), germination rates were 10.46% lower in the 4 dS m^{-1} treatment, 32.05% lower in the 8 dS m^{-1} treatment, 54.99% lower in the 12 dS m^{-1} treatment, and 78.14% lower in the 16 dS m^{-1} treatment. The results indicate that mutant lines with superior salinity performance may be suitable for inclusion in yield trials as variety candidates in areas where salinity is a problem and for use as genetic resources in salt tolerance breeding studies.

Keywords: Wheat, mutant, stress, salinity, germination, seedling growth

1. GİRİŞ

Buğday üretimini kısıtlayan en önemli faktörler; uygun olmayan tarımsal faaliyetler, tarım alanlarının amaç dışı kullanımı, erozyon sonucu verimliliğin azalması, insan eliyle bozulan doğal dengenin bir sonucu olarak artan zararlılar ve küresel bir sorun olan iklim değişikliği nedeni ile giderek şiddetlenen stres faktörleridir. Bu sebeplerle azalan tarım alanlarında birim alanda buğday veriminin artması zorunlu hale gelmiştir. Bunun içinde; yüksek verimli, yüksek kaliteli ve stres faktörlerine dayanıklı çeşitler geliştirmek önemlidir. Ayrıca bölgelerin iklim ve toprak faktörlerine uygun bitki ve çeşitlerin yetiştirilmesi de büyük önem taşımaktadır (Benlioğlu ve Özkan, 2015).

Tarım yapılan alanlarda verimliliği kısıtlayan önemli faktörlerden birisi tuzluluktur. Dünyada sulanabilir tarım arazilerinin yaklaşık üçte birinde tuzluluk sorunu olup bu alanın yaklaşık 400-950 milyon ha olduğu tahmin edilmektedir (Hasegawa, 1986; Özkaldı, 2004; Taghipour ve Salehi, 2008). Ülkemizde ise tarım topraklarının yaklaşık 1.5 milyon hektarı tuzluluk problemi olduğu, özellikle buğday ambarı olarak nitelendirilen İç Anadolu Bölgesinde bitki yetiştirilmesini sınırlandıran en önemli etkenler tuzluluk ve alkalilik olduğu bildirilmektedir (Özcan, 2000). Özellikle kurak ve yarı kurak bölgelerde yetersiz yağış ve yüksek buharlaşma tuzluluğun başlıca nedenlerindendir. Diğer taraftan sulamadaki yanlış uygulamalar, özellikle iyi bir drenajın olmadığı alanlarda tuzluluğa neden olabilmektedir (Baltacı, 2004). Bir toprak elektriksel iletkenliği yaklaşık 4 dS m^{-1} (≈ 40 mM ≈ 2,38 g/L NaCl) veya daha yüksek değerlerde ve yaklaşık 0,2 MPa ozmotik basınca sahip olduğunda "tuzlu" olarak nitelendirilmektedir (El Goumi, 2014).Yüksek tuzluluk, bitkilerde pek çok fizyolojik ve biyokimyasal olayın bozulmasına, iyon stresi ve ozmotik stres yanında hormon ve besin dengesizlikleri gibi ikincil streslere de neden olmakta (Türkan ve Demiral, 2009), tüm gelişim aşamalarında bitki büyüme ve gelişmesini olumsuz yönde etkileyerek verimliliğin düşmesine yol açmaktadır (Machado ve Serralheiro, 2017).

Tuz stresi bitkilerin tüm gelişme evrelerini etkileyebilir, ancak pek çok bitki türünde en ciddi zararların çimlenme ve erken büyüme aşamalarında meydana geldiği bilinmektedir (Munns, 2002). Son yıllarda etkisi giderek artan, küresel ısınmanın bir sonucu olarak buharlaşmanın etkisi ile kurak ve yarı kurak alanlarda toprak yüzeyinde yüksek düzeyde tuz birikimi meydana gelmektedir. Bu da çimlenme ve erken fide gelişme aşamasında bitkilerin sonraki gelişme dönemlerine göre daha yüksek tuzluluk seviyeleri ile karşı karşıya kalmasına neden olmaktadır (El Goumi, 2014). Tahılların gerek çimlenme gerekse erken fide döneminde yüksek tuzluluğa karşı duyarlı oldukları bildirilmiştir (Ghoulam ve Fares, 2001). Ekmeklik buğday orta derecede tuza dayanıklı bitkiler grubunda olup, toprakta 100 Mm NaCl seviyesinde tuzluluk olduğu durumlarda buğdayda verimi azalır. Bunun yanı sıra, tuzluluğa en dayanıklı olan buğdayda da 250 mM NaCl tuz konsantrasyonunda uzun süre kaldığı durumlarda bitki ölümlerinin gerçekleştiği ifade edilmiştir.

Kültür bitkilerine istenilen özelliklerin kazandırılmasında, kalıtsal yapıda ani değişmeler (mutasyon) yapacak yöntemlerin kullanılmasıyla kısa zamanda yeni varyasyonlar yaratılabilmektedir.

Birden fazla karaktere sahip mutantın izole edebilmesi yapay mutasyonların en büyük avantajıdır (Louali ve ark., 2015). Ekonomik açıdan önemli olan ürünlerin yetiştirildiği bölgelerde, çevresel değişimlere karşı dayanıklı çeşitlerin tercih edilmesi büyük önem taşımaktadır. Tuzluluk sorunu olan alanlarda yetiştirilecek buğday çeşitlerinin tolerans düzeylerinin bilinmesi başarılı bir yetiştiricilik ve yüksek verim için oldukça önemlidir.

Bu çalışma ile NaCl konsantrasyonları kullanılarak oluşturulacak farklı tuzluluk stresi koşullarının ekmeklik buğday mutant hatları ve çeşitlerinin çimlenme özelliklerine etkilerinin

incelenmesi ve tuzluluğa dayanıklılık ıslahı çalışmalarında genitör olarak kullanılabilecek ümitvar hatların tespit edilmesi amaçlanmıştır.

2. MATERYAL VE YÖNTEM

2.1. Materyal

Tekirdağ Namık Kemal Üniversitesi Tekirdağ Ziraat Fakültesi Tarla Bitkileri Bölümü tarafından geliştirilmiş olan NKÜ Lider ile Trakya Bölgesinde tarımı yapılan 2 adet ekmeklik buğday çeşidi Sagittario ve Flamura 85 seçilmiş, bu çeşitlerin ^{60}Co kaynağından gamma ışını uygulaması ile edilmiş olan M_4 populasyonlarından geliştirilmiş olan mutant ileri hatlardan seçilmiş olan 12 mutant ileri hat ve bunların anaçları çalışmada materyal olarak kullanılmıştır (Çizelge 1).

Çizelge 1. Araştırmada kullanılan ekmeklik buğday çeşitleri ile mutant ileri hatları

2.2. Yöntem

Deneme, 2022-2023 yetiştirme döneminde, Tekirdağ Namık Kemal Üniversitesi Ziraat Fakültesi Tarla Bitkileri Bölümü Tohumluk ve Teknolojisi Laboratuvarında yürütülmüştür. Deneme, ekmeklik buğday genotiplerinin çimlenme dönemindeki tuzluluk stresine yanıtlarını belirlemek amacıyla, çeşitler ana parsellere, NaCl kullanılarak oluşturulan 5 farklı tuz çözeltisi (0, 4, 8, 12 ve 16 dS m^{-1}) alt parselleri oluşturacak şekilde, Tesadüf Parsellerinde Bölünmüş Parseller Deneme Desenine göre 3 tekrarlamalı olarak kurulmuştur. Tuz çözeltilerinin hazırlanmasında başka kimyasal etmenlerin etkisini ortadan kaldırmak amacıyla steril edilmiş saf su kullanılmıştır. Steril edilmiş tohumlar, içerisinde 10 ml tuz çözeltisi bulunan ve önceden steril edilmiş 9 cm çaplı petri kaplarına, her kaba 20 adet tohum olacak şekilde, önceden steril edilmiş özel çimlendirme kağıtları arasına yerleştirilmiştir. Petri kaplarında meydana gelecek buharlaşmayı önlemek için petri kapları streç film ile sarılarak ve ağızları kilitlenebilen şeffaf plastik poşetlerin içerisine konulmuştur. Petri kapları daha sonra iklimlendirme dolabına alınarak, 16 saat aydınlık 8 saat karanlık periyotta, 25 ±1 ^{0}C'de 8 gün süresince çimlenmeye (ISTA, 1996), 14 gün süresince erken fide gelişimine bırakılmıştır. Tohumların radiculaları (kökçükleri) 2 mm olana kadar uzadığında çimlenmiş olarak kabul edilmiştir (Adjel ve ark., 2013). Petri kaplarındaki özel çimlendirme kağıtları ve tuz çözeltileri deneme süresince iki günde bir yenilenmiştir.

2.3. Verilerin elde edilmesi

Denemelerde incelenecek özelliklere ait gözlem ve ölçümler aşağıda açıklandığı şekilde yapılmıştır. Çimlenme oranı: Sekiz gün sonunda, petri kaplarında çimlenen tohumlar sayılmış ve çimlenme oranları (%) olarak aşağıdaki formüle göre belirlenmiştir. Ortalama çimlenme süresi: Ele alınan çeşitlerin 5 farklı tuz çözeltisindeki ortalama çimlenme süreleri (OÇS), Ellis ve Roberts (1980)' e göre; "OÇS=∑(fx) / ∑ f" formülü ile belirlenmiştir. Formülde; "f" sayım günündeki çimlenen tohum sayısını, "x" sayım yapılan gün sayısını ifade etmektedir. Tohum gücü indeksi: Tohum gücü indeksi (SVI); Zhang ve ark. (2007)'e göre "SVI = SL × Σ (ni/ti)" formülü ile belirlenmiştir. Formülde; SL= sürgün uzunluğunu, ni=sayım gününde çimlenen tohum sayısını, ti= ekim gününden itibaren gün cinsinden süreyi ifade etmektedir. Tuz tolerans indeksi: Fidelerin sürgün ve kök toplam kuru ağırlıkları kullanılarak, aşağıdaki eşitlik ile "tuz tolerans indeksi" hesaplanmıştır (Carpıcı ve ark., 2009).

Tuz Tolerans İndeksi (%) = (T_t x TKA / T_0 x TKA) x 100

Eşitlikte, TKA= toplam kuru ağırlığı, T_t= t tuz dozundaki toplam kuru ağırlığı, T_0= kontrol uygulamasındaki toplam kuru ağırlığını ifade etmektedir.

2.4. Biyometrik değerlendirme

Denemeden elde edilen verilerde tesadüf parsellerinde bölünmüş parseller deneme desenine göre varyans analizi yapılmıştır. Denemede incelenen özelliklerin ortalama değerleri arasındaki farkların istatistiki anlamda önemlilikleri JUMP 5.0 istatistik paket programı kullanılarak LSD (En Küçük Önemli Fark) testine göre belirlenmiştir (Düzgüneş ve ark., 1987).

3. SONUÇLAR VE TARTIŞMA

Denemeye alınan mutant hat ve genotiplerin 5 farklı tuz çözeltisinde elde edilen çimlenme özelliklerine ilişkin veriler üzerinde yapılan varyans analizi sonuçları Çizelge 2' de verilmiştir.

Çizelge 2. Çimlenme özelliklerine ilişkin kareler ortalamaları ve önemlilik düzeyleri

VK	Genotip (G)	Tuz Konsantrasyonu (T)	GxT İnteraksiyonu
SD	**14**	**23**	**56**
Çimlenme oranı	2251,400**	41193,500**	283,321**
Çimlenme süresi	0,509**	73,142**	0,275**
Tohum gücü indeksi	9541,860**	768820**	3315,120**
Tuz tolerans indeksi	5129,950**	64015,100**	1996,440**

**: %5 düzeyinde önemli, **: %1 düzeyinde önemli*

Çimlenme Oranı: Çimlenme oranı için varyans analiz çizelgesi incelendiğinde genotipler, tuz konsantrasyonları ve çeşit x tuz konsantrasyonu interaksiyonu istatistiki anlamda 0,01 düzeyinde önemli bulunmuştur (Çizelge 2). Çalışmada kullanılan ekmeklik buğday çeşit ve mutant hatlarının çimlenme oranı ortalamaları arasındaki farklılığı ortaya koymak amacıyla gerçekleştirilen EKÖF önemlilik testi sonuçları Çizelge 3'de verilmiştir.

Çizelge 3' ün incelenmesinden anlaşılacağı gibi denemeye alınan ekmeklik buğday genotiplerinin çimlenme oranı ortalamaları %27,00-73,66 arasında değişmiştir. En yüksek çimlenme oranı Flamura 85 300/15 çeşidinde belirlenmiş, bunu %73,33 ile aynı istatistiki grupta yer alan Flamura 85 200/58 çeşidi izlemiştir. En düşük çimlenme oranı ise Sagittario 300/5 genotiplerinden elde edilmiş, bunu 46,33 ile Sagittario 100/7 genotipi izlemiştir.

Denememizde tuz çözeltilerinden elde edilen ortalama çimlenme oranı %20,66-94,55 arasında değişmiştir (Çizelge 3). En yüksek çimlenme oranı 0 dS m^{-1} tuz çözeltisinde saptanmış, bunu %84,66 ile 4 dS m^{-1} tuz çözeltisi izlemiştir. En düşük çimlenme oranı ise 16 dS m^{-1} tuz çözeltisinde belirlenmiş, bunu %42,55 ile 12 dS m^{-1} tuz çözeltisi izlemiştir.

Çizelge 3. Çimlenme oranına (%) ilişkin ortalama değerler ve önemlilikleri

G:Genotip, T: Tuz konsantrasyonları, GxT: Genotip x Tuz konsantrasyonu interaksiyonu

Genotip x tuz interaksiyonunda ortalama çimlenme oranı %10-100 arasında değiştiği belirlenmiştir (Çizelge 3). En yüksek çimlenme oranı Flamura 85 300/15, NKÜ Lider, NKÜ Lider 200/11 genotiplerinin 0 dS m^{-1} tuz çözeltisinde olurken, %98,33 ile Sagittario, Flamura 85 200/58, NKÜ Lider 200/7, NKÜ Lider 100/22 0 dSm^{-1} ve Flamura 85 300/15 4 dS m^{-1} tuz oranı bunları izlemiştir. En düşük çimlenme oranı ise Sagittario 300/5 genotipinin 16 dS m^{-1} tuz oranında elde edilmiş, bunu 11,66 ile Sagittario ve Flamura 85 400/1 genotipinin 16 dS m^{-1} izlemiştir.

Araştırma sonucunda NaCl konsantrasyonlarındaki artışın çimlenme oranında önemli bir şekilde azalmaya neden olduğu gözlenmektedir. Kontrolle karşılaştırıldığında (0 dS m^{-1}) 4 dS m^{-1} uygulamasında %10,46, 8 dS m^{-1}uygulamasında%32.31, 12 dS m^{-1}uygulamasında %54.99

ve 16 dS m^{-1} uygulamasında %78,15 oranında çimlenme oranında azalma olduğu belirlenmiştir. Bu durum, çimlenme ortamındaki NaCl konsantrasyonlarının artmasına bağlı olarak oluşan osmotik basıncın tohumların çimlenmek için gereksinim duyduğu suyu çekmesinin engellemesinin bir sonucu olmaktadır. Yaptığımız bu araştırma sonuçları Javid ve ark. (2023), Hameed ve ark. (2023), Bayat ve ark. (2022), Köseoğlu ve Doğru (2021), Dirik ve ark. (2020), İnan ve ark. (2018), Çiçek ve ark. (2017), Doğan ve Çarpıcı (2015), Vardar ve ark. (2014), El Goumi ve ark. (2014), Dumlupınar (2005)' ın sonuçları ile paralellik göstermektedir.

Mutant hatlar anaç çeşitleri ile karşılaştırıldığında; değişen tuz konsantrasyonlarında Sagittario 200/49, Sagittario 200/59, Flamura 85 200/58, Flamura 85 300/15, NKÜ Lider 200/7, NKÜ Lider 200/11 ve NKÜ Lider 100/22 daha yüksek çimlenme oranına sahip oldukları belirlenmiştir. Sagittario 200/59 'un %6.94, Flamura 85 300/15'in %1.36 ve NKÜ Lider 200/7 'nin anaclarına göre %14.49 daha yüksek çimlenme oranına sahip olmuşlardır.

Ortalama Çimlenme Süresi: Denemeye alınan genotiplerin 5 farklı tuz oranında elde edilen ortalama çimlenme süresine ilişkin önemlilik grupları Çizelge 4' de verilmiştir.

Çizelge 4. Ortalama çimlenme süresine (gün) ilişkin ortalama değerler ve önemlilikleri

G:Genotip, T: Tuz konsantrasyonları, GxT: Genotip x Tuz konsantrasyonu interaksiyonu

Çizelge 4' ün incelenmesinden genotiplerin ortalama çimlenme süresinin 2.95-3.60 gün arasında değiştiği anlaşılmaktadır. En uzun çimlenme süresi 3.60 gün ile Sagittario 300/5

genotipinde gözlenmiş, bunu 3.46 gün ile Sagittario 200/49 ve Sagittario 200/59 genotipleri izlemiştir. En kısa çimlenme süresi ise NKÜ Lider 200/11 çeşidinde belirlenmiş, bunu 2.95 gün ile Flamura 85 100/60 genotipi izlemiştir.

Tuz oranında belirlenen ortalama çimlenme süresi 2.19-5.30 gün arasında değişmiştir (Çizelge 4). En uzun çimlenme süresi 16 dS m^{-1} tuz çözeltisinde saptanmış, bunu 3.55 gün ile 12 dS m^{-1} tuz çözeltisi izlemiştir. En kısa çimlenme süresi ise 0 dS m^{-1} tuz çözeltisinde belirlenmiş, bunu 2.41 gün ile 4 dS m^{-1} tuz çözeltisi izlemiştir.

Genotip x tuz interaksiyonunda ortalama çimlenme süresinin 2.07-6.66 gün arasında değiştiği belirlenmiştir (Çizelge 4). En uzun ortalama çimlenme süresi Sagittario 300/5 genotipinin 16 dS m^{-1} tuz çözeltisinde gözlenmiştir. Bunu 6.33 gün ile Sagittario 200/49 genotipinin 16 dS m^{-1} tuz çözeltisi izlemiştir. En kısa ortalama çimlenme süresi ise NKÜ Lider 200/11 genotipinin 0 dS m^{-1} tuz çözeltisinden elde edilmiş olup, bunu aynı istatistiki grupta yer alan Flamura 85 ve Flamura 85 200/58 genotiplerinin 0 dS m^{-1} tuz çözeltisi (2.10 gün) takip etmiştir.

Araştırmamızda, çimlenme ortamındaki tuz konsantrasyonu arttıkça ortalama çimlenme süresinin geciktiği belirlenmiştir. Bu gecikme, kontrol uygulamasına göre 4 dS m^{-1} uygulamasında %10.04, 8 dS m^{-1} uygulamasında %20.54, 12 dS m^{-1} uygulamasında %62.10 ve 16 dS m^{-1} uygulamasında %142.0 olarak gerçekleşmiştir. Bu durum, çimlenme ortamındaki tuz konsantrasyonunun artışına bağlı olarak suyun tutulma gücünün artmasından ve bunun sonucunda tohumların çimlenebilmek için gereksinim duydukları suyu daha uzun sürede almalarından kaynaklanmış olabilir. Elde ettiğimiz bu sonuçlar buğdayda çimlenme ortamındaki tuz konsantrasyonu artışına bağlı olarak çimlenme süresinde önemli bir gecikme meydana geldiğini açıklayan Javid (2023), Hameed (2023), Hmissi (2023), Doğan ve Çarpıcı (2015), Vardar (2014), El Goumi ve ark. (2014) 'nin sonuçları ile uyum içerisindedir.

Değişen tuz konsantrasyonlarında Flamura 85 100/60, Flamura 85 400/1 ve NKÜ Lider 200/11 anaçlarından daha kısa çimlenme süresi ortalamalarına sahip oldukları, Flamura 85 100/60 in %5,7 ve NKÜ Lider 200/11 in de %1.05 anacına göre daha kısa çimlenme süresine sahip oldukları anlaşılmaktadır.

Tohum Gücü İndeksi: Denemeye alınan çeşitlerin 4 farklı tuz çözeltisinde elde edilen tohum gücü indeksine ilişkin ortalama değerler ve önemlilik grupları Çizelge 5' te verilmiştir.

Çizelge 5. Tohum gücü indeksine (%) ilişkin ortalama değerler ve önemlilikleri

G:Genotip, T: Tuz konsantrasyonları, GxT: Genotip x Tuz konsantrasyonu interaksiyonu

Çizelge 5' ten denemeye alınan genotiplerin ortalama tohum gücü indeksinin %56.26-167.30 arasında değiştiği anlaşılmaktadır. En yüksek tohum gücü indeksi Flamura 85 100/60 genotipinde belirlenmiş, bunu %165.49 ile Flamura 85 200/58 takip etmiştir. En düşük tohum gücü indeksi ise Sagittario 300/5 genotipinden elde edilmiş, bunu %107.98 ile Sagittario 100/7 genotipi izlemiştir.

Kullanılan tuz çözeltilerinde ortalama tohum gücü indeksi %11.51-305.46 arasında değiştiği belirlenmiştir (Çizelge 5). En yüksek tohum gücü indeksi oranı 0 dS m^{-1} tuz çözeltisinde (%305.46) saptanmış, bunu %180.05 ile 4 dS m^{-1} tuz uygulaması izlemiştir. En düşük tohum gücü indeksi ise 12 dS m^{-1} tuz oranında (%11,51) belirlenmiş, bunu %64,13 ile 8 dS m^{-1} izlemiştir.

Genotip x tuz interaksiyonunda tohum gücü indeksi %3.09-365.65 arasında değişmiştir (Çizelge 5). En yüksek tohum gücü indeksi NKÜ Lider 220/7 genotipinin 0 dS m^{-1} tuz çözeltisinden (%365.65) elde edilmiş, bunu %352.12 ile Flamura 85 200/58 genotipinin 0 dS m^{-1} tuz çözeltisi izlemiştir. Sagittario 300/5 genotipinin 12 dS m^{-1} tuz çözeltisi ise en düşük tohum gücü indeksi değerine sahip olmuş, bunu NKÜ Lider 200/11 genotipinin 12 dS m^{-1} tuz çözeltisi (%6.13) takip etmiştir.

Çimlenme ortamında tuz konsantrasyonlarındaki artışın buğdayda tohum gücü indeksini önemli bir şekilde azalttığı belirlenmiştir. Bu azalma, 0 dS m^{-1} (kontrol) uygulamasına göre 4 dS m^{-1} uygulamasında % 41.02, 8 dS m^{-1} uygulamasında %79 ve 12 dS m^{-1} uygulamasında %96.23 olarak gerçekleşmiştir. Elde ettiğimiz bu sonuçlar, buğdayda çimlenme ortamında tuz konsantrasyonunun artışına bağlı olarak tohum gücü indeksinin önemli bir şekilde azaldığını açıklayan İnal (2018), Doğan ve Çarpıcı (2015), Vardar, (2014) ve El Goumi (2014)'nin sonuçları ile uyum içerisindedir.

Mutant hatları anaç çeşitleri ile karşılaştırıldığında; değişen tuz konsantrasyonlarında Sagittario 200/49, Flamura 85 10/60, Flamura 85 200/58, Flamura 85 300/15, NKÜ Lider 200/7, NKÜ Lider 200/11 ve NKÜ Lider 100/22 anaçlarından daha yüksek tohum gücü indeksi ortalamalarına sahip oldukları Sagittario 200/49 un %1.92, Flamura 85 100/60 in %8.87 ve NKÜ Lider 200/ in %7.07 anacına göre daha yüksek tohum gücü indeksine sahip oldukları anlaşılmaktadır.

Tuz Tolerans İndeksi: Denemeye alınan genotiplerin 4 farklı tuz konsantrasyonunda elde edilen ortalama tuz tolerans indeksine ilişkin ortalama değerler ve önemlilikleri Çizelge 6' da verilmiştir.

Çizelge 6. Tuz tolerans indeksine (%) ilişkin ortalama değerler ve önemlilikleri

Genotipler	Tuz konsantrasyonları (dS m^{-1})				Ortalama

Çizelge 6' nın incelenmesinden genotiplerin ortalama tuz tolerans indeksi değerleri %60.5-145.38 arasında değişmiştir. En yüksek tuz tolerans indeksi Sagittario 300/5 genotipinde (%145,38) belirlenmiş, bu genotipi %94.94 ile Sagittario 200/59 genotipi izlemiştir. En düşük tuz tolerans indeksi ise %60.5 ile NKÜ Lider 200/11 genotipinden elde edilmiş, bunu %63.8 ile Flamura 85 400/1 genotipi izlemiştir.

Denemede tuz konsantrasyonlarında elde edilen tuz tolerans indeksi değerleri %28.9-113.3 arasında bir varyasyona sahip olmuştur (Çizelge 6). En yüksek tuz tolerans indeksi 4 dS m^{-1} tuz çözeltisinde (%113.3) saptanmış, bunu %100 ile 0 dS m^{-1} tuz çözeltisi izlemiştir. En düşük tuz tolerans indeksi ise 12 dS m^{-1} tuz çözeltisinde (%28.9) tespit edilmiş, bu değeri %66.60 ile 8 dS m^{-1} tuz çözeltisi izlemiştir.

Genotip x tuz interaksiyonundan elde edilen tuz tolerans indeksi değerleri %16.6-299.3 arasında değişmiştir (Çizelge 6). En yüksek tuz tolerans indeksi Sagittario 300/5 genotipinin 4 dS m^{-1} tuz çözeltisinde belirlenmiştir. Bunu, Sagittario 200/49 %132 ile genotiplerinin 4 dS m^{-1} tuz çözeltilerinde belirlenen tuz tolerans indeksi değerleri takip etmiştir. En düşük tuz tolerans indeksi ise Sagittario 100/7 genotipinin 12 dS m^{-1} tuz çözeltisinden elde edilmiş, bunu Sagittario genotipinin 12 dS m^{-1} tuz çözeltisi (%17.92) izlemiştir.

Tuzlu ortamda yetiştirilen bitkiler, bünyelerine aldıkları Na^+ ve Cl^- iyonlarını kök, gövde ve yaprak gibi çeşitli organlarında biriktirmektedir. Bitkilerin çeşitli organlarında biriken bu iyonlar ise belli bir oranın üzerine çıkınca gelişmeyi yavaşlatmakta ve tuza toleransını önemli bir şekilde etkilemektedir. Ortamda tuz konsantrasyonu arttıkça ortalama tuz tolerans indeksinde ciddi azalmalar olduğunu görülmüştür. Bu azalmalar, 0 dS m^{-1} (kontrol) uygulamasına göre 4 dS m^{-1} uygulamada %13.30, 8 dS m^{-1} uygulamada %34.40 ve 12 dS m^{-1} uygulamada %71.10 olarak gerçekleşmiştir. Elde etiğimiz sonuçlar buğdayda çimlenme ortamında artan tuz konsantrasyonuna bağlı olarak tuz tolerans indeksinin düştüğünü açıklayan Köseoğlu ve Doğru (2021) ve Dirik (2020)'nin sonuçları ile uyum içerisindedir.

Değişen tuz konsantrasyonlarında Sagittario 300/5, Sagittario 200/49, Sagittario 200/59, Flamura 85 100/60, Flamura 85 200/58, Flamura 85 300/15, NKÜ Lider100/22, NKÜ Lider 400/10 ve NKÜ Lider 100 /22 mutantları anaçlarından daha yüksek tuz toleransı indeksi sahip olmuşlardır. Sagittario 300/5 %52,68, Flamura 85 100/60 %14.29 ve NKÜ Lider 200/7 %7.07 de anaçlarına göre daha yüksek tuz toleransı indeksine sahip olmuşlardır.

4. SONUÇ VE ÖNERİLER

Çalışmada, 16 dS m^{-1} tuz çözeltisinde denemeye alınan buğday genotiplerinin tohumlarında çimlenme olmuş fakat fide gelişimi olmamıştır. Denemeye alınan buğday genotipleri arasında en yüksek çimlenme oranı Flamura 85 300/15 genotipinde belirlenmiştir. Genel olarak değerlendirildiğinde, mutant ileri hatların anaçlara göre yüksek çimlenme oranına sahip oldukları belirlenmiştir. Çimlenme ortamında artan tuz konsantrasyonlarının çimlenme oranını önemli bir şekilde azalttığı görülmüştür. Kontrol uygulamasına (0 dS m^{-1}) göre çimlenme oranı 4 dS m^{-1} uygulamasında %10.46, 8 dS m^{-1} uygulamasında %32.05,12 dS m^{-1} uygulamasında %54.99 ve 16 dS m^{-1} % 78.14 daha düşük gerçekleşmiştir. Sonuçlar, tuzluluk yönünden üstün performans gösteren mutan hatların tuzluluğun sorun olduğu alanları için çeşit adayı olarak verim denemelerine alınmasının, tuza dayanıklılık ıslah çalışmalarında gen kaynağı olarak kullanılmalarının uygun olabileceği göstermektedir.

ÖZET

Tekirdağ ekolojik koşullarında yürütülen araştırmada, sorgum x sudan otu melez çeşidi Jumbo Star ve silajlık mısır çeşidi PR32W86 materyali kullanılmıştır. Çalışmada mısır ekimi, 5 metre uzunluğunda 4 sıra halinde, sıra arası 70 cm ve sıra üzeri 16 cm olacak şekilde yapılmıştır. Sorgum ekimi, 5 metre uzunluğunda 4 sıra halinde, sıra arası 70 cm ve sıra üzeri 3 cm olacak şekilde yapılmıştır. Çalışmada sulama uygulamaları; sulamasız, 1 sulama, 2 sulama ve 3 sulama şeklinde yapılmıştır. Sulama uygulamaları, mısır bitkisinin gelişiminin izlendiği ve bitkilerin su ihtiyacının başladığı dönemde uygulanmıştır. Sulama uygulaması, mısır ve sorgum sıraları arasına yerleştirilen damla sulama sistemi ile yapılmış ve toprak doygunluğu dikkate alınarak 10 saat damla sulama uygulanmıştır. Çalışmada, taban gübresi olarak 40 kg 20.20.0 gübresi, üst gübre olarak ise bitkiler 10-15 cm boylandığında 25 kg/da ve bitkiler 35-40 cm boylandığında 20 kg/da olmak üzere iki kez üre gübresi uygulanmıştır.

Değerlendirmeye göre, sorgum ve mısır genotiplerinde farklı sulama uygulamalarında yeşil ot verimi, protein oranı, ADF ve NDF oranları incelendiğinde, sulama seviyesine göre önemli bir değişim gözlenmiştir. Sulama uygulamasındaki artışlar her iki türde de paralel olarak yeşil ot verimi ve protein oranında artışa neden olmuş, Her iki türde de sulama uygulamalarında sulanmayan alanlara göre daha düşük ADF ve NDF değerleri elde edilmiştir. Elde edilen sonuçlar, sulamanın mısır ve sorgumda yeşil ot kalitesini önemli ölçüde artırdığını göstermektedir.

Anahtar Kelimeler: Mısır, Sorgum, Silaj verimi, Protein oranı, Kalite.

EFFECT OF DIFFERENT IRRIGATION APPLICATION ON SILAGE YIELD AND SOME QUALITY CHARACTERS IN SORGHUM AND CORN

ABSTRACT

In the research conducted in Tekirdağ ecological conditions sorghum x sudangrass hybrid variety Jumbo Star and silage corn variety PR32W86 materials were used. In the study, corn sowing was done in 4 rows with 5 meters of length, 70 cm between rows and 16 cm on the rows. Sorghum sowing was done in 4 rows of 5 meters, with 70 cm between rows and 3 cm on the rows. In the experimental area, species were placed in the main plot and irrigation applications were placed in the sub-plot. In the study, irrigation applications were made as non-irrigation, 1 irrigation, 2 irrigations and 3 irrigations. Irrigation applications were applied during the period when the corn plant development was monitored and the plants showed the beginning of water need. Irrigation application was made with a drip irrigation system laid between the corn and sorghum rows and 10 hours of drip irrigation was applied considering the soil saturation. In the study, 40 kg of 20.20.0 fertilizer was applied as base fertilizer, while urea fertilizer was applied twice as top fertilizer, 25 kg/da when the plants were 10-15 cm and 20 kg/da when the plants were 35-40 cm.

According to the evaluation, when silage yield, protein ratio, ADF and NDF ratios were examined in sorghum and maize genotypes in different irrigation applications, there was a significant change according to irrigation level. Increases in irrigation application caused an increase in parallel silage yield and protein ratio in both species. In both species, lower ADF and NDF values were obtained in irrigation applications compared to non-irrigated areas. The obtained results show that irrigation significantly increases green grass quality in maize and sorghum.

Keywords: Corn, Sorghum, Silage yield, Protein ratio, Quality.

1. GİRİŞ

Türkiye hayvan sayısı yönünden büyük bir varlığa sahip ama hayvansal üretim planlanan düzeye çıkarılamamaktadır. Buna sebep olan durumlardan biri, sektörün ihtiyacı kaba yemi karşılayacak kaynakların doğru kullanılamamasıdır. Üreticiler, kaba yem sıkıntısının olduğu dönemlerde, besin değeri düşük olan bu tahılın üzerini samanla kapatmaya çalışıyorlar. Gelişmiş ülkelerde olduğu gibi Türkiye' de de bilinçli hayvancılık yapan büyük işletmelerde kış aylarında yem kullanımı, gıda açığının kapatılması ve hayvansal ürünlerin veriminin arttırılması için önemli bir kaynaktır (Özata ve ark., 2012). Ülkemiz birçok yem bitkisinin yetiştirilmesi için oldukça uygun ekolojik koşullara sahip olmasına rağmen yem bitkilerinin yetişme alanı açıkça istenilen düzeyin altındadır. Besin değerinin yüksek olması, taşınması, saklanması ve muhafaza edilmesinin kolay olması silajlık mısır ve sorgum ekim alanını arttırır.

Olumsuz şartlara özellikle susuzluğa mısırdan daha dayanıklı olan sorgum x sudan otu melezi, su ihtiyacının az olması, ekildiği bölgeye adaptasyonunun hızlı olması, zararlılara ve hastalıklara karşı dayanıklı olması, besin maddesi bakımında ve veriminin yüksek olmasından kaynaklı mısıra alternatif olabilir. (Çiğdem ve Uzun, 2006). Sorgum türlerine ait çeşitler silaj ve dane üretimden kaynaklı yetiştirilmektedir. Silaj verimleri ortalama 3-9 ton/da olarak kayıtlara geçmiştir.

Hayvanları beslerken konsantre yem ve kaba yem giderek daha fazla önem kazanıyor. Yem olarak besin değeri en yüksek olan bitkilerden biri de mısırdır. Mısır (*Zea mays* L.), Poaceae familyasına ait tek yıllık bir bitkidir. Hayvancılıkta en çok kullanılan silaj bitkilerinden biri olan mısır, çok iyi silaj özelliklerine sahiptir. Silajlık mısır (*Zea mays* L.) yetiştiriciliği, yüksek verim, mekanizasyona uygunluk ve çeşitli ortamlara geniş adaptasyon gibi birçok özelliği sayesinde her geçen gün artmaktadır. Diğer yemlere göre sulu, lezzetli ve besleyicidir. Sindirimi kolay ve besin değeri yüksektir. Ayrıca mısır, düşük tamponlama kapasitesi, yüksek şeker içeriği ve yüksek laktik asit bakteri sayısı nedeniyle kolayca silolanan bir yem olarak bilinir. Buna karşın, mısır silajı nispeten daha düşük ham protein içeriğine sahiptir.

Ülkemizde mısır ekim alanları her geçen gün artmaktadır. Mısır ekim alanının artmasının temel nedenlerinden biri mısırda birim alandan elde edilen gelirin yüksek olması ve silaj ve tahıl üretiminin her geçen gün artmasıdır. Üreticiler bunu silaj olarak kullanıyor. Mısır bitkisinin büyüme ve gelişme döneminde su ihtiyacının yüksek olması, kuru, yarı kurak iklimlerde ve sulamanın yapılmadığı durumlarda verimin düşmesine neden olmaktadır. Son yıllarda artan küresel iklim değişiminin etkisinin daha fazla görülmeye başlanması sulama yapılmadan yada kısıtlı sulamayla yetiştirilebilecek bitkilerin dönemi artmaktadır. Trakya bölgesi gibi yağışın 600 mm civarında olduğu bölgelerde sulama yapılmadan üretilecek ve birim alan verimi yüksek bitkilerden biriside sorgumdur. Bu da mısıra kıyasla su kullanımı daha az ve verimli bitkilerin önemini göstermektedir. İklim değişikliği ve mısır için artan talep karşısında, kuraklığa dayanıklı sorgum silajı; iklim değişikliğinden kaynaklanan kuraklık ve mısıra artan talepten kaynaklanan silaj kıtlığına son vereceği düşünülmektedir.

Çalışmada kaba yem üretiminde sulamalı alanlar ve sulanmayan alanlarda önemli bir potansiyeline sahip olan mısır ve sorgumun sulama yapılmadan, farklı sulama uygulamalarında kalite özellikleri yönünden potansiyellerinin ortaya konması amacıyla yürütülmüştür.

2. MATERYAL VE YÖNTEM

Tekirdağ ekolojik koşullarında Bağcılık Araştırma Enstitüsünde 2022 yılında yürütülen araştırmada sorgum x sudanotu melez çeşidi Jumbo Star ve silajlık mısır çeşidi PR32W86 materyal olarak kullanılmıştır. Tekirdağ ili Süleymanpaşa ilçesi Bağcılık Araştırma Enstitüsünde 2022 yılında yapılan çalışma bölünmüş parseller deneme desenine göre 4 tekrarlamalı olarak yürütülmüştür.

Deneme yapılmadan önce lavanta yetiştiriciliği yapılmış olan tarlada ürün hasadından sonra gölge tavında 15-20 cm derinlikte pullukla sürüm yapılmış ve daha sonra ilkbahar mevsiminde diskaro ile kazayağı çekilerek tarla yüzeyindeki kesekler ufalanmış ve ardından toprak ekimden sonra çıkacak otları engellemek için ilac atılmış, tırmık ile toprak 10-15 cm derinliğinde işlenerek ekim yatağı hazırlığı tamamlanmıştır.

Çalışmada mısır ekimi sıra arası 70 cm, sıra üzeri 16 cm olarak her parsel 5 metre uzunluğunda 4 sıradan oluşmuştur. Sorgumda ekimler sıra arası 70 cm, sıra üzeri ise 3 cm olacak şekilde 5 metrelik 4 sıra olarak yapılmıştır. Ekimler 13 Haziranda yapılmıştır. Deneme alanında türler ana parsele, sulama uygulamaları ise alt parsele yerleştirilmiştir. Çalışmada sulama uygulaması olarak, sulama yapılmayan, 1 sulama, 2 sulama ve 3 defa sulama uygulaması yapılmıştır. Sulama uygulamaları mısır bitkisinin gelişimi izlenerek bitkilerin su ihtiyacı başlangıcı gösterdiği dönemde uygulanmıştır. Sulama uygulaması mısır ve sorgum sıra aralarına döşenen damla sulama sistemi ile yapılmış ve toprak doygunluğu dikkate alınarak 10 saat damla sulama uygulaması yapılmıştır. Çalışmada taban gübresi olarak 40 kg 20.20.0 gübresi uygulanırken, üst gübre olarak bitkiler 10-15 cm olduğunda 25 kg/da ve bitkiler 35-40 cm 20 kg/da olmak üzere 2 defa üre gübresi uygulanmıştır. Yem bitkisi yetiştirirken verimliliğin yanı sıra üretilen ot yeminin kalitesi de oldukça önemlidir. Çalışmada ham protein değeri, ADF ve NDF değerleri belirlenmiştir

Elde edilen veriler, JMP istatistik programları ile bölünmüş deneme desenine göre varyans edilmiş ve ortalama farklılıkların anlamlılığının kontrolü TUKEY testi ile belirlenmiştir. (Düzgüneş ve ark., 1983).

3. ARAŞTIRMA SONUÇLARI VE TARTIŞMA

3.1. Yeşil Ot Verimi

Farklı sulama uygulamalarında sorgum ve mısır genotiplerinden elde edilen verim sonuçları üzerinde varyans analizi yapılmış olup, sulama düzeyleri arasındaki farklılıklar istatistiki olarak 0,01 düzeyinde önemli bulunmuş, türler, tür x sulama interaksiyonu, arasındaki farklılıklar istatistiki olarak önemsiz bulunmuştur. Ortalama değerler arasındaki farklılıkları belirlemek için yapılan önemlilik testi (EKÖF) sonuçları Çizelge 1' de verilmiştir.

Çizelge 1. Yeşil ot verimine ilişkin ortalamalar ve karşılaştırmalar

	Sulamasız	***1 sulamalı***	***2 sulamalı***	***3 sulamalı***	***Ortalama***
Mısır	2389.33	3090.00	3184.33	3844.33	3137.00
Sorgum	2038.33	2910.66	3201.33	4122.00	3068.08
Ortalama	2213.833	3000.333	3192.833	4003.167	

Yapılan önemlilik testi sonucunda türler arasında en yüksek verim ortalama olarak 3137 kg/da ile mısırda olurken bunu aynı istatistiki gruptaki sorgum 3068.00 kg/da ile izlemiştir. Sulama düzeylerini verim etkisine bakıldığında 4003.17-2213.83 kg/da arası değişmiştir. En fazla verime sahip bitkiler üç sulama yapılanlarda 4003.17 kg/da olarak ölçülmüştür. En az verime sahip bitkiler sulama olmayan parsellerde 2213.83 kg/da ile olmuştur. Üç sulama uygulaması sulanmayan alanlara göre %100 yakın verim artışı sağlamıştır. Tür x sulama interaksiyonu istatistiki olarak önemsiz olmakla birlikte, en fazla verim 4122 kg/da ile sorgumda 3 sulamada elde edilirken bunu aynı istatistik gruptaki mısırın üç sulamada 3844 kg/da verimi izlemiştir. En az verim değeri sulama yapılmayan parsellerde 2038 kg/da ile sorgumda elde edilmiş, bunu 2389 kg/da ile mısırda sulama yapılmayan parsel takip etmiştir. Sorgumda genotiplere göre; yeşil ot verimi 2247-12029 kg/da arasında (Göler ve Özyazıcı, 2024) değiştiği, mısır

çeşitlerinin yeşil ot verimlerinin denemenin yürütüldüğü bölgelere göre önemli değişimler olduğu (Özata ve ark., 2012; Yozgatlı ve ark., 2019; Erdurmuş ve Soylu, 2023) belirlenmiştir.

3.2. Protein Oranı

Farklı sulama uygulamalarında sorgum ve mısır genotiplerinden elde edilen protein sonuçları üzerinde varyans analizi yapılmış olup, türler, sulama düzeyleri, tür x sulama interaksiyonu arasındaki farklar 001 düzeyinde istatistiksel olarak önemli bulunmuştur. Ortalama değerler arasındaki farkları tespit etmek amacıyla yapılan anlamlılık testi (EKÖF) sonuçları Çizelge 2' de verilmiştir.

Çizelge 2. Mısır ve Sorgum çeşitlerinde sayısı değerlerinde ortalama değerler ve önemlilikleri

	Sulamasız	***1 sulamalı***	***2 sulamalı***	***3 sulamalı***	***Ortalama***
Mısır	3.440 c	4.840 cd	5.160 bc	4.680 d	4.530 b
Sorgum	5.170 bc	5.410 b	7.490 a	7.380 a	6.363 a
Ortalama	4.305 c	5.125 b	6.325 a	6.030 a	

Yapılan önemlilik testi sonucunda türler arasında en fazla protein %6.36 ile sorgumda elde edilirken mısırda protein oranı 4.305 olmuştur. En fazla proteine sahip bitkiler iki ve 3 sulama yapılan bitkilerde %6.33 ve 6.03 protein değeri ile ölçülmüştür. En az proteine sahip bitki sulama yapılmayan parselde %4.31 ile elde edilmiştir. Tür x sulama interaksiyonu incelendiğinde en fazla protein %7.49 ile sorgumda 2 sulamada elde edilirken bunu aynı istatistik gruptaki üç sulamalı %7.38 ile sorgum izlemiştir. En az protein değeri sulama yapılmayan mısır parselinde %3.44 ile elde edilmiştir. Sorgum çeşitlerinin ham protein oranının %10.1 olduğunu (Cacares ve Santana, 1987), sugar leaf sorgum x sudanotu melez çeşidinde ham protein oranını %8.35 olarak (Aydın ve Albayrak, 1995), sorgum, sudanotu ve sorgum x sudanotu melez çeşitlerinin ham protein oranının %8.50-10.20 arasında olduğu (Büyükburç ve ark., 1997), tane ve silajlık sorgum çeşitlerinde ham protein değeri %10.40 olduğu (Siefers ve ark., 1997), sorgum x sudanotu hibrit çeşitlerinin ham protein değeri %9.55-9.65 olduğu (Aslan, 1998), sorgumda ham protein değerlerinin %7.2-8.9 arasında değiştiği (Hosaflıoğlu, 1998), silajlık sorgum x sudanotu melez çeşitlerinde en fazla ham protein değeri %11.10 olarak (Roozeboom ve Evans, 2000) belirlenmiştir.

3.3. NDF Değeri

Farklı sulama uygulamalarında sorgum ve mısır genotiplerinden elde edilen NDF sonuçları üzerinde varyans analizi yapılmış olup, tür, sulama düzeyi ve tür x sulama etkileşimi arasındaki farklar 0,01 düzeyinde istatistiksel olarak önemli bulunmuştur. Ortalama değerler arasındaki farkları tespit etmek amacıyla yapılan anlamlılık testi (EKÖF) sonuçları Çizelge 3' de verilmiştir.

Çizelge 3. NDF' ye ilişkin ortalamalar ve karşılaştırmalar

	Sulamasız	***1 sulamalı***	***2 sulamalı***	***3 sulamalı***	***Ortalama***
Mısır	51.67 a	47.00 b	50.00 ab	40.67 c	47.33 a
Sorgum	38.00 cd	35.00 de	34.00 ef	30.67 f	34.41 b
Ortalama	44.00 a	41.00 b	42.83 b	35.67 f	

Yapılan önemlilik testi sonucunda türler arasında en az NDF değeri %30.67 ile sorgumda elde edilirken en fazla NDF %51.67 ile de mısırda olmuştur. Sulama düzeylerini NDF değerlerine bakıldığında %51.67-30.67 arası değişmiştir. En fazla NDF' ye sahip bitki %51.67 ile mısırda sulama olmayan parselde elde edilirken, bunu mısırın 1 sulamalı parselindeki bitkiler %47.00 ile izlemiştir. En az NDF değeri üç sulama yapılan sorgum parselinde %30.67 ve 2 sulama yapılan sorgum parsellerdeki bitkilerde %34.00 ile sorgumda olmuştur. Sugar Graze ve Jumbo Plus çeşitlerinin NDF oranının ise %69.36 ile %70.58 arasında değiştiği bildirilmiştir (Pushparajah ve Sinniah, 2018).

3.4. ADF Değeri

Farklı sulama uygulamalarında sorgum ve mısır genotiplerinden elde edilen ADF sonuçları için varyans analizi yapılmış olup, türler, sulama düzeyleri, tür x sulama interaksiyonu arasındaki farklar 0.01 düzeyinde istatistiksel olarak önemli bulunmuştur. Ortalama değerler arasındaki farkları tespit etmek amacıyla yapılan anlamlılık testi (EKÖF) sonuçları Çizelge 4' de verilmiştir.

Çizelge 4. Mısır ve Sorgum çeşitlerinde sayısı değerlerinde ortalama değerler ve önemlilikleri

	Sulamasız	***1 sulamalı***	***2 sulamalı***	***3 sulamalı***	***Ortalama***
Mısır	30.490 ab	31.493 a	29.210 b	23.390 cd	28.646 a
Sorgum	24.690 c	21.370 ef	22.660 de	20.660 f	22.345 b
Ortalama	27.590 a	26.432 ab	25.93 b	22.025 c	

Yapılan önemlilik testi sonucunda türler arasında mısırda ADF değeri %28.65 sorgumda ise %22.34 olmuştur. Sulama düzeylerini ADF etkisine bakıldığında %27.590-22.025 arası değiştiği görülmektedir. En fazla ADF değerine sahip bitki bir sulama yapılan mısırda %31.49 olarak belirlenmiş, bunu mısırın sulanmayan bitkileri %30.49 ADF değeri ile aynı istatistiki grupta izlemişlerdir. En az ADF değeri ise 3 sulama uygulanan bitkilerde %22.025 değeri ile belirlenmiştir. Tür x sulama interaksiyonu incelendiğinde en fazla ADF değeri %31.493 ile 1 defa sulanan mısırda elde edilirken bunu aynı istatistik gruptaki sulamasız mısır %30.49 ile izlemiştir. En az ADF değeri sorgumda 3 defa sulama yapılan parselde %20.66 ile elde edilmiştir. Sorgum x sudanotu melez çeşidin de ADF oranı %43.02 olduğu (Khaleduzzaman ve ark., 2013), Farklı araştırıcılar tarafından yapılan çalışmalarda mısır ve sorgum çeşitlerinden ADF oranının %28.00-45.54 arasında değiştiği belirlenmiştir (Karadağ ve Öztürk, 2014; Pires ve ark., 2017; Pushparajah ve Sinniah, 2018; Yılmaz ve ark., 2020; Şimşek Soysal ve ark., 2017).

4. SONUÇ VE ÖNERİLER

Sonuçlara göre, sorgum ve mısır genotiplerinde farklı sulama uygulamalarında yeşil ot verimi, protein oranı, ADF ve NDF oranları incelendiğinde, sulama seviyesine göre önemli bir değişim gözlenmiştir. Sulama uygulamasındaki artışlar her iki türde de paralel olarak yeşil ot verimi ve protein oranında artışa neden olmuş, Her iki türde de sulama uygulamalarında sulanmayan alanlara göre daha düşük ADF ve NDF değerleri elde edilmiştir. Elde edilen sonuçlar, sulamanın mısır ve sorgumda yeşil ot verimini önemli ölçüde artırdığını göstermektedir.

Yazar Katkı Beyanı

Tüm yazarlar bildirinin hazırlanmasına eşit oranda katkı sağlamıştır.

Çıkar Çatışması Beyanı

Tüm yazarlar bu makaleyle ilgili herhangi bir çıkar çatışması olmadığını beyan etmektedir.

Teşekkür

Bu çalışma ilk yazarın yüksek lisans tezinin bir bölümünden üretilmiştir.

ABSRACT

Their inclusion in agricultural culture has played a very important role in the survival of medicinal and aromatic plants around the world. The majority of medicinal and aromatic plants are drought-tolerant and are grown both rain-fed and irrigated. Especially in arid regions, the cultivation of these plants is preferred for rain-fed production. Irrigation is the most effective measure to reduce water stress and increase crop yields in arid areas. Therefore, irrigation is inevitable for medicinal and aromatic plants as well. Lavender, a medicinal and aromatic plant, is drought-tolerant and is cultivated for its essential oil. This study was conducted to evaluate some research on irrigation in lavender. Within this scope, this paper presents an analysis of recent studies that have demonstrated the effect of different irrigation practices on the herb and essential oil yield and essential oil quality of lavender. Consequently, irrigation significantly increases lavender yield in arid regions. Therefore, there is a need to develop irrigation schedules that provide high irrigation water productivity for lavender cultivation in regions experiencing water scarcity.

Keywords: Lavender; Irrigation management; Essential oil yield; Oil quality

SULAMANIN LAVANTA (*l. angustifolia mill.)* ÜRÜN VERİMİ VE YAĞ KALİTESİNE ETKİLERİ ÜZERİNE BİR İNCELEME

ÖZET

Tarım kültürüne alınması, tıbbi ve aromatik bitkilerin dünyada varlığını sürdürmesinde çok önemli bir rol oynamıştır. Tıbbi ve aromatik bitkilerin ekseriyeti kuraklığa töleranslı olup, hem yağışa dayalı ve hem de suluda yetiştirilmektedir. Özellikle kurak bölgelerde, yağışa dayalı üretim için bu bitkilerin tarımı tercih edilebilmektedir. Sulama, kurak alanlarda su stresini azaltmak ve ürün verimini artırmak için en etkili önlemdir. Dolayısıyla tıbbi ve aromatik bitkilerde de sulama kaçınılmazdır. Tıbbi ve aromatik bitki olan lavanta, kurağa dayanıklı olup, uçucu yağı için üretilmektedir. Bu çalışma, lavantada sulama üzerine yapılan bazı araştırmaların değerlendirilmesi amacıyla yapılmıştır. Bu kapsamda, bu bildiride, yakın geçmişte yapılan ve farklı sulama programlarının lavantanın ot ve uçucu yağ verimi ile uçucu yağ kalitesi üzerindeki etkisini ortaya koyan bazı çalışmaların bir analizi sunulmuştur. Sonuç olarak, kurak bölgelerde sulama işlemi lavantanın ürün verimini önemli ölçüde artırmaktadır. Dolayısıyla su kıtlığı olan bölgelerde lavanta tarımı için de yüksek sulama suyu üretkenliği sağlayan sulama programlarının geliştirilmesine ihtiyaç duyulmaktadır.

Anahtar kelimeler: Lavanta; Sulama yönetimi; Uçucu yağ verimi; Yağ kalitesi

1.GİRİŞ

Lavanta, çok yıllık olup, çiçekleri için üretilen önemli bir tıbbi ve aromatik bitkidir. Çok yıllık bir bitki olması nedeniyle lavantadan ekonomik olarak 15-20 yıl yararlanılmaktadır (Kara ve Baydar, 2011). Günümüzde lavanta kozmetik, parfümeri, gıda, sağlık, aromaterapi ve peyzaj gibi pek çok alanda değerlendirilme olanağı bulabilmektedir (STB, 2020). Özellikle tıbbi uçucu yağı açısından değer taşıyan lavanta, ilaç, parfümeri ve kozmetik amaçlı yetiştirilmektedir (Sarfaraz ve ark., 2024). Dünyada çoğu Akdeniz orjinli olan 39 kadar lavanta türü bulunmaktadır. Bunlardan lavander, lavandin ve spike lavender olmak üzere üç türünün ticari değeri yüksektir (Kara, 2023). Dünyada iki önemli lavanta türünün (lavandin ve lavender) tarımı yapılmaktadır. Dünya lavanta üretim alanlarının %80'ini lavandin, ve %20 'sini lavender oluşturmaktadır. Fransa ve Bulgaristan dünya lavanta üretim alanlarının 2/3'üne hâkim olup, Çin, Rusya, bazı Doğu Avrupa ve Kuzey Afrika ülkeleri lavanta tarımında ve ticaretinde söz sahibi ülkelerdir. Fransa, lavanta yağı üreten ve ihraç eden lider bir ülkedir ve lavanta yağı pazarının %34'üne hâkimdir. Kısacası Fransa dünyada lavanta yağı üretiminde ilk sırada yer almaktadır. Fransa'yı Bulgaristan ve Çin takip etmektedir. Çin küresel pazarda % 11.9'luk pazar payına sahiptir(STB, 2020).

Türkiye'de lavanta tarımı yoğun olarak Göller Bölgesinde yapılmakta olup, özellikle Isparta, Afyonkarahisar, Burdur ve Denizli illeri lavanta üretiminin en yoğun yapıldığı illerdir. Ülkemizde son yıllarda lavanta üretimi farklı illerimize yayılmış durumdadır. Ülkemizde 2015 yılına kadar lavandin çeşitlerinin (süper) tarımı yapılırken, günümüzde lavender çeşitlerinin tarımına başlanmıştır. Lavanta olumsuz toprak koşullarında bile verim verebilen ve tarımında hastalık ve zararlı faktörü neredeyse minimum düzeyde olan ve tarımsal anlamda az emek isteyen bir bitkidir. Son yıllarda lavanta tomurcuğu ve lavanta yağına olan ilgi nedeniyle birçok üretici tarafından tercih sebebi haline gelmiştir (STB, 2020).

Su kıtlığı, dünyadaki tarım alanlarının çoğunda bitki büyümesini ve ürün verimliliğini kısıtlayan en önemli faktördür (Abedi ve Pakniyat, 2010). Buna karşın sulama ise, bitki gelişimini, ürün verimini ve kalitesini artırmak için yegane önlemdir (Singh ve Goswamy, 2000). Su kıtlığı koşullarında, bitki su ihtiyacının sulama ile tümüyle karşılanması her geçen gün daha da zorlaşmaktadır. Dolayısıyla, daha az su ile sulamanın gerçekleştirileceği teknolojik sulama yöntem ve sulama yönetimi stratejilerinin uygulamaya sokulması kaçınılmazdır. Özellikle kuraklığa hassasiyeti düşük olan bitkilerde, bitki büyüme dönemleri ve bu gelişme dönemlerinin su stresine (su kısıntısına) tepkilerinin bilinmesi, bitkiler için kısıntılı ve tamamlayıcı sulama stratejileri uygulamasına imkan sağlamaktadır. Bu usulle hem ürün verimi ve kalitesi artarken hem de ve kıt su kaynaklarının en verimli şekilde kullanılmasını sağlanabilir (Singh ve Goswamy, 2000).

Kuraklığın tıbbi ve aromatik bitkilerin büyümesi ve gelişimi üzerindeki etkisi, daha önceki bazı çalışmalarda incelenmiştir. Önceki çalışmalar, sulamanın bitkilerin verimi belirleyen morfolojik ve fizyolojik özellikleri üzerinde önemli bir etkiye sahip olduğunu göstermiştir. Dahası, sulama seviyeleri verimi ve uçucu yağların bazı önemli bileşenlerini de etkilemektedir (Llorens-Molina ve Vacas, 2017; An ve Liang, 2013; Rioba ve ark., 2015; Sánchez-Blanco ve ark., 2004).

Bu çalışmanın amacı, lavantada sulamanın ürün verimi ve uçucu yağ kalitesine etkilerini konu edinen ve yakın dönemde yapılmış çalışmaların kısa bir değerlendirmesini sunmaktır.

2. BİTKİSEL UÇUCU YAĞ KALİTESİNE ETKİ EDEN FAKTÖRLER

Birçok tıbbi ve aromatik bitki, özellikle kuraklık olmak üzere zorlu çevre koşullarında gelişme yeteneğine sahiptir ve bu da onları kurak bölgeler için oldukça uygun hale getirmiştir (Kulak, 2020). Kurak bölgelerde su kıtlığı, hemen tüm bitkilerde olduğu gibi tıbbi ve aromatik bitkilerin

büyümesini ve verimini önemli ölçüde etkiler (Nouri ve ark., 2023; Wahab ve ark., 2022). Ayrıca kuraklık, tıbbi ve aromatik bitkilerdeki aktif bileşenlerin kalitesini de olumsuz etkilemektedir (Bistgani ve ark., 2017a; Gao ve ark., 2020). Toprak nem muhtevası, tıbbi bitki bileşenlerinin büyümesini, gelişimini ve sentezini etkileyen önemli bir çevresel faktördür (Vosoughi ve ark., 2018; Zhu ve ark., 2018). Bazı çalışmalar, çevresel streslerin ikincil metabolitlerin artan seviyelerine yol açtığını öne sürmektedir (George ve ark., 2017; Bistgani ve ark., 2017b). Kuraklığın zamanlaması, süresi ve sıklığı, toprak özellikleri ve yağış desenleri gibi çeşitli faktörler, bir bitkinin kuraklığa karşı direncini etkilemektedir (Rezaei ve ark., 2019; Morshedloo ve ark., 2016).

Tıbbi ve aromatik bitkilerdeki uçucu yağlar farklı fakörlerin etkisi altındadır. Birçok iç ve dış faktör esansiyel yağların yapısını, belirli bileşenlerin konsantrasyonunu ve nihayetinde uçucu yağ verimini etkilemektedir (Djouahri ve ark., 2015; Formisano ve ark., 2015; Rehman ve ark., 2016). Bu faktörleri bitkiden kaynaklanan koşullar ve dış faktörler olarak sınıflandırmak mümkündür. Bitkiden kaynaklanan koşullar; genetik, bitki popülasyonu, bitkinin kökeni, bitkinin kullanılan kısmı, örnekleme dönemi, fizyolojik ve biyokimyasal süreçleri ve tüm bitki fizyolojisini kapsamaktadır. Dış faktörler ise iklim koşullarını, yetiştirme koşullarını ve hasat sonrası teknikleri (kurutma yöntemleri ve ekstraksiyon, damıtma süresi, miktar tayini yöntemleri ve analiz koşulları) kapsamaktadır (Yurteri ve ark., 2021). Kısacası, tıbbi ve aromatik bitkilerde uçucu yağ içeriği ve bileşimi çevre koşulları, yetiştirme koşulları, ve kültürel uygulamalar (sulama, gübreleme) (Özgüven ve ark., 2008; Rioba ve ark., 2015) tarafından etkilenmektedir.

Kuraklık stresi tıbbi bitkilerde uçucu ve ikincil metabolitlerin üretimini etkilemektedir (Goncalves ve ark., 2023). Örneğin lavantada, uçucu yağ içeriği ve linalool seviyeleri kuraklık stresi altında artar (Saunier ve ark., 2022). Su eksikliği, ikincil metabolitlerin üretimi de dahil olmak üzere bitki metabolizmasında önemli değişikliklere neden olabilir (Soltanipour, 2005).

Lavanta yaprakları ve çiçekleri uçucu yağlarında 40'tan fazla farklı bileşik içerir, bunların en belirginleri linalool asetat, linalool, sineol, kafur ve geranioldür (Caprari ve ark., 2021). Çok sayıda uçucu yağ üreten bitkiler arasında Lavandula angustifolia Mill. en değerli olanlardan biri olarak öne çıkmaktadır (Crisan ve ark., 2023).

Lavanta yağının kalitesi özellikle linalool, linalil asetat ve kafur içeriği ile ölçülmektedir. Özellikle linalool ve linalil asetat lavanta yağının kalitesini pozitif yönde belirleyen en önemli bileşenler olup, parfüm sanayinde kullanılacak lavanta yağında (ISO3515:2002 lavanta yağı kalite standartlarına göre) en az % 25 oranında bulunmaları istenmektedir (Anonymous, 2002). Kafur ise lavanta yağının kalitesini düşüren en önemli bileşiktir ve %0.5'den daha az olması istenir, yüksek oranda bulunması durumunda uçucu yağı düşük fiyattan satılmaktadır. Düşük kafur içerikli lavanta yağı gıda, kozmetik ve ilaç sanayinde (parfüm, krem, kolonya), yüksek kafur içerikli lavanta yağı ise mum, sabun, böcek ilacı ve diğer ürünlerin yapımında kullanılmaktadır (Tisserand ve Balacs,1999; Baydar, 2010).

3. LAVANTA VERİMİ VE YAĞ KALİTESİNE SULAMANIN ETKİSİ

Kurak alanlar, dünyanın ekili alanlarının yaklaşık %80'ini kaplar ve toplam gıda üretiminin yaklaşık %60'ına katkıda bulunur (World Water Assessment Programme, 2009).Yağış, özellikle kurak ve yarı kurak bölgelerde tarımsal üretimi etkileyen en önemli faktörlerden biridir. Yıllık yağış miktarı ve mevsimsel dağılımı, bir bölgenin tarımsal üretimi için çok önemlidir, çünkü yağış, su dengesi, sulama gereksinimleri ve farklı bitkilerin su üretkenliğini doğrudan etkiler. Günümüzde, kurak bölgelerde sınırlı su kaynakları nedeniyle, tam su ihtiyacını karşılayacak sulama uygulamaları gerçekleştirmek olası değildir. Bu nedenle günümüze kadar, birçok bitkide ürün verimini artırmak ve/veya sulama suyu üretkenliğini artırmak için tamamlayıcı sulama ve kısıntılı sulama üzerine çeşitli çalışmalar yapılmıştır (Wang ve ark., 2001; Zhang ve ark., 2003).

Aynı şekilde, tarımı yapılan tıbbi ve aromatik bitkilerde de benzer çalışmalar yapılmıştır. Gelinen noktada, sulama seviyesi, tıbbi ve aromatik bitkilerin uçucu yağ verimi ve kompozisyonunu etkilemektedir (Bettaieb ve ark., 2009; Petropoulos ve ark., 2008; Vahidipour ve ark., 2013). Bu bağlamda lavanta tarımında sulama ve sulama yönetiminin verime ve kalitesine etkilerini belirlemek üzere saksı ve tarla düzeyinde araştırmalar yürütülmüştür. Lavanta yetiştiriciliğinde sulama ve farklı su yönetim uygulamalarının verime etkilerini konu edinen bazı araştırmalar incelenerek, günümüze kadar gelinen noktadaki mevcut durumun kısa bir özeti bu bildiride sunulmaya çalışılmıştır.

Farklı sulama programlarının etkilerini değerlendirmek amacıyla Chrysargyris ve ark. (2016), lavanta ve adaçayı bitkilerinde sulamanın bitki gelişimine, ürün verimine ve kalitesine etkilerini araştırmışlardır. Saksı denemesi olarak yürütülen çalışmada, bitkiler, tam sulama, orta seviyede kısıntılı sulama ve şiddetli su stresi altında sera koşullarında yetiştirilmiştir. Bu kapsamda tam sulamada saksı başına günlük 50 ml, orta seviyede kısıntılı sulamada 3 günde bir 50 ml ve şiddetli kısıntılı sulamada ise haftada bir 50 ml olarak uygulanmıştır. Genel olarak, su stresi altındaki bitkiler, tam sulama altındaki bitkilere göre daha az büyüme ve değişen kimyasal bileşim sergilemiştir. Buna ek olarak, su stresi altındaki bitkiler, daha yüksek antioksidan (fenolik) konsantrasyonları ile uçucu yağ kalitesinde fayda sağlamıştır. Kısacası bu çalışmanın sonuçları, kısıntılı sulamanın lavanta bitkisinin uçucu yağ kalitesini artırabileceğini göstermiştir. Benzer içerikte farklı sulama planlaması uygulayan Hosseini ve Heidari (2025), İran'da yaptıkları serada saksı denemesinde, kuraklık stresinin lavanta üzerindeki etkilerini ve su kıtlığına verdiği yanıtın altında yatan moleküler mekanizmaları araştırmışlardır. Çalışmada dört farklı sulama seviyesi planlanmış olup; bunlar toprağın tarla kapasitesi'nin (TK) %80, 60, 40 ve 20'sine tekabül eden sırasıyla 2, 1.5, 1 ve 0.5 litre sudan oluşturulmuştur. Sulamalar üç ay boyunca üç günde bir uygulanmıştır. Sulama suyu kısıntıları altında; protein ve klorofil içerikleri, fenolik ve flavonoid bileşikler, antioksidan kapasitesi, uçucu yağ içeriği, uçucu yağın antibakteriyel özellikleri ve uçucu yağ bileşimi dahil olmak üzere çeşitli parametreler incelenmiştir. Elde edilen bulgulara göre, su kısıntısı artıkça, protein ve klorofil içeriği de azalmıştır. Yine İran'da yürütülen başka bir saksı denemesinde Shabankareh ve ark. (2021), farklı su stresi rejimleri altında yetiştirilen üç lavanta çeşidinin tepkisini araştırmışlardır. Çalışmada tarla kapasitesinin(TK) farklı seviyelerindeki (%90-100TK, %70-80TK, 50-60TK ve %30-40TK) sulamalardan oluşan dört farklı sulama rejimi uygulanmış ve su stresinin lavanta yağı kalitesine etkileri araştırılmıştır. Araştırma bulgularına göre, su stresi lavanta kuru madde verimini önemli ölçüde azaltmış olup, en düşük kuru ot verimi en az sulanan konudan elde edilmiştir. Sulama seviyesi artıkça esansiyel yağ oranı azalırken, en yüksek yağ oranı en düşük seviyede sulamadan elde edilmişken, en yüksek yağ verimi ise %70-80 TK sulama rejiminde elde edilmiştir. Değerlendirilen tüm genotiplerde, artan kuraklık stresiyle birlikte başta linalil asetat ve linalool gibi monoterpen bileşikleri azalış gösterirken, seskiterpen bileşiklerinin arttığı belirlenmiştir. Türkiye'de yürütülen benzeri başka bir saksı denemesinde Noory (2020) açık alanda yaptığı çalışmada, farklı yetişme ortamı ve kuraklığın lavanta bitkisinin gelişimi üzerine etkilerini araştırmıştır. Bu bağlamda, biri yağışa dayalı, biri tam tam sulama ve ikisi kısıntılı sulama konusu olmak üzere dört farklı sulama seviyesi altında 7 farklı yetiştirme ortamının lavantanın morfolojik özelliklerine etkisi belirlenmeye çalışılmıştır. Sulama suyu kap buharlaşması esas alınarak haftada bir veya iki kez olacak şekilde belirlenmiş, tam sulama konusuna sulama aralığında gerçekleşen buharlaşma miktarı kadar su uygulanmış olup, %33 kısıntılı sulamada, tam sulama suyunun %66'sı ve %66 kısıntılı sulamada ise %33'ü uygulanmıştır. Elde edilen sonuçlara göre, tam sulama, %33 ve %66 kısıntılı sulama konularına sırasıyla 275, 182 ve 91 mm sulama suyu uygulanmıştır. Sulama seviyeleri lavantanın morfolojik özelliklerine önemli ölçüde etki etmiş olup, tam sulama konusu bitki boyu, bitki gövde çapı, çiçek sapı uzunluğu ve çiçek sayısı bakımından en iyi performansı göstermiştir.

Bir başka saksı çalışmasında Saunier ve ark (2022) iki lavanta türüne (*L. Angustifolia, L. x intermedia*) ait farklı çeşitlerde uygulanan su stresinin etkilerini araştırmışlardır. Bu kapsamda serada saksı denemesi ile iki farklı sulama seviyesinin bitkide fizyolojik ve metabolik özelliklere etkisi test edilmiştir. Sulama uygulamasının birincisinde (kontrol), bitkiler her gün toprağın (karışım) tarla kapasitesinin (TK) %75'ine karşılık gelen 300 mL su ile sulanırken, ikincisi kuraklık stresi uygulaması olup, TK'nın %25'ine karşılık gelen 100 mL su ile her 2 günde bir sulanmıştır. Sulama uygulamaları *L. angustifolia* çeşitlerinde 17 Mayıs ve *L.x intermedia* çeşitlerinde ise 24 Mayısta başlatılmış ve her iki türe ait çeşitlerde 22 Temmuzda sonlandırılmıştır. Sulama seviyelerinin bitkilerin fizyolojik ve metabolik özelliklerine etkileri; biri çiçeklerin yaklaşık %50'sinin açıldığı 10 Haziran - 4 Temmuz döneminde ve diğeri ise çiçeklerin tohum oluşturduğu 9-22 Temmuz dönemi olmak üzere iki fenolojik dönemde ölçümler yapılarak belirlenmiştir. Çalışmanın bulguları, su stresinin, tüm bitki ölçeğinde terpen emisyonlarında önemli bir azalmaya yol açarken, çiçek terpen üretimi azalışının daha düşük seviyede gerçekleştiğini göstermiştir. Yine çalışma sonuçları, her iki türün de su stresi ile başa çıkmak için kuraklığa dayanıklı bir strateji sergilediğini ve L. angustifolia'nın daha rekabetçi bir strateji izlediğini göstermiştir. Çalışma sonuçları ayrıca, Fransa'da geliştirilen yeni bir çeşit olan 'Rapido' (L. angustifolia) ve 'Sumian' (L. x intermedia) çeşitlerinin, şiddetli kuraklık koşullarında yetiştirilmeye en uygun adaylar olabileceğini göstermiştir.

Lavantada sulama üzerine yapılan araştırmaların bazıları tarla denemesi olarak yürütülmüştür. Örneğin Salata (2020) Polonya'da yürüttüğü bir tarla denemesi ile sulamanın lavantanın ot ve çiçek salkımı verimine etkisini araştırmıştır. Araştırmada, biri tamamlayıcı sulama ve diğeri yağışa dayalı olmak üzere lavanta üretimi gerçekleştirilmiş ve iki üretim sistemi karşılaştırılmıştır. Sulamalar damla sulama yöntemi ile toprak su potansiyeli -20 kPa veya bu değere yakınlaştığında uygulanmış olup, her sulamada sabit 15 mm olmak üzere toplam 6 kez sulama yapılmıştır. Çalışma sonuçlarına göre, sulama lavantanın taze ot verimi ile taze çiçek salkım verimini önemli ölçüde artırmıştır. Yağışa dayalı üretimle karşılaştırıldığında, tamamlayıcı sulama taze ot verimini %40.2, taze çiçek verimini %51.76 ve hava kurusu çiçek verimini ise yaklaşık iki kat artırmıştır. Araştırma bulguları ayrıca çiçeklerden elde edilen uçucu yağ verimini de önemli ölçüde artırmış olup, yağışlı üretime göre %17.65 artırmıştır. Buna karşın sulama toplam fenolik asitler oranını %22.83 azaltmıştır. Diğer bir çalışmada Pirzad ve Mohammadzadeh (2018) İran'da yaptıkları bir tarla denemesinde lavanta, biberiye ve kekik bitkilerinde sulamanın biyolojik verime, uçucu yağ verimine ve bitki su tüketimine etkilerini araştırmışlardır. Çalışmada, bitkiler tarla kapasitesinin %75'i (iyi sulanmış, 0.75TK) ve %50'sinde (orta stres, %50TK) olmak üzere iki farklı nem seviyesinde, yani iki farklı sulama aralığı sulama koşullarında yetiştirilmiştir. Ayrıca kontrol amaçlı olarak yağışa dayalı bir konuda çalışmaya dahil edilmiştir. Araştırma sonuçlarına göre, %75TK ve %50TK konularına uygulanan sulama suyu miktarları birinci yılda sırasıyla 218.7, 150 ve 0 mm, ikinci yılda 262.5, 225 ve 0 mm olmuştur. Sulama sıklığı artıkça uçucu yağ oranı azalmış, en yüksek oran sulamasız koşullarda elde edilmiştir. Ancak tarla kapasitenin %50'sinde sulama ile yağışa dayalı konuların yağ oranları arasında önemli bir fark olmadığı belirlenmiştir. Sonuçlara göre, sulama sıklığı artıkça lavanta biyolojik verimi ve uçucu yağ verimi önemli ölçüde artış göstermiş, en yüksek verim değerleri tarla kapasitesinin %75'inde sulanan konudan elde edilmiştir. Benzer içerikli başka bir çalışmada Sarfaraz ve ark (2024) tarafından İran'da yürütülen bir tarla denemesinde farklı sulama seviyeleri ve farklı gübre kaynaklarının lavantaya olan etkileri araştırılmıştır. Denemede, tarla kapasitesi nemine (TK) dayalı dört farklı sulama seviyesi (%95 TK (S1), %75TK (S2), %50TK (S3) ve %25TK (S4)) ve üç farklı gübre kaynağı iki farklı lavanta çeşidine uygulanarak, uygulamaların lavantanın biyolojik ve çiçek verimi ile uçucu yağ oranı ve yağ verimine etkileri araştırılmıştır. Elde edilen bulgulara göre S1, S2, S3 ve S4 konuları 7 kez sulanmış ve sırasıyla toplamda 750, 584, 391 ve 305 mm sulama suyu uygulanmıştır. Sulama suyu miktarı artıkça lavanta biomass verimi ile çiçek verimi önemli

ölçüde artış göstermiştir. En yüksek verimler en yüksek sulama suyu uygulanan kontrol konusundan elde edilmiştir. En düşük sulama suyu uygulaması ile kıyaslandığında, en yüksek sulama seviyesi biyolojik verimi %68.5 ve çiçek verimini ise %105 artırmıştır. Sulama seviyeleri lavanta uçucu yağ oranını önemli ölçüde etkilemiş olup, en düşük oranlar en az sulanan konu ile en fazla sulanan konudan elde edilmiştir.

Hasibi ve ark (2022) tarafından yapılan çalışmada, farklı seviyelerdeki su stresini kullanarak lavantanın kuraklığa dayanıklılığı tarla koşullarında test edilmiştir. Bu bağlamda 4, 8, 12 ve 20 günde bir sulama olmak üzere dört farklı sulama konusu bitkilere uygulanmış ve lavantanın morfolojik ve biyokimyasal özelliklere etkisi belirlenmeye çalışılmıştır. Bu denemenin sonuçları, stres düzeylerinin morfolojik, biyokimyasal ve uçucu yağ üzerindeki etkisinin ayrı ayrı önemli olduğunu göstermiştir. Lavanta sürgün boyu, sürgün sayısı, sürgün kuru ağırlığı, yaprak alanı ve yaprak kuru ağırlığı gibi morfolojik özellikler sık sulamada en yüksek değerleri göstermiş iken, stoma direnci sulama aralığı artıkça artmıştır. Benzer şekilde klorofil içeriği, SOD (süperoksit desmotaz), POD (polifenol oksidaz), APX (askorbater oksidaz) gibi biyokimyasal özellikler sulama aralığı uzadıkça azalış gösterirken, prolin içeriği artış göstermiştir. En yüksek prolin değeri 20 gün sulama aralığında elde edilmiştir. Sulama aralığı bağlamında benzer içerikli İran'da yapılan bir araştırmada Satarzadeh ve ark. (2024), lavanta bitkisinde farklı sulama rejimleri, farklı seviyeyi içeren biyogübre aşılması (Thiobacillus, Pseudomonas ve Thiobacillus + Pseudomonas aşılaması ve kontrol olarak aşılamasız konu) ve iki farklı fosforlu gübre dozunun (0 ve 50 kg ha^{-1}) etkisini araştırmışlardır. Çalışmada sulama seviyeleri, A sınıfı buharlaşma kabından 60, 90 ve 120 mm buharlaşma sonrası sulama uygulaması olmak üzere üç konudan oluşturulmuştur. Sonuçlar, sulamanın her kademesinde fosfor tüketiminin ve biyogübre ile aşılamanın, kontrol ile karşılaştırıldığında çiçeklerin kuru ağırlığını artırdığını göstermiştir. Bu çalışmanın sonuçlarına dayanarak, su stresi koşullarında, biyolojik gübrelerin fosforlu gübrelerle birlikte kullanılmasının lavanta bitkisinde yetersiz beslenme vakalarını büyük ölçüde azaltabileceği ifade edilmiştir.

García-Caparrós ve ark (2019) tarafından İspanya'da yapılan çalışmada, Ballıbabagiller (Lamiaceae) familyasına ait bazı (ballıbaba, nane, kekik, lavanta, dağ çayı vb.) bitkilerin su stresine tepkisi bir tarla denemesi ile araştırılmıştır. Denemede iki farklı sulama seviyesi planlanmış olup, sulama seviyeleri referans bitki su tüketimi (ETo) ve yağış miktarı (R) farkına dayalı oluşturulmuştur. Çalışmada, bitkilere tam sulama ve %30 kısıntılı sulama seviyeleri damla sulama sistemi ile uygulanarak, biyolojik verime ve uçucu yağ içeriğine etkisi test edilmiştir. Araştırma sonuçlarına göre, %30 sulama suyu kısıntısı lavanta bitkisini olumsuz etkilemişken, diğer bitkilerde (adaçayı, nane, kekik) sulama seviyeleri olumsuz bir etki oluşturmamıştır. Tam sulama ile kıyaslandığında, %30 kısıntılı sulama lavantanın kuru ot verimi ve uçucu yağ verimini sırasıyla %32 ve %35.9 azaltmıştır.

Türkiye'de de lavanta yetiştiriciliğinde sulama verim ilişkileri, sulama yönetimi ve sulama üretkenliğini önceleyen az sayıda da olsa araştırma yapıldığı görülmektedir. Örneğin Akçay ve ark. (2021) Aydın Ovası koşullarında damla yöntemi ile farklı sulama seviyelerinin lavanta bitkisinde verime etkileri üzerine bir tarla denemesi yürütmüşlerdir. Çalışmada kap buharlaşması ve toprak nemine dayalı olmak üzere iki sulama stratejisi dikkate alınmış olup, her bir sulama stratejisinde biri tam ve üçü kısıntılı (tam seviyenin %67, 33 ve 0) olmak üzere dört sulama seviyesi uygulanmıştır. A sınıfı kap buharlaşması stratejisinde 7 gün sulama aralığı ve toprak nemine dayalı sulama stratejisinde ise tam sulama uygulanan parselde bitki kök bölgesinde faydalı su kapasitesinin %50'si tüketilince sulamalar yinelenmiştir. Elde edilen sonuçlara göre, buharlaşma kabına dayalı strateji ile karşılaştırıldığında, toprak nemine dayalı sulama stratejisi önemli ölçüde daha yüksek verim değerleri sağlamıştır. Sulama seviyeleri lavanta verimini önemli şekilde etkilemiş olup, yaş çiçek verimi 381-510 kg da^{-1} ve drog çiçek verimleri ise 172-263 kgda^{-1} arasında bulunmuştur. Çalışmanın sonuçları, sulama seviyesi

artıkça lavanta çiçek verimi ve drog çiçek veriminin önemli ölçüde arttığını göstermiştir. Sulama suyunun üretkenliği, sulama seviyesi artıkça azalış göstermiş olup, sulamalı konular arasında en düşük değer her iki sulama stratejisinde de tam sulama seviyesinden elde edilmiştir. Ayrıca bu çalışma, yeterli su varlığı koşullarda, sulama programının toprak nemine dayalı yapılmasını ve tam sulama uygulanmasını, su kısıtlı koşularda ise hem toprak nemin hem de kap buharlaşması sulama stratejisinde %33 kısıntılı sulama seviyesinin lavanta tarımı için önerilebileceğini göstermiştir. Yine Türkiye'de yarı kurak iklime sahip Niğde koşullarında Yetik ve Şen (2025) tarafından yapılan bir tarla denemesinde, damla sulama yöntemi ile uygulanan farklı sulama seviyelerinin lavantanın verimi, verim bileşenleri, uçucu yağ içeriği, su üretkenliği ve sulama suyu üretkenliği üzerine etkileri beş üretim mevsimi için araştırılmıştır. Sulama konuları; tam sulama (TS), orta derecede kısıntılı sulama (KS1, %33 su eksikliği), şiddetli kısıntılı sulama (KS2, %66 su eksikliği) ve yağışa dayalı üretimden (YD) oluşmuştur. Sonuçlar, KS1'in TS ile karşılaştırılabilir taze verim (144-227 kg /da) ve yağ verimi (2,7-6,9 kg/ da) elde ettiğini ve bitki su tüketiminin 781,5-923,6 mm arasında değiştiğini göstermiştir. Yağışa dayalı konuda ürün verimi önemli ölçüde azalırken, su üretkenliği en üst düzeyde gerçekleşmiştir. Bu da önemli su eksiklikleri altında bile lavantanın suyu çok etkili kullanma potansiyeline sahip olduğunu göstermektedir. Araştırma bulguları, lavantanın, kısıntılı sulamaya uygun olduğunu, göstermiştir. Sonuç olarak, araştırıcılar; %33 su kısıntısının verim düşüşünü en aza indirerek su üretkenliğini optimize etmek için, %66 su kısıntısını ise su kısıtlı yarı kurak iklimlerde sürdürülebilir lavanta üretimi için uygun bir sulama programı olarak önerilebileceğini bildirmişlerdir.

4.SONUÇ

Bu incelemede, önemli bir tıbbi ve aromatik bitki olan lavantanın tarımında sulamanın bitki verimine ve uçucu yağ kalitesine etkisi ele alınmıştır. Bu kapsamda yakın geçmişte lavantada sulama üzerine yapılmış çalışmaların bazıları incelenerek, sulamanın etkisine ilişkin kısa özetleri sunulmaya çalışılmıştır. Yapılan incelemeden elde edilen sonuçlara göre; sulamanın lavantanın gelişimini, çiçek verimi ile uçucu yağ verimini önemli şekilde artırdığı, uçucu yağ oranını ise kısmen olumsuz etkilediği, ancak uçucu yağ verimini artırdığı görülmektedir. Bu nedenle, kurak ve su kısıtlı bölgelerde, lavantanın az miktarda su ile damla sulama yöntemiyle birkaç kez sulanması yararlı olacaktır.

ÖZET

Tarım, Türkiye gibi gelişmekte olan ülkelerin kalkınmasında önemli bir rol oynayan, gelişmiş ülkelerin ekonomilerinin ise temelini oluşturan bir sektördür. Plansız kentleşme ve nüfus artışı, gün geçtikçe yoğunlaşan sanayileşme ile azalan tarım alanlarına rağmen üretim kaygısı devamlı artış göstermiştir. Artan nüfusun besin ihtiyacını azalan tarımsal alanlarla karşılamak amacıyla tarımsal teknikler gün geçtikçe gelişmiş, bu gelişme ile birlikte özellikle ilaç, gübre gibi kimyasal ürünlerin kullanımı artmıştır. Birim alandan daha yüksek verim kaygısı ile kullanımı kontrolsüz bir şekilde artan kimyasal girdilerin bir süre sonra bazı zararları tespit edilmiştir. Bu girdilerin kullanımı ürün veriminde her ne kadar artış sağlasa da çevreye ve toprağa verdiği zararlar bazı çözümleri zorunlu kılmıştır. Toprak yapısının, organik içeriğinin ve canlı florasının bozulması konularının çözümü amacıyla organik temelli ürünlerin kullanımı çözüm için önemli çıkış kapıları olmuşlardır. Toprak organik maddesinin artırılması, toprakların kimyasal ve fiziksel yapılarının onarılması ve hatta toprakta canlı mevcudiyetinin artırılması için en önemli çözüm yolu olarak yaygınlaşmaya başlamıştır. Ayrıca yapılan bilimsel çalışmaların ışığında tüketiciler ve üreticilerde artan bilinç kimyasal girdilerin dozunda kullanımını ve organik ürünlerin yetiştiricilikte girdi olarak daha fazla yer almasını sağlamıştır.

Son yıllarda artan bilinç organik temelli ürünlerin kullanımında önemli bir artış sağlamıştır. Bu sayede ürün çeşitliliği de artarak devam etmiş ve günümüzde bu ürünler piyasada önemli bir yer almaya başlamışlardır. Humik ve Fulvik Asit içerikli girdiler bu ürünlerin en önemlilerinden birisidir. Bu ürünlerin kullanımı yalnızca toprak yapısının iyileştirilmesini ve bitkilerin besin maddelerinden daha iyi faydalanmasını sağlamaz, aynı zamanda ürün gelişimini de destekleyerek verim ve gelir artışını da önemli oranda destekler. Bu ürünlerin kullanımı ağır metalleri sabitleyebilir ve organik kirleticileri parçalayabilir.

Bu çalışmada, humik ve fulvik asit temelli organik ürünlerin tarımsal amaçla kullanım olanakları sunularak yapılan güncel araştırmalar derlenecektir.

Anahtar Kelimeler: Humik, Fulvik, Organik, Tarım

HUMIC AND FULVIC ACIDS IN AGRICULTURAL PRODUCTION: UTILIZATION POTENTIALS AND RECENT STUDIES

ABSTRACT

Agriculture is a sector that plays a vital role in the development of emerging economies such as Türkiye, while serving as the foundation of the economies of developed nations. Despite declining agricultural lands due to unplanned urbanization, population growth, and accelerating industrialization, the concern for maintaining and increasing agricultural production has persisted. To meet the nutritional demands of a growing population with shrinking agricultural resources, agricultural technologies have steadily advanced. However, this progress has also led to a substantial increase in the use of chemical inputs such as fertilizers and pesticides. Over time, the uncontrolled application of these chemicals, initially aimed at maximizing yield per unit area, has revealed several detrimental effects. Although such inputs contribute to yield enhancement, their adverse impacts on the environment and soil health have necessitated alternative solutions. The degradation of soil structure, organic content, and microbial diversity has prompted the search for sustainable remedies, among which the use of organic-based products has emerged as a promising approach. Increasing soil organic matter, improving the chemical and physical properties of soils, and enhancing microbial activity are now regarded as key strategies for sustainable soil management.

Furthermore, growing awareness among consumers and producers, supported by scientific research, has led to a more measured use of chemical inputs and a rising adoption of organic products in agricultural production systems. In recent years, this increasing awareness has significantly boosted the utilization of organic-based materials, resulting in expanding product diversity and a growing market presence. Among these, inputs containing humic and fulvic acids stand out as particularly important. Their use not only improves soil structure and enhances the uptake of nutrients by plants, but also promotes plant growth, thereby contributing to higher yields and increased economic returns. Additionally, these substances can immobilize heavy metals and decompose organic pollutants, further supporting environmental sustainability.

In this review, recent studies on the agricultural applications and potential uses of humic and fulvic acid–based organic products will be compiled and evaluated.

Keywords: Humic, Fulvic, Organic, Agriculture

1. GİRİŞ

Günümüzde meydana gelen iklimsel kaymalar, küresel ısınma ve benzeri olaylarla beraber artan sanayileşme, plansız kentleşme gibi faktörler tarımsal faaliyetlerin kısıtlanmasına sebep olmaktadır. Gittikçe artan dünya nüfusunun besin ihtiyacının karşılanması ise her geçen gün daha da önem kazanmaktadır. Bu ihtiyacın karşılanmasına yönelik uygulamaların büyük kısmını kimyasal girdilerin kullanımı oluşturmaktadır. Özellikle toprak beslemede kullanılan gübre preparatları bilinçsiz uygulamalarla birleştiğinde toprakta ve yer altı sularında bulaşmalara sebebiyet verebilmektedir. Üretim kaygısı nedeniyle artan bu uygulamalar topraklarda bazı birikimlere sebebiyet vermekle birlikte verim artışına tamamen çözüm olamamaktadırlar. Toprağın organik yapısı, fiziksel ve kimyasal özelliklerinin tam olarak bilinmediği durumlarda yapılan uygulamalar tam çözüm olmamakla birlikte verim kaygısıyla çiftçiler kimyasal girdilere daha çok sarılabilmekte bu durum da kısır bir döngüye sebebiyet vermektedir.

Toprak organik madde içeriğinin geliştirilmesi, yapısının iyileştirilmesi verimli üretimin ilk koşulu olmakla birlikte, gelecek nesillere sağlıklı bir üretim bırakmak açısından da oldukça önem arz etmektedir.

Küresel ısınma, iklim kaymaları, tarım topraklarında ve yer altı sularında meydana gelen kirlenmeler, su kaynaklarının azalması gibi olaylar insan yaşamına önemli bir tehdit olarak ortaya çıkmıştır. Bu sebeple gelişmiş ülkeler başta olmak üzere dünya çevresinde doğa dostu çözümler üzerine eğilim artmıştır ve artmaya devam etmektedir. Tarımsal faaliyetlerin doğa dostu çözümler ile desteklenmesi, kimyasal girdilerin daha az miktarlarda uygulanmasına rağmen daha fazla verim alınması gibi konular son yıllarda üzerinde sıkça durulan araştırmalar olmuştur.

Destekleyici ürünler olarak mikroorganizmalar, alginik asitler, amino asitler, humik ve fülvik asitler, solucan gübreleri gibi ürünlerin konu olduğu birçok çalışma yapılmış ve bu ürünlerin kimyasal girdilerin verimi üzerine etkileri araştırılmıştır. Hümik ve fülvik asit bu ürünler arasında başı çeken ürünlerdir. Bu derlemede hümik ve fülvik asit ile ilgili bazı detaylardan bahsedilecek ve yapılmış bazı çalışmalar irdelenecektir.

2. HÜMİK ve FÜLVİK ASİT

Hümik ve fülvik asitler, toprak organik maddesinin temel bileşenlerini oluşturan, bitkisel ve hayvansal artıkların mikrobiyal ayrışmasıyla meydana gelen karmaşık doğal bileşiklerdir. Bu maddeler, toprakta fiziksel, kimyasal ve biyolojik dengeyi düzenleyerek verimliliğin sürdürülmesinde kilit rol oynar (Stevenson, 1994; Akıncı, 2011). Hümik maddeler çözünürlüklerine göre üç alt fraksiyona ayrılır: hümik asit, fülvik asit ve hümin (Chen & Aviad, 1990). Hümik asit alkali ortamda çözünür, asidik ortamda çökelir; fülvik asit ise her pH aralığında çözünür durumda kalır (Piccolo, 2001).

Yapısal olarak hümik asitler yüksek molekül ağırlıklı, aromatik karakterli ve hidrofobik özellik gösterirken; fülvik asitler düşük molekül ağırlıklı, alifatik ve hidrofiliktir (Canellas ve ark., 2015). Bu fark, fülvik asidin bitki kökleri tarafından daha hızlı emilmesine ve kısa vadede etkili olmasına, hümik asidin ise toprakta uzun süreli kalıcılık ve tamponlama etkisi göstermesine neden olur (Nardi ve ark., 2002).

Her iki bileşik de karboksil, fenolik ve hidroksil grupları sayesinde metal iyonlarını şelatlayarak Fe, Zn, Cu ve Mn gibi mikro besinlerin alınabilirliğini artırır (Ay, 2015; Khashroum ve ark., 2024). Ayrıca hümik maddeler, toprak su tutma kapasitesini yükseltir, mikrobiyal aktiviteyi teşvik eder ve kök zar geçirgenliğini artırarak iyon taşınımını düzenler (Canellas ve ark., 2015; Gao ve ark., 2022).

Son yıllarda bu maddeler, yalnızca toprak düzenleyici olarak değil, aynı zamanda biyostimülan olarak da değerlendirilmektedir. Hümik ve fülvik asitler bitkilerde hormon benzeri etki göstererek auxin ve sitokinin benzeri yanıtları tetikler; bu durum kök büyümesini, sürgün gelişimini ve yaprak yüzey alanını artırır (Nardi ve ark., 2016; Alsudays ve ark., 2024). Özellikle kuraklık, tuzluluk ve ağır metal stresi gibi abiyotik faktörlere karşı dayanıklılığı artırmada önemli oldukları son çalışmalarla da kanıtlanmıştır (Mosaad ve ark., 2025; Song ve ark., 2025).

3. KONU İLE İLGİLİ YAPILMIŞ ÇALIŞMALAR

3.1. Bitki Gelişimi ve Verim Üzerindeki Genel Etkiler

Yapılan birçok araştırma, hümik ve fülvik asitlerin bitki gelişimini teşvik ederek verim ve kaliteyi artırdığını göstermiştir. Erdal ve ark. (2014), kireçli toprakta yetiştirilen domateste 1000 ppm dozunda hümik + fülvik asit uygulamasının azot alımı ve kök kuru ağırlığını önemli ölçüde artırdığını bildirmiştir. Arduç, ve ark. (2020) tarafından yapılan çalışmada da ekmeklik buğdayda bu bileşiklerin tane verimini %25 oranında artırdığı ve protein içeriğini yükselttiği belirtilmiştir.

Benzer şekilde Zhang ve ark. (2021), mısır sapından elde edilen fülvik asidin domateste fotosentetik etkinliği ve meyve kalitesini artırdığını, yüksek dozların ise optimum verim noktasını aşınca verim düşüşü oluşturabileceğini vurgulamıştır. Bu durum, fülvik asidin bitkide iyon taşınımını hızlandırarak kısa vadede pozitif etki yapmasına rağmen, yüksek konsantrasyonlarda ozmotik stres oluşturabileceğini göstermektedir.

Çilek üzerine yapılan bir araştırmada, Zydlik ve Zydlik (2023) hümik asit içeren yapraktan uygulanan gübrelerin toprak enzim aktivitesini iki kat artırdığını, yaprak yüzey alanını %60 oranında büyüttüğünü ve meyve sertliği ile şeker içeriğini yükselttiğini bildirmiştir. Bu bulgular, özellikle biyostimülan içerikli yapraktan uygulamaların, klasik mineral gübrelemeye göre daha dengeli bir büyüme sağladığını ortaya koymaktadır.

3.2. Kuraklık ve Tuzluluk Stresi Altında Etkiler

Kuraklık ve tuzluluk, tarımsal üretimin en ciddi stres faktörleri arasında yer alır. Song ve ark. (2025), kurak koşullarda yetiştirilen domateslerde 400 $mg \cdot L^{-1}$ fülvik asit uygulamasının fotosentez oranını %67, su kullanım etkinliğini %42 artırdığını, aynı zamanda meyve kalitesi ve C vitamini içeriğini belirgin şekilde iyileştirdiğini göstermiştir.

Tuzlu koşullarda yürütülen çalışmalarda da benzer sonuçlar elde edilmiştir. Mosaad ve ark. (2025), farklı tuzluluk seviyelerindeki tritikale denemelerinde hümik ve fülvik asitlerin klorofil içeriğini yükselttiğini, prolin birikimini azalttığını ve tane ağırlığını artırdığını bildirmiştir. Araştırmacılar, bu etkilerin hümik bileşiklerin iyon homeostazını düzenleyici ve antioksidan savunmayı güçlendirici mekanizmalarından kaynaklandığını belirtmiştir.

Benzer şekilde Nargesi ve ark. (2022), zeytin çeşitlerinde hümik ve fülvik asidin membran stabilitesini artırdığını, prolin birikimini azalttığını ve özellikle 'Zard' çeşidinde kalsiyum ve magnezyum içeriğini yükselttiğini rapor etmiştir. Bu sonuç, organik asitlerin iyon dengeleme ve hücresel zar koruma görevlerini destekler niteliktedir.

3.3. Çimlenme ve Toprak Özellikleri Üzerine Etkiler

Khashroum ve ark. (2024), kabakgillerde (kabak ve salatalık) sulama suyuna eklenen farklı hümik + fülvik asit konsantrasyonlarının toprak pH'sını düşürdüğünü, elektriksel iletkenliği azalttığını ve çimlenme oranını belirgin artırdığını tespit etmiştir. Özellikle 0,5 $mL \cdot L^{-1}$ konsantrasyonun çimlenmeyi hızlandırdığı ve çiçeklenmeyi 12 gün erkene çektiği bildirilmiştir.

Bu, düşük doz uygulamaların bitkisel fizyolojide optimum düzeyde uyarıcı etki sağladığını göstermektedir.

Benzer şekilde Yıldırım ve ark. (2021), kadmiyum stresi altındaki tere bitkisine uygulanan hümik + fülvik asit karışımının Cd birikimini azalttığını, klorofil miktarını ve antioksidan enzim aktivitelerini artırarak stres toleransını güçlendirdiğini ortaya koymuştur. Bu bulgu, humik bileşiklerin ağır metal toksisitesine karşı detoksifikasyon ve iyon rekabeti yoluyla koruyucu etkilerini destekler.

3.4. Meyve Türlerinde Kalite ve Besin İçeriği

Meyve türlerinde yapılan araştırmalar da hümik ve fülvik asitlerin kalite parametreleri üzerindeki olumlu etkilerini göstermektedir. Sedaghathoor ve ark. (2022), zeytinde bu asitlerin yağ içeriğini ve fenolik bileşikleri artırdığını rapor etmiştir. He ve ark. (2022) limonda, benzer şekilde, bu uygulamaların meyve şeker oranı, C vitamini ve flavonoid düzeylerini yükselttiğini vurgulamıştır.

Ayrıca Zydlik ve Zydlik (2023) tarafından çilek bitkisinde yapılan çalışma, hümik asidin yaprak biyokütlesini, enzim aktivitesini ve toprak solunumunu iki kat artırdığını göstermiştir. Bu sonuçlar, hümik ve fülvik asitlerin bitkisel metabolizmayı güçlendirerek meyve kalitesine dolaylı katkı sağladığını ortaya koymaktadır.

4. SONUÇ VE ÖNERİ

Hümik ve fülvik asitler, tarımsal üretimde hem besin alım düzenleyicisi hem de biyostimülan olarak önemli bir yere sahiptir. Toprak yapısını iyileştirir, mikrobiyal aktiviteyi artırır, bitki büyümesini teşvik eder ve stres koşullarında fizyolojik dengeyi korur. Son dönem çalışmalar, bu maddelerin bitkilerde fotosentez, enzim aktivitesi, iyon taşınımı ve antioksidan sistemler üzerindeki etkilerini daha net ortaya koymuştur (Canellas ve ark., 2015; Song ve ark., 2025; Mosaad ve ark., 2025). Gelecekteki araştırmalarda, farklı kaynaklardan elde edilen hümik maddelerin (ör. leonardit, linyit, kompost, biyokömür) kimyasal karakterizasyonunun bitkisel yanıtlarla ilişkilendirilmesi ve her tür için optimum uygulama dozu belirlenmelidir. Ayrıca, atık bazlı organik materyallerden hümik madde üretimi, hem çevre koruma hem de sürdürülebilir gübreleme açısından stratejik önemdedir. Genel olarak, 1990'lardan bu yana yürütülen klasik çalışmalar (Chen & Aviad, 1990; Stevenson, 1994) ile güncel bulgular (Zydlik & Zydlik, 2023; Khashroum ve ark., 2024; Song ve ark., 2025) birlikte değerlendirildiğinde, hümik ve fülvik asitlerin modern tarımda ekolojik, ekonomik ve fizyolojik açıdan vazgeçilmez katkılar sunduğu açıktır.

ÖZET

Gelişmiş toplumlar kalkınma hedeflerine ulaşmak için ekonomilerinin temellerini sağlam bir zemine oturtmuşlardır. Bu temeli oluştururken de ilk adım tarımsal üretim ile başlamıştır. Ekonomilerde genel kalınmanın en önemli yolu kırsal kalkınmadan geçmektedir. Bunu başarabilmek ise doğru planlama sonucunda birim alandan elde edilecek gelirin artırılmasından geçmektedir. Türkiye' de gelişmekte olan ülkeler arasında yer almakla birlikte tarımsal kalkınma sürecini tam anlamıyla tamamlayamamıştır. Özellikle planlamada yaşanan problemler bu sürecin uzamasında önemli bir rol oynamaktadır.

Meyvecilik önemli bir tarımsal faaliyve arkanıdır. Tarla ürünlerine oranla birim alandan getirisi yüksek bir üretim koludur. Türkiye bu üretim kolunda önemli bir yerdedir. Ancak karasal iklime sahip bölgelerinde ve uygun olmayan toprak koşularından bu faaliyve arkanından yararlanmak oldukça zordur. Yapılan faaliyetlerden ise başarı elde edilememekle birlikte harcanan zaman ve para da çoğu zaman boşa gitmektedir.

Türkiye bitki gen kaynakları bakımından önemli bir konumdadır. Birçok yabani türün gen merkezidir. Alıç (*Crataegus* spp.) bu türlerin en önemlilerindendir. Yetiştiricilik özellikleri ve piyasada alıcı bulduğu fiyat düşünüldüğünde yüksek bir potansiyele sahiptir. Alıç meyveleri ülkemizde geleneksel anlamda önemli görülmekle birlikte, son yıllarda alıç meyvelerinden üretilen marmelat, sirke ve turşu gibi ürünler de yoğun talep görmektedir. Farkı türlerinin bulunduğu alıç ayrıca peyzaj bitkisi olarak da değerlendirilebilmektedir. Günümüzde taze olarak 200-300 TL/kg fiyatlara alıcı bulabilmektedir. Ayrıca alıcın farklı bitki kısımları da çay olarak değerlendirilebilmektedir. Alıcın alternatif bir tür olarak potansiyel göstermesinin yanında akraba türlere (elma, armut, ayva vb.) anaç olma potansiyeli de ayrıca önem arz etmektedir. Sebepler değerlendirildiğinde alıcın mevcut meyve türlerine alternatif bir tür olarak değerlendirilmesi üzerinde durulması gereken bir konu olarak karşımıza çıkmaktadır.

Bu çalışmada, alıcın özellikleri, güncel çalışmalar ve endüstriyel potansiyeli tartışılarak ülkemizin doğal bitkisi olan bu türün mevcut meyve türlerine alternatif bir tür olarak kullanılması üzerine önerilerde bulunulacaktır.

Anahtar Kelimeler: Alıç, Crataegus, Potansiyel, Alternatif

HAWTHORN (*Crataegus spp.):* POTENTIALS AND FUTURE PERSPECTIVES AS AN ALTERNATIVE SPECIES

ABSTRACT

Developed societies have established their economies on solid foundations to achieve their development goals, and the first step in building this foundation has traditionally been agricultural production. Sustainable economic development largely depends on rural development, which in turn requires proper planning and the optimization of income obtained per unit area. Although Türkiye is classified among developing countries, it has not yet fully completed its agricultural development process. Problems encountered in agricultural planning have played a major role in prolonging this process.

Fruit growing is an important field of agricultural production and offers higher economic returns per unit area compared to field crops. Türkiye holds a significant position in this sector; however, in regions characterized by a continental climate and unfavorable soil conditions, fruit cultivation faces considerable challenges. As a result, many attempts in these areas have failed to achieve success, leading to significant losses of both time and financial resources.

Türkiye possesses remarkable plant genetic diversity and serves as a gene center for many wild species. Among these, hawthorn (*Crataegus* spp.) stands out as one of the most important. Considering its cultivation characteristics and the prices it can fetch in the market, hawthorn exhibits high potential as a valuable crop. While hawthorn fruits have traditionally been appreciated in Türkiye, there has been increasing demand in recent years for value-added products such as marmalade, vinegar, and pickles made from hawthorn. In addition, various species of hawthorn can be utilized as ornamental plants in landscaping. Fresh fruits can currently be sold at prices ranging from 200 to 300 TL per kilogram. Moreover, different parts of the plant are also used to produce herbal teas. Beyond its potential as an alternative fruit species, hawthorn's possible use as a rootstock for related species such as apple, pear, and quince further increases its importance. Considering these factors, the evaluation of hawthorn as an alternative fruit species represents a promising area for future agricultural development.

This study aims to discuss the characteristics, recent research findings, and industrial potential of hawthorn (*Crataegus* spp.), while providing recommendations for its use as an alternative fruit species native to Türkiye.

Keywords: Hawthorn, *Crataegus*, Potential, Alternative

1. GİRİŞ

Alıç (*Crataegus* spp.), Rosaceae familyasının önemli bir üyesi olup Anadolu florasında geniş bir taksonomik çeşitlilik göstermektedir. Türkiye, tür ve genetik varyasyon açısından Crataegus cinsinin önemli gen merkezlerinden biridir (Gerçekçioğlu ve ark., 2022). Anadolu'nun hemen her bölgesinde doğal olarak yetişen bu tür, ekolojik esnekliği sayesinde dağlık, kireçli ve düşük organik madde içeren marjinal topraklarda dahi gelişebilme kapasitesine sahiptir (İkinci ve ark., 2022; Aydemir, 2022). Bu nedenle alıç, tarımsal üretim için uygun olmayan alanların ekonomik olarak değerlendirilebileceği alternatif bir meyve türü olarak dikkat çekmektedir.

Ekolojik adaptasyon kabiliyeti kadar, biyokimyasal içeriği de türün önemini artırmaktadır. Alıç meyveleri yüksek oranda fenolik bileşikler, flavonoidler, C vitamini ve organik asitler içerir; bu özellikleriyle antioksidan kapasitesi oldukça yüksektir (Bostan & Mazı, 2021; Öztürk ve ark., 2022). Bu zengin içerik, alıcı yalnızca gıda sanayi için değil, fonksiyonel gıda ve fitoterapi

alanlarında da değerli kılmaktadır. Nitekim *Crataegus* türlerinden elde edilen ekstraktlar, kalp-damar sağlığı, hipertansiyon ve kolesterol kontrolü üzerine olumlu etkiler göstermektedir (Karagül, 2024).

Türkiye'de alıç genellikle yabani olarak değerlendirilen bir tür olmasına karşın, son on yılda yürütülen seleksiyon çalışmaları sonucunda birçok yerel tip belirlenmiş ve tescil aşamasına gelmiştir. Bu süreç, alıcın doğal bir bitkiden ekonomik değeri yüksek kültür meyvesi konumuna geçişini hızlandırmıştır (Akça & Bostan, 2022). Ayrıca, doğada kendiliğinden yetişme yeteneği ve düşük bakım gereksinimi sayesinde, iklim değişikliği koşullarında bile sürdürülebilir üretim potansiyeli taşımaktadır (Aydemir, 2022).

2. TÜRKİYE'DE ALIÇ YETİŞTİRİCİLİĞİNİN GELECEĞİ VE POTANSİYELİ

2.1. Yeni Tescilli Çeşitler ve Seleksiyon Çalışmaları

Türkiye'de alıç üzerine yapılan sistematik çalışmalar son yıllarda hız kazanmıştır. Birçok yörede bu çalışmalar yürütülmüş; Artvin (Çoruh Vadisi), Sivas, Tokat (Niksar), Yozgat, Kırşehir, Şanlıurfa, Ağrı, Hatay ve Diyarbakır bölgelerinde yürütülen seleksiyon çalışmaları, yüksek meyve kalitesine sahip birçok genotipin belirlenmesini sağlamıştır (Keles, 2018; Keles, 2021; Akça ve Bostan, 2022; Gerçekçioğlu ve ark., 2022; İkinci ve ark., 2022; Sağbaş, 2022; Göztak, 2023; Tuğrul ve Gürsoy, 2024; Çalışkan ve ark., 2025).

Bu çalışmaların en somut çıktılarından biri, 2023 yılında tescillenen "Sultan" çeşididir (Çalışkan ve ark., 2025). "Sultan" alıcı, *Crataegus azarolus* türüne aittir, iri meyve yapısı, yüksek suda çözünür kuru madde içeriği ve cazip rengiyle hem taze tüketim hem işleme sanayii için uygundur. Ayrıca "Polat Efe" adıyla yine 2023 yılında tescillenmiş *Crataegus orientalis* türüne mensup bir alıç çeşidi daha literatüre girmiştir.

2.2. Endüstriyel Kullanım Alanları ve Ekonomik Potansiyel

Alıç meyvesinin endüstriyel kullanım alanları giderek genişlemektedir. Gıda endüstrisinde marmelat, reçel, sirke, meyve suyu ve şarap üretiminde kullanımı artarken, farmasötik sektörde doğal antioksidan ve kalp sağlığı destekleyici içerikler olarak değerlendirilmektedir (Çavdar & Adar, 2024; Karagül, 2024). Ayrıca meyve çekirdeklerinden elde edilen yağ, yüksek düzeyde linoleik asit (yaklaşık %70) içeriğiyle kozmetik ve ilaç endüstrisinde potansiyel bir hammadde konumundadır (Öztürk ve ark., 2022).

Alıcın işlenmiş ürünlerine yönelik pazar talebi de yükseliştedir. Özellikle doğal ve fonksiyonel gıdalara yönelim, iç pazarda alıç bazlı ürünlerin değerini artırmıştır. Uluslararası pazarda ise özellikle Uzak Doğu ülkelerinde alıç, geleneksel tıp ve fonksiyonel içecek sektörlerinde yüksek talep görmektedir (Karagül, 2024).

2.3. Üretim Modelleri ve Yatırım Gelişmeleri

Son yıllarda tescilli alıç çeşitlerinin sözleşmeli üretim modeli ile yaygınlaştırılması hedeflenmektedir. "Sultan" ve "Polat Efe" çeşitlerinin üretim hakkını alan özel bir firma, 2000 dekar büyüklüğünde ticari bahçe kurulumuna başlamış ve üreticilerle sözleşmeli iş birliği modeli planlamıştır. Bu modelde üreticilerin en az 20 dekar büyüklüğünde bahçeler kurması öngörülmekte; ürünlerin firma tarafından ihracat amaçlı satın alınması düşünülmektedir. Böylece üretici açısından pazar garantisi oluşurken, organizasyon sahibi firmanın da ihracat yoluyla yüksek katma değer elde etmesi öngörülmektedir.

Bu girişim, alıç yetiştiriciliğini yalnızca marjinal topraklar için bir çözüm olmaktan çıkarıp, yüksek ekonomik potansiyele sahip organize bir üretim alanı hâline getirme yönünde önemli bir adımdır. Ayrıca sözleşmeli modelin, kırsal kalkınma projeleriyle entegre edilmesi

durumunda hem üretici gelirini artıracağı hem de ihracat kapasitesine katkı sağlayacağı düşünülmektedir.

2.4. Ekolojik ve Sürdürülebilir Değer

Alıç, ekolojik açıdan da dikkat çekici bir türdür. Kök yapısı sayesinde toprak erozyonunu önler, kıraç ve taşlık alanlarda stabilizasyon sağlar (Aydemir, 2022). Bu nedenle karayolu ve demiryolu güzergâhlarında yeşil şerit bitkisi olarak kullanımı önerilmektedir. Ayrıca çiçekleri arılar için önemli bir nektar kaynağı olduğundan, arıcılıkla entegre üretim modelleri geliştirilmesi mümkündür (Gerçekçioğlu ve ark., 2022).

Yüksek çevresel toleransı, düşük su gereksinimi ve hastalıklara dayanıklılığı nedeniyle alıç, iklim değişikliğine karşı dayanıklı tarımsal sistemlerin bir bileşeni olarak değerlendirilebilir. Bu özellikler, hem ekolojik sürdürülebilirlik hem de kırsal kalkınma açısından stratejik bir avantaj sunmaktadır.

3. SONUÇ VE ÖNERİLER

Alıç, Türkiye'nin geniş ekolojik çeşitliliği içinde marjinal alanların ekonomik olarak değerlendirilmesine olanak tanıyan en önemli alternatif meyve türlerinden biridir. Yeni tescilli çeşitlerin ortaya çıkması, bu türün tarımsal üretimde ticari bir değere dönüşümünü hızlandırmıştır. "Sultan" gibi tescilli genotipler, yüksek kalite ve verim potansiyeliyle hem işleme sanayi hem de ihracat pazarı açısından cazip fırsatlar sunmaktadır (Çalışkan ve ark., 2025).

Alıç yetiştiriciliğinde sürdürülebilir bir gelişim için şu adımlar önerilmektedir:

- Tescilli çeşitlerin çoğaltımı ve fide temin zincirinin oluşturulması,
- Sözleşmeli üretim modelinin yaygınlaştırılması,
- Üniversite–özel sektör iş birliğiyle Ar-Ge destekli ıslah programlarının sürdürülmesi,
- Meyve işleme teknolojilerinin geliştirilerek ihracata yönelik katma değerli ürün üretiminin teşvik edilmesi.

Sonuç olarak alıç, yalnızca tarım dışı alanlarda değil, uygun ekolojilerde de ekonomik potansiyeli yüksek bir türdür. Ekolojik dayanıklılığı, endüstriyel değerlendirilebilirliği ve pazar gücü sayesinde Türkiye'nin alternatif meyve üretiminde önemli bir stratejik tür olma yolundadır.

ÖZET

Küresel iklim değişikliğiyle birlikte artan sıcaklık ve azalan yağışlar, özellikle yarı kurak bölgelerde su kaynaklarının sürdürülebilirliğini tehdit etmekte ve bitkisel üretimde ciddi verim kayıplarına neden olmaktadır. Domates *(Solanum lycopersicum* L.) gibi ekonomik öneme sahip türler, su kısıtı koşullarına karşı oldukça duyarlı olup, su stresine verilen yanıtın moleküler temellerinin aydınlatılması büyük önem taşımaktadır. Bu çalışmada, farklı düzeylerde kısıntılı sulamanın domateste su stresine yanıt veren *SlNCED1* ve *SlDREB2* genlerinin ekspresyon düzeyleri üzerine etkisi araştırılmıştır. Deneme, Van Yüzüncü Yıl Üniversitesi Ziraat Fakültesi serasında H-2274 çeşidi kullanılarak yürütülmüştür. Bitkiler %100, %66,6 ve %33,3 sulama seviyeleriyle sulanmış; gen ekspresyonu için yaprak örnekleri denemenin 15. ve 45. günlerinde toplanmıştır. RT-qPCR sonuçlarına göre, *SlNCED* geninin ekspresyon seviyesi sulama miktarı azaldıkça düşüş gösterirken; *SlDREB2* geninin ekspresyon seviyesi ise sulama miktarı ile birlikte artmıştır. Elde edilen bulgular, su kısıtı koşullarında ABA biyosentezinde görev alan *SlNCED1* geninin baskılandığını, buna karşılık ABA-bağımsız sinyal yolunda görev alan *SlDREB2* geninin aktive olduğunu ortaya koymaktadır. Bu durum, uzun süreli veya şiddetli stres koşullarında domates bitkisinin ABA-bağımlı yanıttan ABA-bağımsız adaptasyon mekanizmasına geçtiğini göstermektedir. Sonuç olarak, su stresine verilen yanıtın dinamik ve zamanla yeniden düzenlenen bir süreç olduğu, bu süreçte *SlDREB2*'nin stres toleransının sürdürülmesinde önemli rol oynadığı belirlenmiştir.

Anahtar Kelimeler: *SlNCED1*, *SlDREB2*, abiyotik stres, ABA sinyalizasyonu, gen ekspresyonu

ABSTRACT

Increasing temperatures and decreasing precipitation caused by global climate change threaten the sustainability of water resources, particularly in semiarid regions, and lead to significant yield losses in crop production. Economically important species such as tomato (*Solanum lycopersicum* L.) are highly sensitive to water deficit conditions, and elucidating the molecular basis of their response to water stress is of great importance. In this study, the effects of different levels of deficit irrigation on the expression of *SlNCED1* and *SlDREB2* genes both involved in the water stress response in tomato were investigated. The experiment was conducted in the greenhouse of Van Yuzuncu Yil University, Faculty of Agriculture, using the H-2274 tomato cultivar. Plants were irrigated at 100%, 66.6%, and 33.3% irrigation levels, and leaf samples for gene expression analysis were collected on the 15th and 45th days of the experiment. According to RT-qPCR results, the expression level of *SlNCED1* decreased with decreasing irrigation, whereas the expression of *SlDREB2* increased under more severe water deficit conditions. These findings indicate that *SlNCED1*, a key gene in ABA biosynthesis, is transcriptionally repressed under prolonged water limitation, while *SlDREB2*, a transcription factor involved in ABA-independent signaling pathways, is activated. This suggests that under extended or severe stress conditions, tomato plants may shift from an ABA-dependent response toward an ABA-independent adaptive mechanism. In conclusion, the molecular response to water stress in tomato appears to be dynamic and time-regulated, with *SlDREB2* playing a critical role in maintaining stress tolerance.

Keywords: *SlNCED1*, *SlDREB2*, abiotic stress, ABA signaling, gene expression

GİRİŞ

Su kıtlığı, dünya genelinde tarımsal üretimi sınırlayan başlıca çevresel stres faktörlerinden biridir (FAO, 2012; FAO, 2020). Küresel iklim değişikliği ile birlikte artan sıcaklık, azalan yağış miktarı ve düzensiz hidrolojik rejimler, özellikle yarı-kurak ve kurak bölgelerde su kaynaklarının kullanılabilirliğini azaltmaktadır (IPCC AR6, 2022; FAO, 2020). Bu durum, bitkisel üretimde su stresini artırarak verim kayıplarına yol açabilir (Ingrao et al., 2023). FAO, iklim değişikliği, su kaynaklarının tükenmesi ve artan tarımsal ihtiyaçlar nedeniyle 2050 yılına gelindiğinde birçok sulanabilir tarım alanında su kıtlığı riski oluşacağını belirtmektedir (FAO, 2020). Bu durum, suyun etkin kullanımını zorunlu kılmakta ve kısıntılı sulama stratejilerinin geliştirilmesini önemli hale getirmektedir. Domates (*Solanum lycopersicum* L.) dünya genelinde en fazla yetiştirilen sebze türlerinden biri olup, su stresi koşullarına karşı oldukça duyarlıdır (Krishna et al., 2022). Su kısıtı, domates bitkilerinde fotosentez hızının azalmasına, yaprak turgorunun düşmesine, hücre genişlemesinin yavaşlamasına ve sonuç olarak verim kaybına neden olur (Shao et al., 2008). Bitkiler, bu tür stres koşullarına karşı morfolojik, fizyolojik ve moleküler düzeyde çok yönlü adaptasyon mekanizmaları geliştirir (Bartels & Sunkar, 2005).

Moleküler düzeyde kuraklık yanıtının en erken göstergelerinden biri absisik asit (ABA) hormonunun birikimidir. ABA, köklerden yapraklara taşınarak stomatal kapanmayı teşvik eder ve su kaybını azaltır (Park et al., 2009). ABA biyosentezinde rol alan enzimlerden 9-cis-epoxycarotenoid dioxygenase (NCED), bu yolakta hız kısıtlayıcı basamakta görev alır ve genellikle su stresi altında hızlı şekilde indüklenir (Iuchi et al., 2001). Domateste *SlNCED1* gen ekspresyonu, su stresi koşullarında sıklıkla yukarı regüle olmaktadır; bu artış, ABA biyosentezinin yükselmesiyle ilişkili olarak stres sinyalizasyon yollarını destekleyebilir (Thompson et al., 2000; Vo et al., 2025). Dolayısıyla *SlNCED1*, bitkinin stres algılamasında erken bir genetik belirteç olarak kabul edilmektedir.

ABA'ya ek olarak, bitkiler kuraklığa karşı ABA-bağımsız sinyal yolları da kullanmaktadır. Bu yollarda görev yapan Dehydration-Responsive Element Binding Protein 2 (*DREB2*), bitkilerin çevresel streslere verdiği yanıtın önemli düzenleyicilerinden biridir. *DREB2* ailesine ait transkripsiyon faktörleri, DNA üzerinde DRE/CRT (dehydration-responsive element/C-repeat) bölgelerine bağlanarak stresle ilişkili genlerin ekspresyonunu aktive eder (Lata & Prasad, 2011). Domateste tanımlanan *SlDREB2*, kuraklık, tuzluluk ve yüksek sıcaklık koşullarında aktive olur; hücresel su dengesinin korunmasında, protein stabilizasyonunda ve metabolik adaptasyon süreçlerinde görev alır (Hichri et al., 2016; Guo et al., 2011). Dolayısıyla, *SlNCED1* ve SlDREB2, su stresi koşullarında ABA-bağımlı ve ABA-bağımsız yanıt mekanizmalarını temsil eden iki tamamlayıcı bileşen olarak görev yapmaktadır.

Bu nedenle, su stresine verilen yanıtın hem hormonal sinyalizasyon (ABA biyosentezi ve iletimi) hem de ABA-bağımsız transkripsiyonel düzenleme (*DREB2* aracılı gen ekspresyonu) yönlerini eş zamanlı olarak değerlendirmek, domatesin su kısıtına karşı geliştirdiği tolerans mekanizmalarının daha kapsamlı biçimde anlaşılmasına olanak tanır. Bu kapsamda, kısıntılı sulama koşullarının domates bitkilerinde su stresine yanıt veren iki genin (*SlNCED1* ve *SlDREB2*) ekspresyon düzeyleri üzerindeki etkilerinin incelenmesi, bitkinin stres yanıtının moleküler temellerinin ortaya konulması açısından önem taşımaktadır. Ayrıca gen ekspresyonundaki değişimlerin stresin erken (15. gün) ve geç (45. gün) dönemlerinde karşılaştırılması, su stresine verilen yanıtın ABA-bağımlıdan ABA-bağımsıza geçiş sürecini ve bu yanıtın zaman içindeki dinamik düzenlenmesini anlamaya katkı sağlayacaktır.

MATERYAL VE METOD

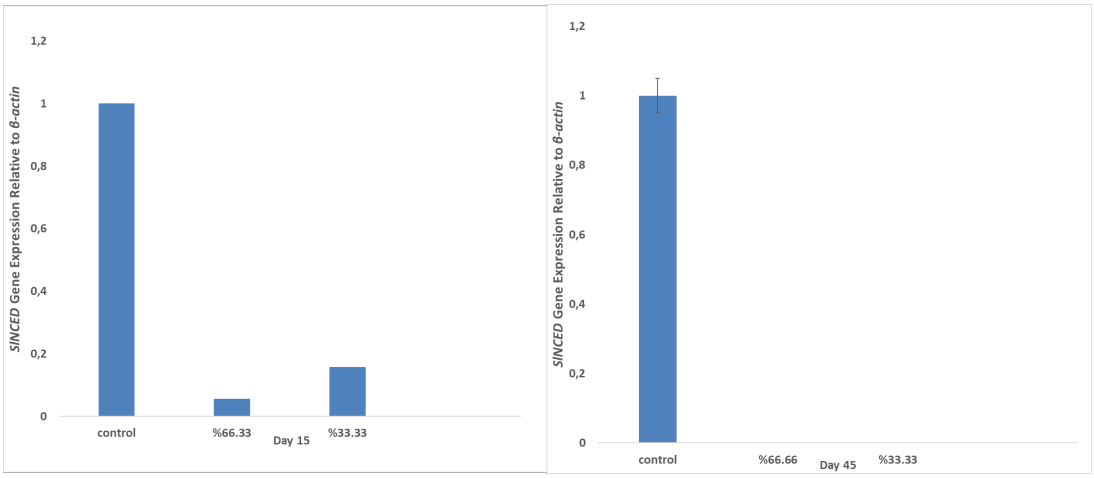
Bitki Materyali ve Deneme Dizaynı

Çalışma Van Yüzüncü Yıl Üniversitesi Ziraat Fakültesi'nin kontrollü iklim odalarında yürütülmüştür. Sera ortamında ortalama sıcaklık gündüzleri 25 ± 2 °C, geceleri 18 ± 2 °C, bağıl nem %60–70 ve fotoperiyot 16 saat aydınlık / 8 saat karanlık olacak şekilde ayarlanmıştır. Çalışmada *Solanum Lycopersicum* L., - cv. H2274 çeşidi kullanılmıştır. Fideler 3-4 yapraklı dönemde eşit gelişim düzeyinde olacak şekilde seçilerek saksılara dikilmiştir. 3 tekerrürlü tamamen tesadüfi faktöriyel deneme deseninde yürütülen çalışmadaki saksı sayısı 9'dur. Çalışmada hava kurusu halindeki elenmiş topraklar saksılara aktarılmış akabinde fide aşamasındaki domates bitkilerinin dikimi gerçekleştirilmiştir. Sulamalarda 3 farklı değişen sulama suyu seviyesi (% 100: tam sulama, % 66.66: tam sulamanın 2/3'ü seviyesinde kısıntılı sulama ve % 33.33: tam sulamanın 1/3'ü seviyesinde kısıntılı sulama) kullanılmıştır. . İlk sulamada tüm saksılara eşit miktarda saksı kapasitesine tamamlanacak şekilde sulama yapılmıştır. Bu dönemden sonraki sulamalara değişen sulama suyu seviyeleri ile (% 100, % 66.66 ve % 33.33) üç gün aralıklı olarak devam edilmiştir. Gen ekspresyonu için örnekler çalışma başladıktan sonraki 15. günde ve 45. günde alınmış; gen ifade düzeylerinin farklılıklarına bakılmıştır.

Gen Ekspresyon Analizi

Gen ekspresyon analizinde yaprak örnekleri 15. ve 45. günde her bir uygulama için üç biyolojik tekrar halinde toplanmış ve RNA izolasyon aşamasına kadar -80°C'de saklanmıştır. RNA izolasyonundan önce, dondurulmuş yaprak dokuları sıvı nitrojen kullanılarak toz haline getirildi. RNA izolasyonu TRIzol reaktifi (Nucleogene) kullanılarak gerçekleştirildi ve elde edilen RNA'ların saflığı ve miktarı, NanoDrop spektrofotometresi (Thermo Scientific) kullanılarak bakıldı. Tamamlayıcı DNA (cDNA) sentezi, RNA örnekleri 10 ng/µL'lik son konsantrasyona seyreltilerek Solver (SLV-M-2021-007) cDNA Sentez Kiti kullanılarak gerçekleştirildi. Daha sonra, Rotor-Gene Q9000 sistemi (Qiagen) üzerinde Solver qPCR Master Mix (SLV-M-2021-002) kullanılarak kantitatif gerçek zamanlı PCR (RT-qPCR) gerçekleştirildi. Deneysel hatayı en aza indirmek için, PCR reaksiyonları tüm örnekler için iki kez gerçekleştirildi. Analiz için 3 gen kullanıldı: 2 hedef gen (*SlNCED1*, *SlDREB2*) ve referans gen *β-actin*. Gen-spesifik primer dizileri ve bağlanma sıcaklıkları Tablo 1'de listelenmiştir. *SlNCED1, SlDREB2* ve *SlActin* için primerler Chen ve ark. (2024), Tao ve ark. (2022) ve Løvdal ve ark. (2009) tarafından bildirilen çalışmalardan referans alınmıştır. *β-actin* geni, RT-qPCR reaksiyonlarında Ct değerlerinin normalizasyonu için dahili kontrol olarak kullanılmıştır.

Table 1. Gene name, nucleotide sequences, annealing temperatures, and accession numbers



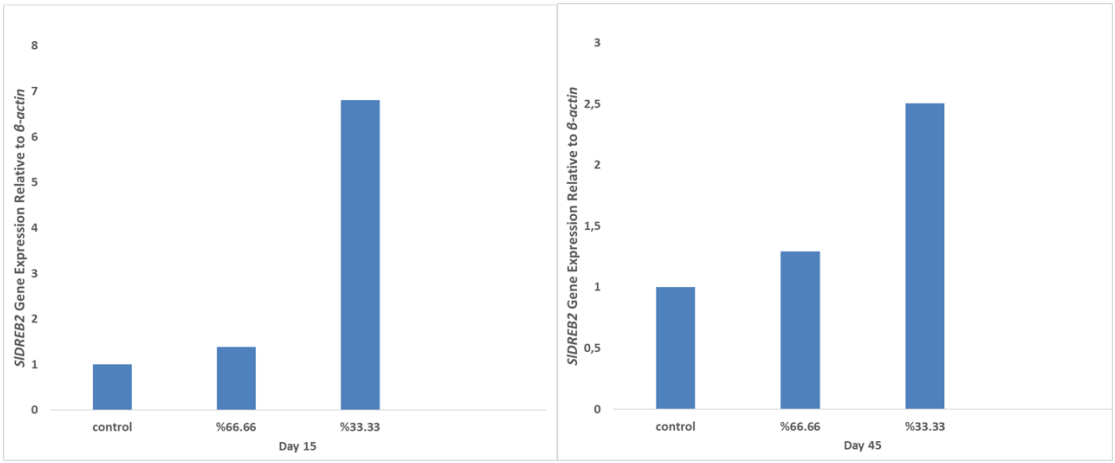
Gene Name	Forward Sequence	Reverse Sequence	Annealing Temperature
SlNCED1	TGGCAGATTTGGTTCGGAGG	ACAGCTGACTTTCCGGTGTT	59°C
SlDREB2	ATCGCCATCTTCCGTTCTTC	AACGCCCGAAACTAACGAC	57°C
SlActin	GAAATAGCATAAGATGGCAGACG	ATACCCACCATCACACCAGTAT	59°C

İstatistiksel Analiz

Gen ekspresyon düzeyleri, Livak ve Schmittgen (2001) tarafından tanımlanan göreceli kantifikasyon (relative quantification) yöntemine dayalı olarak çevrimiçi gen ekspresyon analiz araçları kullanılarak hesaplanmıştır.

BULGULAR VE TARTIŞMA

Kısıntılı sulama uygulamaları, domates bitkilerinde *SlNCED1* geninin ekspresyon düzeylerini önemli ölçüde etkilemiştir (Şekil 1). Denemenin 15. gününde kontrol grubunda gen ifadesi en yüksek düzeyde belirlenmiş, sulama oranı azaldıkça ekspresyon düzeyinde de belirgin bir azalma gözlenmiştir. %66.6 sulama uygulanan grupta *SlNCED1* geninin ekspresyonu kontrolün yaklaşık %10'u düzeyine gerilerken, %33.3 sulama uygulanan grupta ise bu oran yaklaşık %20 düzeyinde kalmıştır. Denemenin 45. gününde ise *SlNCED1* geninin ifadesi kontrol grubunda yüksek seviyede devam etmiş, kısıntılı sulama uygulanan gruplarda ise gen ifadesi neredeyse tamamen baskılanmıştır. Bu sonuçlar, hem erken (15. gün) hem de geç (45. gün) dönemde artan su kısıtının *SlNCED1* geninin transkripsiyonel aktivitesini bastırdığını göstermektedir.



Şekil 1. *SlNCED* geninin sulama seviyelerine göre ifadesi (15. ve 45. gün)

SlNCED1, absisik asit (ABA) biyosentezinde hız kısıtlayıcı basamakta görev alan 9-cis-epoxycarotenoid dioxygenase (NCED) enzimini kodlar ve özellikle kuraklık/dehidrasyon koşullarında sıklıkla yukarı düzenlenir (Iuchi et al., 2001; Thompson et al., 2000). Ancak bu çalışmada gözlenen gen ifadesindeki azalma, stresin süresine ve şiddetine bağlı olarak *SlNCED1*'in geç dönemde baskılanabileceğini düşündürmektedir. Nambara ve Marion-Poll (2005), uzun süreli meydana gelen stres sonrasında ABA katabolizmasının devreye girerek hormon düzeylerini dengeleyerek metabolik/genetik bir yeniden ayarlama yaşandığını belirtir. Bu bulgular, domatesin uzun süreli veya şiddetli su kısıtı altında ABA biyosentezini azaltarak enerji dengesinin korumaya yönelebileceğini düşündürmektedir. Sonuç olarak, *SlNCED1* geninin hem 15. hem 45. günde azalan ekspresyonu, kısıntılı sulama koşullarında domatesin ABA-bağımlı yanıt mekanizmasından ABA-bağımsız adaptasyon stratejisine geçmiş olabileceğini göstermektedir. Bu geçiş, stresin süresi ve şiddetine bağlı olarak dinamik biçimde düzenlenen bir moleküler adaptasyon süreci olarak da yorumlanabilir.

Kısıntılı sulama uygulamalarının domates bitkisinde *SlDREB2* geninin ekspresyonu Şekil 2'de verilmiştir. Denemenin 15. gününde kontrol grubunda en düşük ekspresyon oranı gözlenmiş olup; sulama kısıtı oldukça ekspresyon seviyesi artmıştır. %33.33 sulama uygulanan grupta en yüksek gen ifadesi gözlenmiş yaklaşık 7 katlık bir artış olmuştur. Kontrol grubunda ve %66.66'lık grupta ise gen ifade seviyeleri hemen hemen aynı olmuştur. Denemenin 45. gününde ise *SlDREB2* geninin ifadesi kontrol grubunda en düşük seviyede iken %66.66 su kısıtı

uygulanan grupta kontrol ile benzer seviyede ifade olmuştur. %33.33 su kısıtı uygulanan grupta ise en yüksek ekspresyon oranı görülmüş, yaklaşık 2,5 kat artmıştır. Bu sonuçlar, hem erken (15. gün) hem de geç (45. gün) dönemde su kısıtı uygulamasının arttıkça *SlDREB2* geninin transkripsiyonel aktivitesinin de arttığını göstermektedir.

Şekil 2. *SlDREB2* geninin sulama seviyelerine göre ifadesi (15. ve 45. gün)

DREB (Dehydration-Responsive Element-Binding) transkripsiyon faktörleri, bitkilerin ABA-bağımsız stres yanıtı mekanizmalarının temel düzenleyicileridir. Bu gen ailesi, su eksikliği, tuzluluk ve yüksek sıcaklık gibi abiyotik stres koşullarında hücre zarının bütünlüğünü korumak, antioksidan enzimleri düzenlemek ve ozmotik dengeyi sağlamak gibi işlevleri kontrol etmektedir (Lata & Prasad, 2011). Özellikle *SlDREB2* geni kuraklık ve tuzluluk gibi abiyotik stres altında yukarı regüle olarak toleransın sürdürülmesinde önemli rol oynamaktadır. Hichri et al. (2016), *SlDREB2*'nin domates ve Arabidopsis bitkilerinde NaCl ve su kısıtı koşullarında anlamlı şekilde arttığını ve bu genin aşırı ekspresyonunun stres toleransını artırdığını bildirmiştir. Benzer şekilde Guo & Wang (2011), *LeDREB2* geninin domateste farklı abiyotik streslerde yukarı regüle olduğunu ve özellikle genç yaprak ile kök dokularında daha yüksek ifade gösterdiğini rapor etmiştir. Bu çalışma sonucunda gözlenen *SlDREB2* gen ifadesi artışı, domatesin kısıntılı sulama koşullarında ABA-bağımlı sinyallerden bağımsız bir adaptasyon stratejisi geliştirdiği için olabilir. Bu genin erken (15. gün) dönemde hızlı şekilde aktive olması, su stresinin algılanmasında ve hücresel savunma yanıtının başlatılmasında kritik rol oynadığını göstermektedir. Geç dönemde (45. gün) ekspresyon düzeylerinin görece azalmasına rağmen kontrolün üzerinde kalması, stres yanıtının devam ettiğini ve bitkinin uzun süreli adaptasyon sürecinde DREB2-aracılı mekanizmaları koruduğunu ortaya koymaktadır.

SONUÇ

Bu çalışmada, farklı düzeylerde kısıntılı sulamanın domates bitkisinde su stresine yanıt veren *SlNCED1* ve *SlDREB2* genlerinin ekspresyon düzeyleri üzerindeki etkileri incelenmiştir. RT-qPCR analizleri, artan su kısıtının *SlNCED1* geninin ifadesini baskıladığını, buna karşılık *SlDREB2* geninin ekspresyonunu belirgin biçimde artırdığını ortaya koymuştur. Bu durum, su stresinin erken dönemlerinde ABA biyosentezine dayalı bir yanıtın baskın olduğunu, ancak stresin şiddetinin ve süresinin artmasıyla birlikte bitkinin ABA-bağımlı yanıttan ABA-bağımsız bir adaptasyon stratejisine geçtiğini göstermektedir. Elde edilen sonuçlar, domatesin uzun süreli veya şiddetli su kısıtı altında enerji dengesini korumak ve hücresel bütünlüğünü sürdürmek için DREB2-aracılı stres yanıtlarını aktive ettiğini göstermektedir. Bu da *SlDREB2* geninin su stresi koşullarında toleransın sürdürülmesinde kilit bir moleküler belirteç olabileceğini düşündürmektedir. Çalışma, kısıntılı sulama altında gen ekspresyonu temelli adaptasyon süreçlerinin aydınlatılmasına katkı sağlamış olup, gelecekte su kullanım verimliliğini artırmaya yönelik genetik ve fizyolojik araştırmalar için temel bir veri seti sunmaktadır.

ÖZET

Toprak mikrobiyal çeşitliliği, bitki besin elementlerinin döngüsünde kritik bir rol oynamakta ve sürdürülebilir tarım uygulamalarının temelini oluşturmaktadır. Kimyasal gübrelerin uzun süreli ve aşırı kullanımı, toprak mikrobiyal dengesini bozarak ekosistem sağlığını olumsuz etkilemektedir. Bu çalışmada, Türkiye'nin farklı bölgelerinden izole edilen *Bacillus* ve *Pseudomonas* türü bakteri suşlarından oluşturulan mikrobiyal gübre konsorsiyumlarının, mısır (*Zea mays L.*) bitkisi üzerindeki üst aksam yaş ve kuru ağırlık, kök kuru ağırlığı ve üst aksam boy uzunluk parametreleri sera koşullarında değerlendirilmiştir. Elde edilen bulgular, özellikle GFBİO1 uygulamasının üst aksam yaş ağırlığında %33,4 ve üst aksam kuru ağırlığında %42,70 oranında artış sağladığını göstermiştir. GFBİO5 uygulaması ise, gövde kalınlığı üzerine %15 ve kök kuru ağırlığı üzerine %9 oranında artış sağlamıştır. Araştırma sonucunda, bazı mikrobiyal formülasyonların bitki gelişimi ve verimi açısından kimyasal gübrelere benzer veya üstün etki gösterdiği belirlenmiştir. Elde edilen veriler, biyogübrelerin sürdürülebilir tarımda potansiyel bir alternatif olduğunu göstermektedir.

Bu kapsamda, kontrol grubu ile karşılaştırıldığında, GFBİO1 ve GFBİO5 konsorsiyumlarının mikrobiyal gübre olarak umut vadettiği belirlenmiştir. Başarılı bulunan mikrobiyal gübre konsorsiyumlarının ilerleyen süreçte tescillenerek ticari ürüne dönüştürülmesi planlanmaktadır.

Anahtar Kelimeler: Mikrobiyal gübre, *Bacillus*, *Pseudomonas*, *Zea mays*, biyogübre, sürdürülebilir tarım, bitki büyümesi, sera koşulları

INVESTİGATION OF THE EFFECTS OF MICROBIAL FERTILIZER FORMULATIONS CREATED WITH BACTERIAL STRAINS ISOLATED FROM TURKISH SOILS ON GRAIN CORN (*ZEA MAYS L.*) PLANTS UNDER GREENHOUSE CONDITIONS

ABSTRACT

Soil microbial diversity plays a critical role in the cycling of plant nutrients and forms the basis of sustainable agricultural practices. Long-term and excessive use of chemical fertilizers disrupts the soil microbial balance, negatively impacting ecosystem health. In this study, microbial fertilizer consortia composed of Bacillus and Pseudomonas bacterial strains isolated from different regions of Turkey were evaluated under greenhouse conditions for the parameters of aerial fresh and dry weight, root dry weight, and aerial height on corn (Zea mays L.) plants. The findings showed that the GFBİO1 application, in particular, increased aerial fresh weight by 33.4% and aerial dry weight by 43.40%. The GFBİO5 application, on the other hand, increased stem thickness by 15% and root dry weight by 9%. The study determined that some microbial formulations have similar or superior effects to chemical fertilizers in terms of plant growth and yield. The obtained data suggest that biofertilizers are a potential alternative in sustainable agriculture.

In this context, when compared with the control group, the GFBİO1 and GFBİO5 consortia were determined to be promising microbial fertilizers. The successful microbial fertilizer consortia are planned to be registered and converted into commercial products in the future.

Keywords: *Microbial fertilizer, Bacillus, Pseudomonas, Zea mays, biofertilizer, sustainable agriculture, plant growth, greenhouse conditions*

GİRİŞ

Günümüz tarımında verimliliği artırmak amacıyla yaygın şekilde kullanılan kimyasal gübreler, uzun vadede toprak kalitesini olumsuz etkileyerek biyoçeşitlilik kaybına ve çevresel bozulmaya yol açmaktadır (Zhang ve ark., 2023). Sürdürülebilir tarım uygulamalarının gerekliliği, bitki büyümesini destekleyen mikrobiyal çözümlerin önemini artırmıştır. Bitki gelişimini teşvik eden rizobakteriler (PGPR), azot fiksasyonu, fosfat çözünürlüğü, indol asetik asit üretimi ve siderofor salgılanması gibi biyolojik mekanizmalarla bitki besin elementlerinin biyoyararlılığını artırmaktadır (Bhattacharyya ve Jha, 2012; Vejan ve ark., 2016).

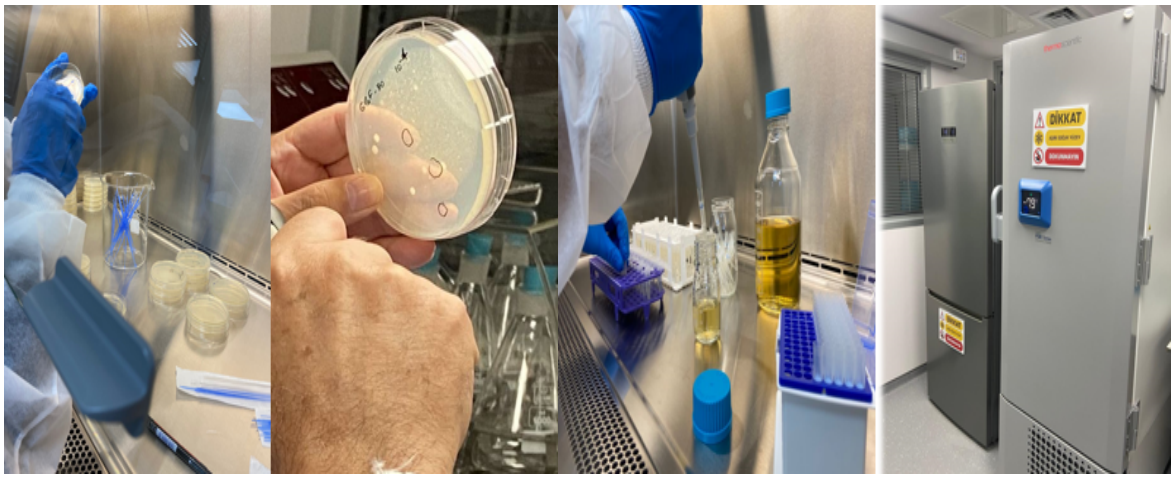
Bacillus ve *Pseudomonas* cinsleri, biyogübre üretiminde öne çıkan mikrobiyal gruplar arasında yer almakta, bitki kökleri ile simbiyotik ilişkiler kurarak hem biyotik hem abiyotik streslere karşı direnç geliştirmektedir (Backer ve ark., 2018). Ayrıca, fosfat çözümleyen mikroorganizmaların toprakta sınırlı bulunan fosforun bitki tarafından erişilebilir hale gelmesinde oynadığı rol, kimyasal gübre kullanımını azaltma potansiyeli açısından önem arz etmektedir (Sharma ve ark., 2013).

Bu çalışmada, Türkiye'nin farklı bölgelerinden elde edilen toprak örneklerinden izole edilen bakteriyel suşlar ile oluşturulan mikrobiyal gübrelerin, sera koşullarında mısır bitkisi üzerine etkileri incelenmiştir. Amaç, alternatif ve çevre dostu gübre seçeneklerinin tarıma kazandırılmasıdır.

Bu çalışmada, Türkiye'nin farklı bölgelerinden Adana Saimbeyli ve Dokuztekne, Doğu Karadeniz Kaçkar Dağları, Çanakkale Gökçeada ve Bozcaada, Karaman Karadağ, Balıkesir Balya) toplanan toprak örneklerinden izole edilen mikroorganizmalar kullanılarak, sera koşullarında biyolojik gübre olarak değerlendirilebilecek suşlar belirlenmiştir. Bu amaçla kullanılan mikroorganizmalar şunlardır: GFBİO1 (RC631 *Bacillus subtilis*, GBF01 *Bacillus megaterium*, GBF251 *Pseudomonas fluorescens*), GFBİO2 (RC631 *Bacillus subtilis*, GBF14 *Bacillus megaterium*, GBF251 *Pseudomonas fluorescens*), GFBİO3 (RC631 *Bacillus subtilis*, A54 *Bacillus pumilus*, GBF251 *Pseudomonas fluorescens*), GFBİO4 (RC631 *Bacillus subtilis*, GBF01 *Bacillus megaterium*, GBF251 *Pseudomonas fluorescens*), GFBİO5 (GBF07 *Pseudomonas putida*, GBF120 *Bacillus megaterium*, GBF72 *Bacillus subtilis*).

MATERYAL METOT

Toprak Örneklerinin Alınması



Bu çalışma kapsamında, Adana Ceyhan Dokuztekne ve Adana Saimbeyli Beypınarı, Çanakkale Gökçeada Yeni Çamlık ve Çanakkale Bozcaada Mumcular Üzüm Bağları, Doğu Karadeniz Kaçkar Dağları, Karaman Karadağ, Balıkesir Balya bölgelerinden alınan toprak numunelerinde toprağın üst kısmı temizlenmiştir. Daha sonra steri olarak hazırlanan 0 – 15 cm arası derinlikte, bitki kök bölgesine yakın kısımdan yaklaşık 500g alınan toprak numuneleri, +4 ^{O}C' de laboratuvara transfer edilmiştir. Analize alınıncaya kadar +4 ^{O}C' de muhafaza edilmiştir. Bitkilerden alınan toprak numunelerine ait görseller Şekil 1' de verilmiştir.

Şekil 1. Bitkilerden Alınan Toprak Numunelerinin Görselleri

Topraktan Bakteri İzolasyonu

Aseptik koşullarda laboratuvara getirilen toprak örnekleri, biyogüvenlik kabini içerisinde açılarak, mikroorganizmalar izole edilmiştir. Stoklanan mikroorganizmalara ait görseller Şekil 2'de sunulmuştur.

Şekil 2. Bitkilerden alınan toprak numunelerinden izole edilerek stoklanan mikroorganizmalara ait görseller

Bakteri Suşlarının Bruker Maldi – Tof MS Sisteminde İdentifikasyonu (Tanılama)

Elde edilen bakteri izolatlarının identifikasyonu MALDI-TOF MS (Matrix Assisted Laser Desorption Ionization–Time of Flight Mass Spectrometry, Bruker Daltonics GmbH, Bremen, Almanya) sistemi kullanılarak gerçekleştirilmiştir. Tanımlama aşamasında, saf kültürlerden elde edilen örneklerde protein ekstraksiyonu için etanol–formik asit bazlı ön işlem uygulanmıştır.

Örneklerden elde edilen kütle spektrumları cihazın flexControl yazılımı (Biotyper 3.0; Microflex LT, Bruker Daltonics GmbH, Bremen, Almanya) aracılığıyla kaydedilmiş ve MALDI Biotyper Real-Time Classification (RTC) yazılımındaki referans veri tabanı ile karşılaştırılarak değerlendirilmiştir. Sonuçların yorumlanmasında sistemin verdiği log(score) değerleri esas alınmış; 2.000–3.000 aralığındaki skorlar tür düzeyinde güvenilir tanımlama (yeşil seviye), 1.700–1.999 aralığındaki skorlar ise cins düzeyinde ya da muhtemel tür düzeyinde tanımlama (sarı seviye) olarak kabul edilmiştir (Carolis ve ark., 2012; Chalupová ve ark., 2014; Kara ve ark., 2017; Uysal ve ark., 2018).

Sera Denemesi

Denemede kullanılan toprak materyali ülkemiz toprakları temsil edilecek şekilde seçilmiş olup daha önce yetiştiricilik yapılmamış bir araziden temin edilmiştir. Deneme toprağının bazı kimyasal ve fiziksel özellikleri Tablo 1'de verilmiştir. Analiz sonuçlarına göre denemede kullanılan toprak; killi bünyeye sahip, alkali karakterli, tuzsuz, çok kireçli ve organik maddece çok az sınıfında yer almaktadır. Alınabilir P, K ve değişebilir Ca elementlerince zengin, alınabilir Fe, Mn ve Cu elementleri miktarları ise yeterli düzeydedir. Alınabilir Zn bakımından çok fazla sınıfta iken değişebilir Mg elementlerince az olarak sınıflandırılmıştır.

Tablo 1. Denemede kullanılan toprak örneğinin kimyasal özellikleri

Parametre	Metod	Sonuç	Değerlendirme
Bünye	Bouyoucos	72,60	Kil
pH	01:02,5	7,95	Alkali
EC (µS/cm)	01:02,5	-	-
Kireç (%)	Scheibler	28,26	Çok kireçli
Organik Madde(%)	Walkley-Black	0,32	Çok az
Toplam N (%)	Kjeldahl	0,016	Çok fakir
Alınabilir P(mg/kg)	Olsen-Spektro	26,00	Yüksek
Alınabilir K(mg/kg)	A.Asetat-ICP	79,00	Fazla
Değişebilir Ca(mg/kg)	A.Asetat-ICP	6360	Fazla
Değişebilir Mg(mg/kg)	A.Asetat-ICP	95,80	Az
Alınabilir Fe(mg/kg)	DTPA-ICP	5,20	Yeterli
Alınabilir Mn(mg/kg)	DTPA-ICP	2,64	Yeterli
Alınabilir Zn (mg/kg)	DTPA-ICP	17,21	Çok fazla
Alınabilir Cu (mg/kg)	DTPA-ICP	0,53	Yeterli

Bu çalışma, Gübre Fabrikaları TAŞ. ve Gebze Teknik Üniversitesi iş birliği kapsamında kurulan kurulan cam serada yürütülmüştür. Sera ortamında 5,5 litrelik saksılarda danelik mısır *Zea mays L.*) çeşidi yetiştirilmiştir. Sera koşullarında gerçekleştirilen deneme toplam 28 saksıdan oluşmaktadır (7 konu x 4 tekerrür) ve her saksıda bir bitki olacak şekilde toplamda 28 bitki üzerinde çalışılmıştır. Deneme deseni Tablo 2'de verilmiştir

Tablo 2. Sera deneme deseni

Bitki	Konular	Saksı No			
	Kontrol	1	2	3	4

MISIR	**Negatif Kontrol**	5	6	7	8
	GFBİO1	9	10	11	12
	GFBİO2	13	14	15	16
	GFBİO3	17	18	19	20
	GFBİO4	21	22	23	24
	GFBİO5	25	26	27	28

Denemenin hazırlık aşamasında, saksı başına 5,2 kg toprak ve iyi yanmış vasıflı hayvan gübresi karışımı tartılmış, 150 ppm azot, 25 ppm fosfor ve 30 ppm potasyum ile zenginleştirilmiş, ardından homojenleştirme amacıyla karıştırılmıştır. Bazal gübreleme olarak MAP ($NH_4H_2PO_4$), [Kalsiyum Nitrat [$Ca(NO_3)_2$] ve Potasyum Sülfat (K_2SO_4) gübreleri kullanılmıştır. Bakteri uygulamaları için GÜBRETAŞ Ar-Ge Laboratuvarı tarafından temin edilen 5 farklı mikrobiyal gübre konsorsiyumu (GBF1, GBF2, GBF3, GBF4 ve GBF5) kullanılmış ve uygulan dozajlar CFU değerleri ($1x10^7$ kob ml^{-1}) eşitlenecek şekilde hesap edilmiştir. Deney süresince uygulama gruplarına saksı başına 5ml/saksı/ dozunda 95 ml su karıştırılarak, ilki fide dikim esnasında can suyu ile birlikte, diğeri dikimden 30 gün sonra olmak üzere iki uygulama gerçekleştirilmiştir.

Denemede, üst yaş ve kuru ağırlık (gr/saksı), gövde kalınlığı (gr/saksı), üst aksam uzunluğu (cm/saksı), kök kuru ağırlığı (gr/saksı) ve yaprak mineral analiz (ppm) kriterleri üzerinde durulmuştur. Tesadüf parselleri deneme deseni düzeninde 4 tekrarlı olarak yürütülen araştırmadan elde edilen veriler, SPSS (sürüm 17.0) istatistik paket programında deneme desenine uygun olarak değerlendirilmiştir. Ortalamalar arasındaki farklılıkları belirlemek için %5 önem düzeyinde LSD testi kullanılmıştır.

BULGULAR VE TARTIŞMA

Örneklerin Toplanması ve Mikroorganizmaların İzolasyonu

Bu çalışma kapsamında, Adana Ceyhan Dokuztekne ve Adana Saimbeyli Beypınarı, Çanakkale Gökçeada Yeni Çamlık ve Çanakkale Bozcaada Mumcular Üzüm Bağları, Doğu Karadeniz Kaçkar Dağları, Karaman Karadağ, Balıkesir Balya bölgelerinden alınan toprak numunelerinde toprağın üst kısmı temizlenerek örnekler alınmıştır. Bu bitkilerden yapılan izolasyonlar sonucunda farklı mikroorganizma türlerinin besi yerlerinde gelişim gösterdiği gözlemlenmiştir. İnkübasyon sonucunda, Nutrient agar besi yerinde yaklaşık 84 bakteri kolonisinin geliştiği belirlenmiştir. Bu koloniler arasından, farklı türde bakteri temsil eden toplam 7 saf izolat elde edilmiştir.

Mikroorganizma Türlerinin MALDI-TOF MS Tekniği ile Tanımlanması

Farklı bölgelerden (Adana, Çanakkale, Doğu Karadeniz, Karaman ve Balıkesir) alınan toprak örneklerinden mikroorganizmalar izole edilmiştir. Elde edilen izolatların identifikasyonu MALDI-TOF MS sistemi kullanılarak gerçekleştirilmiş, log(score) değerlerine göre tür ve cins düzeyinde güvenilir tanımlamalar yapılmıştır. Elde edilen sonuçlar Tablo 3'de verilmiştir.

Tablo 3. Bruker Maldi – Biotyper identifikasyon sonuçları

MİKROORGANİZMA ID	MALDI-TOF MS SONUCU
GBF01	*Bacillus megaterium*
GBF07	*Pseudomonas putida*

Sera Denemesi

Mikrobiyal gübre uygulamasının mısır bitkisinin üst aksam yaş ağırlığı üzerine etkisi Tablo 4'de verilmiştir. Mikrobiyal gübre uygulamasının üst aksam yaş ağırlık değerleri kontrol grubuna kıyasla GFBİO1 uygulamasında %33,4, GFBİO3'te %27,0 ve GFBİO5 uygulamasında ise %27,8 artış göstermiştir. Sera koşullarında mısır bitkisi üzerinde yapılan denemede bakteri uygulaması kontrol grubuna kıyasla, üst aksam yağ ağırlığında % 63,0 oranında artış sağladığını bildirmiştir (Youseif, 2018).

Tablo 4. Mısırda mikrobiyal gübre uygulamasının üst aksam yaş ağırlığı üzerine etkisi

Uygulamalar	Üst Aksam Yaş Ağırlığı (g/bitki)	Kontrol'e Göre Artışlar (%)
KONTROL	23,51c±3,51	-
NK	25,52bc±3,15	8,54
GFBİO1	31,36a±5,11	33,40
GFBİO2	27,80abc±2,27	18,24
GFBİO3	29,87ab±0,51	27,00
GFBİO4	25,86abc±1,55	10,00
GFBİO5	30,04ab±1,48	27,80

Mikrobiyal gübre uygulamasının mısır bitkisinin üst aksam kuru ağırlık üzerine etkisi Tablo 5'de verilmiştir. Mikrobiyal gübre uygulamasının üst aksam kuru ağırlık değerleri kontrol grubuna kıyasla GFBİO5 uygulamasında %43,40 ve GFBİO1 uygulamasında %42,70 göstermiştir. Mikrobiyal gübre uygulamaları üst aksam kuru ağırlık üzerine etkilerinin istatistiksel olarak önemli ($p<0.05$) olduğu görülmektedir. Kadıoğlu ve Canpolat (2019) serada mısır bitkisi üzerinde yaptıkları denemede *Bacillus subtilis* uygulamasının kontrol grubuna kıyasla, üst aksam kuru ağırlığında % 20 oranında artış sağladığını bildirmişlerdir.

Tablo 5. Mısırda mikrobiyal gübre uygulamasının üst aksam kuru ağırlık üzerine etkisi

Uygulamalar	Üst Aksam Kuru Ağırlığı (g/bitki)	Kontrol'e Göre Artışlar (%)

KONTROL	4,47b±0b44	-
NK	4,09b±0,45	-9,29
GFBİO1	6,38a±1,15	42,70
GFBİO2	5,28ab±1,00	18,12
GFBİO3	5,23ab±0,60	17
GFBİO4	4,53b±0,69	1,34
GFBİO5	6,41a±0,42	43,40

Mikrobiyal gübre uygulamasının mısır gövde kalınlığı üzerine etkisi Tablo 6'da verilmiştir. Mikrobiyal gübre uygulamasının gövde kalınlık değerleri kontrol grubuna kıyasla GFBİO5 uygulamasında %15 artış göstermiştir. Altunlu ve ark., (2019) sera koşullarında mısır bitkisi üzerinde yaptıkları denemede bakteri uygulamasının kontrol grubuna kıyasla, gövde kalınlığını % 20 oranında artırdığını bildirmişlerdir.

Tablo 6. Mısırda mikrobiyal gübre uygulamasının gövde kalınlığı üzerine etkisi

Uygulamalar	Gövde Kalınlığı (g/bitki)	Kontrol'e Göre Artışlar (%)
KONTROL	9,54bc±0,84	-
NK	9,3c±0,73	-2,58
GFBİO1	10,03abc±0,64	5,13
GFBİO2	10,19abc±0,30	6,81

GFBİO4	9,93abc±0,35	4,08
GFBİO5	10,98a±0,06	15,09

Mikrobiyal gübre uygulamasının mısır üst aksam uzunluğu üzerine etkisi Tablo 7'de verilmiştir. Mikrobiyal gübre uygulamasının üst aksam uzunluğu değerleri kontrol grubuna kıyasla, GFBİO1 uygulamasında %4,91, GFBİO2 uygulamasında %6,07, GFBİO3 uygulamasında %6,46, GFBİO4 uygulamasında % 5,55 ve GFBİO5 uygulamasında ise % 6,25 oranında artış göstermiştir. Mikrobiyal gübre uygulamalarının mısır üst aksam uzunluğu üzerine etkilerinin istatistiksel olarak önemli ($p<0.05$) olduğu görülmektedir. Altunlu ve ark,. (2019) yaptıkları çalışmada, mikrobiyal gübre uygulamasının kontrol grubuna kıyasla mısır bitkisi üst aksam uzunluğunu %3,53 oranında arttırdığını bildirmişlerdir.

Tablo 7. Mısırda mikrobiyal gübre uygulamasının üst aksam uzunluğu üzerine etkisi

Uygulamalar	Üst Aksam Uzunluğu (cm/bitki)	Kontrol'e Göre Artışlar (%)
KONTROL	96,63b±3,35	-

NK	98,25b±4,63	1,67
GFBİO1	101,38a±6,55	4,91
GFBİO2	102,50a±0,91	6,07

GFBİO4	102,00a±1,87	5,55
GFBİO5	102,67a±2,25	6,25

Mısırda mikrobiyal gübre uygulamasının kök ağırlığı üzerine etkisi Tablo 8'de verilmiştir. Mikrobiyal gübre uygulamasının meyve verim değerleri kontrol grubuna kıyasla GFBİO5, GFBİO3 ve GFBİO1 uygulamalarında %8,94 artış göstermiştir. Mikrobiyal gübre uygulamalarının kök kuru ağırlığı üzerine etkilerinin istatistiksel olarak önemli ($p<0.05$) olduğu görülmektedir.

Tablo 8. Mısırda mikrobiyal gübre uygulamasının kök ağırlığı üzerine etkisi

Uygulamalar	**Kök kuru Ağırlığı (g/bitki)**	**Kontrol'e Göre Artışlar (%)**
KONTROL	1,23b±0,18	-
NK	1,29b±0,108	4,9
GFBİO1	1,34a±0,14	8,94
GFBİO2	1,13b±0,15	-8,85
GFBİO3	1,34a±0,121	8,94
GFBİO4	1,15b±0,135	-6,95
GFBİO5	1,34a±0,107	8,94

Mikrobiyal gübre uygulamasının mısır bitkisinin makro ve mikro mineral analizleri üzerine etkisi Tablo 9'da verilmiştir. Analizlere göre kontrol grubuna kıyasla, GFBİO3 uygulaması kalsiyum konsantrasyonunu %30,7 ve GFBİO4 uygulaması demir konsantrasyonunu %37,9 oranında artırmıştır. Fakat bu artış miktarını istatiski olarak harflendirmek anlamlı değildir. Diğer mikrobiyal gübre uygulamaları makro ve mikro besin elementlerinin konsantrasyonu üzerinde önemli bir artış göstermemiştir.

SONUÇ

Elde edilen bulgular, mikrobiyal gübre konsorsiyumlarının mısır bitkisinde önemli büyüme parametrelerini pozitif yönde etkilediğini ortaya koymaktadır. Özellikle GFBİO1 uygulaması, üst aksam yaş ve kuru ağırlığı sırasıyla %33,4 ve %42,70 oranında anlamlı artışlar sağlamıştır. GFBİO5 uygulaması ise üst aksam yaş, kuru ağırlığı gövde kalınlığı sırasıyla %28,70, %43,40 ve %15 oranında anlamlı artışlar sağlamıştır. Ayrıca, bazı uygulamaların toprakta mevcut mikro ve makro elementlerin bitki bünyesine taşınmasını artırdığı gözlemlenmiştir. Özellikle GFBİO3 uygulaması mısırdaki kalsiyum konsantrasyonunu %30,70 ve GFBİO4 uygulamasını demir konsantrasyonu %37,9 oranında artırmıştır. Bu artışlar, PGPR bakterileri tarafından üretilen sideroforların demir gibi metalleri şelatlayarak bitki kökleri tarafından alınmasını kolaylaştırdığını ortaya koymaktadır.

Elde edilen bulgular doğrultusunda, mikrobiyal gübrelerin hem ülkemiz hem de dünya tarımının geleceği açısından yararlı olacağı öngörülmektedir. Mikrobiyal gübreler, bitki beslenmesini doğal yollarla destekleyen, toprak sağlığını iyileştiren ve kimyasal gübre kullanımını azaltan biyolojik ürünlerdir. Avrupa Birliği'nin Green Deal hedefleri doğrultusunda; sürdürülebilir tarım, sera gazı emisyonlarının azaltılması ve çevresel etkilerin minimize edilmesi ön plandadır. Bu nedenle, bu tür biyolojik uygulamaların yaygınlaştırılması ve kullanımının teşvik edilmesi büyük önem taşımaktadır. Ayrıca, bu çalışma gelecekte gerçekleştirilecek daha kapsamlı araştırmalara zemin hazırlayacak niteliktedir. Bu araştırmanın, çiftçi ve saha şartlarında mikrobiyal gübre uygulamalarıyla desteklenerek geliştirilmesinin, mevcut sonuçları daha da güçlendireceği düşünülmektedir.

ÖZET

Toprak mikrobiyal çeşitliliği, bitki besin elementlerinin döngüsünde kritik bir rol oynamakta ve sürdürülebilir tarım uygulamalarının temelini oluşturmaktadır. Kimyasal gübrelerin uzun süreli ve aşırı kullanımı, toprak mikrobiyal dengesini bozarak ekosistem sağlığını olumsuz etkilemektedir. Bu çalışmada, Türkiye'nin farklı bölgelerinden izole edilen *Bacillus* ve *Pseudomonas* türü bakteri suşlarından oluşturulan mikrobiyal gübre konsorsiyumlarının, sivri biber (*Capsıcum annuum L.*) bitkisi üzerindeki meyve ağırlık, üst aksam kuru ağırlık ve makro-mikro besin elemet konsantrasyonu parametreleri sera koşullarında değerlendirilmiştir. Elde edilen bulgular, GFBİO5 uygulamasının meyve ağırlığında %65,79 ve GFBİO3 uygulaması %63,55 oranında artış sağladığını göstermiştir. GFBİO3 uygulaması, üst aksam kuru ağırlık üzerine %22,54 oranında artış sağlamıştır. Araştırma sonucunda, bazı mikrobiyal formülasyonların bitki gelişimi ve verimi açısından kimyasal gübrelere benzer veya üstün etki gösterdiği belirlenmiştir. Elde edilen veriler, biyogübrelerin sürdürülebilir tarımda potansiyel bir alternatif olduğunu göstermektedir.

Bu kapsamda, kontrol grubu ile karşılaştırıldığında, GFBİO3 ve GFBİO5 konsorsiyumlarının mikrobiyal gübre olarak umut vadettiği belirlenmiştir. Başarılı bulunan mikrobiyal gübre konsorsiyumlarının ilerleyen süreçte tescillenerek ticari ürüne dönüştürülmesi planlanmaktadır.

Anahtar Kelimeler: Mikrobiyal besin döngüsü, Toprak ekosistemleri, Sürdürülebilir tarım, Kimyasal gübreler, Toprak sağlığı, Biyolojik çeşitlilik, Bitki gelişimini teşvik eden rizobakteriler (PGPR), Besin elementlerinin biyoyararlanımı, Sürdürülebilir ürün yetiştiriciliği, *Bacillus*, *Pseudomonas*, Biyogübre, Sera koşulları, Mineral gübreler, Ticari biyogübre geliştirme, Mikrobiyal gübre.

INVESTIGATION OF THE EFFECTS OF MICROBIAL FERTILIZER FORMULATIONS CREATED WITH BACTERIAL STRAINS ISOLATED FROM TURKISH SOILS ON GREEN PEPPER (*Capsıcum annuum l.*) PLANTS UNDER GREENHOUSE CONDITIONS.

ABSTRACT

Soil microbial diversity plays a critical role in the cycling of plant nutrients and forms the basis of sustainable agricultural practices. Long-term and excessive use of chemical fertilizers disrupts the soil microbial balance, negatively impacting ecosystem health. In this study, microbial fertilizer consortia composed of Bacillus and Pseudomonas bacterial strains isolated from different regions of Turkey were evaluated under greenhouse conditions for fruit weight, topside dry weight, and macro-micronutrient element concentration parameters on green pepper (Capsicum annuum L.) plants. The findings showed that the GFB1O5 application increased fruit weight by 65.79%, and the GFB1O3 application increased topside dry weight by 63.55%. The GFB1O3 application increased topside dry weight by 22.54%. The study determined that some microbial formulations have similar or superior effects to chemical fertilizers in terms of plant growth and yield. The obtained data suggest that biofertilizers are a potential alternative in sustainable agriculture. In this context, when compared with the control group, the GFBİO3 and GFBİO5 consortia were determined to be promising microbial fertilizers. The successful microbial fertilizer consortia are planned to be registered and converted into commercial products in the future.

Keywords: Microbial nutrient cycling, Soil ecosystems, Sustainable agriculture, Chemical fertilizers, Soil health, Biological diversity, Plant growth-promoting rhizobacteria (PGPR), Bioavailability of nutrients, Sustainable crop production, *Bacillus*, *Pseudomonas*, Biofertilizer potential, Greenhouse conditions, Mineral fertilizers, Commercial biofertilizer development, microbial fertilizer.

GİRİŞ

Mikroorganizmalar, topraktaki besin döngüsünde aktif faaliyetleri nedeniyle tarımsal alanlarda, özellikle bitki büyümesini teşvik etmede önemli bir rol oynamaktadırlar (Bull ve ark., 2000). Yeşil devrim teknolojileriyle birlikte, gübreler modern tarımsal üretim üzerinde önemli ölçüde olumlu etkiler yaratmış; bitkilerin daha hızlı ve verimli bir şekilde yetiştirilmesini sağlayan sentetik gübre kullanımı giderek artmıştır. Ancak yüksek oranda sentetik gübre kullanımının sürekliliği, çevre kirliliği, toprak ekosisteminde fiziko-kimyasal koşullarda kalıcı değişimler, toprak biyolojik sağlığının ve kalitesinin bozulması, toprak verimliliğinin kademeli olarak kaybına, besinlerin sızmasıyla yüzey ve yeraltı sularının kirlenmesine, ötrofikasyona, sera gazı emisyonlarının artmasına ve sucul biyolojik çeşitlilik üzerinde olumsuz etkilere yol açmaya başlamıştır (Çakmakçı ve Karabulut, 2023).

PGPB (Plant Growth Promoting Bacteria) bakterilerinin mikrobiyal gübreler içinde başarı ve etkinliği, bu bakterilerin bitki köklerini kolonize etme yetenekleri, bitki kökleri tarafından eksudasyon yoluyla salgılanan maddelerden faydalanabilmeleri ve bitki kökleriyle kurdukları faydalı ilişkiler ile toprak sağlığı gibi çevresel faktörlerden etkilenmektedir (Beauregard ve ark., 2013). PGPB kapsamındaki bakteriler, bitki gelişimini destekleyen mekanizmalardan biri olarak, biyolojik azot fiksasyonu, topraktan alınabilir formdaki besin elementlerinin bitki için erişilebilirliğinin artırılması, kök yüzey alanının artırılması ve bitki gelişim hormonlarının sentezlenmesi gibi yollarla büyümeyi teşvik etmektedirler. Bu anlamda biyolojik gübre olarak *Bacillus* türlerinin kullanımı, hem bitki gelişimini teşvik etmekte hem de uygun çevresel koşullarda patojenleri baskılayarak antibiyotik sentezleme gibi önemli katkılar sunmaktadır (Chabot ve ark., 1996).

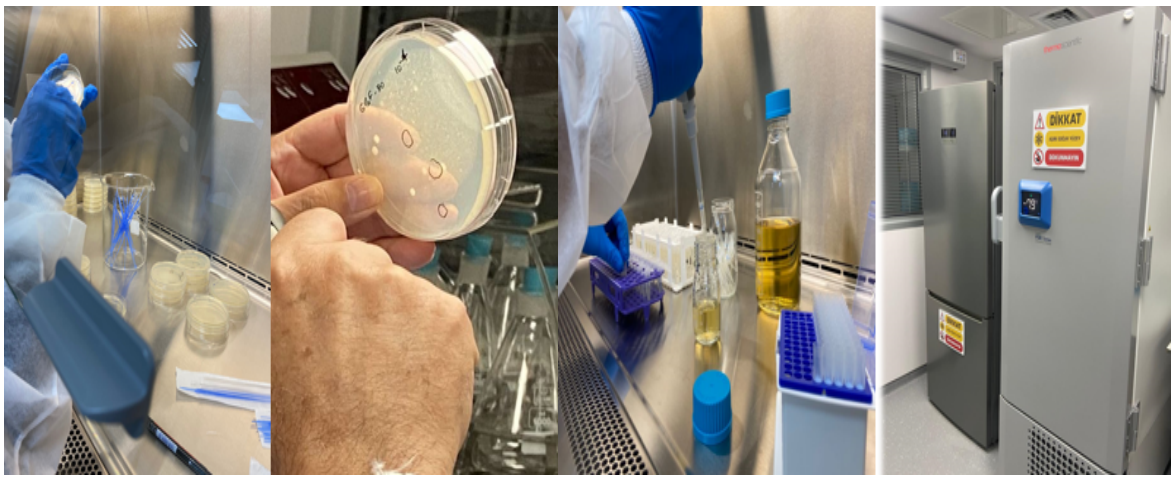
Fosfat çözücü bakteriler, bitki büyümesini ve fosfor (P) çözünürlüğünü artırabilir; ayrıca tarım arazilerinde aşırı kullanılan kimyasal gübrelerin olumsuz etkilerini azaltarak toprak ortamını iyileştirebilirler. Fosfor, toprakta bitki büyümesi ve besin döngüsünde önemli bir makro element olmasına rağmen, toplam fosfor miktarı yüksek olsa da, bitkiler tarafından doğrudan kullanılabilir formda bulunmaması nedeniyle sınırlayıcı bir besin elementi olarak kabul edilmektedir (Soltangheisi ve ark., 2016). Fosfat çözücü bakteriler, özellikle topraktaki çözünmeyen fosfor bileşiklerinin alınabilir forma dönüştürülmesini sağlayarak bitki gelişimini destekleyebilir (Sadaf ve ark., 2019).

Bu çalışmada, Türkiye'nin farklı bölgelerinden (Adana Saimbeyli ve Dokuztekne, Doğu Karadeniz Kaçkar Dağları, Çanakkale Gökçeada ve Bozcaada, Karaman Karadağ, Balıkesir Balya) toplanan toprak örneklerinden izole edilen mikroorganizmalar kullanılarak, sera koşullarında biyolojik gübre olarak değerlendirilebilecek suşlar belirlenmiştir. Bu amaçla kullanılan mikroorganizmalar şunlardır: GFBİO1 (RC631 *Bacillus subtilis*, GBF01 *Bacillus megaterium*, GBF251 *Pseudomonas fluorescens*), GFBİO2 (RC631 *Bacillus subtilis*, GBF14 *Bacillus megaterium*, GBF251 *Pseudomonas fluorescens*), GFBİO3 (RC631 *Bacillus subtilis*, A54 *Bacillus pumilus*, GBF251 *Pseudomonas fluorescens*), GFBİO4 (RC631 *Bacillus subtilis*, GBF01 *Bacillus megaterium*, GBF251 *Pseudomonas fluorescens*), GFBİO5 (GBF07 *Pseudomonas putida*, GBF120 *Bacillus megaterium*, GBF72 *Bacillus subtilis*).

MATERYAL METOT

Toprak Örneklerinin Alınması

Bu çalışma kapsamında, Adana Ceyhan Dokuztekne ve Adana Saimbeyli Beypınarı, Çanakkale Gökçeada Yeni Çamlık ve Çanakkale Bozcaada Mumcular Üzüm Bağları, Doğu Karadeniz Kaçkar Dağları, Karaman Karadağ, Balıkesir Balya bölgelerinden alınan toprak numunelerinde toprağın üst kısmı temizlenmiştir. Daha sonra steri olarak hazırlanan 0 – 15 cm arası derinlikte, bitki kök bölgesine yakın kısımdan yaklaşık 500g alınan toprak numuneleri, +4 ^{O}C' de



laboratuvara transfer edilmiştir. Analize alınıncaya kadar +4 ^{O}C‘ de muhafaza edilmiştir. Bitkilerden alınan toprak numunelerine ait görseller Şekil 1’ de verilmiştir.

Şekil 1. Bitkilerden alınan toprak numunelerinin görselleri

Topraktan Bakteri İzolasyonu

Aseptik koşullarda laboratuvara getirilen toprak örnekleri, biyogüvenlik kabini içerisinde açılarak, mikroorganizmalar izole edilmiştir. Stoklanan mikroorganizmalara ait görseller Şekil 2’de sunulmuştur.

Şekil 2. Bitkilerden alınan toprak numunelerinden izole edilerek stoklanan mikroorganizmalara ait görseller

Bakteri Suşlarının Bruker Maldi – Tof MS Sisteminde İdentifikasyonu (Tanılama)

Elde edilen bakteri izolatlarının identifikasyonu MALDI-TOF MS (Matrix Assisted Laser Desorption Ionization–Time of Flight Mass Spectrometry, Bruker Daltonics GmbH, Bremen, Almanya) sistemi kullanılarak gerçekleştirilmiştir. Tanımlama aşamasında, saf kültürlerden elde edilen örneklerde protein ekstraksiyonu için etanol–formik asit bazlı ön işlem uygulanmıştır.

Örneklerden elde edilen kütle spektrumları cihazın flexControl yazılımı (Biotyper 3.0; Microflex LT, Bruker Daltonics GmbH, Bremen, Almanya) aracılığıyla kaydedilmiş ve MALDI Biotyper Real-Time Classification (RTC) yazılımındaki referans veri tabanı ile karşılaştırılarak değerlendirilmiştir. Sonuçların yorumlanmasında sistemin verdiği log(score) değerleri esas alınmış; 2,000–3,000 aralığındaki skorlar tür düzeyinde güvenilir tanımlama (yeşil seviye), 1,700–1,999 aralığındaki skorlar ise cins düzeyinde ya da muhtemel tür düzeyinde tanımlama (sarı seviye) olarak kabul edilmiştir (Carolis ve ark., 2012; Chalupová ve ark., 2014; Kara ve ark., 2017; Uysal ve ark., 2018).

Sera Denemesi

Denemede kullanılan toprak materyali ülkemiz toprakları temsil edilecek şekilde seçilmiş olup daha önce yetiştiricilik yapılmamış bir araziden temin edilmiştir. Deneme toprağının bazı kimyasal ve fiziksel özellikleri Tablo 1'de verilmiştir. Analiz sonuçlarına göre denemede kullanılan toprak; killi bünyeye sahip, alkali karakterli, tuzsuz, çok kireçli ve organik maddece çok az sınıfında yer almaktadır. Alınabilir P, K ve değişebilir Ca elementlerince zengin, alınabilir Fe, Mn ve Cu elementleri miktarları ise yeterli düzeydedir. Alınabilir Zn bakımından çok fazla sınıfta iken değişebilir Mg elementlerince az olarak sınıflandırılmıştır.

Tablo 1. Denemede kullanılan toprak örneğinin kimyasal özellikleri

Parametre	Metod	Sonuç	Değerlendirme
Bünye	Bouyoucos	72,60	Kil
pH	01:02,5	7,95	Alkali
EC (µS/cm)	01:02,5	-	-
Kireç (%)	Scheibler	28,26	Çok kireçli
Organik Madde(%)	Walkley-Black	0,32	Çok az
Toplam N (%)	Kjeldahl	0,016	Çok fakir
Alınabilir P(mg/kg)	Olsen-Spektrofotometrik	26,00	Yüksek
Alınabilir K(mg/kg)	A.Asetat-ICP	79,00	Fazla
Değişebilir Ca(mg/kg)	A.Asetat-ICP	6360,00	Fazla
Değişebilir Mg(mg/kg)	A.Asetat-ICP	95,80	Az
Alınabilir Fe(mg/kg)	DTPA-ICP	5,20	Yeterli
Alınabilir Mn(mg/kg)	DTPA-ICP	2,64	Yeterli
Alınabilir Zn(mg/kg)	DTPA-ICP	17,21	Çok fazla
Alınabilir Cu(mg/kg)	DTPA-ICP	0,53	Yeterli

Bu çalışma, Gübre Fabrikaları TAŞ. ve Gebze Teknik Üniversitesi iş birliği kapsamında kurulan kurulan cam serada yürütülmüştür. Sera ortamında 5,5 litrelik saksılarda sivri biber (*Capsıcum annuum L.*) bitkisi yetiştirilmiştir. Sera koşullarında gerçekleştirilen deneme toplam 28 saksıdan oluşmaktadır (7 konu x 4 tekerrür) ve her saksıda bir bitki olacak şekilde toplamda 28 bitki üzerinde çalışılmıştır. Deneme deseni Tablo 2'de verilmiştir.

Tablo 2. Sera deneme deseni

Bitki	**Konular**	**Saksı No**			
SİVRİ BİBER	**Kontrol**	1	2	3	4
	Negatif Kontrol	5	6	7	8
	GFBİO1	9	10	11	12
	GFBİO2	13	14	15	16
	GFBİO3	17	18	19	20
	GFBİO4	21	22	23	24
	GFBİO5	25	26	27	28

Denemenin hazırlık aşamasında, saksı başına 5,2 kg toprak ve iyi yanmış vasıflı hayvan gübresi karışımı tartılmış, 150 ppm azot, 25 ppm fosfor ve 30 ppm potasyum ile zenginleştirilmiş, ardından homojenleştirme amacıyla karıştırılmıştır. Bazal gübreleme olarak MAP ($NH_4H_2PO_4$), [Kalsiyum Nitrat [$Ca(NO_3)_2$] ve Potasyum Sülfat (K_2SO_4) gübreleri kullanılmıştır. Bakteri uygulamaları için GÜBRETAŞ Ar-Ge Laboratuvarı tarafından temin edilen 5 farklı mikrobiyal gübre konsorsiyumu (GBF1, GBF2, GBF3, GBF4 ve GBF5) kullanılmış ve uygulan dozajlar CFU değerleri ($1x10^7$ kob ml^{-1}) eşitlenecek şekilde hesap edilmiştir. Deney süresince uygulama gruplarına saksı başına 5ml/saksı/ dozunda 95 ml su karıştırılarak, ilki fide dikim esnasında can suyu ile birlikte, diğeri dikimden 30 gün sonra olmak üzere iki uygulama gerçekleştirilmiştir.

Denemede, meyve ağırlığı (gr/saksı), üst aksam kuru ağırlığı (gr/saksı) ve yaprak mineral analiz (ppm) kriterleri üzerinde durulmuştur. Tesadüf parselleri deneme deseni düzeninde 4 tekrarlı olarak yürütülen araştırmadan elde edilen veriler, SPSS (sürüm 17.0) istatistik paket programında deneme desenine uygun olarak değerlendirilmiştir. Ortalamalar arasındaki farklılıkları belirlemek için %5 önem düzeyinde LSD testi kullanılmıştır.

BULGULAR VE TARTIŞMA

Örneklerin Toplanması ve Mikroorganizmaların İzolasyonu

Bu çalışma kapsamında, Adana Ceyhan Dokuztekne ve Adana Saimbeyli Beypınarı, Çanakkale Gökçeada Yeni Çamlık ve Çanakkale Bozcaada Mumcular Üzüm Bağları, Doğu Karadeniz Kaçkar Dağları, Karaman Karadağ, Balıkesir Balya bölgelerinden alınan toprak numunelerinde toprağın üst kısmı temizlenerek örnekler alınmıştır. Bu bitkilerden yapılan izolasyonlar sonucunda farklı mikroorganizma türlerinin besi yerlerinde gelişim gösterdiği gözlemlenmiştir. İnkübasyon sonucunda, Nutrient agar besi yerinde yaklaşık 84 bakteri kolonisinin geliştiği belirlenmiştir. Bu koloniler arasından, farklı türde bakteri temsil eden toplam 7 saf izolat elde edilmiştir.

Mikroorganizma Türlerinin MALDI-TOF MS Tekniği ile Tanımlanması

Farklı bölgelerden (Adana, Çanakkale, Doğu Karadeniz, Karaman ve Balıkesir) alınan toprak örneklerinden mikroorganizmalar izole edilmiştir. Elde edilen izolatların identifikasyonu

MALDI-TOF MS sistemi kullanılarak gerçekleştirilmiş, log(score) değerlerine göre tür ve cins düzeyinde güvenilir tanımlamalar yapılmıştır. Elde edilen sonuçlar Tablo 3'de verilmiştir.

Tablo 3. Bruker Maldi – Biotyper identifikasyon sonuçları

MİKROORGANİZMA ID	MALDI-TOF MS SONUCU
GBF01	*Bacillus megaterium*
GBF07	*Pseudomonas putida*
GBF14	*Bacillus megaterium*
GBF120	*Bacillus megaterium*
GBF251	*Pseudomonas fluorescens*
A54	*Bacillus pumilus*
RC631	*Bacillus subtilis*

Sera Denemesi

Mikrobiyal gübre uygulamasının sivri biber bitkisinin meyve ağırlığı üzerine etkisi Tablo 4'de verilmiştir. Mikrobiyal gübre uygulamasının meyve verim değerleri kontrol grubuna kıyasla GFBİO5 uygulaması %65,79 ve GFBİO3 uygulaması %63,55 artış göstermiştir. Mikrobiyal gübre uygulamaları meyve verim üzerine etkilerinin istatistiksel olarak önemli ($p<0.05$) olduğu görülmektedir. Topuz ve ark. (2024) biber bitkisi üzerine serada yaptıkları çalışmada, mikrobiyal gübre uygulamasının toplam bitki verimini %36,57 oranında artırdığını bildirmişlerdir.

Tablo 4. Biberde mikrobiyal gübre uygulamasının meyve ağırlığı üzerine etkisi

Uygulamalar	Meyve Ağırlığı (g/saksı)	Kontrol'e Göre Artışlar (%)
KONTROL	$29,41^{b}$±4,9	-
NK	$35,08^{ab}$±3,57	19,28
GFBİO1	$42,21^{ab}$±4,59	43,52
GFBİO2	$41,50^{ab}$±2,08	41,10
GFBİO3	$48,10^{a}$±4,36	63,55
GFBİO4	$39,49^{ab}$±6,57	34,27
GFBİO5	$48,76^{a}$±8,9	65,79

Mikrobiyal gübre uygulamasının sivri biber bitkisinin üst aksam kuru ağırlık üzerine etkisi Tablo 5'de verilmiştir. Mikrobiyal gübre uygulamasının üst aksam kuru ağırlık değerleri kontrol grubuna kıyasla GFBİO3 uygulaması %22,54, GFBİO5 uygulaması %18,56, GFBİO1 %18,04 ve GFBİO4 uygulaması ise %16,71 oranında artış sağlamıştır. Zhao ve ark., (2019), dekara 6 litre dozunda fosfor çözücü bakteri içeren mikrobiyal gübre uygulamasının biber biyokütlesi üzerindeki etkileri kontrol ile karşılaştırıldığında, önemli artışlar sağladığını bildirmişlerdir. Çelik (2022) yaptığı bir çalışmada, marul bitkisi üzerine uygulanan bakteri strainlerinin gövde ve kökün yaş ve kuru ağırlığını, gövde ve kök uzunluğunu önemli oranda artırdığını bildirmiştir.

Tablo 5. Biberde mikrobiyal gübre uygulamasının üst aksam kuru ağırlık üzerine etkisi

Uygulamalar	Üst Aksam Kuru Ağırlık (g/saksı)	Kontrol'e Göre Artışlar (%)
Kontrol	7,54b±0,73	-
NK	8,79a±0,51	16,57
GFBİO1	8,90a±0,80	18,04
GFBİO2	8,05ab±0,89	6,76
GFBİO3	9,24a±0,73	22,54
GFBİO4	8,80a±0,83	16,71
GFBİO5	8,94a±0,57	18,56

Mikrobiyal gübre uygulamasının sivri biber bitkisinin yaprağın makro ve mikro mineral analiz üzerine etkisi Tablo 6'da verilmiştir. Mikrobiyal gübre uygulamasının sivri biberdeki makro ve mikro besin element değerleri kontrol grubu ile kıyaslandığında, GFBİO1 uygulaması demir konsantrasyonunu %196,64 ve kükürt konsantrasyonunu %12,88 oranında artırmıştır.

Tablo 6. Biberde mikrobiyal gübre uygulamasının makro ve mikro besin elementleri konsantrasyonuna etkisi

Uygulamalar	[K] (%)	[P] (%)	[Mg] (%)	[Ca] (%)	[Fe] (%)	[Zn] (%)	[S] (%)
Kontrol	3,48±0,25	0,26±0,02	0,71±0,37	0,32±0,02	146,28±17,59	26,26±2,35	0,450±0,027
NK	3,34±0,40	0,25±0,01	0,74±0,94	0,33±0,04	187,09±7,21	24,79±1,73	0,471±0,041
GFBİO1	3,95±0,36	0,25±0,02	0,69±0,58	0,32±0,02	433,93±9,00	27,10±3,42	0,508±0,029
GFBİO2	3,55±0,61	0,23±0,03	0,67±0,56	0,31±0,01	205,63±25,14	26,95±4,79	0,495±0,044
GFBİO3	3,29±0,37	0,23±0,01	0,71±0,63	0,33±0,03	188,78±37,98	21,62±1,21	0,475±0,029
GFBİO4	3,32±0,41	0,23±0,05	0,68±1,23	0,33±0,04	194,12±10,02	21,86±2,29	0,473±0,400
GFBİO5	3,42±0,21	0,23±0,01	0,68±0,49	0,30±0,03	222,00±34,73	19,70±2,30	0,480±0,049

Mikrobiyal gübre uygulamasının makro ve mikro besin elemetleri değerleri kontrol grubuna kıyasla, GFBİO1 uygulaması potasyum, demir ve çinko konsantrasyonu üzerinde artış göstermiştir fakat istatiski olarak harflendirmek anlamlı değildir. Diğer mikrobiyal gübre uygulamaları makro ve mikro besin elementlerin konsantrasyonu üzerinde önemli bir artış göstermemiştir. Küçük ve ark., (2008), yaptıkları araştırmada kök bölgesine uygulanan bakteri uygulamalarının bitkinin çinko içeriği üzerine olumlu etkilere sahip olduğunu bildirmişlerdir.

SONUÇ

Elde edilen bulgular, mikrobiyal gübre konsorsiyumlarının sivri biber bitkisinde önemli büyüme parametrelerini pozitif yönde etkilediğini ortaya koymaktadır. Özellikle GFBİO5 uygulaması, meyve ağırlığı üzerinde %65,79, GFBİO3 uygulaması ise %63,55 oranında anlamlı artışlar sağlamıştır. Uygulamaların üst aksam kuru ağırlık üzerine etkilerine bakıldığında GFBİO3, GFBİO1 ve GFBİO4 uygulamaları sırasıyla, %22,54, %18 ve %16,71 oranında artış sağlamıştır. Ayrıca, bazı uygulamaların toprakta mevcut mikro ve makro elementlerin bitki bünyesine taşınmasını artırdığı gözlemlenmiştir. GFBİO1 uygulamasının demir konsantrasyonu %196,64 ve demir konsantrasyonu %12,88 oranında artış sağlamıştır. PGPR bakterileri tarafından üretilen sideroforlar, demir gibi metallerin şelatlanarak bitki kökleri tarafından alınmasını kolaylaştırdığını ortaya koymaktadır.

Elde edilen bulgular doğrultusunda, mikrobiyal gübrelerin hem ülkemiz hem de dünya tarımının geleceği açısından yararlı olacağı öngörülmektedir. Mikrobiyal gübreler, bitki beslenmesini doğal yollarla destekleyen, toprak sağlığını iyileştiren ve kimyasal gübre kullanımını azaltan biyolojik ürünlerdir. Avrupa Birliği'nin Green Deal hedefleri doğrultusunda; sürdürülebilir tarım, sera gazı emisyonlarının azaltılması ve çevresel etkilerin minimize edilmesi ön plandadır. Bu nedenle, bu tür biyolojik uygulamaların yaygınlaştırılması ve kullanımının teşvik edilmesi büyük önem taşımaktadır. Ayrıca, bu çalışma gelecekte gerçekleştirilecek daha kapsamlı araştırmalara zemin hazırlayacak niteliktedir. Bu araştırmanın, çiftçi ve saha şartlarında mikrobiyal gübre uygulamalarıyla desteklenerek geliştirilmesinin, mevcut sonuçları daha da güçlendireceği düşünülmektedir.

ABSTRACT

Their inclusion in agricultural culture has played a very important role in the survival of medicinal and aromatic plants around the world. The majority of medicinal and aromatic plants are drought-tolerant and are grown both rain-fed and irrigated. Especially in arid regions, the cultivation of these plants is preferred for rain-fed production. Irrigation is the most effective measure to reduce water stress and increase crop yields in arid areas. Therefore, irrigation is inevitable for medicinal and aromatic plants as well. Lavender, a medicinal and aromatic plant, is drought-tolerant and is cultivated for its essential oil. This study was conducted to evaluate some research on irrigation in lavender. Within this scope, this paper presents an analysis of recent studies that have demonstrated the effect of different irrigation practices on the herb and essential oil yield and essential oil quality of lavender. Consequently, irrigation significantly increases lavender yield in arid regions. Therefore, there is a need to develop irrigation schedules that provide high irrigation water productivity for lavender cultivation in regions experiencing water scarcity.

Keywords: Lavender; Irrigation management; Essential oil yield; Oil quality

SULAMANIN LAVANTA (*L. ANGUSTIFOLIA MILL.*) ÜRÜN VERİMİ VE YAĞ KALİTESİNE ETKİLERİ ÜZERİNE BİR İNCELEME

ÖZET

Tarım kültürüne alınması, tıbbi ve aromatik bitkilerin dünyada varlığını sürdürmesinde çok önemli bir rol oynamıştır. Tıbbi ve aromatik bitkilerin ekseriyeti kuraklığa töleranslı olup, hem yağışa dayalı ve hem de suluda yetiştirilmektedir. Özellikle kurak bölgelerde, yağışa dayalı üretim için bu bitkilerin tarımı tercih edilebilmektedir. Sulama, kurak alanlarda su stresini azaltmak ve ürün verimini artırmak için en etkili önlemdir. Dolayısıyla tıbbi ve aromatik bitkilerde de sulama kaçınılmazdır. Tıbbi ve aromatik bitki olan lavanta, kurağa dayanıklı olup, uçucu yağı için üretilmektedir. Bu çalışma, lavantada sulama üzerine yapılan bazı araştırmaların değerlendirilmesi amacıyla yapılmıştır. Bu kapsamda, bu bildiride, yakın geçmişte yapılan ve farklı sulama programlarının lavantanın ot ve uçucu yağ verimi ile uçucu yağ kalitesi üzerindeki etkisini ortaya koyan bazı çalışmaların bir analizi sunulmuştur. Sonuç olarak, kurak bölgelerde sulama işlemi lavantanın ürün verimini önemli ölçüde artırmaktadır. Dolayısıyla su kıtlığı olan bölgelerde lavanta tarımı için de yüksek sulama suyu üretkenliği sağlayan sulama programlarının geliştirilmesine ihtiyaç duyulmaktadır.

Anahtar kelimeler: Lavanta; Sulama yönetimi; Uçucu yağ verimi; Yağ kalitesi

1.GİRİŞ

Lavanta, çok yıllık olup, çiçekleri için üretilen önemli bir tıbbi ve aromatik bitkidir. Çok yıllık bir bitki olması nedeniyle lavantadan ekonomik olarak 15-20 yıl yararlanılmaktadır (Kara ve Baydar, 2011). Günümüzde lavanta kozmetik, parfümeri, gıda, sağlık, aromaterapi ve peyzaj gibi pek çok alanda değerlendirilme olanağı bulabilmektedir (STB, 2020). Özellikle tıbbi uçucu yağı açısından değer taşıyan lavanta, ilaç, parfümeri ve kozmetik amaçlı yetiştirilmektedir (Sarfaraz ve ark., 2024). Dünyada çoğu Akdeniz orjinli olan 39 kadar lavanta türü bulunmaktadır. Bunlardan lavander, lavandin ve spike lavender olmak üzere üç türünün ticari değeri yüksektir (Kara, 2023). Dünyada iki önemli lavanta türünün (lavandin ve lavender) tarımı yapılmaktadır. Dünya lavanta üretim alanlarının %80'ini lavandin, ve %20 'sini lavender oluşturmaktadır. Fransa ve Bulgaristan dünya lavanta üretim alanlarının 2/3'üne hâkim olup, Çin, Rusya, bazı Doğu Avrupa ve Kuzey Afrika ülkeleri lavanta tarımında ve ticaretinde söz sahibi ülkelerdir. Fransa, lavanta yağı üreten ve ihraç eden lider bir ülkedir ve lavanta yağı pazarının %34'üne hâkimdir. Kısacası Fransa dünyada lavanta yağı üretiminde ilk sırada yer almaktadır. Fransa'yı Bulgaristan ve Çin takip etmektedir. Çin küresel pazarda % 11.9'luk pazar payına sahiptir(STB, 2020).

Türkiye'de lavanta tarımı yoğun olarak Göller Bölgesinde yapılmakta olup, özellikle Isparta, Afyonkarahisar, Burdur ve Denizli illeri lavanta üretiminin en yoğun yapıldığı illerdir. Ülkemizde son yıllarda lavanta üretimi farklı illerimize yayılmış durumdadır. Ülkemizde 2015 yılına kadar lavandin çeşitlerinin (süper) tarımı yapılırken, günümüzde lavender çeşitlerinin tarımına başlanmıştır. Lavanta olumsuz toprak koşullarında bile verim verebilen ve tarımında hastalık ve zararlı faktörü neredeyse minimum düzeyde olan ve tarımsal anlamda az emek isteyen bir bitkidir. Son yıllarda lavanta tomurcuğu ve lavanta yağına olan ilgi nedeniyle birçok üretici tarafından tercih sebebi haline gelmiştir (STB, 2020).

Su kıtlığı, dünyadaki tarım alanlarının çoğunda bitki büyümesini ve ürün verimliliğini kısıtlayan en önemli faktördür (Abedi ve Pakniyat, 2010). Buna karşın sulama ise, bitki gelişimini, ürün verimini ve kalitesini artırmak için yegane önlemdir (Singh ve Goswamy, 2000). Su kıtlığı koşullarında, bitki su ihtiyacının sulama ile tümüyle karşılanması her geçen gün daha da zorlaşmaktadır. Dolayısıyla, daha az su ile sulamanın gerçekleştirileceği teknolojik sulama yöntem ve sulama yönetimi stratejilerinin uygulamaya sokulması kaçınılmazdır. Özellikle kuraklığa hassasiyeti düşük olan bitkilerde, bitki büyüme dönemleri ve bu gelişme dönemlerinin su stresine (su kısıntısına) tepkilerinin bilinmesi, bitkiler için kısıntılı ve tamamlayıcı sulama stratejileri uygulamasına imkan sağlamaktadır. Bu usulle hem ürün verimi ve kalitesi artarken hem de ve kıt su kaynaklarının en verimli şekilde kullanılmasını sağlanabilir (Singh ve Goswamy, 2000).

Kuraklığın tıbbi ve aromatik bitkilerin büyümesi ve gelişimi üzerindeki etkisi, daha önceki bazı çalışmalarda incelenmiştir. Önceki çalışmalar, sulamanın bitkilerin verimi belirleyen morfolojik ve fizyolojik özellikleri üzerinde önemli bir etkiye sahip olduğunu göstermiştir. Dahası, sulama seviyeleri verimi ve uçucu yağların bazı önemli bileşenlerini de etkilemektedir (Llorens-Molina ve Vacas, 2017; An ve Liang, 2013; Rioba ve ark., 2015; Sánchez-Blanco ve ark., 2004).

Bu çalışmanın amacı, lavantada sulamanın ürün verimi ve uçucu yağ kalitesine etkilerini konu edinen ve yakın dönemde yapılmış çalışmaların kısa bir değerlendirmesini sunmaktır.

2. BİTKİSEL UÇUCU YAĞ KALİTESİNE ETKİ EDEN FAKTÖRLER

Birçok tıbbi ve aromatik bitki, özellikle kuraklık olmak üzere zorlu çevre koşullarında gelişme yeteneğine sahiptir ve bu da onları kurak bölgeler için oldukça uygun hale getirmiştir (Kulak, 2020). Kurak bölgelerde su kıtlığı, hemen tüm bitkilerde olduğu gibi tıbbi ve aromatik bitkilerin

büyümesini ve verimini önemli ölçüde etkiler (Nouri ve ark., 2023; Wahab ve ark., 2022). Ayrıca kuraklık, tıbbi ve aromatik bitkilerdeki aktif bileşenlerin kalitesini de olumsuz etkilemektedir (Bistgani ve ark., 2017a; Gao ve ark., 2020). Toprak nem muhtevası, tıbbi bitki bileşenlerinin büyümesini, gelişimini ve sentezini etkileyen önemli bir çevresel faktördür (Vosoughi ve ark., 2018; Zhu ve ark., 2018). Bazı çalışmalar, çevresel streslerin ikincil metabolitlerin artan seviyelerine yol açtığını öne sürmektedir (George ve ark., 2017; Bistgani ve ark., 2017b). Kuraklığın zamanlaması, süresi ve sıklığı, toprak özellikleri ve yağış desenleri gibi çeşitli faktörler, bir bitkinin kuraklığa karşı direncini etkilemektedir (Rezaei ve ark., 2019; Morshedloo ve ark., 2016).

Tıbbi ve aromatik bitkilerdeki uçucu yağlar farklı fakörlerin etkisi altındadır. Birçok iç ve dış faktör esansiyel yağların yapısını, belirli bileşenlerin konsantrasyonunu ve nihayetinde uçucu yağ verimini etkilemektedir (Djouahri ve ark., 2015; Formisano ve ark., 2015; Rehman ve ark., 2016). Bu faktörleri bitkiden kaynaklanan koşullar ve dış faktörler olarak sınıflandırmak mümkündür. Bitkiden kaynaklanan koşullar; genetik, bitki popülasyonu, bitkinin kökeni, bitkinin kullanılan kısmı, örnekleme dönemi, fizyolojik ve biyokimyasal süreçleri ve tüm bitki fizyolojisini kapsamaktadır. Dış faktörler ise iklim koşullarını, yetiştirme koşullarını ve hasat sonrası teknikleri (kurutma yöntemleri ve ekstraksiyon, damıtma süresi, miktar tayini yöntemleri ve analiz koşulları) kapsamaktadır (Yurteri ve ark., 2021). Kısacası, tıbbi ve aromatik bitkilerde uçucu yağ içeriği ve bileşimi çevre koşulları, yetiştirme koşulları, ve kültürel uygulamalar (sulama, gübreleme) (Özgüven ve ark., 2008; Rioba ve ark., 2015) tarafından etkilenmektedir.

Kuraklık stresi tıbbi bitkilerde uçucu ve ikincil metabolitlerin üretimini etkilemektedir (Goncalves ve ark., 2023). Örneğin lavantada, uçucu yağ içeriği ve linalool seviyeleri kuraklık stresi altında artar (Saunier ve ark., 2022). Su eksikliği, ikincil metabolitlerin üretimi de dahil olmak üzere bitki metabolizmasında önemli değişikliklere neden olabilir (Soltanipour, 2005).

Lavanta yaprakları ve çiçekleri uçucu yağlarında 40'tan fazla farklı bileşik içerir, bunların en belirginleri linalool asetat, linalool, sineol, kafur ve geranioldür (Caprari ve ark., 2021). Çok sayıda uçucu yağ üreten bitkiler arasında Lavandula angustifolia Mill. en değerli olanlardan biri olarak öne çıkmaktadır (Crisan ve ark., 2023).

Lavanta yağının kalitesi özellikle linalool, linalil asetat ve kafur içeriği ile ölçülmektedir. Özellikle linalool ve linalil asetat lavanta yağının kalitesini pozitif yönde belirleyen en önemli bileşenler olup, parfüm sanayinde kullanılacak lavanta yağında (ISO3515:2002 lavanta yağı kalite standartlarına göre) en az % 25 oranında bulunmaları istenmektedir (Anonymous, 2002). Kafur ise lavanta yağının kalitesini düşüren en önemli bileşiktir ve %0.5'den daha az olması istenir, yüksek oranda bulunması durumunda uçucu yağı düşük fiyattan satılmaktadır. Düşük kafur içerikli lavanta yağı gıda, kozmetik ve ilaç sanayinde (parfüm, krem, kolonya), yüksek kafur içerikli lavanta yağı ise mum, sabun, böcek ilacı ve diğer ürünlerin yapımında kullanılmaktadır (Tisserand ve Balacs,1999; Baydar, 2010).

3. LAVANTA VERİMİ VE YAĞ KALİTESİNE SULAMANIN ETKİSİ

Kurak alanlar, dünyanın ekili alanlarının yaklaşık %80'ini kaplar ve toplam gıda üretiminin yaklaşık %60'ına katkıda bulunur (World Water Assessment Programme, 2009).Yağış, özellikle kurak ve yarı kurak bölgelerde tarımsal üretimi etkileyen en önemli faktörlerden biridir. Yıllık yağış miktarı ve mevsimsel dağılımı, bir bölgenin tarımsal üretimi için çok önemlidir, çünkü yağış, su dengesi, sulama gereksinimleri ve farklı bitkilerin su üretkenliğini doğrudan etkiler. Günümüzde, kurak bölgelerde sınırlı su kaynakları nedeniyle, tam su ihtiyacını karşılayacak sulama uygulamaları gerçekleştirmek olası değildir. Bu nedenle günümüze kadar, birçok bitkide ürün verimini artırmak ve/veya sulama suyu üretkenliğini artırmak için tamamlayıcı sulama ve kısıntılı sulama üzerine çeşitli çalışmalar yapılmıştır (Wang ve ark., 2001; Zhang ve ark., 2003).

Aynı şekilde, tarımı yapılan tıbbi ve aromatik bitkilerde de benzer çalışmalar yapılmıştır. Gelinen noktada, sulama seviyesi, tıbbi ve aromatik bitkilerin uçucu yağ verimi ve kompozisyonunu etkilemektedir (Bettaieb ve ark., 2009; Petropoulos ve ark., 2008; Vahidipour ve ark., 2013). Bu bağlamda lavanta tarımında sulama ve sulama yönetiminin verime ve kalitesine etkilerini belirlemek üzere saksı ve tarla düzeyinde araştırmalar yürütülmüştür. Lavanta yetiştiriciliğinde sulama ve farklı su yönetim uygulamalarının verime etkilerini konu edinen bazı araştırmalar incelenerek, günümüze kadar gelinen noktadaki mevcut durumun kısa bir özeti bu bildiride sunulmaya çalışılmıştır.

Farklı sulama programlarının etkilerini değerlendirmek amacıyla Chrysargyris ve ark. (2016), lavanta ve adaçayı bitkilerinde sulamanın bitki gelişimine, ürün verimine ve kalitesine etkilerini araştırmışlardır. Saksı denemesi olarak yürütülen çalışmada, bitkiler, tam sulama, orta seviyede kısıntılı sulama ve şiddetli su stresi altında sera koşullarında yetiştirilmiştir. Bu kapsamda tam sulamada saksı başına günlük 50 ml, orta seviyede kısıntılı sulamada 3 günde bir 50 ml ve şiddetli kısıntılı sulamada ise haftada bir 50 ml olarak uygulanmıştır. Genel olarak, su stresi altındaki bitkiler, tam sulama altındaki bitkilere göre daha az büyüme ve değişen kimyasal bileşim sergilemiştir. Buna ek olarak, su stresi altındaki bitkiler, daha yüksek antioksidan (fenolik) konsantrasyonları ile uçucu yağ kalitesinde fayda sağlamıştır. Kısacası bu çalışmanın sonuçları, kısıntılı sulamanın lavanta bitkisinin uçucu yağ kalitesini artırabileceğini göstermiştir. Benzer içerikte farklı sulama planlaması uygulayan Hosseini ve Heidari (2025), İran'da yaptıkları serada saksı denemesinde, kuraklık stresinin lavanta üzerindeki etkilerini ve su kıtlığına verdiği yanıtın altında yatan moleküler mekanizmaları araştırmışlardır. Çalışmada dört farklı sulama seviyesi planlanmış olup; bunlar toprağın tarla kapasitesi'nin (TK) %80, 60, 40 ve 20'sine tekabül eden sırasıyla 2, 1.5, 1 ve 0.5 litre sudan oluşturulmuştur. Sulamalar üç ay boyunca üç günde bir uygulanmıştır. Sulama suyu kısıntıları altında; protein ve klorofil içerikleri, fenolik ve flavonoid bileşikler, antioksidan kapasitesi, uçucu yağ içeriği, uçucu yağın antibakteriyel özellikleri ve uçucu yağ bileşimi dahil olmak üzere çeşitli parametreler incelenmiştir. Elde edilen bulgulara göre, su kısıntısı artıkça, protein ve klorofil içeriği de azalmıştır. Yine İran'da yürütülen başka bir saksı denemesinde Shabankareh ve ark. (2021), farklı su stresi rejimleri altında yetiştirilen üç lavanta çeşidinin tepkisini araştırmışlardır. Çalışmada tarla kapasitesinin(TK) farklı seviyelerindeki (%90-100TK, %70-80TK, 50-60TK ve %30-40TK) sulamalardan oluşan dört farklı sulama rejimi uygulanmış ve su stresinin lavanta yağı kalitesine etkileri araştırılmıştır. Araştırma bulgularına göre, su stresi lavanta kuru madde verimini önemli ölçüde azaltmış olup, en düşük kuru ot verimi en az sulanan konudan elde edilmiştir. Sulama seviyesi artıkça esansiyel yağ oranı azalırken, en yüksek yağ oranı en düşük seviyede sulamadan elde edilmişken, en yüksek yağ verimi ise %70-80 TK sulama rejiminde elde edilmiştir. Değerlendirilen tüm genotiplerde, artan kuraklık stresiyle birlikte başta linalil asetat ve linalool gibi monoterpen bileşikleri azalış gösterirken, seskiterpen bileşiklerinin arttığı belirlenmiştir. Türkiye'de yürütülen benzeri başka bir saksı denemesinde Noory (2020) açık alanda yaptığı çalışmada, farklı yetişme ortamı ve kuraklığın lavanta bitkisinin gelişimi üzerine etkilerini araştırmıştır. Bu bağlamda, biri yağışa dayalı, biri tam tam sulama ve ikisi kısıntılı sulama konusu olmak üzere dört farklı sulama seviyesi altında 7 farklı yetiştirme ortamının lavantanın morfolojik özelliklerine etkisi belirlenmeye çalışılmıştır. Sulama suyu kap buharlaşması esas alınarak haftada bir veya iki kez olacak şekilde belirlenmiş, tam sulama konusuna sulama aralığında gerçekleşen buharlaşma miktarı kadar su uygulanmış olup, %33 kısıntılı sulamada, tam sulama suyunun %66'sı ve %66 kısıntılı sulamada ise %33'ü uygulanmıştır. Elde edilen sonuçlara göre, tam sulama, %33 ve %66 kısıntılı sulama konularına sırasıyla 275, 182 ve 91 mm sulama suyu uygulanmıştır. Sulama seviyeleri lavantanın morfolojik özelliklerine önemli ölçüde etki etmiş olup, tam sulama konusu bitki boyu, bitki gövde çapı, çiçek sapı uzunluğu ve çiçek sayısı bakımından en iyi performansı göstermiştir.

Bir başka saksı çalışmasında Saunier ve ark (2022) iki lavanta türüne (*L. Angustifolia, L. x intermedia*) ait farklı çeşitlerde uygulanan su stresinin etkilerini araştırmışlardır. Bu kapsamda serada saksı denemesi ile iki farklı sulama seviyesinin bitkide fizyolojik ve metabolik özelliklere etkisi test edilmiştir. Sulama uygulamasının birincisinde (kontrol), bitkiler her gün toprağın (karışım) tarla kapasitesinin (TK) %75'ine karşılık gelen 300 mL su ile sulanırken, ikincisi kuraklık stresi uygulaması olup, TK'nın %25'ine karşılık gelen 100 mL su ile her 2 günde bir sulanmıştır. Sulama uygulamaları *L. angustifolia* çeşitlerinde 17 Mayıs ve *L.x intermedia* çeşitlerinde ise 24 Mayısta başlatılmış ve her iki türe ait çeşitlerde 22 Temmuzda sonlandırılmıştır. Sulama seviyelerinin bitkilerin fizyolojik ve metabolik özelliklerine etkileri; biri çiçeklerin yaklaşık %50'sinin açıldığı 10 Haziran - 4 Temmuz döneminde ve diğeri ise çiçeklerin tohum oluşturduğu 9-22 Temmuz dönemi olmak üzere iki fenolojik dönemde ölçümler yapılarak belirlenmiştir. Çalışmanın bulguları, su stresinin, tüm bitki ölçeğinde terpen emisyonlarında önemli bir azalmaya yol açarken, çiçek terpen üretimi azalışının daha düşük seviyede gerçekleştiğini göstermiştir. Yine çalışma sonuçları, her iki türün de su stresi ile başa çıkmak için kuraklığa dayanıklı bir strateji sergilediğini ve L. angustifolia'nın daha rekabetçi bir strateji izlediğini göstermiştir. Çalışma sonuçları ayrıca, Fransa'da geliştirilen yeni bir çeşit olan 'Rapido' (L. angustifolia) ve 'Sumian' (L. x intermedia) çeşitlerinin, şiddetli kuraklık koşullarında yetiştirilmeye en uygun adaylar olabileceğini göstermiştir.

Lavantada sulama üzerine yapılan araştırmaların bazıları tarla denemesi olarak yürütülmüştür. Örneğin Salata (2020) Polonya'da yürüttüğü bir tarla denemesi ile sulamanın lavantanın ot ve çiçek salkımı verimine etkisini araştırmıştır. Araştırmada, biri tamamlayıcı sulama ve diğeri yağışa dayalı olmak üzere lavanta üretimi gerçekleştirilmiş ve iki üretim sistemi karşılaştırılmıştır. Sulamalar damla sulama yöntemi ile toprak su potansiyeli -20 kPa veya bu değere yakınlaştığında uygulanmış olup, her sulamada sabit 15 mm olmak üzere toplam 6 kez sulama yapılmıştır. Çalışma sonuçlarına göre, sulama lavantanın taze ot verimi ile taze çiçek salkım verimini önemli ölçüde artırmıştır. Yağışa dayalı üretimle karşılaştırıldığında, tamamlayıcı sulama taze ot verimini %40.2, taze çiçek verimini %51.76 ve hava kurusu çiçek verimini ise yaklaşık iki kat artırmıştır. Araştırma bulguları ayrıca çiçeklerden elde edilen uçucu yağ verimini de önemli ölçüde artırmış olup, yağışlı üretime göre %17.65 artırmıştır. Buna karşın sulama toplam fenolik asitler oranını %22.83 azaltmıştır. Diğer bir çalışmada Pirzad ve Mohammadzadeh (2018) İran'da yaptıkları bir tarla denemesinde lavanta, biberiye ve kekik bitkilerinde sulamanın biyolojik verime, uçucu yağ verimine ve bitki su tüketimine etkilerini araştırmışlardır. Çalışmada, bitkiler tarla kapasitesinin %75'i (iyi sulanmış, 0.75TK) ve %50'sinde (orta stres, %50TK) olmak üzere iki farklı nem seviyesinde, yani iki farklı sulama aralığı sulama koşullarında yetiştirilmiştir. Ayrıca kontrol amaçlı olarak yağışa dayalı bir konuda çalışmaya dahil edilmiştir. Araştırma sonuçlarına göre, %75TK ve %50TK konularına uygulanan sulama suyu miktarları birinci yılda sırasıyla 218.7, 150 ve 0 mm, ikinci yılda 262.5, 225 ve 0 mm olmuştur. Sulama sıklığı artıkça uçucu yağ oranı azalmış, en yüksek oran sulamasız koşullarda elde edilmiştir. Ancak tarla kapasitenin %50'sinde sulama ile yağışa dayalı konuların yağ oranları arasında önemli bir fark olmadığı belirlenmiştir. Sonuçlara göre, sulama sıklığı artıkça lavanta biyolojik verimi ve uçucu yağ verimi önemli ölçüde artış göstermiş, en yüksek verim değerleri tarla kapasitesinin %75'inde sulanan konudan elde edilmiştir. Benzer içerikli başka bir çalışmada Sarfaraz ve ark (2024) tarafından İran'da yürütülen bir tarla denemesinde farklı sulama seviyeleri ve farklı gübre kaynaklarının lavantaya olan etkileri araştırılmıştır. Denemede, tarla kapasitesi nemine (TK) dayalı dört farklı sulama seviyesi (%95 TK (S1), %75TK (S2), %50TK (S3) ve %25TK (S4)) ve üç farklı gübre kaynağı iki farklı lavanta çeşidine uygulanarak, uygulamaların lavantanın biyolojik ve çiçek verimi ile uçucu yağ oranı ve yağ verimine etkileri araştırılmıştır. Elde edilen bulgulara göre S1, S2, S3 ve S4 konuları 7 kez sulanmış ve sırasıyla toplamda 750, 584, 391 ve 305 mm sulama suyu uygulanmıştır. Sulama suyu miktarı artıkça lavanta biomass verimi ile çiçek verimi önemli

ölçüde artış göstermiştir. En yüksek verimler en yüksek sulama suyu uygulanan kontrol konusundan elde edilmiştir. En düşük sulama suyu uygulaması ile kıyaslandığında, en yüksek sulama seviyesi biyolojik verimi %68.5 ve çiçek verimini ise %105 artırmıştır. Sulama seviyeleri lavanta uçucu yağ oranını önemli ölçüde etkilemiş olup, en düşük oranlar en az sulanan konu ile en fazla sulanan konudan elde edilmiştir.

Hasibi ve ark (2022) tarafından yapılan çalışmada, farklı seviyelerdeki su stresini kullanarak lavantanın kuraklığa dayanıklılığı tarla koşullarında test edilmiştir. Bu bağlamda 4, 8, 12 ve 20 günde bir sulama olmak üzere dört farklı sulama konusu bitkilere uygulanmış ve lavantanın morfolojik ve biyokimyasal özelliklere etkisi belirlenmeye çalışılmıştır. Bu denemenin sonuçları, stres düzeylerinin morfolojik, biyokimyasal ve uçucu yağ üzerindeki etkisinin ayrı ayrı önemli olduğunu göstermiştir. Lavanta sürgün boyu, sürgün sayısı, sürgün kuru ağırlığı, yaprak alanı ve yaprak kuru ağırlığı gibi morfolojik özellikler sık sulamada en yüksek değerleri göstermiş iken, stoma direnci sulama aralığı artıkça artmıştır. Benzer şekilde klorofil içeriği, SOD (süperoksit desmotaz), POD (polifenol oksidaz), APX (askorbater oksidaz) gibi biyokimyasal özellikler sulama aralığı uzadıkça azalış gösterirken, prolin içeriği artış göstermiştir. En yüksek prolin değeri 20 gün sulama aralığında elde edilmiştir. Sulama aralığı bağlamında benzer içerikli İran'da yapılan bir araştırmada Satarzadeh ve ark. (2024), lavanta bitkisinde farklı sulama rejimleri, farklı seviyeyi içeren biyogübre aşılması (Thiobacillus, Pseudomonas ve Thiobacillus + Pseudomonas aşılaması ve kontrol olarak aşılamasız konu) ve iki farklı fosforlu gübre dozunun (0 ve 50 kg ha^{-1}) etkisini araştırmışlardır. Çalışmada sulama seviyeleri, A sınıfı buharlaşma kabından 60, 90 ve 120 mm buharlaşma sonrası sulama uygulaması olmak üzere üç konudan oluşturulmuştur. Sonuçlar, sulamanın her kademesinde fosfor tüketiminin ve biyogübre ile aşılamanın, kontrol ile karşılaştırıldığında çiçeklerin kuru ağırlığını artırdığını göstermiştir. Bu çalışmanın sonuçlarına dayanarak, su stresi koşullarında, biyolojik gübrelerin fosforlu gübrelerle birlikte kullanılmasının lavanta bitkisinde yetersiz beslenme vakalarını büyük ölçüde azaltabileceği ifade edilmiştir.

García-Caparrós ve ark (2019) tarafından İspanya'da yapılan çalışmada, Ballıbabagiller (Lamiaceae) familyasına ait bazı (ballıbaba, nane, kekik, lavanta, dağ çayı vb.) bitkilerin su stresine tepkisi bir tarla denemesi ile araştırılmıştır. Denemede iki farklı sulama seviyesi planlanmış olup, sulama seviyeleri referans bitki su tüketimi (ETo) ve yağış miktarı (R) farkına dayalı oluşturulmuştur. Çalışmada, bitkilere tam sulama ve %30 kısıntılı sulama seviyeleri damla sulama sistemi ile uygulanarak, biyolojik verime ve uçucu yağ içeriğine etkisi test edilmiştir. Araştırma sonuçlarına göre, %30 sulama suyu kısıntısı lavanta bitkisini olumsuz etkilemişken, diğer bitkilerde (adaçayı, nane, kekik) sulama seviyeleri olumsuz bir etki oluşturmamıştır. Tam sulama ile kıyaslandığında, %30 kısıntılı sulama lavantanın kuru ot verimi ve uçucu yağ verimini sırasıyla %32 ve %35.9 azaltmıştır.

Türkiye'de de lavanta yetiştiriciliğinde sulama verim ilişkileri, sulama yönetimi ve sulama üretkenliğini önceleyen az sayıda da olsa araştırma yapıldığı görülmektedir. Örneğin Akçay ve ark. (2021) Aydın Ovası koşullarında damla yöntemi ile farklı sulama seviyelerinin lavanta bitkisinde verime etkileri üzerine bir tarla denemesi yürütmüşlerdir. Çalışmada kap buharlaşması ve toprak nemine dayalı olmak üzere iki sulama stratejisi dikkate alınmış olup, her bir sulama stratejisinde biri tam ve üçü kısıntılı (tam seviyenin %67, 33 ve 0) olmak üzere dört sulama seviyesi uygulanmıştır. A sınıfı kap buharlaşması stratejisinde 7 gün sulama aralığı ve toprak nemine dayalı sulama stratejisinde ise tam sulama uygulanan parselde bitki kök bölgesinde faydalı su kapasitesinin %50'si tüketilince sulamalar yinelenmiştir. Elde edilen sonuçlara göre, buharlaşma kabına dayalı strateji ile karşılaştırıldığında, toprak nemine dayalı sulama stratejisi önemli ölçüde daha yüksek verim değerleri sağlamıştır. Sulama seviyeleri lavanta verimini önemli şekilde etkilemiş olup, yaş çiçek verimi 381-510 kg da^{-1} ve drog çiçek verimleri ise 172-263 kgda^{-1} arasında bulunmuştur. Çalışmanın sonuçları, sulama seviyesi

artıkça lavanta çiçek verimi ve drog çiçek veriminin önemli ölçüde arttığını göstermiştir. Sulama suyunun üretkenliği, sulama seviyesi artıkça azalış göstermiş olup, sulamalı konular arasında en düşük değer her iki sulama stratejisinde de tam sulama seviyesinden elde edilmiştir. Ayrıca bu çalışma, yeterli su varlığı koşullarda, sulama programının toprak nemine dayalı yapılmasını ve tam sulama uygulanmasını, su kısıtlı koşularda ise hem toprak nemin hem de kap buharlaşması sulama stratejisinde %33 kısıntılı sulama seviyesinin lavanta tarımı için önerilebileceğini göstermiştir. Yine Türkiye'de yarı kurak iklime sahip Niğde koşullarında Yetik ve Şen (2025) tarafından yapılan bir tarla denemesinde, damla sulama yöntemi ile uygulanan farklı sulama seviyelerinin lavantanın verimi, verim bileşenleri, uçucu yağ içeriği, su üretkenliği ve sulama suyu üretkenliği üzerine etkileri beş üretim mevsimi için araştırılmıştır. Sulama konuları; tam sulama (TS), orta derecede kısıntılı sulama (KS1, %33 su eksikliği), şiddetli kısıntılı sulama (KS2, %66 su eksikliği) ve yağışa dayalı üretimden (YD) oluşmuştur. Sonuçlar, KS1'in TS ile karşılaştırılabilir taze verim (144-227 kg /da) ve yağ verimi (2,7-6,9 kg/ da) elde ettiğini ve bitki su tüketiminin 781,5-923,6 mm arasında değiştiğini göstermiştir. Yağışa dayalı konuda ürün verimi önemli ölçüde azalırken, su üretkenliği en üst düzeyde gerçekleşmiştir. Bu da önemli su eksiklikleri altında bile lavantanın suyu çok etkili kullanma potansiyeline sahip olduğunu göstermektedir. Araştırma bulguları, lavantanın, kısıntılı sulamaya uygun olduğunu, göstermiştir. Sonuç olarak, araştırıcılar; %33 su kısıntısının verim düşüşünü en aza indirerek su üretkenliğini optimize etmek için, %66 su kısıntısını ise su kısıtlı yarı kurak iklimlerde sürdürülebilir lavanta üretimi için uygun bir sulama programı olarak önerilebileceğini bildirmişlerdir.

4.SONUÇ

Bu incelemede, önemli bir tıbbi ve aromatik bitki olan lavantanın tarımında sulamanın bitki verimine ve uçucu yağ kalitesine etkisi ele alınmıştır. Bu kapsamda yakın geçmişte lavantada sulama üzerine yapılmış çalışmaların bazıları incelenerek, sulamanın etkisine ilişkin kısa özetleri sunulmaya çalışılmıştır. Yapılan incelemeden elde edilen sonuçlara göre; sulamanın lavantanın gelişimini, çiçek verimi ile uçucu yağ verimini önemli şekilde artırdığı, uçucu yağ oranını ise kısmen olumsuz etkilediği, ancak uçucu yağ verimini artırdığı görülmektedir. Bu nedenle, kurak ve su kısıtlı bölgelerde, lavantanın az miktarda su ile damla sulama yöntemiyle birkaç kez sulanması yararlı olacaktır.

ÖZET

Sekonder metabolitler, bitkilerde doğal olarak sentezlenen ancak primer metabolitler gibi doğrudan yaşamsal süreçlerde görev almayan bileşiklerdir. Bu bileşikler, bitkilerin çevresel stres faktörlerine karşı kendilerini koruma mekanizmalarının önemli bir parçasıdır. Bitkiler tarafından savunma, rekabet veya çevresel koşullara uyum amacıyla üretilen sekonder metabolitler; fenolik bileşikler, alkaloidler, terpenoidler ve flavonoidler gibi geniş bir grubu kapsamaktadır. Son yıllarda yapılan araştırmalar, bu bileşiklerin yalnızca bitkiler için değil, insan sağlığı açısından da oldukça önemli olduğunu ortaya koymuştur. Antioksidan, antifungal, antibakteriyel ve antikanser özellikleri sayesinde sekonder metabolitlerin; kanser, kardiyovasküler hastalıklar, tip II diyabet ve nörodejeneratif rahatsızlıklar gibi birçok hastalığın önlenmesi ve tedavisinde potansiyel etkilerinin bulunduğu belirlenmiştir. Bu nedenle ilaç sanayisinden gıda ve kozmetik endüstrisine, hatta zirai mücadele uygulamalarına kadar pek çok sektörde kullanım alanı bulmaktadır. Bu araştırma kapsamında, "Michele Palieri" üzüm çeşidinde *Ascophyllum nodosum* uygulamalarının tanelerde birer sekonder metabolit olan fenolik bileşiklerin birikimi üzerindeki etkileri incelenmiştir. Ayrıca, bitkinin savunma mekanizmasında rol oynayan ve aynı zamanda birer fitohormon niteliğinde olan indol asetik asit, gibberellik asit, zeatin, absisik asit ve salisilik asit gibi hormonların yanı sıra organik asit miktarlarındaki değişimler de değerlendirilmiştir. Bu çalışma, söz konusu uygulamaların bitkisel metabolizma üzerindeki düzenleyici etkilerini ortaya koymayı ve biyostimülantların sekonder metabolit üretimi üzerindeki potansiyel katkılarını aydınlatmayı amaçlamaktadır.

Anahtar Kelimeler: Sekonder metabolitler, Ascophyllum nodosum, Fenolik bileşikler

INVESTIGATION OF THE EFFECTS OF *ASCOPHYLLUM NODOSUM* APP LICATIONS ON SECONDARY METABOLITE ACCUMULATION IN BERRIES IN "MICHELE PALIERI" GRAPE VARIETY

ABSTRACT

Secondary metabolites are compounds naturally synthesized in plants that, unlike primary metabolites, do not play a direct role in vital physiological processes. These compounds form an important part of the plant's defense mechanisms against various environmental stress factors. Produced by plants for purposes such as defense, competition, or adaptation to environmental conditions, secondary metabolites include a wide range of compounds such as phenolics, alkaloids, terpenoids, and flavonoids. Recent studies have shown that these compounds are not only essential for plants but also have significant benefits for human health. Owing to their antioxidant, antifungal, antibacterial, and anticancer properties, secondary metabolites have been reported to exhibit positive effects on the prevention and treatment of diseases such as cancer, cardiovascular disorders, type II diabetes, and neurodegenerative diseases. Therefore, they have attracted growing interest in various sectors, including pharmaceuticals, food, cosmetics, and agricultural protection.

In this study, the effects of ***Ascophyllum nodosum*** applications on the accumulation of phenolic compounds—known as secondary metabolites—in "**Michele Palieri"** grape variety were investigated. Additionally, changes in phytohormones such as indole acetic acid, gibberellic acid, zeatin, abscisic acid, and salicylic acid, which play key roles in plant defense mechanisms, as well as variations in organic acid contents, were also evaluated. The study aims to reveal the regulatory effects of these applications on plant metabolism and to elucidate the potential contributions of biostimulants to secondary metabolite production.

Keywords: Grape, Secondary metabolites, *Ascophyllum nodosum,* Phenolic compounds,

1. GİRİŞ

A. nodosum ekstraktlarının ülkemizde ve dünyada gerek örtüaltı yetiştiriciliği gerek açık alanlarda olmak üzere elma, armut, turunçgiller ve süs bitkileri yetiştiriciliğinde farklı amaçlarla kullanım alanı buldukları bilinmektedir (Güner ve Aysel, 1996). Üzümde ise söz konusu uygulamanın etkinliğinin belirlenmesine yönelik yapılmış sınırlı sayıda araştırma bulunmaktadır. Burada genellikle tane özellikleri, verim ve kalite bileşenleri üzerinde yoğunlaşıldığı, hastalık ve zararlılara dayanım üzerine etkisi ile şaraplık çeşitlerde de şarap bileşimine olan etkisini incelemeye odaklanıldığı tespit edilmiştir (Mondello vd., 2018; Gutiérrez-Gamboa vd., 2019b; Salvi vd., 2019; Taskos vd., 2019; Gutiérrez-Gamboa vd., 2020a, b, c; Thankaraj vd., 2020). Karaerik üzüm çeşidinde yürütülmüş bir araştırmada ise üç ticari deniz yosunu ekstraktının fidanlarda besin elementi alımı üzerine etkisi incelenmiş ve araştırma sonucunda fidanlarda bakır ve diğer mikro besin elementlerinin alımının arttığı belirtilmiştir (Turan ve Köse, 2004).

Önemli renkli ve erkenci çeşitlerimizden olan Trakya İlkeren çeşidinde deniz yosunu uygulamalarının sofralık üzümlerdeki kalite parametreleri üzerinde olumlu etki gösterdiğini belirtmişlerdir (Kök vd., 2010).

Bir araştırmada da Fetească albă üzüm çeşidinde vejetatif büyüme parametreleri üzerinde *A. nodosum* ekstraktının etkileri incelenmiştir. Omcalara yapraktan sprey olarak gerçekleştirilen uygulamalar sonrası bitkilerde sürgün uzunluğu, sürgün çapı ve yaprak alanının arttığı saptanmıştır (Popescu ve Popescu, 2014).

Ülkemizin önemli şaraplık çeşitlerinden olan, aynı zamanda salamuralık yaprak olarak da ciddi bir tüketimi bulunan Narince üzüm çeşidinde yapılmış bir araştırmada da *A. nodosum* ekstraktlarının asmaların yaprak kuru ağırlığının, tane ağırlığının, tane hacminin artmasında, ayrıca Ca, Zn, S ve B minerallerinin alımının teşvik edilmesinde etkili olduğunu tespit etmişlerdir (Sabır vd., 2014). Tane tutumu ve verimliliği üzerine deniz yosunu uygulamalarının etkisini araştıran araştırmacılar, Carmenère üzüm çeşidinde *A. nodosum* ekstraktının uygulamasının bu parametreler üzerinde olumlu etki gösterdiğini ifade etmişlerdir (Gutiérrez-Gamboa vd., 2019a).

Riesling üzüm çeşidinde deniz yosunu ve hümik asit uygulamalarının tane biyokimyasal özellikleri üzerine etkilerini inceleyen araştırmacılar söz konusu uygulamaların çeşidin tane biyokimyasal özelliklerini değiştirdiğini tespit etmişlerdir (Kök ve Bal, 2016).

Bir diğer araştırmada ülkemizin önemli kurutmalık üzüm çeşitlerinden olan Sultani Çekirdeksiz üzüm çeşidinde *A. nodosum* ekstraktının verim parametreleri üzerine etkisi incelenmiş, suda çözünür kuru madde dışındaki incelenen diğer özelliklerde olumlu etkiler gösterdiği tespit edilmiştir (Norrie vd., 2002).

Yukarıda da detaylandırıldığı üzere asmada deniz yosunu uygulamalarının büyük çoğunlukla bitkinin verim parametreleri ve besin elementi alımı ile olan ilişkisini incelemeye yönelik gerçekleştirilmiştir. Bu araştırmada ise söz konusu uygulamanın sekonder metabolizma üzerinde etkili olup olmadığı incelenmiştir. Deniz yosununun metabolit birikimi üzerine olan çalışmalar son derece sınırlı sayıda ve sınırlı bileşen üzerinde gerçekleştirilmiştir. Örneğin Frioni vd. (2018) ile Salvi vd. (2019), *A. nosodum* ekstraktının üzümde fenolik bileşen üzerindeki etkisini incelemişlerdir. Bu uygulamanın tane ve kabuk antosiyanin birikimini teşvik ettiğini, toplam fenolik bileşik içeriğini artırdığını belirlemişlerdir. Taskos vd. (2019), Merlot üzüm çeşidinde *A. nodosum* uygulamasının verim ve salkım sayısını arttırdığını, tane toplam polifenol indeksini ise azalttığını saptamışlardır. Tempranillo Blanco üzüm çeşidine ait omcalarda deniz yosunu uygulamalarının kateşin ve flavonol içeriklerini artırdığı da saptanmıştır Gutiérrez-Gamboa, 2020).

2. MATERYAL VE YÖNTEM

Araştırma, 2024-2025 yılları arasında yürütülmüştür. Uygulamalar Yozgat Merkez Köylerinden olan Recepli Köyü'nde 5 da arazi üzerine tesis edilmiştir. 1103 Paulsen Amerikan asma anacı üzerine aşılanmış Michele Palieri üzüm çeşidinden oluşan 8 yaşındaki bağda yapılmıştır. Uygulamalara geçilmeden önce 2024 kış budamasında (Nisan 2024) budama işlemleri gerçekleştirilmiş ve omcalar üzerinde olabildiğince eşit sayıda göz bırakılmaya çalışılmıştır. Uygulamalar, söz konusu çeşidin fenolojik gözlemleri baz alınarak tanelerin koruk safhasında, ben düşme döneminde ve hasattan 10 gün önce olacak şekilde 3 ayrı dönemde yapılmıştır. Bu süreçte bağda sadece rutin kültürel işlemler ve külleme mücadelesi yapılmıştır. Uygulamalarda "Acadian" firmasına ait sıvı formdaki *A. nodosum* solüsyonu kullanılmıştır. Tüm omca pülverizatör ile ıslatılmış, kontrol bitkilerine sadece saf su uygulaması yapılmıştır. *A. nodosum,* 1/10; 1/15 ve 1/20 dozlarında uygulanmıştır. Hasat döneminde salkımlar alınıp bağa getirilerek aşağıda detaylandırılan analizlerin yapılmasına kadar olan süreç içerisinde derin dondurucuda muhafaza edilmiştir. Laboratuvar işlemleri Yozgat Bozok Üniversitesi, Ziraat Fakültesi, Bahçe Bitkileri Bölümü laboratuvarında yapılmıştır.

2.1. FENOLİK BİLEŞİK EKSTRAKSİYONU

Fenolik bileşik ekstraksiyonları Kiselev (2007)'ye göre yapılmıştır.

2.2. TOPLAM FENOLİK MADDELERİN BELİRLENMESİ

Ekstrakte edilmiş örneklerde toplam fenolik bileşik miktarları Folin Ciocalteu kolorimetrik metodu kullanılarak Singleton ve Rossi (1965)'ye göre yapılmıştır. Spektrofotometrede okumalar 765 nm dalga boyunda gerçekleştirilmiştir. Standart gallik asit çözeltisinden hazırlanan kurveden yararlanılarak, toplam fenolik madde miktarları gallik asit eşdeğeri (GAE) olarak belirlenmiştir (Çizelge 1).

2.3. TOPLAM FLAVONOL MİKTARININ BELİRLENMESİ

Toplam flavonol miktarı Neu solusyonu kullanılarak Dai vd. (1995)'ne göre yapılmıştır. Toplam flavonollerin miktarı, rutin standardından hazırlanmış olan körveden yararlanılarak, rutin eşdeğeri olarak (Rutin Equivalent, RE) mg/g şeklinde belirlenmiştir (Çizelge 1).

2.4. TOPLAM FLAVANOL MİKTARININ BELİRLENMESİ

Toplam flavanol miktarı Arnous vd. (2001)'ne göre DMAC (dimetil amino sinnamaldehit) metodu kullanılarak gerçekleştirilecektir. Sonuçlar kateşin standardından hazırlanmış olan körveden yararlanılarak, kateşin eşdeğeri (Catechin Equivalent, CE) (mg/g) cinsinden sunulmuştur (Çizelge 1).

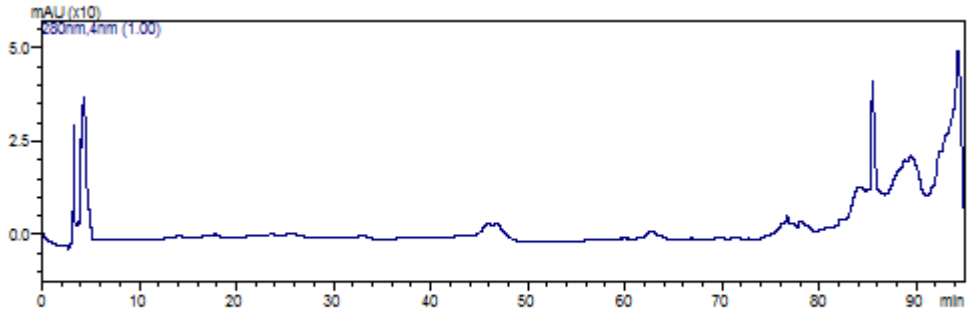
2.5. FENOLİK BİLEŞİKLERİN VE BİTKİSEL HORMONLARIN TANIMLANMASI

Fenolik bileşiklerin ve bitkisel hormonların tanımlanması HPLC (Shimadzu Prominence, Tokyo, Japonya) ile yapılmıştır. Bu amaçla modifiye edilmiş Gomes vd. (1999)'nin yöntemi tercih edilmiştir. Fenolik bileşikler içerisinden asmada ve üzümde en fazla bulunan kateşin, epikateşin, ellajik asit, gallik asit, 3,4-dihidroksi benzoik asit, 4-dihidroksi benzoik asit, kafeik asit, naringin, sinnamik asit, 2,5- dihidroksi benzoik asit, vanilik asit, p-kumarik asit, ferulik asit, klorogenik asit, rutin, kuersetin ve resveratrol miktarlarının tespiti yapılmıştır. Bitkisel hormonlar içerisinde indol asetik asit, gibberellik asit, zeatin, absisik asit ve salisilik asit miktarları belirlenmiştir (Çizelge 3). Ayrıca organik asit miktarları da incelenmiştir.

2.6. VERİLERİN İSTATİSTİKSEL ANALİZİ

Araştırmada yapılan analizlerden elde edilen sayısal veriler SPSS 20.0 paket programı kullanılarak test edilmiştir. Grup ortalamaları arasındaki farklılıkların belirlenmesinde ise Duncan çoklu karşılaştırma testi kullanılmıştır.

3. BULGULAR



Çizelge 1. Spektrofotometrik olarak belirlenen fenolik bileşik miktarları

A. nodosum	Toplam fenolik madde (mg/g GAE)	Toplam flavonol (mg/g RE)	Toplam flavanol (mg/g CE)
Kontrol	0,1641 d*	0,0583 c	0,0275 b
1/20	0,2529 c	0,0689 b	0,0280 b
1/15	0,4662 a	0,0890 a	0,0671 a
1/10	0,3582 b	0,0833 a	0,0778 a

*Aynı sütunda farklı harflerle gösterilen ortalamalar arasında istatistiksel olarak farklılık bulunmaktadır ($p<0.05$).

Çizelge 1' in incelenmesi ile de anlaşılacağı üzere bitkinin savunma mekanizmasında önemli etkiler gösteren birer sekonder metabolit olan fenolik bileşiklerin miktarları 1/15 oranında seyreltilmiş *A. nodosum* uygulanan omcaların tümünde yüksek olarak belirlenmiştir. Bununla birlikte toplam flavonol ve toplam flavanol değerleri bakımından 1/10 oranında seyreltilmiş *A. nodosum* uygulaması da istatistiksel olarak önemli bulunmuştur.

Asmada ve üzümde en fazla bulunan fenolik bileşikler bileşen bazında HPLC ile de belirlenmişlerdir. Bunlar kateşin, ellajik asit, epikateşin, gallik asit, 3,4-dihidroksi benzoik asit, 4-dihidroksi benzoik asit, kafeik asit, naringin, sinnamik asit, 2,5- dihidroksi benzoik asit, vanilik asit, p-kumarik asit, ferulik asit, klorogenik asit, rutin, kuersetin ve resveratroldür. *A. nodosum* uygulamalarının bu fenolik bileşenler üzerine etkileri Çizelge 2'de sergilenmiştir. Örneğe ait bir kromatogram da Şekil 1. de sunulmuştur.

Şekil 1. Örneğe ait kromatogram görünümü

Çizelge 2 incelendiğinde kateşin, 4-dihidroksi benzoik asit, 2,5- dihidroksi benzoik asit, ferulik asit ve kuersetin dışında diğer tüm bileşenlerin A.nodosum uygulanan omcalarda istatistiksel olarak daha yüksek düzeyde elde edildiği görülmektedir ($p<0.05$). Burada özellikle ellajik asidin 1/15 oranında *A. nodosum* uygulanan omcalarda en düşük değere göre yaklaşık 30 kat artmış olması (1007,21 ppm), aynı uygulama grubunda kafeik asit içeriğinin en düşük değere göre yaklaşık 13 kat artmış olması (104,55 ppm) ve rutin içeriğinin en düşük değere göre 224 kat artmış olması (235,22 ppm) son derece dikkat çekicidir (Çizelge 2). 3,4-dihidroksi benzoik asidin 1/10 oranında *A. nodosum* uygulanan omcalarda en düşük değere göre yaklaşık 21 kat artmış olduğu görülmektedir (0,87 ppm).

Çizelge 3. de bitkisel hormonlar içerisinde yer alan indol asetik asit, gibberellik asit, zeatin, absisik asit ve salisilik asit miktarlarının asmalara *A. nodosum* uygulaması karşısındaki değişim gösterilmektedir. Burada indol asetik asit hariç tüm hormonların kontrol uygulamasında bir diğer ifade ile *A. nodosum* uygulanmayan omcalarda düşük miktarlarda sentezlendikleri anlaşılmaktadır. Indol asetik asit miktarının ilginç bir şekilde 1/10 oranında *A. nodosum* uygulamasında da kontrol grubu ile aynı olmak üzere istatistiksel olarak en yüksek düzeye ulaştığı dikkati çekmektedir (Çizelge 3). Zeatin ve salisilik asit miktarı 1/20 oranında A.nodosum uygulanan omcalarda yüksek düzeyde sentezlenirken, gibberellik asit ve absisik asidin, indol asetik asit de olduğu gibi 1/10 oranında *A. nodosum* uygulanan grupta yüksek miktarda sentezlenmişlerdir.

Çizelge 2. HPLC ile belirlenen fenolik bileşik miktarları (ppm)

*Aynı sütunda farklı harflerle gösterilen ortalamalar arasında istatistiksel olarak farklılık bulunmaktadır ($p<0.05$).

Çizelge 4. HPLC ile belirlenen organik asit miktarları (ppm)

A. nodosum	Oksalik asit	Tartarik asit	Malik asit	Askorbik asit	Laktik asit	Sitrik asit	Süksinik asit	Fumarik asit	Şikimik asit
Kontrol	0,49 c	1476,52 c	23,52 a	29,33 b	3033,46 a	631,04 a	4442,44 c	0,43 b	802,64 c
1/20	36,77 b	1652,67 b	14,87 c	29,97 b	2002,11 b	148,56 c	4434,09 c	0,02 c	1201,46 a
1/15	0,47 c	2118,80 a	20,68 b	25,32 c	1932,08 b	113,95 d	9185,08 b	3,29 a	954,74 b
1/10	286,55 a	1403,30 d	20,25 b	45,63 a	1387,62 c	171,76 b	11703,43 a	0,52 b	815,91 c

*Aynı sütunda farklı harflerle gösterilen ortalamalar arasında istatistiksel olarak farklılık bulunmaktadır ($p<0.05$).

Organik asit miktarlarının da incelendiği araştırmada tartatik asit, askorbik asit, süksinik asit, fumarik asit ve şikimik asit miktarlarının farklı seyreltme oranlarında olmakla birlikte tümünde *A. nodosum* uygulanan gruplarda yüksek miktarlarda sentezlendikleri dikkati çekmektedir (Çizelge 4). Oksalik asit miktarında 1/10 *A. nodosum* grubunda oksalik asit miktarında istatistiksel olarak önemli ve oldukça yüksek bir artış olduğu dikkati çekmektedir (286,55 ppm). Benzer şekilde süksinik asidin de yine aynı uygulama grubunda çok yüksek düzeyde üretildiği görülmektedir (11703,43 ppm).

4. SONUÇ

Araştırmada sonuç olarak spektrofotometrik olarak belirlenen fenolik bileşik miktarları ile HPLC ile belirlenen fenolik bileşenler, bitkisel hormonlar ve organik asit içerikleri değerlendirildiğinde genel olarak *A. nodosum* uygulamalarının bu bileşenleri artırmada olumlu etkiler gösterdikleri anlaşılmaktadır. Bu durum hem tane kompozisyonunun içeriğinin zenginleştirilmesi hem de bileşenlerin çoğunun doğal savunma bileşenleri olması bakımından önemlidir.

ÖZET

2025 yılında yürürlüğe giren 7552 sayılı Türkiye İklim Kanunu, net sıfır emisyon hedefleri, yeşil büyüme vizyonu ve iklim değişikliğine uyum ilkeleri çerçevesinde tarımsal üretim, arazi kullanımı ve kırsal alan yönetimini kritik düzeyde etkileyen bir düzenlemedir. Bu çalışmanın amacı, Kanun'un tarımsal peyzajlar üzerindeki olası etkilerini ortaya koymaktır. Çalışmada, belge analizi ve GZFT (Güçlü, Zayıf, Fırsat, Tehdit) analizi kullanılmıştır. Kanun, ekosistem temelli yaklaşımlar ve sürdürülebilirlik ilkeleri aracılığıyla tarımsal peyzajların direncini ve uyum kapasitesini güçlendirme potansiyeline sahip olmanın yanında tarımsal peyzajlar için başta karbon depolama ve sera gazı azaltımı, iklim dirençli ürün desenleri ve yeşil finansmana erişim olmak üzere önemli fırsatlar sunmaktadır. Ancak, küçük üreticilerin finansman ve teknolojiye erişim güçlükleri ile Kanun'un mevcut ulusal mevzuatla entegrasyonundaki belirsizlikler uygulamadaki etkinliği sınırlayabilecek temel yapısal risklerdir. Sonuç olarak, Türkiye İklim Kanunu, tarımsal peyzajları çözümün merkezine konumlandırma potansiyeline sahiptir. Bu potansiyelin tam olarak gerçekleşmesi, ancak küçük üreticiyi gözeten adil geçiş politikalarının somutlaştırılması, toprak karbonu yönetimi ve gıda güvenliğini önceliklendiren bütüncül bir politik yaklaşım benimsenmesiyle mümkün olacaktır.

Anahtar Kelimeler: Türkiye İklim Kanunu, iklim değişikliğine uyum, tarımsal peyzajlar, sürdürülebilir tarım. Karbon Yönetimi, Gıda Güvenliği.

AN ASSESSMENT OF THE POTENTIAL IMPACTS OF TURKEY'S CLIMATE LAW ON AGRICULTURAL LANDSCAPES

ABSTRACT

The Turkish Climate Law No. 7552, which entered into force in 2025, is a regulation that critically affects agricultural production, land use, and rural area management within the framework of net-zero emission targets, the green growth vision, and climate change adaptation principles. The objective of this study is to reveal the potential impacts of the Law on agricultural landscapes. The methodology employed involves document analysis and a SWOT (Strengths, Weaknesses, Opportunities, Threats) analysis. The Law holds the potential to enhance the resilience and adaptation capacity of agricultural landscapes through ecosystem-based approaches and sustainability principles. The Law presents significant opportunities for agricultural landscapes, primarily including carbon sequestration and greenhouse gas mitigation, the development of climate-resilient cropping patterns, and access to green finance. However, the difficulties faced by small-scale producers in accessing finance and technology, along with the uncertainties in the Law's integration with existing national legislation, constitute key structural risks that may limit its effectiveness in implementation. In conclusion, the Turkish Climate Law has the potential to position agricultural landscapes at the core of the climate solution. The full realization of this potential, however, depends on the concretization of just transition policies that prioritize small-scale producers, and the adoption of a holistic political approach that prioritizes soil carbon management and food security.

Keywords: Turkish Climate Law, Climate Change Adaptation, Agricultural Landscapes, Sustainable Agriculture, Carbon Management, Food Security

1. GİRİŞ

Tarımsal peyzajlar, kültürel peyzajlar hiyerarşisi içerisinde yer alan ve bu kültürel mirasın kritik bir alt bileşeni olan kırsal peyzajların temel kategorisi olarak kabul edilir (Forman ve Godron, 1986; Farina 2022). Bu peyzajlar, tarımsal üretim ile ilgili arazilerin ve faaliyetlerin (ekili alanlar, hayvancılık birimleri, sulama sistemleri gibi altyapılar dahil) baskın olduğu alanlardır. Tarımsal peyzajlar, insan müdahalesi ve doğal süreçlerin tarihsel etkileşiminin ve ekolojik adaptasyonunun bir sonucu olarak ortaya çıkan, dinamik sosyo-ekonomik sistemleri temsil etmektedir (Goudie ve Viles, 2013; Gülçin, 2019; Brown ve Goetcheus, 2023).

Tarımsal peyzajlar; biyolojik çeşitlilik, doğal süreçler ve kültürel mirasın korunması, bölgesel sosyo-ekonomik işlevlerin sürdürülmesi, kendine özgü görsel estetik değerlerin sunulması ve insan-doğa karşılıklı etkileşimlerinin somut izlerini taşıması gibi çok boyutlu özelliklerle karakterize edilmektedir. Bu peyzajlar insan faaliyetlerinin doğal çevre ile doğrudan ve yoğun etkileşimde olduğu, tarih içinde karakterini kazanmış ve değişime en hassas olan peyzajlardır (Forman ve Godron, 1986; Bellwood, 2004; Raskin, 2025).

Tarımsal peyzajların korunması ve geliştirilmesi, tarımın sürdürülebilirliği ve genel olarak kentsel sürdürülebilirlik açısından kritik öneme sahiptir. Bununla birlikte insanlık tarihi boyunca plansız sanayileşme, yerleşim baskısı ve modern tarım uygulamalarının neden olduğu parçalanma ve kayıplarla karşı karşıya kalmıştır. Bu gün tarımsal peyzajların dayanıklılığını tehdit eden ve acil koruma tedbirlerini zorunlu kılan en büyük risk faktörü olarak karşımızda iklim değişikliği durmaktadır (Bennetzen, 2012, Dubey, vd. 2023).

İklim değişikliğinin temel bileşenleri olan atmosferik karbondioksit artışları, yükselen sıcaklıklar ve değişen yağış düzenleri, tarımsal verimliliği doğrudan ve önemli ölçüde etkileyecektir. İklim değişikliğinin tarımsal üretime etkileri dört noktada ele alınır. Bunlar (Walthall, 2013);

- Hayvancılık üretim sistemleri, özellikle yükselen sıcaklık streslerine karşı yüksek hassasiyet göstermektedir.
- Aşırı hava olaylarının öngörülen daha yüksek görülme sıklığı, tarımsal verimlilik üzerinde artan ve yıkıcı bir etkiye sahip olacaktır.
- Yapılan projeksiyonlar, önümüzdeki 25 yıl boyunca iklim değişikliğinin mahsul ve hayvancılık üretim sistemleri üzerindeki etkilerinin karmaşık ve bölgesel farklılıklar göstereceğini ortaya koymaktadır.
- İklim değişikliği, tarımsal bitkiler ve hayvanlar üzerindeki mevcut biyotik stresleri (zararlılar, hastalıklar) daha da kötüleştirerek yeni tehditler oluşturacaktır.

Tarımsal peyzajlar, karbon tutumu ve depolama potansiyeli sayesinde iklim değişikliğini hafifletme (azaltım stratejisi) açısından önemli ve olumlu katkılar sunmaktadır. Bu katkılar, temel olarak aşağıdaki mekanizmalar aracılığıyla gerçekleşir (Shukla, 2019, IPCC, 2025):

- Toprak Karbon Depolamasının Artırılması: Örtü bitkileri kullanımı, azaltılmış toprak işleme, tarımsal ormancılık (agroforestri) ve uygun ürün rotasyonu gibi sürdürülebilir tarım uygulamaları, toprağın organik madde içeriğini yükselterek karbon depolama kapasitesini önemli ölçüde artırır. Bu süreç, atmosferdeki karbondioksit miktarını düşürerek iklim değişikliğini hafifletmeye yönelik kritik bir stratejiyi temsil eder.
- Peyzaj Bazlı Biyokütle Karbon Tutumu ve Mikro İklim Düzenlemesi: Tarımsal peyzaj sistemlerine ağaç ve çalıların entegrasyonu, sadece biyokütle yoluyla ek karbon tutumunu maksimize etmekle kalmaz; aynı zamanda yerel mikro iklim üzerinde (rüzgâr hızının

azaltılması, nemin artırılması ve sıcaklık değişimlerinin dengelenmesi gibi) olumlu düzenleyici etkiler yaratır.

- Su döngüsü ve enerji dengesi üzerindeki etkiler: Albedo etkisi, tarım arazilerindeki bitki örtüsünün türü ve yoğunluğu, güneş ışığını yansıtma miktarını etkileyerek bölgesel sıcaklıkları değiştirebilir. Buharlaşma ve yağış etkisi, sulama ve bitki örtüsü yapısı, yüzeydeki suyun buharlaşma ve terleme miktarını değiştirerek hem yerel nemi hem de yağış rejimlerini etkileyebilir.

Tarımsal üretim ve arazi kullanımındaki değişiklikler, toplam insan kaynaklı sera gazı (GHG) emisyonlarının yaklaşık %30'undan sorumludur. Bununla birlikte küresel gıda üretiminin 2050 yılına kadar yaklaşık %70 oranında artırılması gerekmektedir. Tarımsal üretim, mevcut yöntemlerle yönetilmeye devam edilirse, küresel iklim değişikliği üzerindeki etkileri artacaktır. Ancak, tarımın iklim değişikliğinin azaltılmasında önemli bir potansiyeli olmasına rağmen, bu alan hâlâ azaltım politikalarına sınırlı ölçüde dahil edilmektedir. Bu bağlamda, tarımsal üretimden kaynaklanan GHG emisyonlarını azaltma politikaları önemlidir (Bennetzen, 2012). Ayrıca tarımın iklim değişikliğine karşı kırılganlığı, büyük ölçüde bu etkileri hafifletmek ve sistemleri uyumlaştırmak amacıyla benimsenecek tepkilere ve politikalara bağlıdır (Walthall, 2013).

Türkiye geçmişten günümüze önemli bir tarım ülkesi olmuştur. Bu bağlamda Türkiye'nin küresel tarım sektöründeki konumu ve son yirmi yıldaki performansı şöyledir (İstikbal, 2022):

- Küresel üretim ve pay: Dünya tarım topraklarının yalnızca %0,8'ine sahip olmasına rağmen, toplam küresel tarımsal çıktının %1,29'undan fazlasını üretmektedir. Bu oran, Türkiye'nin verimlilik potansiyelini göstermektedir.

- Dış ticaret hacmi: Küresel tarımsal ihracatın %1,57'sini ve ithalatın %1,14'ünü gerçekleştirerek, uluslararası tarım ticaretinde önemli bir aktör konumundadır.

- Ekonomik büyüklük: Geçirdiği 20 yıllık dönüşümün ardından, yaklaşık 50 milyar dolarlık üretim kapasitesi ile dünyanın en büyük 10. tarım ekonomisi konumuna yükselmiştir. Türkiye, 2002'deki 24,48 milyar dolarlık tarımsal üretim hacmini 2020 yılında 47,52 milyar dolara taşımıştır.

- Verimlilik artişi (kişi başına üretim): İstihdam edilen kişi başına düşen ortalama üretim değeri, 2002'de 3.285 dolar iken, 2020'de bu değer 9.281 dolara yükselmiştir. Bu, tarım sektöründeki verimlilik ve katma değerdeki önemli artışı işaret etmektedir.

Türkiye İstatistik Kurumu (TÜİK) 2022 yılı verilerine göre, Türkiye'nin çayır ve mera arazilerini de içeren toplam tarım alanı 38.462 bin hektar olarak kaydedilmiştir. Bu arazi işlenen alanlar (%52,4) çok yıllık meyvelikler (%9,6), daimi çayır ve mera alanları (%38) şeklinde dağılım göstermektedir. Türkiye'de nüfus artışına paralel olarak toplam tarım alanlarının azalması, kişi başına düşen tarım alanı miktarında kayda değer bir düşüşe yol açmıştır. 1990-2018 yılları arasında, Türkiye nüfusunun yaklaşık %45,2 oranında büyümesine karşın, aynı dönemde kişi başına düşen tarım alanlarındaki daralma %39,3 olarak tespit edilmiştir. Bu eğilim sonucunda, 1990 yılında 0,76 hektar olan kişi başına toplam tarım alanı miktarı, 2021 yılı itibarıyla 0,45 hektara gerilemiştir. Son verilere göre (2022 yılı), toplam ekilebilir alan (23.845 bin hektar) dikkate alındığında, kişi başına düşen ekilebilir alan miktarı 0,28 hektar düzeyindedir (Çevresel Göstergeler, 2025).

Türkiye'nin iklim değişikliği senaryosu, ülkenin coğrafi konumundan kaynaklanan karmaşık ve olumsuz etkiler içermektedir. Türkiye, Akdeniz Havzası'nda yer aldığı için, küresel ısınmadan en çok etkilenecek bölgelerden biri olarak kabul edilmektedir. Türkiye'nin 2050 ve 2100 yılları

hedeflenerek ortaya konulan iklim değişikliği senaryosunun temel öngörüleri aşağıda verilmiştir:

Sıcaklık artışı, Türkiye iklim senaryosunun en belirgin ve en yüksek güvenilirliğe sahip unsurudur.

- Yükselen Sıcaklıklar: Türkiye genelinde ortalama sıcaklıkların, 21. yüzyılın sonuna kadar 2-6oC arasında artması beklenmektedir. En yüksek artışlar, yaz aylarında ve iç bölgelerde (İç Anadolu, Güneydoğu Anadolu) yaşanacaktır.
- Sıcak Hava Dalgası: Aşırı sıcak hava dalgalarının hem sıklığı hem de süresi önemli ölçüde artacaktır. Bu, özellikle kentlerde yaşayan nüfusun sağlığı üzerinde ciddi bir baskı oluşturacaktır.
- Isınma Etkisi: Bu senaryo, karasal ısınmanın küresel ortalamadan daha hızlı gerçekleştiği yönündeki mevcut gözlemleri desteklemektedir.

Yağışlar hem miktar hem de dağılım açısından büyük bir değişime uğrayacaktır.

- Yağış Azalması: Özellikle Akdeniz, Ege ve Güneydoğu Anadolu bölgelerinde kış ve ilkbahar yağışlarında önemli azalmalar beklenmektedir. Bu, bölgedeki kuraklık ve çölleşme riskini artıracaktır.
- Düzensiz Yağışlar: Yağışların yıl içindeki dağılımı düzensizleşecek; toplam yıllık yağış miktarı stabil kalsa bile, bu yağışlar kısa ve yoğun sağanaklar halinde düşecektir.
- Su Stresi: Yükselen sıcaklıklar ve azalan kış yağışları nedeniyle buharlaşma artacak, bu da yer altı ve yer üstü su kaynaklarında ciddi azalmalara yol açarak Türkiye'yi su stresi (water stress) yüksek olan bir ülke haline getirecektir.

Deniz Seviyesi ve Kıyısal Etkiler

- Deniz Seviyesi Yükselmesi: Küresel ortalamaya paralel olarak deniz seviyesinin yükselmesi, özellikle Çukurova, Gediz ve Büyük Menderes gibi alçak kıyı ovalarında tuzlu su girişimine ve tarım arazilerinin kaybına neden olacaktır.
- Kıyı Erozyonu: Fırtına dalgalarının sıklığı ve şiddetindeki artış, kıyı erozyonunu hızlandıracak ve kıyı altyapılarını tehdit edecektir.

Bu çalışmanın temel amacı, 7552 sayılı Türkiye İklim Kanunu'nun tarımsal peyzajlar üzerindeki etkilerini; ortaya çıkaracağı fırsatlar, yaratacağı tehditler ve potansiyel riskler çerçevesinde analiz etmektir.

2. MATERYAL VE YÖNTEM

2.1. Materyal

Çalışmanın birincil ve ikincil materyalleri aşağıdaki verilmiştir.

- Yasal Metinler: Değerlendirmenin ana objesi, 09.07.2025 tarihinde yürürlüğe giren 7552 sayılı Türkiye İklim Kanunu'nun resmi metni ve ilgili maddeleri.
- Akademik ve sektörel literatür: Tarımsal peyzajlar ve iklim değişikliği konulu ulusal ve uluslararası bilimsel yayınlar.
- Resmî veri ve raporlar: Kanunun etki alanını anlamak için Türkiye'deki tarımsal peyzajlar, iklim değişikliği ile ilgili kurumsal verilerden faydalanılmıştır.

2.2. Yöntem

Bu çalışma, 09.07.2025 tarihinde yürürlüğe giren 7552 sayılı Türkiye İklim Kanunu'nun tarımsal peyzajlar üzerindeki potansiyel etkilerini incelemeyi amaçlayan nitel bir araştırmadır.

Araştırmada Kanun'un tarımsal peyzajlar üzerindeki çok boyutlu etkileşimleri belirlenmiş ve bu alanların, "*iklim değişikliğinin yükünü taşıyan, aynı zamanda çözümün merkezinde yer alan alanlar haline gelme potansiyeli*" değerlendirilmiştir. Çalışmada, Türkiye İklim Kanunu'nun tarımsal peyzajlar üzerindeki etkilerini bütüncül bir bakış açısıyla analiz etmek amacıyla Belge Analizi ve GZFT (Güçlü, Zayıf, Fırsat, Tehdit) Analizi ile değerlendirilmiştir.

Belge Analizi ile 7552 sayılı Kanun'un amaç, kapsam, genel ilkeler ve esasları içeren hükümleri sistematik olarak incelenmiştir. Özellikle tarımsal üretim, arazi kullanımı ve kırsal alan yönetimi ile ilgili olan; "*karbon yutakları, ekosistem temelli uyum, su bütçesi, yerel iklim planları ve karbon kredilendirme sistemleri*"ne ilişkin maddeler tespit edilmiştir.

Kanun hükümleri, GZFT (Güçlü, Zayıf, Fırsat, Tehdit) analizi ile irdelenerek olası etkiler Fırsat-Tehdit-Risk açısından üç ana kategori altında sınıflandırılmıştır.

- Fırsatlar: Kanunun, tarımsal peyzajların direncini ve uyum kapasitesini güçlendirme potansiyelini destekleyen olumlu etkilerdir (örneğin, yeşil finansman, ekosistem temelli planlama zorunluluğu).
- Tehditler: Özellikle sanayi ve enerji sektörlerinden kaynaklanan ve tarımsal peyzajların temel işlevini (gıda güvenliği) tehlikeye atma potansiyeli taşıyan dışsal baskılardır (örneğin, Emisyon Ticaret Sistemi-ETS yükümlülüklerinin tarım arazisi üzerinden denkleştirilmesi, "karbon yutağı üreten tarım" baskısı).
- Riskler: Kanunun uygulamadaki etkinliğini sınırlayabilecek, belirsizlik içeren veya mevcut yapısal zorlukları (örneğin, küçük üreticilerin finansmana erişim güçlükleri, arazi kullanım çatışmaları) ortaya çıkarabilecek içsel ve yapısal zorluklardır.

3. BULGULAR

3.1. Kanun Genel Çerçevesi

İklim Kanunun amacı, yeşil büyüme vizyonu ve net sıfır emisyon hedefi doğrultusunda iklim değişikliğiyle mücadele etmektir. Bu Kanun; «iklim değişikliği ile mücadelede esas olan sera gazı emisyonlarının azaltılması ve iklim değişikliğine uyum faaliyetleri ile planlama ve uygulama araçlarını, gelirleri, izin ve denetimi ve bunlara ilişkin yasal ve kurumsal çerçevenin usul ve esaslarını» kapsamaktadır (1. Bölüm, Madde 1-2) (İklim Kanunu, 2025).

Kanunun genel ilkeleri genel ilkeler şunlardır (2. Bölüm, Madde 3) (İklim Kanunu, 2025) ;

- İklim değişikliği ile mücadelede, ülkemizin ortak fakat farklılaştırılmış sorumluluklar ve göreceli kabiliyetler ilkesi dikkate alınarak, eşitlik, iklim adaleti, ihtiyatlılık, katılım, entegrasyon, sürdürülebilirlik, şeffaflık, adil geçiş ve ilerleme yaklaşımları esas alınır.
- Kamu kurum ve kuruluşları ile gerçek ve tüzel kişiler, bu Kanun doğrultusunda kamu yararı gözetilerek alınacak tedbirlere ve düzenlemelere süresinde uymakla ve bunları uygulamakla yükümlüdür.
- Ulusal Katkı Beyanında, net sıfır emisyon hedefi doğrultusunda ülkenin kalkınma öncelikleri ve özel koşulları göz önünde bulundurulur ve bu çerçevede önlemler alınır.

Kanun beş temel esasa sahiptir (2. Bölüm, Madde 4) (İklim Kanunu, 2025) (İklim Kanunu, 2025).

- Sera gazı emisyonlarının azaltımı ve iklim değişikliğine uyum faaliyetlerine ilişkin ilerlemeler yıllık bazda Başkanlıkça izlenir.
- Kanun kapsamında gerekli görülen tedbirlerin alınması amacıyla görev alanı dâhilinde; kurumlar arası koordinasyonu sağlamak, faaliyetleri ve standartları belirlemek, gelişmeleri

izlemek, karbon fiyatlandırmasına ilişkin piyasaya dayalı mekanizmaları düzenlemekle Başkanlık yetkilidir.

- Kamu kurum ve kuruluşları il gerçek ve tüzel kişiler; kendi yetki ve sorumlulukları çerçevesinde plan ve projeler yapar, yaptırır, uygular, destekler ve iş birliği yapar.

- 4/3/2016 tarihli ve 6698 sayılı Kişisel Verilerin Korunması Kanunu hükümleri saklı kalmak kaydıyla, Başkanlık; bu Kanunun uygulanmasına yönelik olarak gerekli gördüğü bilgi, belge ve veriyi; kamu kurum ve kuruluşları ile gerçek ve tüzel kişilerden doğrudan istemeye yetkilidir. Kendilerinden bilgi ve belge talebinde bulunulanlar; bunları istenilen sürede bedelsiz olarak Başkanlıkla paylaşmakla yükümlüdür. Başkanlık; kendi iş ve işlemleri için ihtiyaç duyduğu verileri de öncelikli olarak Ulusal Coğrafi Bilgi Platformundan temin eder. Temin ettiği veriler ile kendi ürettiği verileri de kamu kurum ve kuruluşları ile paylaşılmak üzere Ulusal Coğrafi Bilgi Platformuna aktarır. Başkanlık, Ulusal Coğrafi Bilgi Platformunda bulunmayan verileri ilgili kamu kurum ve kuruluşları ile protokol yaparak temin edebilir. Millî savunma ve millî güvenliğe ilişkin bilgi ve belgelerin paylaşılmasına dair usul ve esaslar Bakanlık ve ilgili bakanlık tarafından müşterek olarak belirlenir.

- Bu Kanunda Bakanlığa verilen yetkiler bakımından Bakanlık, sınırlarını açıkça belirlemek ve yazılı olmak kaydıyla gerektiğinde yetkilerini Başkanlığa devredebilir.

İklim Kanunu'nun tarımsal peyzajlar üzerindeki etkileri; "*karbon yutakları*", "*ekosistem temelli uyum*", "*su bütçesi*", "*yerel iklim planları*" ve "*karbon kredilendirme sistemleri*" anahtar kavramları odağında analiz edilmiştir. Yapılan inceleme sonucunda, Kanunun tarımsal peyzajları etkileyecek düzenlemeleri iki temel eksende ele aldığı belirlenmiştir: sera gazı emisyonlarının azaltılması ve iklim değişikliğine uyum (Madde 5, 6, 7, 9 ve Geçici Madde 2). Ayrıca, Kanun tarımsal peyzajlar üzerindeki etkilerini bu iki eksenle sınırlı tutmayıp; planlama, finansman, kurumsal dönüşüm, dönüşüm takvimi ve destek mekanizmaları gibi tamamlayıcı alanlarda da düzenlemeler getirmiştir (Madde 8, 12, 13). Söz konusu Kanun maddelerine ilişkin detaylar aşağıda verilmiştir (İklim Kanunu, 2025).

- Madde 5 (İlgili Fıkralar: 5/1, 5/2, 5/3, 5/4): Tarım sektöründeki üretim süreçlerinde (makineleşme, gübre kullanımı, hayvancılık vb.) enerji ve kaynak verimliliğini artırmayı, temiz teknolojilere geçişi sağlamayı ve sıfır atık sistemlerini yaygınlaştırmayı zorunlu kılarak sera gazı emisyonlarını azaltmayı hedeflemektedir. Bu kapsamda, tarımsal faaliyetlerin çevresel etkilerini en aza indirmek ve sürdürülebilir üretim yöntemlerini benimsemek amaçlanmaktadır.

- Madde 5 (Beşinci Fıkra: 5/5): Orman, tarım, mera ve sulak alanlarda karbon yutağı kayıplarının engellenmesini ve bu alanların korunarak karbon yutak kapasitesinin artırılmasını hedeflemektedir. Bu hüküm, tarım topraklarının ve meraların karbon depolama potansiyelini (toprakta karbon tutma) açıkça ön plana çıkarmaktadır. Bu vurgu, onarıcı (rejeneratif) tarım uygulamalarının teşvik edilmesinin yasal zeminini oluşturmaktadır.

- Madde 6 (Dördüncü Fıkra: 6/4): İklim değişikliğinin etkilerine karşı su kaynaklarının etkin yönetimini sağlayacak planlama araçlarının hazırlanmasını zorunlu kılmaktadır. Bu hüküm, özellikle tarımsal sulama ve su bütçesinin dengeli kullanımı açısından kritik bir gerekliliktir.

- Madde 6 (Beşinci Fıkra: 6/5): İklim değişikliğinin ekosistemler ve biyolojik çeşitlilik üzerindeki etkilerini azaltmayı ve arazi tahribatını dengelemeyi hedeflemektedir. Bu, tarımsal üretimin doğal ekosistemlere zarar vermeden planlanmasını ve yürütülmesini gerektirmektedir.

- Madde 6 (Altıncı Fıkra: 6/6): Tarım sektörünün sürdürülebilirliğini güvence altına almak amacıyla; iklim değişikliğine dirençli ürün deseni oluşturulmasını, ekosistem temelli uyum yaklaşımını ve doğa temelli çözümleri esas alan planlama araçlarının geliştirilmesini

açıkça zorunlu kılmaktadır. Bu hüküm, çiftçilik uygulamalarında (örneğin, kuraklığa dayanıklı çeşitlere geçiş ve agro-ekolojik yöntemlerin benimsenmesi gibi) köklü bir dönüşümü beraberinde getirecektir.

- Madde 7 (Planlama ve Entegrasyon): Madde, tüm ulusal ve yerel ölçekteki plan, program ve stratejilerin hazırlanmasında azaltım ve uyum hedeflerinin dikkate alınması zorunluluğunu getirir. Böylece, tarımsal politikalar da dahil olmak üzere tüm sektörel politikaların iklim hedefleriyle entegre edilmesi hedeflenir (planlama ve entegrasyon zorunluluğu). Ayrıca Yerel İklim Değişikliği Eylem Planları, tarımsal peyzajların yönetimini il/bölge ölçeğinde somutlaştıran mekanizmalar oluşturur.

- Madde 9: Madde, ETS'nin kurulmasını ve işletilmesini düzenlemektedir. Madde tarımsal peyzajlar üzerinde doğrudan değil, dolaylı ve yapısal etkiler yaratır. Genellikle enerji, sanayi ve büyük ölçekli tesisler gibi yüksek emisyonlu sektörleri hedef alır. Tarımsal işletmelerin kendileri (çiftçiler) doğrudan ETS kapsamına dahil edilmeyebilir (ancak bu, yönetmeliklerle belirlenecektir). Ancak, tarımsal peyzajlar üzerindeki etkisi, tarım sektörünün girdi ve çıktı ilişkileri aracılığıyla dolaylı olarak gerçekleşir.

- Geçici Madde 2 (Uygulama Süresi): Azaltım (Madde 5) ve uyum (Madde 6) ile ilgili planlama ve uyarlama yükümlülükleri için ilgili kurumlara 31/12/2027 tarihine kadar süre vererek, dönüşüm takvimini belirler (uygulama süresi).

- Madde 8 (Birinci Fıkra, b bendi): Döngüsel ekonomi hedefleri ve sıfır atık uygulamaları doğrultusunda bir dizi mekanizmanın geliştirilmesini öngörmektedir. Bu mekanizmalar; ürünlerin yeniden kullanımını, atıkların yan ürün veya alternatif ham madde olarak değerlendirilmesini, ayrıca geri dönüşüm ile elde edilen ürünlerin zorunlu kullanım oranlarının belirlenmesine yönelik destekleri kapsar. Bu düzenleme, özellikle tarım sektöründe ortaya çıkan biyo-atıklar başta olmak üzere tarımsal atıkların yönetimi ile bu atıkların gübre veya enerji girdisi olarak tekrar kullanılması konularını doğrudan etkileyecektir.

- Madde 8 (Birinci Fıkra, c bendi - Finansman): Sera gazı emisyonlarının azaltılması ve iklim değişikliğine uyum faaliyetlerinin finansmanına yönelik kaynakların geliştirilmesi ve kullanılması esas alınır. Bu düzenleme, özellikle tarım sektöründeki azaltım ve uyum projelerine sağlanan finansal desteklerin artırılacağı anlamına gelmektedir. Ayrıca, Başkanlık, finansal kaynakları iklim değişikliğiyle mücadele yatırımlarına yönlendirmeyi kolaylaştırmak amacıyla Türkiye Yeşil Taksonomisini kurar ve yürütür. Bu Taksonomi, tarımsal yatırımların yeşil dönüşümle uyumlu olup olmadığını belirleyen temel çerçeveyi oluşturacaktır.

- Madde 8 (Üçüncü Fıkra, b bendi - Yeşil İş Gücü): Millî Eğitim Bakanlığı (MEB) ve Yükseköğretim Kurulu (YÖK) tarafından, ilgili bakanlıklarla koordinasyon içinde, tüm eğitim düzeylerindeki müfredat ve öğretim programlarının güncellenmesini zorunlu kılmaktadır. Bu çalışmaların temel amacı, iklim değişikliğiyle mücadeleye yönelik yeni ve yetenekli yeşil iş gücünün yetiştirilmesini sağlamaktır. Bu hüküm, özellikle tarım ve çevre sektörlerinde ihtiyaç duyulan nitelikli insan kaynağının geliştirilmesine olanak tanıyacaktır.

- Madde 12-13 (Adil Geçiş ve Destekler): Kanun kapsamında elde edilen gelirlerin (örneğin ETS) tahsisat satışları veya cezalar gibi) yüzde onuna kadar olan kısmının, adil geçiş uygulamaları çerçevesinde yürütülecek faaliyetlere tahsis edilebileceği belirtilmektedir. Bu düzenleme, özellikle tarım ve kırsal alanlardaki sosyal ve ekonomik dönüşümü desteklemek üzere önemli bir finansman kaynağı potansiyeli sunmaktadır. Ayrıca Kanunun temel esaslarından biri, sera gazı emisyonlarını azaltma veya iklim değişikliğine uyum potansiyeli yüksek olan iklim dostu yatırımların (ki buna tarımsal yatırımlar da dahildir) desteklenmesidir. Bu amaçla, yeşil dönüşümü ve iklim değişikliğiyle mücadeleyi hedefleyen desteklerin kullanımına yönelik uygun finansal mekanizmalar oluşturulacaktır.

3.2. Kanun Tarımsal Peyzajlara Olası Etkileri (Güçlü, Zayıf, Fırsat, Tehdit)

İçsel Faktörler

Bu faktörler, Kanun'un kendi yapısından, hükümlerinden veya ulusal uygulamadaki mevcut yapısal eksikliklerden kaynaklanan ve uygulayıcılar tarafından kontrol edilebilir olan unsurlardır. İçsel faktörler, güçlü ve zayıf yönler olmak üzere iki başlık altında değerlendirilmiştir.

a) Güçlü Yönler

Kanun'un tarımsal peyzajların direncini ve uyum kapasitesini güçlendiren pozitif hükümler aşağıda verilmiştir (İklim Kanunu, 2025).

- Ekosistem Temelli Planlama Zorunluluğu: Kanun, tarım sektöründe ekosistem temelli uyum yaklaşımını ve doğa temelli çözümleri zorunlu kılar. Bu, monokültür yerine biyoçeşitliliği ve su bütçesini gözeten çok işlevli peyzaj tasarımına yasal zemin hazırlar (Madde 6).

- Karbon Yutaklarının Korunması: Orman dışındaki tarım, mera ve sulak alanlarda karbon yutağı kayıplarını engellemeyi ve yutak alanların korunarak artırılmasını hedefler. Peyzaj plancıları için ekolojik ağ tasarımına dayalı planlama olanağı yaratır (Madde 5).

- Yerel Yönetimlerin Yetki Alanı: Yerel İklim Değişikliği Eylem Planları'nın il ve büyükşehir belediyeleri tarafından hazırlanması, planlama kararlarının yerel ölçekte uygulanabilirliğini ve kurumlar arası entegrasyonu artırır (Madde 7).

- İklim Adaleti İlkesi: Mücadelede eşitlik, iklim adaleti ve adil geçiş yaklaşımlarını esas alır. Bu ilke, küçük üreticilerin adaptasyon sürecinde göz önünde bulundurulması için yasal bir dayanak sunar (Madde 3).

- Su Bütçesi Gözetimi: Tarım sektöründe su bütçesini dikkate alan planlama araçları geliştirilmesini ve su kaynaklarının etkin yönetimi ile iklim değişikliğine dirençli ürün deseni geliştirilmesini hedefler (Madde 6).

b) Zayıf Yönler

Kanun'un kendisinden veya ulusal uygulamadaki mevcut yapısal eksikliklerden kaynaklanan, Kanun'un uygulamadaki etkinliğini sınırlayan içsel/yapısal sorunlar (Mevcut Riskler) aşağıda verilmiştir (İklim Kanunu, 2025).

- Adil Geçiş Mekanizması Belirsizliği: Kanun adil geçişi esas alsa da , küçük çiftçilerin Kanunun getirdiği yüksek uyum ve teknoloji maliyetlerini karşılamasına yönelik somut finansal ve teknolojik destek mekanizmalarının Kanunda detaylandırılmaması yapısal bir zayıflıktır (Madde 3, Madde 12, Madde 13).

- Sektörler Arası Arazi Tahsisi Çatışması: Kanun, iklim değişikliğine uyum çerçevesinde su kaynaklarının etkin yönetimini (Madde 6/4) ve iklim dirençli ürün deseni oluşturulmasını zorunlu kılsa da , Su, Gıda ve Enerji (SGE) sektörleri arasındaki arazi kullanım çatışmalarını çözmeye yönelik net bir dengeleme mekanizmasından yoksundur. Özellikle verimli tarım arazilerinde giderek artan GES/RES projeleri (Enerji) baskısı, su bütçesini gözeten tarımsal üretimi (Gıda ve Su) tehdit etmektedir. Kanunun planlama ve entegrasyon zorunluluğu (Madde 7) mevcut olsa bile, bu tür hayati kaynak çatışmalarına kesin bir çözüm getiren maddenin bulunmaması, yasal bir boşluk ve uygulamada büyük bir yapısal risk teşkil etmektedir (Madde 6, Madde 7).

- Veri Paylaşımında Bürokratik Riskler: Başkanlık'ın veriyi Ulusal Coğrafi Bilgi Platformu'ndan (UCBP) temin etme yetkisine rağmen, karmaşık bürokrasi ve kurumlar arası

veri standardizasyonu eksikliği, etkin peyzaj planlaması için kritik olan güncel bilgiye erişimi yavaşlatabilir (Madde 4).

- Mevzuat Entegrasyonu Eksikliği: Kanun'un mevcut Tarım Kanunu, Mera Kanunu ve teşvik sistemleri gibi ulusal mevzuatlarla uyumu konusundaki belirsizlikler, uygulamadaki bütüncüllüğü sınırlayabilecek yapısal riskler olarak öne çıkmaktadır (Madde 3, Madde 7).

Dışsal Faktörler

Bu faktörler, Kanun'un uygulama alanını etkileyen, Kanun koyucunun veya uygulayıcının kontrolü dışında olan makroekonomik, çevresel veya sektörel gelişmelerdir. Dışsal faktörler, fırsatlar ve tehditler başlıkları altında değerlendirilmiştir.

a)Fırsatlar

Kanun'un dış çevreden gelen olumlu gelişmeleri veya araçları kullanarak tarımsal peyzajları güçlendirme potansiyeli aşağıda verilmiştir (İklim Kanunu, 2025).

- Karbon Kredisi ve Yeşil Finansman: Kanun'un ulusal bir karbon kredilendirme ve denkleştirme sistemi kurulmasını öngörmesi, tarımsal araziler ve meralar için karbon çiftçiliği yoluyla ek gelir kaynağı yaratabilir. Bu, peyzaj projelerinin karbon piyasası ile finanse edilmesini sağlar (Madde 8, Madde 9).

- Biyoçeşitlilik ve Ekosistem Hizmetleri: Yeşil finansman ve karbon piyasalarına erişim, tarımsal peyzajlarda biyolojik çeşitlilik ile uyumlu uygulamaları (agroekoloji, agroforestri) güçlendirme fırsatı sunar (Madde 6, Madde 8, Madde 9).

- Küresel Uyum Hedefleri: Kanun'un net sıfır emisyon ve yeşil büyüme vizyonu çerçevesinde düzenlenmesi, uluslararası fonlara, teknoloji transferine ve AB Yeşil Mutabakatı'na uyum süreçlerine erişimi kolaylaştırır (Madde 1, Madde 3, Madde 8).

- İklim Dirençli Ürün Desenleri: Su kaynaklarının etkin yönetimi ile iklim değişikliğine dirençli ürün desenleri geliştirilmesi hedefi , tarımsal peyzajların küresel iklim şoklarına karşı daha az kırılgan hâle gelmesi için bir katalizör işlevi görür (Madde 6).

b) Tehditler

Kanun'un tarımsal peyzajların temel işlevini (gıda güvenliği, arazi bütünlüğü) tehlikeye atma potansiyeli taşıyan dışsal baskılar aşağıda verilmiştir (İklim Kanunu, 2025).

- "Yutak Alan" Üzerinden Sektörel Baskı: Sanayi ve enerji sektörlerinin ETS yükümlülüklerini, tarım ve orman alanlarından elde edilen karbon kredileriyle (denkleştirme) yerine getirme isteği , "Gıda Üreten Tarım" yerine "Karbon Yutağı Üreten Tarım"a kayma baskısı yaratarak gıda güvenliğini tehlikeye atabilir (Madde 9).

- Kentsel ve Endüstriyel Yayılım ve Arazi Bütünlüğü Kaybı: Nüfus artışı ve kentsel genişleme sonucu tarım alanlarının sürekli azalması, Kanun'un koruma hedeflerine rağmen devam eden mekânsal bir tehdittir. Bu yayılım, aynı zamanda Kanun'daki dengeleme mekanizması eksikliği nedeniyle, tarım arazilerinin temiz enerji yatırımlarına tahsisiyle (SGE çatışması) birleşerek arazi bütünlüğünü iki kat tehdit altına almaktadır (Madde 6, Madde 7).

- Dolaylı Karbon Maliyeti (ETS'ye Girme Riski): Kanun tarımı doğrudan ETS'ye almasa da, büyük tarım işletmelerinin veya tedarik zincirlerinin dolaylı olarak Emisyon Ticaret Sistemi'ne dahil olma riski bulunmaktadır. Bu, çiftçilerin maliyetlerini artırarak rekabet gücünü düşürebilir.

- İklim Uyumsuz Altyapı Yatırımları: Yerel yönetimlerin, risk analizlerini dikkate alma yükümlülüğüne rağmen, kısa vadeli siyasi ve ekonomik baskılarla iklim değişikliğine karşı

savunmasız bölgelerde (taşkın ovaları, kurak alanlar) uyumsuz arazi kullanım kararlarının (yoğun sulu tarım, yapılaşma) devam etme riski bulunur.

4. SONUÇ ve ÖNERİLER

Bu çalışma, 7552 sayılı Türkiye İklim Kanunu'nun tarımsal peyzajlar üzerindeki potansiyel etkilerini GZFT (Güçlü Yönler, Zayıf Yönler, Fırsatlar, Tehditler) çerçevesinde değerlendirmektedir. Bulgular, Kanun'un tarımsal peyzajları iklim değişikliğinin yükünü taşıyan alanlar olmaktan çıkarıp, çözümün merkezine konumlandıran kritik bir dönüşüm potansiyeli taşıdığını ortaya koymaktadır.

Kanun, sistemsel güçlendirme araçları sunarak peyzajların direncini ve adaptasyon kapasitesini artırmaktadır. Bu güçlenme, ekosistem temelli uyum yaklaşımları, sürdürülebilirlik ilkeleri ve yeni finansal mekanizmalar aracılığıyla gerçekleşmektedir.

Kanun, tarımsal peyzajlara yönelik, ekolojik ve ekonomik kazanımları birleştiren geniş bir fırsatlar yelpazesi sunmaktadır:

- Ekolojik İşlevlerin Kurumsallaşması: Karbon yutaklarının (tarım, mera, sulak alanlar) korunması, rejeneratif tarım, agroekoloji ve agroforestri uygulamaları gibi çok işlevli yaklaşımları zorunlu kılmaktadır. Bu hükümler, toprak sağlığının iyileştirilmesi, karbon depolama ve biyoçeşitliliğin arazi kullanım planlamasında merkezi bir rol üstlenmesini sağlamaktadır.
- İklim Direncinin Artırılması: Su bütçesi gözetimi ve ekosistem temelli uyum yaklaşımları, iklim dirençli ürün desenleri geliştirilmesini teşvik ederek tarımsal sistemlerin kuraklık ve düzensiz yağışlara karşı kırılganlığını azaltacak köklü bir dönüşümü teşvik etmektedir.
- Yeni Finansal Akışlar: Yeşil finansman araçlarının ve ulusal karbon kredilendirme sisteminin oluşturulması, uyum ve azaltım projelerine yatırımı kolaylaştırmakta; yeşil finansmana erişim ve karbon piyasalarıyla entegrasyon yoluyla çiftçiler için yeni gelir ve teşvik mekanizmaları yaratmaktadır.

Kanun'un bu potansiyeli somutlaştırması, uygulamadaki bütüncüllük, yerel uyarlama ve adil geçiş politikaları ile mümkün olacaktır. Ancak Kanun'un etkinliği, aşağıdaki kritik yapısal riskler ve dışsal tehditler nedeniyle sınırlanabilir:

- Gıda Güvenliği Tehdidi (Sektörel Baskı): En büyük dışsal tehdit, Emisyon Ticaret Sistemi (ETS) kapsamındaki sanayi sektörlerinin emisyonlarını tarımsal alandan elde edilen karbon kredileriyle denkleştirme potansiyelidir. Bu durum, tarımsal peyzajların temel işlevi olan gıda üretimi yerine, sadece karbon yutağı üretimine odaklanma zorunluluğu yaratarak ulusal gıda güvenliğini riske atmaktadır.
- Adil Geçiş Finansman Uçurumu: Kanun adil geçiş ilkesini vurgulamasına rağmen, küçük üreticilerin yüksek uyum ve teknoloji maliyetlerini karşılamasına yönelik somut ve yeterli finansal destek mekanizmalarının eksikliği önemli bir yapısal risktir. Bu durum, teknolojik ve mali uçurumu derinleştirme potansiyeli taşımaktadır.
- Mevzuat ve Planlama Çatışmaları: Kanun'un mevcut Tarım Kanunu, Mera Kanunu ve teşvik sistemleri ile entegrasyonundaki belirsizlikler, uygulamada bütüncüllüğü tehdit etmektedir. Ayrıca, kentsel yayılım ve Su-Gıda-Enerji sektörleri arasındaki arazi kullanım çatışmalarını çözecek net bir dengeleme mekanizmasının yokluğu, mekânsal baskıları artırmaktadır.

Kanun'un beklenen dönüşümü başarılı bir şekilde gerçekleştirmesi ve riskleri minimize etmesi, sadece yasal metnin varlığına değil, aşağıdaki politik ve operasyonel şartların yerine getirilmesine bağlıdır:

- Bütüncül Yönetim ve Yerel Uyarlama: Merkezi politikaların, bölgesel iklim farklılıklarını ve su bütçesi dengelerini hassasiyetle gözeterek, Yerel İklim Değişikliği Eylem Planları aracılığıyla ve kurumlar arası entegrasyonla uygulanması zorunludur.

- Hedeflenmiş Adil Geçiş Mekanizmalarının Tesisi: Toprak karbonu yönetimi ve biyoçeşitlilik entegrasyonu gibi teknik gerekliliklerin maliyetini dengelemek üzere; kapsamlı çiftçi eğitim programları, bölgesel adaptasyon planları ve küçük üreticiyi gözeten güçlü adil geçiş finansman araçları somut olarak tahsis edilmelidir.

- Gıda Güvenliği Kalkanı ve Politik Önceliklendirme: Sektörel rekabet karşısında Kanun'un, gıda güvenliğini tehdit eden karbon yutağı baskısına karşı tarımsal peyzajların temel işlevini korumaya yönelik net ve kararlı bir politik önceliklendirme sergilenmesi elzemdir. Bu kapsamda, Su-Gıda-Enerji sektörleri arasındaki arazi tahsisi çatışmalarını önleyen şeffaf bir dengeleme mekanizmasının acilen oluşturulması gerekmektedir. Kanunun başarı kriteri, ekolojik hedefler ile ulusal kaynak güvenliği arasındaki dengeyi sağlayabilme yeteneğine bağlıdır.

7552 sayılı İklim Kanunu, tarımsal peyzajlar için yalnızca yeni bir mevzuat değil, geleceğe yönelik bir varoluş sözleşmesidir. Kanun, çiftçinin elindeki toprağı savunmasız bir yükümlülük olmaktan çıkarıp, ulusal direncin ve küresel çözümün canlı arşivi olarak konumlandırma gücüne sahiptir. Bu kritik eşikte, Kanun'un potansiyelinin hayata geçirilmesi, yapısal riskleri göz ardı eden teknik bir görev değil; gıda güvenliğinden toprak sağlığına uzanan, bütüncül bir politik kararlılık gerektiren bir ulusal önceliktir. Eğer Kanun, bürokratik engellere ve sektörel çıkarların baskısına yenilmez, aksine adil geçiş mekanizmalarıyla küçük üreticiyi merkeze alırsa, Türkiye sadece iklim hedeflerine ulaşmakla kalmayacak; aynı zamanda gıda sistemlerinin sürdürülebilirliğini güvence altına alan, ekolojik refahı politikalarının temeline koyan dirençli peyzajlara sahip olacaktır.

ÖZET

Tarım alanları, yalnızca bitkisel üretim yapılan toprak parçaları olmayıp; gıda güvenliği, ekosistem hizmetleri, biyolojik çeşitlilik ve iklim düzenleme fonksiyonları açısından stratejik öneme sahip doğal varlıklardır. Bu nedenle, bu alanların hukuki koruma altına alınması, ekosistem işlevlerinin güvence altına alınması ve doğal sermayenin sürdürülebilir yönetimi açısından hayati önem taşımaktadır. Bu çalışma, tarım alanlarının stratejik önemine karşın, Türkiye'deki mevcut yasal düzenlemelerden kaynaklanan çok katmanlı hukuki kırılganlığını incelemeyi amaçlamaktadır. Çalışma, tarım alanlarının korunmasını düzenleyen 5403 sayılı Toprak Kanunu ile arazi kullanım kararlarını doğrudan etkileyen diğer üç temel kanunun (6306 sayılı Afet Riski Kanunu, 6360 sayılı Bütünşehir Yasası ve 3194 sayılı İmar Kanunu) etkileşimini, "*normatif tutarsızlık ve çatışma, idari takdir yetkisinin genişliği, kurumsal ve yönetsel denetim boşlukları*" gibi kırılganlık bileşenleri üzerinden analiz etmiştir. Yapılan analizde, ilgili dört kanunun birlikte değerlendirilmesi sonucunda, tarım topraklarının mekânsal bütünlüğünü ve ekolojik işlevselliğini tehdit eden yapısal bir risk alanı oluştuğu ortaya konmuştur. Bu kırılganlığın ana kaynakları, 5403 sayılı Kanun'daki 'kamu yararı' belirsizliği, 6306 sayılı Kanun'daki geniş 'rezerv yapı alanı' tanımı, 6360 sayılı Kanun'un yerel yetkiyi zayıflatıcı etkisi ve 3194 sayılı Kanun'un tarım alanlarını 'ikincil unsur' konumuna düşüren hükümleri olarak belirlenmiştir. Bu yasal düzenlemelerin birleşik ve aşındırıcı etkisi, tarım alanlarının hukuki ve mekânsal kırılganlığını derinleştirerek ülkenin uzun vadeli gıda güvencesini ciddi biçimde tehdit etmektedir. Bu yapısal riskleri bertaraf etmek amacıyla, tarım alanlarının sürdürülebilir korunması için mevzuatın bütüncül bir yaklaşımla entegrasyonu zorunludur. Bu bağlamda; afet yönetimi, imar ve yerel yönetim mevzuatının uyumlaştırılması, Toprak Koruma Kurulları'nın (TKK) görüşünün bağlayıcı hâle getirilmesi ve ekosistem temelli planlama ilkelerinin uygulanması gerekmektedir. Bu bütünleşik yaklaşım, tarım alanlarının hukuki ve mekânsal risklere karşı dayanıklılığını artırarak, ekolojik işlevselliğin ve gıda güvencesinin sürdürülmesini güvence altına alabilecektir.

Anahtar Kelimeler: Tarım Alanları, Hukuki Kırılganlık, Afet Yönetimi, Arazi Kullanımı

THE LEGAL VULNERABILITY OF AGRICULTURAL AREAS: TURKIYE EXAMPLE

ABSTRACT

Agricultural areas are not merely patches of land used for crop production; they constitute natural assets of strategic importance in terms of food security, ecosystem services, biodiversity, and climate regulation functions. Therefore, the legal protection of these areas is vital for safeguarding ecosystem functions and ensuring the sustainable management of natural capital. This study aims to examine the multilayered legal vulnerability of agricultural areas in Türkiye, which stems from existing legal regulations, despite their strategic significance. The study analyzed the interaction between the Soil Conservation Law (Law No. 5403), which regulates the protection of agricultural lands, and three other fundamental laws that directly affect land use decisions: the Law on Transformation of Areas under Disaster Risk (Law No. 6306), the Metropolitan Municipality Law (Law No. 6360), and the Zoning Law (Law No. 3194). This analysis utilized vulnerability components such as "normative inconsistency and conflict, broad administrative discretion, and institutional and managerial oversight gaps." The analysis demonstrated that the combined assessment of the four relevant laws creates a structural risk area that fundamentally threatens the spatial integrity and ecological functionality of agricultural lands. The primary sources of this vulnerability were identified as: the ambiguity of 'public interest' in Law No. 5403; the broad definition of 'reserve building areas' in Law No. 6306; the debilitating effect of Law No. 6360 on local authority; and the provisions of Law No. 3194 that relegate agricultural areas to the status of a 'secondary element'. The combined and erosive impact of these legal regulations deepens the legal and spatial vulnerability of agricultural areas, posing a severe threat to the country's long-term food security. To mitigate these structural risks, the holistic integration of legislation is imperative for the sustainable protection of agricultural lands. This requires the harmonization of disaster management, zoning, and local government legislation, making the opinions of the Soil Conservation Boards (TKK) binding, and implementing ecosystem-based planning principles. This integrated approach will bolster the resilience of agricultural areas against legal and spatial risks, thereby securing the continuation of both ecological functionality and food assurance.

Keywords: Agricultural Lands, Legal Vulnerability, Disaster Management, Land Use Policy

1. GİRİŞ

Tarım alanları, yalnızca ekonomik üretim sahaları olmayıp; gıda güvencesi, kırsal kalkınma, ekosistem hizmetleri ve iklim değişikliğine uyum politikalarının merkezinde yer alan stratejik doğal varlıklardır. Bununla birlikte, kentleşme, altyapı yatırımları ve arazi kullanım biçimlerinin değişimi, tarım alanlarını artan biçimde tarım dışı kullanımlara yönlendirmektedir. Bu dönüşüm, üretim kapasitesinde azalmaya, habitat kayıplarına ve ekosistem hizmetlerinde belirgin düşüşlere yol açmaktadır (OECD, 2023; Chen et al., 2024; Mersha et al., 2025). Oysa ki bu alanlar, toprak sağlığının sürdürülmesi, su döngüsünün dengelenmesi, biyolojik çeşitliliğin korunması ve karbon döngüsünün düzenlenmesi gibi çoklu ekosistem hizmetlerinin temel sağlayıcısıdır. Dolayısıyla bu alanların korunması, yalnızca tarımsal üretimin devamı için değil, aynı zamanda ekosistemlerin bütünlüğünün sürdürülmesi ve toplumların uzun vadeli çevresel dirençliliğinin sağlanması için de yaşamsal öneme sahiptir (Foley et al., 2011; Schaub et al., 2025).

Bu alanların sürdürülebilir yönetimi, toprak verimliliğinin, biyolojik çeşitliliğin, su rejimlerinin ve iklim düzenleme süreçlerinin korunması açısından kritik önem taşımaktadır (Camba-Sans et al., 2024; Raveloaritiana & Wanger, 2024). Küresel ölçekte, insanların yaşanabilir gördüğü kara yüzeyinin yaklaşık yarısının tarımsal faaliyetler için kullanıldığı bilinmektedir (Ritchie & Roser, 2019). Bu veri, tarım alanlarının yalnızca ekonomik üretim aracı değil, aynı zamanda ekolojik sistemlerin sürdürülebilirliği ve toplumsal refahın devamlılığıyla doğrudan ilişkili olduğunu göstermektedir.

Bu kapsamda tarım alanlarının sürdürülebilirliğini sağlamak, yalnızca teknik veya çevresel bir mesele değil, aynı zamanda hukuki bir zorunluluktur. Bu bağlamda, arazi koruma mekanizmalarının yasal düzeyde tanımlanması, karar alma süreçlerinde uzun vadeli ekolojik perspektifin benimsenmesini sağlar ve ekonomik ya da altyapısal baskılara karşı etkili bir koruma çizgisi oluşturur. Özellikle hızlı kentleşme, mekânsal olarak verimli tarım topraklarının geri dönüşü güç biçimde kaybedilmesine neden olmaktadır (Seto, Güneralp & Hutyra, 2012). Bu nedenle, mutlak tarım alanı rejimleri, mera koruma hükümleri, çevresel etki değerlendirme süreçleri ve sıkı imar denetimleri gibi planlama araçları, sürdürülebilir arazi yönetimi açısından giderek daha kritik hâle gelmektedir.

Küresel düzeyde, IPCC'nin 2023 tarihli Sentez Raporu (AR6), iklim değişikliği, arazi kullanımı ve gıda güvenliği arasındaki etkileşimi yeniden ele alarak sürdürülebilir arazi yönetimi ve güçlü yönetişim çerçevelerinin gerekliliğini vurgulamaktadır (IPCC, 2023). Benzer biçimde, FAO'nun 2023 tarihli arazi istatistikleri ve mülkiyet yapısı analizleri, arazi kullanım biçimlerinin dönüşümünün ve mülkiyet haklarının korunmasının, tarım alanlarının sürdürülebilirliği açısından belirleyici olduğunu ortaya koymaktadır (FAO, 2023a; FAO, 2023b).

Türkiye özelinde yapılan araştırmalar ve resmi istatistikler de, tarım alanlarının hem nicelik hem de nitelik bakımından önemli bir dönüşüm süreci içinde olduğunu göstermektedir. CORINE ve ulusal arazi örtüsü analizleri, 2000'li yıllardan itibaren tarım arazilerinin kentsel ve yapay kullanımlara dönüştüğünü ortaya koymaktadır. Bayar (2018), 2006–2012 döneminde tarım alanlarının önemli bir kısmının kent ve sanayi kullanımlarına kaydığını tespit etmiştir. Benzer biçimde, il ve ilçe ölçeğinde yapılan CBS tabanlı çalışmalar da (1990–2018) kentleşme ve altyapı projelerinin çevresindeki yüksek verimli tarım topraklarını hızla azalttığını doğrulamaktadır. İklim değişikliğinin etkilerine yönelik ekonometrik incelemeler, artan sıcaklık rejimlerinin tarımsal üretim için uygun alanları daralttığını; her bir derece sıcaklık artışının belirli bölgelerde birkaç yüzde puanlık tarım alanı kaybına neden olabileceğini göstermektedir (Demirdöğen, 2020). Buna paralel olarak, Dinçer ve Aydın'ın (2024) yapısal analizleri, tarım alanlarındaki daralmanın yalnızca mekânsal küçülme değil, aynı zamanda mülkiyet yapılarının,

işletme büyüklüklerinin ve tarım dışı gelir stratejilerinin değişimiyle de yakından ilişkili olduğunu ortaya koymaktadır.

Ülkedeki resmî veriler de bu bulguları desteklemektedir. TÜİK istatistiklerine göre Türkiye'de toplam tarım alanı 2001'de 40.967.000 hektar iken, 2024 itibarıyla 38.640.000 hektara gerilemiştir (TÜİK, 2025). Çevre, Şehircilik ve İklim Değişikliği Bakanlığı'nın kayıtları, 1989–2018 döneminde toplam 2.604.517 hektar tarım arazisinin *"amaç dışı kullanım"* kapsamında elden çıktığını göstermektedir (ÇŞİDB, 2018). Bu eğilim, tarım alanı kaybının artık münferit bir sorun olmaktan çıkarak, gıda güvenliği, kırsal refah ve ekosistem hizmetlerinin sürdürülebilirliği açısından yapısal bir kırılganlık alanına dönüştüğünü ortaya koymaktadır (Tonyaloğlu, 2024).

Dolayısıyla, tarım alanlarının korunması yalnızca çevresel bir gereklilik değil, aynı zamanda hukuki, planlama ve yönetişim boyutlarını içeren çok katmanlı bir politika alanıdır. Türkiye'de bu alanların yasal çerçevesi esas olarak 5403 sayılı "Toprak Koruma ve Arazi Kullanımı Kanunu" ile tanımlanmakla birlikte, 6306 sayılı "Afet Riski Altındaki Alanların Dönüştürülmesi Kanunu" ve 6360 sayılı "On Dört İlde Büyükşehir Belediyesi ve Yirmi Yedi İlçe Kurulmasi İle Bazı Kanun ve Kanun Hükmünde Kararnamelerde Değişiklik Yapılmasına Dair Kanun-Bütünşehir Yasası" ile 3194 sayılı "İmar Kanunu" gibi düzenlemeler de arazi kullanım kararlarını doğrudan etkilemektedir.

Bu bağlamda, çalışmanın temel amacı, Türkiye'de tarım alanlarının hukuki kırılganlık dinamiklerini ilgili mevzuat çerçevesinde sistematik olarak analiz etmektir. Araştırmada, mevcut yasal düzenlemeler ışığında tarım topraklarının mekânsal planlama, imar uygulamaları ve merkezi–yerel yönetim kararları karşısında karşılaşabileceği potansiyel riskler değerlendirilmekte; bu alanların sürdürülebilirlik açısından taşıdığı stratejik önem vurgulanmaktadır. Çalışma, tarım alanlarının korunması, gıda güvenliği-güvencesinin güçlendirilmesi ve ekolojik işlevlerin sürdürülmesi yönünde mevzuatın geliştirilmesine ve politika yapım süreçlerine katkı sunmayı amaçlamaktadır.

2. MATERYAL VE YÖNTEM

2.1. Materyal

Çalışmada tarım alanlarının hukuki kırılganlığını analiz etmek için birincil materyal olarak dört temel kanun ve bu kanunlarla ilişkili idari/kurumsal yapılar materyal olarak kullanmıştır. Çalışmada mevzuat metinlerini ve bunların birbiriyle etkileşimi ana veri kaynağı olarak değerlendirilmiştir. Çalışmada hukuki metinlerin dışında, tarım alanlarının kırılganlığını desteklemek amacıyla bilimsel literatür ve resmi veriler kullanmıştır. Çalışmanın birincil materyallerini

- 5403 sayılı Toprak Koruma ve Arazi Kullanımı Kanunu (RG, 2005)
- 6306 sayılı Afet Riski Altındaki Alanların Dönüştürülmesi Hakkında Kanun (RG, 2012a)
- 6360 sayılı On Dört İlde Büyükşehir Belediyesi ve Yirmi Yedi İlçe Kurulması ile Bazı Kanun ve Kanun Hükmünde Kararnamelerde Değişiklik Yapılmasına Dair Kanun (Bütünşehir Yasası) (RG, 2012b)
- 3194 sayılı İmar Kanunu (RG, 1985) oluşturmaktadır.

2.2. Yöntem

Çalışma, tarım alanlarının karşı karşıya kaldığı riskleri hukuki düzenlemeler zemininde inceleyen bir yöntem benimsemiştir. İncelemenin temelini, bir varlığın (bu çalışmada tarım alanlarının) mevcut yasal ve yönetsel sistemler içinde korunmasız kalma, baskılara karşı

dirençsiz olma ve olumsuz sonuçlara maruz kalma olasılığını ifade eden çok boyutlu bir kavram olan "Hukuki Kırılganlık" oluşturmaktadır.

Arazi yönetimi bağlamında, hukuki kırılganlık; araziyi koruma amacı taşıyan bir yasanın, başka bir yasa veya idari karar alma süreçleri tarafından kolayca aşılabilmesi veya etkisizleştirilebilmesi durumu olarak özetlenmiştir.

Hukuki kırılganlık, Türkiye mevzuatının birbiriyle etkileşiminden doğan üç ana bileşen üzerinden incelenmiştir:

- Normatif Tutarsızlık ve Çatışma: Farklı yasal düzenlemelerin aynı mekânsal alan üzerinde çelişen veya birbirini dışlayan hükümler içermesidir. Örnek olarak, 6306 sayılı Kanun'un tarım alanlarını rezerv yapı alanı olarak kullanma potansiyeli ile 5403 sayılı Kanun'un tarım dışı kullanım sınırlamaları arasındaki gerilim gösterilmiştir.

- İdari Takdir Yetkisinin Genişliği: Yasa metinlerindeki belirsiz veya geniş tanımlamaların ("kamu yararı," "zorunluluk," "rezerv alan") merkezi veya yerel idareye sınırsız denebilecek bir karar alma esnekliği tanımasıdır. Bu durum, koruma kararlarının bilimsel verilerden ziyade siyasi veya ekonomik önceliklere göre alınmasına zemin hazırlar. Örnek, 5403 sayılı Kanun'un 13. Maddesi'ndeki "kamu yararı" kavramının belirsizliği ve 3194 sayılı Kanun ile belediyelere devredilen geniş planlama yetkisi.

- Kurumsal ve Yönetsel Denetim Boşlukları: Yatay (kurumlar arası entegrasyon) ve dikey (merkezi-yerel yönetim) düzeylerde denetim ve eşgüdüm mekanizmalarının yetersiz kalmasıdır. Buna örnek olarak, Toprak Koruma Kurulları'nın (TKK) kararlarının bağlayıcı olmaması (5403 sayılı Kanun) ve 6360 sayılı Kanun ile yerel tarımsal inisiyatifin zayıflaması gösterilmiştir.

Çalışma, bu üç temel bileşenin çok katmanlı ve sistemik etkileşimi olarak Türkiye örneği üzerinden tarım alanlarının hukuki kırılganlığını analiz etmektedir.

3. BULGULAR

3.1. 5403 sayılı Toprak Koruma ve Arazi Kullanımı Kanunu (2005)

2005 yılında yürürlüğe giren 5403 sayılı Toprak Koruma ve Arazi Kullanımı Kanunu, Türkiye'de toprak kaynaklarının korunması ve sürdürülebilir yönetimine ilişkin temel yasal dayanağı oluşturmaktadır. Kanunun genel amacı, tarım topraklarının korunmasını, verimliliklerinin artırılmasını ve tarım dışı kullanımların sınırlandırılmasını sağlamaktır (Madde 1). Bununla birlikte, uygulamada ortaya çıkan kavramsal esneklikler, idari yetki paylaşımındaki dengesizlikler ve diğer mevzuatlarla uyum eksiklikleri, bu yasanın koruma kapasitesini sınırlamaktadır.

Kamu Yararı Kavramının Belirsizliği ve Madde 13'ün Esnek Yorumu: Yasada kamu yararı kavramının net olmaması, uygulamada tartışmalı bir alan olarak öne çıkmaktadır. Madde 13, tarım arazilerinin "kamu yararı" gerekçesiyle tarım dışı kullanımına izin verebilmektedir; ancak *"kamu yararı"* ve *"zorunluluk"* kavramlarının açık tanımları bulunmadığından, idari otoritelerin takdir yetkisi genişleyebilmektedir. Bu durum, özellikle enerji, ulaşım veya savunma yatırımları bağlamında tarım arazilerinin kullanımının kolaylaşmasına ve koruma amacının görece zayıflamasına yol açabilir.

Tarım Arazilerinin Sınıflandırılması (Madde 5) ve Uygulama Sorunları: Madde 5, tarım arazilerini "mutlak, özel ürün, dikili, marjinal ve örtü altı" olarak sınıflandırarak bilim temelli bir arazi yönetimi öngörmektedir. Bununla birlikte, uygulamada bu sınıflandırmanın 3194 sayılı İmar Kanunu çerçevesinde yapılan planlarla tam olarak bütünleşmemektedir. Bu durum, planlama bütünlüğünü azaltabilir ve koruma etkinliğini sınırlayabilir.

Toprak Koruma Kurulları ve Kurumsal Denetim (Madde 14): Toprak Koruma Kurulları teorik olarak denetim ve bilimsel rehberlik sağlamayı hedeflemektedir. Ancak kararlarının bağlayıcı olmaması ve merkezi idareye yoğunlaşan yetki, yerel bilgiye dayalı karar süreçlerini zayıflatabilir ve siyasal önceliklerin etkili olabileceği bir alan yaratabilir.

Tarım Dışı Kullanım İzinleri ve Bakanlık Yetkisi (Madde 13 ve 14): Tarım dışı kullanım izinlerinde merkeziyetçi bir yapı hâkim görünmektedir. Yerel ekolojik ve sosyoekonomik verilerin her zaman dikkate alınmadığı durumlarda, büyük ölçekli altyapı ve enerji projeleri tarımsal koruma hedeflerinin önüne geçebilir.

Arazi Parçalanmasının Önlenmesi (Madde 8) ve Sosyoekonomik Etkiler: Madde 8, tarım arazilerinin ekonomik işletme büyüklüğünün altına düşmesini engellemeyi amaçlamaktadır; ancak miras hukuku ve yerel sosyo-kültürel koşullar, arazi bütünlüğü hedefiyle her zaman uyumlu olmayabilir ve kırsal göç veya mülkiyet uyuşmazlıklarına yol açabilir.

Toprak Kalitesinin Korunması ve Bozulmanın Önlenmesi (Madde 9–11): Erozyon, tuzluluk ve kirlilikle mücadele önlemleri öngörülse de, finansal ve teknik kapasite sınırlamaları nedeniyle uygulamada etkisi sınırlı kalabilir; bu durum toprağın sürdürülebilir yönetimini görece zayıflatabilir.

Diğer Yasal Düzenlemelerle Entegrasyon Sorunları: 5403 sayılı Kanun'un, İmar Kanunu (3194), Mera Kanunu (4342), Büyükşehir Belediyesi Kanunu (5216) ve 6360 sayılı Bütünşehir Yasası ile yeterince bütünleşememesi, tarım alanlarının imara açılmasını kolaylaştıran bir ortam yaratmaktadır. Özellikle köylerin mahalleye dönüşmesiyle belediye imar yetkisinin genişlemesi, 5403 sayılı Kanun'un öngördüğü koruma mekanizmalarını fiilen etkisiz hale getirebilir. Ayrıca ÇED süreçleri, tarım topraklarının ekolojik değeri ve üretim kapasitesi dikkate alınmadan yürütüldüğünde, çevresel ve tarımsal koruma politikaları arasında kopukluk oluşmaktadır. Ulusal İklim Değişikliği Stratejisi (2010–2023) ve Türkiye İklim Kanunu (2025) gibi güncel politika belgeleriyle entegrasyon eksikliği, toprağın karbon depolama ve iklim düzenleyici işlevlerini göz ardı etmektedir.

Sonuç olarak 5403 sayılı Kanun, tarım arazilerini koruma hedefi taşısa da; Madde 13'teki esneklik, Madde 14'teki denetim sınırlılığı ve Madde 8'in sosyoekonomik uyumsuzlukları, uygulamada koruma kapasitesini azaltabilir. Yasaların entegrasyon eksikliği ve merkeziyetçi yapı, tarım alanlarının mekânsal bütünlüğü, ekolojik işlevselliği ve gıda güvenliği açısından riskler oluşturabilir. Bu nedenle, Kanun'un ekolojik bütünlük, iklim uyumu, yerel katılım ve planlama entegrasyonu ilkeleri doğrultusunda güncellenmesi, uzun vadeli toprak koruma stratejileri açısından olası bir gerekliliktir (Resmi Gazete, 2005).

3.2. 6306 sayılı "Afet Riski Altındaki Alanların Dönüştürülmesi Hakkında Kanun" (2012)

2012 yılında yürürlüğe giren 6306 sayılı "Afet Riski Altındaki Alanların Dönüştürülmesi Hakkında Kanun", Türkiye'de afet risklerinin azaltılması, güvenli yaşam alanlarının oluşturulması ve riskli yapı stokunun dönüştürülmesi amacıyla kabul edilmiştir. Ancak Kanun'un uygulama alanına ilişkin kavramsal esneklikleri ile kentsel dönüşüm araçlarının tarım alanlarını da kapsayacak biçimde genişletilmesi, özellikle tarım topraklarının korunması açısından ciddi hukuki ve mekânsal kırılganlıklar doğurmaktadır.

Afet Riski Kavramının Geniş Yorumu ve Tarım Alanlarının Dönüşüm Alanı Olarak Değerlendirilmesi (Madde 2 ve Madde 3): Kanun'un 2. maddesinde "riskli alan" ve "rezerv yapı alanı" kavramları tanımlanmaktadır. Bu alanlar, afet riski taşıyan bölgeleri veya yeni yerleşim alanı olarak kullanılabilecek sahaları kapsamaktadır. Madde 3/1'e göre, rezerv yapı alanı yalnızca riskli bölgelerle sınırlı olmayıp Bakanlık tarafından uygun görülen diğer alanları da kapsayabilmektedir. Bu geniş tanım, tarım topraklarının rezerv yapı alanı olarak ilan edilmesine ve konut, sanayi veya altyapı projelerine tahsis edilmesine potansiyel olarak imkân

tanıyabilir. Özellikle büyükşehir çeperlerinde yer alan verimli tarım arazileri, düşük afet riski taşısalar dahi konumsal cazibeleri nedeniyle rezerv yapı alanı olarak belirlenebilir; bu durum, 5403 sayılı Kanun'un tarım dışı kullanım sınırlamalarıyla olası bir gerilime yol açabilir.

"Kamu Yararı" Gerekçesiyle Tarım Alanlarının Dönüştürülmesi (Madde 6 ve Madde 7): Madde 6 kapsamında dönüşüm alanlarının ilanı kamu yararı ilkesine dayandırılmaktadır. Ancak kamu yararının tarımsal üretim, gıda güvenliği veya ekolojik sürdürülebilirlik bağlamında net bir şekilde tanımlanmamış olması, bu kavramın çoğunlukla konut, altyapı veya kentsel büyüme odaklı yorumlanmasına yol açabilir. Madde 7 ise Hazine veya kamu mülkiyetindeki taşınmazların Bakanlık tarafından doğrudan tahsisine potansiyel imkân tanıyabilir; bu durum, tarım arazilerinin kamu mülkiyetinde olsa dahi rezerv alanlara dönüştürülmesini mümkün kılabilir ve 5403 sayılı Kanun'un koruma ilkesiyle uyumsuzluk yaratabilir.

Planlama Hiyerarşisi Dışında İşleyen Dönüşüm Süreçleri (Madde 9 ve Madde 10): Kanun'un 9. ve 10. maddeleri, rezerv yapı alanlarına ilişkin planlama süreçlerinde mevcut hiyerarşiye muafiyet tanıyabilir. Madde 9/1, Bakanlığa her ölçekte plan yapma veya yaptırma yetkisi sağlayarak, 3194 sayılı İmar Kanunu'ndaki plan kademelenmesini potansiyel olarak devre dışı bırakabilir. Bu durum, tarım alanlarının parçalı ve plansız biçimde yapılaşmasına yol açabilir.

Tarımsal Üretim Alanlarının Rezerv Alan Olarak Tahsisi ve Mekânsal Parçalanma (Madde 2c ve Madde 10/2): Bakanlığa tanınan geniş takdir yetkisi, tarımsal üretim kuşakları içindeki alanların rezerv yapı alanı ilan edilmesini potansiyel olarak mümkün kılabilir. Bu süreç tarımsal bütünlüğün bozulmasına, sulama altyapılarının ve ekolojik bağlantıların kesintiye uğramasına yol açabilir. Tarım alanlarının rezerv alan kapsamına alınması, yalnızca fiziksel dönüşüm değil, aynı zamanda gıda güvenliği, kırsal ekonomi ve arazi bütünlüğü üzerinde uzun vadeli etkiler yaratabilir.

Afet Yönetimi ve Tarım Arazisi İlişkisinde Planlama Tutarsızlıkları: Kanun afet risklerini azaltmayı hedeflese de, afet sonrası yeniden yerleşim planlamasında tarım topraklarının güvenli zemin olarak kullanılması, potansiyel olarak ekolojik sürdürülebilirliği ve tarımsal üretim kapasitesini olumsuz etkileyebilir.

Diğer Yasal Düzenlemelerle Entegrasyon Sorunları: 6306 sayılı Kanun, 5403, 3194 ve 6360 sayılı yasalarla uygulama açısından uyumlu değildir. 5403 sayılı Kanun, tarım dışı kullanım izinlerini Toprak Koruma Kurulları'na bağlarken, 6306 sayılı Kanun merkezi idareye devrederek kurumsal denetimi sınırlamaktadır. 3194 sayılı Kanun açısından, 6306 kapsamındaki planlar imar planı niteliğinde değerlendirilmektedir; ancak plan bütünlüğü, kamu katılımı ve çevresel değerlendirme süreçleri çoğu zaman işletilmemektedir. 6360 sayılı Kanun sonrasında büyükşehir belediyelerinin planlama yetkileri 6306 kapsamındaki alanlarda sınırlandırılmış; böylece yerel yönetimlerin tarım alanları üzerindeki karar süreçlerindeki etkisi azalmıştır. Bu durum, Türkiye'de planlama sisteminin bütüncül bir yaklaşım yerine projeye dayalı işlediğini ve tarım alanlarının korunacak kaynak yerine dönüşüm rezervi olarak konumlandığını göstermektedir.

Sonuç olarak 6306 sayılı Kanun, afet risklerini azaltmayı amaçlasa da, tanımsal esneklik ve planlama hiyerarşisinden bağımsız işleyişi nedeniyle tarım topraklarının sürdürülebilirliği üzerinde potansiyel riskler oluşturabilir. Rezerv yapı alanı kavramının belirsizliği, kamu yararının kentsel öncelikler lehine yorumlanması ve entegrasyon eksiklikleri, tarım alanlarını sistematik olarak risk altına sokabilir. Bu nedenle, Kanun'un 5403 ve 3194 sayılı yasalarla uyumlu hâle getirilmesi, tarım topraklarının mutlak koruma alanı olarak tanımlanması ve Toprak Koruma Kurulları'nın görüşlerinin bağlayıcı hale getirilmesi, gıda güvenliği ve ekolojik dayanıklılık açısından olası kritik önlemler olarak değerlendirilebilir (Resmi Gazete 2012a).

3.3. 6360 Sayılı "On Dört İlde Büyükşehir Belediyesi ve Yirmi Yedi İlçe Kurulması ile Bazı Kanunlarda Değişiklik Yapılmasına Dair Kanun" (2012)

2012 yılında Resmî Gazete'de yayımlanarak 30 Mart 2014 yerel seçimleri sonrasında yürürlüğe giren 6360 sayılı Kanun, Türkiye'de yerel yönetim sistemini köklü biçimde dönüştüren en kapsamlı idari düzenlemelerden biridir. Kanun'un temel amacı, idari bütünleşmeyi sağlamak, hizmet sunumunda etkinliği artırmak ve kaynak kullanımını rasyonelleştirmektir. Ancak bu düzenleme, kırsal alanların statüsünü kaldırarak onları büyükşehir belediyesi sınırlarına dâhil etmesi nedeniyle, tarım topraklarının korunması, kırsal kalkınma ve ekolojik sürdürülebilirlik açısından ciddi kırılganlıklar yaratmıştır.

Kırsal Statünün Ortadan Kalkması ve Tarım Alanlarının İmar Baskısına Açılması: Kanun'un 1. ve 4. maddeleri, büyükşehir belediyesi sınırlarını il mülki sınırlarına genişletmiş ve köy ile belde belediyelerinin tüzel kişiliklerini kaldırarak yerleşimleri mahalle statüsüne dönüştürmüştür. Bu değişikliğin, köylerin arazi yönetim özerkliğini azaltabileceği ve tarımsal nitelikli arazilerin belediye imar mevzuatı kapsamına alınmasını kolaylaştırabileceği düşünülmektedir. Dolayısıyla, 5403 sayılı Kanun'daki tarım dışı kullanım izinlerinin dolaylı olarak aşılma olasılığı ve tarım alanları üzerindeki kentsel gelişme baskısının artması potansiyel bir risk olarak değerlendirilebilir.

Yerinden Yönetimin Zayıflaması ve Tarımsal Karar Yetkisinin Merkezileşmesi: Kanun'un 3. maddesi ve Geçici Madde 2, köy idarelerinin yetki ve görevlerini belediyelere devretmiştir. Bu durumun, mera tahsisleri, üretim kararları ve arazi kullanımı konularında yerel inisiyatifin azalmasına ve karar süreçlerinin belediye ile merkezi idare arasında yoğunlaşmasına yol açabileceği öngörülmektedir.

Belediye Hizmetlerinin Tarımsal Öncelikleri İkincilleştirmesi: 6. madde uyarınca büyükşehir belediyelerine kırsal alanlarda hizmet sağlama yükümlülüğü verilmiş olsa da, uygulamada altyapı ve imar yatırımlarının öncelik kazanması muhtemeldir ve bu durum tarımsal üretim ve kırsal kalkınma projeleri ikincil plana itilebilir. Bu durum, kırsal alanlarda kurumsal öncelik kaymasına ve tarımsal üretim kapasitesinin desteklenmesinde boşluklara yol açabilir.

Arazi Mülkiyetinde Belirsizlik ve Ortak Alanların Hukuki Statüsünün Erozyonu: Köy tüzel kişiliklerinin kaldırılmasıyla köy ortak mallarının mülkiyetinin belediye veya Hazine'ye devri, idari belirsizlikler ve mülkiyet ihtilaflarına yol açabilir. Bu durum, tarım arazilerinin tahsis amacına uygun kullanılmasını sınırlayabilir ve imar veya kamu projelerine tahsis riskini artırabilir.

Kırsal Kültürün ve Tarımsal Kimliğin Zayıflaması: Mahalle statüsüne geçiş, kırsal üretim kültürünün ve topluluk kimliğinin görünürlüğünü azaltabilir; imece, ortak üretim ve kooperatifleşme gibi yerel dayanışma pratiklerinin zayıflaması olasıdır. Tarımsal bilgi aktarımı ve yerel örgütlenme kapasitesinde potansiyel düşüşler, sosyo-kültürel sürdürülebilirliği etkileyebilir.

Kentsel Yayılmanın Tarım Alanları Üzerindeki Mekânsal Etkileri: Yasanın 7. madde ile büyükşehir belediyelerine il düzeyinde planlama yetkisi verilmesi, kentsel gelişmenin tarım arazilerine doğru genişlemesini kolaylaştırabilir. Bu süreç, tarım alanlarının potansiyel rezerv alan olarak değerlendirilmesine ve "mutlak tarım arazilerinin korunması" ilkesinin etkinliğinin azalmasına yol açabilir.

Tarımsal Altyapı ve Sulama Sistemlerinde Kurumsal Zayıflama: Kırsal altyapının belediyelere devri, teknik ve mali kapasite yetersizlikleri nedeniyle boşluklar oluşturabilir; sulama yatırımlarının sürekliliği ve tarımsal verimlilik olası olarak etkilenebilir.

Arazi Koruma Mevzuatının Uygulama Etkinliğinin Azalması: Toprak Koruma Kurulları'nın büyükşehir düzeyine taşınması ve belediye önceliklerinin tarımsal korumayı ikincil plana itmesi, koruma politikalarının etkinliğini sınırlayabilir ve 5403 sayılı Kanun'daki "tarım topraklarının kamu yararı dışında amaçlarla kullanılmaması" ilkesini zayıflatabilir.

Sonuç olarak 6360 sayılı Kanun, kırsal alanların belediye yönetimine dâhil edilmesi ve hizmet etkinliğini artırma hedefi taşısa da, tarımsal sürdürülebilirlik ve gıda güvenliği açısından yapısal kırılganlıklar oluşturabilir. Kentsel planlama yaklaşımının kırsal alanlara genişletilmesi, tarım topraklarının imar ve yatırım faaliyetlerine açılmasını kolaylaştırabilir; bu durum, 5403 sayılı Kanun ile öngörülen koruma ilkeleriyle potansiyel çelişki oluşturabilir. Dolayısıyla, Kanun'un tarımsal arazi yönetimiyle uyumlu biçimde yeniden düzenlenmesi, Türkiye'nin ekolojik planlama, tarımsal üretim güvenliği ve iklim dayanıklılığı açısından stratejik bir gereklilik olarak değerlendirilebilir (Resmi Gazete, 2012b).

3.4. 3194 sayılı İmar Kanunu (1985)

1985 yılında yürürlüğe giren 3194 sayılı İmar Kanunu, Türkiye'de mekânsal planlama, arazi kullanımı ve yapılaşma süreçlerini düzenleyen temel yasal çerçeve olarak kabul edilmektedir. Kanun'un öncelikli amacı yerleşim alanlarının planlı gelişimini desteklemek olsa da, tarım topraklarının korunmasına dair doğrudan bir hüküm içermemesi, uygulamada bu alanların imar baskısına maruz kalma olasılığını artırabilir. Bu durum, özellikle 5403 sayılı Toprak Koruma ve Arazi Kullanımı Kanunu ve 6360 sayılı Büyükşehir Yasası ile birlikte değerlendirildiğinde, Türkiye'de tarımsal alanların planlama sistemine entegrasyonunda bazı yapısal zorlukların var olabileceğini göstermektedir.

Planlama Yetkisi ve Tarım Alanlarının İmar Alanlarına Dönüştürülmesi (Madde 8 ve Madde 9): Kanun'un 8. maddesi, imar planlarının hazırlanması, onaylanması ve yürürlüğe konulması yetkisini büyük ölçüde belediyelere ve il özel idarelerine bırakmaktadır. Bu düzenleme kapsamında, nazım ve uygulama imar planları hazırlanırken tarım alanlarının imar sınırına dâhil edilmesi olasıdır. Ayrıca 9. madde, Çevre, Şehircilik ve İklim Değişikliği Bakanlığı'na gerektiğinde resen plan yapma veya onama yetkisi tanımaktadır. Bu durum, merkezi idareye geniş bir takdir alanı sağlamakta ve kimi durumlarda tarımsal koruma önceliklerinin planlama kararları karşısında geri planda kalmasına yol açabilmektedir. Dolayısıyla, 5403 sayılı Kanun'un 13. ve 14. maddelerinde öngörülen tarım dışı kullanım izinlerinin sınırlandırılması ilkesiyle bir gerilim alanı oluşabileceği söylenebilir.

Kamu Yararı Kavramı Altında Tarım Alanlarının İmar Amaçlı Kullanımı (Madde 5 ve Madde 11): Madde 5'te yer alan "kamu yararı" kavramı, planlama kararlarının temel gerekçesi olarak öne çıkmaktadır. Bununla birlikte, kamu yararının içeriği tarımsal üretim, gıda güvenliği veya ekosistem hizmetleri açısından açık biçimde tanımlanmadığı için, çoğu zaman kentsel gelişme, sanayi yatırımı veya altyapı projeleri lehine yorumlanabilmektedir. Benzer şekilde, Madde 11 kapsamında kamu hizmetlerine ayrılan alanların imar planlarıyla belirlenmesi, tarımsal üretim alanlarının planlı biçimde el değiştirmesine imkân sağlayabilir. Bu nedenle, iki yasa arasında normatif bir tamamlayıcılık öngörülmüş olsa da, uygulamada tarım alanlarının korunma ilkesinin tam olarak güvence altına alınmadığı gözlenebilir.

Plansız Alanlar Yönetmeliği ve Tarım Alanlarının Kapsam Dışı Kalması (Madde 27): Madde 27, plansız alanlarda yapılacak yapılarla ilgili düzenlemeler içermektedir. Bu madde kapsamında, köy yerleşik alanlarında belirli koşullarda yapılaşmaya izin verilmesi olasıdır. Özellikle 6360 sayılı Kanun sonrasında köylerin mahalle statüsüne dönüştürülmesiyle birlikte, bu hüküm tarımsal alanlarda kentsel yapılaşmanın hukuki dayanaklarından biri hâline gelebilir. Dolayısıyla tarım dışı faaliyetlerin (örneğin depo, konut, küçük ölçekli sanayi yapıları) artışı, tarım alanlarının parçalanmasına ve verim kaybına yol açabilir; kırsal peyzajın bozulma riski de gündeme gelebilir.

Planlama Kademeleri Arasındaki Uyum Eksikliği ve Tarımsal Alanların Entegrasyon Sorunu (Madde 6 ve Madde 8): Madde 6 ve Madde 8, mekânsal planlama kademelerini (çevre düzeni, nazım, uygulama imar planları) tanımlamaktadır. Bununla birlikte, bu planlama hiyerarşisi içinde tarım alanlarının korunmasına yönelik özel bir plan türü öngörülmemektedir. Bu durum, 5403 sayılı Kanun kapsamında hazırlanan Toprak Koruma Projeleri ile çevre düzeni planları arasında kurumsal eşgüdüm eksikliğine yol açabilir. Nitekim, 1/100.000 ölçekli çevre düzeni planlarında tarım alanlarının korunma bölgesi olarak belirlenmiş olması, alt ölçekli planlarda (1/5000 ve 1/1000) bu kararların imar uygulamalarıyla kısmen aşılabileceği olasılığını ortaya koymaktadır. Böylece, tarım topraklarının planlama sistemine dikey entegrasyonu sınırlı kalabilmektedir.

Afet ve Yeniden Yapılanma Süreçlerinde Tarım Alanlarının Kullanımı (Madde 9 ve Madde 18): Madde 18, parselasyon işlemlerine ilişkin düzenlemeler getirerek, kamu hizmeti veya yapılaşma amacıyla tarım arazilerinin ifraz ve tevhit yoluyla el değiştirmesine olanak tanıyabilir. Ayrıca Madde 9, Bakanlığa "resen plan yapma" yetkisi vermektedir; bu nedenle, özellikle afet sonrası yeniden yapılanma süreçlerinde tarım topraklarının hızlı biçimde imara açılması ihtimali söz konusu olabilir. Bu durum, afetzede yerleşimleri veya geçici barınma alanları kapsamında tarım arazilerinin kalıcı olarak kaybedilmesine yol açabilir.

Tarım Alanlarının Koruma Statüsünün Planlama Sisteminde İkincilleşmesi: 3194 sayılı Kanun, tarımsal koruma hedeflerini doğrudan düzenlememekte; arazi kullanım kararlarını daha çok imar odaklı olarak şekillendirmektedir. Tarım alanlarının korunmasına yönelik bağlayıcı dayanak, 5403 sayılı Toprak Koruma Kanunu veya 4342 sayılı Mera Kanunu hükümlerinin plan kararlarına entegrasyonu ile sağlanabilir. Ancak uygulamada bu entegrasyon sınırlı kalmakta, imar planları çoğu zaman tarım dışı kullanım izni alınmadan hazırlanmakta ve Toprak Koruma Kurulları sonradan devre dışı kalabilmektedir. Bu nedenle, tarım arazileri planlama sisteminde ikincil veya tali bir unsur olarak konumlanabilir.

Sonuç olarak 3194 sayılı İmar Kanunu, yerleşim planlamasının hukuki çerçevesini sağlamakla birlikte, tarım alanlarının korunması açısından doğrudan bir garanti sunmamaktadır. Kanunun esnek kamu yararı tanımı ve belediyelere geniş planlama yetkisi tanıması, tarım topraklarının planlı kentsel genişleme süreçlerinde el değiştirme olasılığını artırabilir. Bu nedenle, tarım alanlarının mekânsal planlama kademelerinde koruma öncelikli bir kategori olarak tanımlanması, imar planı onay süreçlerinde Toprak Koruma Kurulları'nın görüşünün zorunlu hâle getirilmesi ve ekosistem temelli planlama anlayışının kurumsallaştırılması önerilebilir (Resmi Gazete, 1985).

4. SONUÇ VE ÖNERİLER

Türkiye'de tarım topraklarının korunması, hem ulusal gıda güvenliği hem de ekolojik sürdürülebilirlik açısından kritik öneme sahiptir. Bu çalışma, Türkiye'de tarım alanlarının korunmasının mevcut hukuki çerçevede çeşitli kırılganlıklara sahip olduğunu göstermektedir. 5403 sayılı Toprak Koruma ve Arazi Kullanımı Kanunu, tarım topraklarının korunması için temel bir normatif çerçeve sağlamakla birlikte, merkeziyetçi izin süreçleri ve diğer mevzuatlarla uyum eksiklikleri nedeniyle uygulamada sınırlı etkiye sahiptir. 6306 sayılı Afet Riski Altındaki Alanların Dönüştürülmesi Hakkında Kanun ve 3194 sayılı İmar Kanunu, tarım alanlarının planlama ve imar süreçlerinde "kamu yararı" ve afet gerekçesiyle dönüşümüne olanak tanımakta, bu durum hukuki ve mekânsal kırılganlıkları artırmaktadır. 6360 sayılı Büyükşehir Belediyesi Kanunu ise kırsal idari yapıların ortadan kalkması ve tarım alanlarının belediye planlama yetkisine dâhil edilmesiyle yerel katılım ve tarımsal karar alma mekanizmalarını zayıflatmaktadır.

Buna bağlı olarak, tarım alanlarının korunmasına yönelik politika ve uygulamalarda bütüncül bir yaklaşım geliştirilmesi gerekmektedir. Öncelikle, tarım topraklarının kaybını önleyici

mekanizmalar, merkezi ve yerel düzeyde planlama süreçlerine entegre edilmelidir. Afet sonrası yeniden yapılanma ve kentsel dönüşüm süreçlerinde tarım alanları öncelikli olarak korunmalı, riskli bölgelerde alternatif yerleşim alanları belirlenmelidir. Büyükşehir ve ilçe belediyeleri, planlama kararlarında tarım alanlarının korunmasına özel stratejiler geliştirmeli, bu alanların imara açılması yalnızca zorunlu ve geçici durumlarla sınırlı olmalıdır. Ayrıca, çiftçiler, yerel halk ve sivil toplum kuruluşlarının sürece dâhil edilmesiyle toplumsal katılım güçlendirilerek, denetim ve uygulama kapasitesi artırılmalıdır. Tarımsal üretimi destekleyen ekonomik ve yönetsel teşvikler de tarım alanlarının sürdürülebilir korunmasına katkı sağlayacaktır. Sonuç olarak, Türkiye'de tarım alanlarının hukuki, mekânsal ve toplumsal boyutları dikkate alan bütüncül bir yaklaşım ile korunması, ülkenin gıda güvenliği, kırsal kalkınma ve ekosistem sağlığı açısından stratejik bir zorunluluk olarak ortaya çıkmaktadır.

ABSTRACT

This study was conducted in Yeniköy village, Babaeski district, Kırklareli province, in 2022-23, and aimed to compare two different rapeseed (Brassica napus L.) varieties in terms of yield components. The Agromar Clavier CL and Dekalb DK Exstorm varieties were used as materials in the experiment; yield components such as plant height, number of side branches, thousand-seed weight, number of pods, and number of seeds per pod were evaluated. According to the findings obtained in the study, which was conducted in a randomized block design with three replications, statistically significant differences were found between the varieties in terms of plant height, number of pods, and number of seeds per pod. The Dekalb DK Exstorm variety stood out with its longer plant height (105.1 cm), higher number of capsules (1,201.2 capsules), and higher number of seeds per capsule (33,182.3 seeds). In contrast, the Agromar Clavier CL variety achieved higher values in terms of side shoot number (7.07). No significant difference was observed between the two varieties in terms of thousand-seed weight. The results indicate that the Dekalb DK Exstorm variety has a higher yield potential under regional conditions and, therefore, its production could be suitable for widespread cultivation in the region.

Keywords: Rapeseed, *Brassica napus* L., variety comparison, yield, number of pods

INTRODUCTION

Rapeseed (*Brassica napus* L.) is among the oilseed crops of strategic importance worldwide for both human nutrition and industrial use. Thanks to its high vegetable oil content, it is widely used in the food industry; at the same time, the meal obtained is used as animal feed. Rapeseed oil is among the oils recommended for health due to its low saturated fat content and high oleic acid content; it is also used in energy-related applications such as biodiesel production (Keskin and Yılmaz, 2019).

Canada, China, India, and European Union countries lead the world in rapeseed production. Turkey, despite its production potential in this area, has not yet reached the desired level. However, in recent years, an increase in production areas has been observed, particularly in the Thrace Region, and as a result of this increase, rapeseed cultivation is becoming more integrated into the agricultural production pattern (Çalışkan et al., 2021). Factors such as crop losses due to climate change, the need for crop rotation, and government subsidies appear to have contributed to this development.

Rapeseed production in Turkey is generally carried out in Thrace, Southern Marmara, and to a lesser extent in some regions of the Aegean and Black Sea. Winter rapeseed varieties are preferred in these regions, and their resistance to low temperatures makes them suitable for crop rotation, which is an important advantage for producers. There are many areas in the Thrace Region that are suitable for rapeseed cultivation in terms of soil structure and climatic conditions. Kırklareli province is among these regions, and production there is increasing. However, variety selection is mostly based on traditional knowledge or producer preferences; systematic studies to determine the most suitable variety for the region remain limited (Albayrak and Gürbüz, 2020).

Among rapeseed varieties, there are significant differences in many characteristics such as grain yield, oil content, plant height, maturation period, and oil quality. These differences arise not only from genetic structure but also from the interaction between the variety and the environment. The responses of varieties to environmental conditions determine their adaptation abilities, which directly affect yield and quality (Çalışkan et al., 2021). Therefore, in order to select the most suitable rapeseed variety for a specific region, it is necessary to comparatively evaluate the performance of varieties under the climatic and soil characteristics of that region.

Although research on this subject in Turkey is limited, some studies have revealed the regional performance of different rapeseed varieties. For example, a study conducted in the Southeastern Anatolia Region reported that the “Elvis” and “Excalibur” varieties provided high yields and oil content under dry conditions (Albayrak and Gürbüz, 2020). Similarly, trials conducted in provinces such as Edirne and Tekirdağ determined that varieties such as “Visby,” “Veles,” and “Licord” showed superior performance in some years (Keskin and Yılmaz, 2019). These findings indicate that variety-specific differences in terms of yield and quality should be taken into account in rapeseed cultivation.

This study aims to compare two different rapeseed varieties in terms of yield and quality at a location within Turkey's Thrace Region. The data obtained from the study will not only be useful for the area where the research was conducted but will also shed light on rapeseed cultivation in regions with similar ecological characteristics. At the same time, the aim is to establish a scientific basis for producers to select the most suitable rapeseed variety. Thus, it is intended to contribute to factors such as sustainability, product diversity, and economic efficiency in regional agriculture.

MATERIALS AND METHODS

The research was conducted in October 2022-2023 in the fields of producers in Yeniköy village, Babaeski district, Kırklareli. In our study, the rapeseed (Brassica napus L.) varieties named "DK EXSTORM" from the Dekalb company and "CLAVIER CL" from the Agromar company were used as trial material.

The test plot generally has a loamy and loamy-clay texture and is of medium depth. The pH value of the soils generally varies between slightly acidic and neutral. Organic matter content is low to medium. In terms of lime content, it is moderately calcareous.

Table 1. Climate data for the research site for 2022-23 and long-term years

	Average temperature (°C)		Total rainfall (mm)	
	2022-23	Long term	2022-23	Long term
January	4.5	3.1	35.6	41.6
February	5.0	3.5	30.0	37.2
March	7.8	6.2	40.1	47.8
April	15.6	10.5	45.2	51.9
May	17.2	15.0	50.7	47.2

www.mgm.gov.tr

As shown in Table 1, temperatures were significantly higher than the long-term average in all months during the 2022-2023 period. Particularly during the summer months (June–September), there were notable increases in precipitation amounts parallel to the rise in temperatures. Overall, it can be seen that both temperature and precipitation averages were above the long-term averages during the period under review. The region has suitable climatic conditions for winter rapeseed cultivation in terms of precipitation and temperature values, and these characteristics support plant growth.

The study was conducted in triplicate according to a randomized block design. On October 1, 2022, Agromar's CLAVIER CL variety was planted in the prepared field. Along with the planting, 3.5 kg/da of Microcare fertilizer was applied. On February 20, 2023, 18 kg/da of Ammonium Sulfate fertilizer was used. On March 10, 2023, the commercial pesticides Intervıx Plus and Padlock 240 EC were used. On April 2, 2023, 22 kg/da of granular URE fertilizer was applied. On April 25, 2023, amino acids and foliar fertilizer were applied along with the commercial pesticides Topguard and Zelos. The emergence of canola in the field was observed on February 8, 2023. Flowering began on April 5, 2023. The DK EXSTORM variety from the Dekalb company was planted in the field prepared on October 2, 2022. In October, 22 kg/da of

Zinc-containing 20-20 fertilizer was used. On December 5, 2022, Ammonium Sulfate fertilizer was applied. On January 4, 2023, the commercial pesticide Padlock and Mostar 20 SP were used. On January 10, 2023, 15 kg/da of URE fertilizer was applied. On February 15, 2023, the commercial pesticide Input and boron-containing foliar fertilizer were used. On March 2, 2023, 15 kg/da of URE fertilizer was applied. On May 2, 2023, 25 kg/da of nitrate fertilizer was applied. On May 4, 2023, the commercial pesticides Cayunis and Vantex and boron-containing fertilizer were used. The emergence of canola in the field was observed on February 10, 2023. Flowering began on April 7, 2023.

The study examined characteristics such as plant height (cm), number of side branches (number/plant), 1000-seed weight (g), number of pods (pieces), and number of seeds per pod (per/plant). The statistical analysis of the data was performed using the Totemstat program, and differences between treatments were determined using the LSD test (Açıkgöz et al., 2004).

RESEARCH RESULTS and DISCUSSION

Statistically significant differences were determined between the Agromar-Clavıer CL and Dekalb-DK Exstorm varieties examined in the study in terms of plant height, number of side branches, number of pods, and number of seeds per pod (Table 2). The Dekalb-DK Exstorm variety showed a longer plant height (105.09 cm) (Figure 1) and a higher number of pods (1,201.2 pods) (Figure 2) compared to Agromar-Clavıer CL; these differences were above the LSD (5%) limit and were statistically significant. In terms of seed count per pod, Dekalb-DK Exstorm (33,182.3 seeds) also reached significantly higher values than Agromar-Clavıer CL (19,685.1 seeds) (Figure 3) (LSD 5%). In terms of lateral branch number, the Agromar-Clavıer CL variety (7.07 branches) was higher than the Dekalb-DK Exstorm variety (4.17 branches) (Figure 4). In contrast, there was no statistically significant difference between the varieties in terms of weight per thousand seeds (g) (Figure 5).

Table 2. Agronomic characteristics of the varieties used in the study

Varieties	Plant height (cm)	Weight per thousand seeds (g)	Number of side branches (pieces)	Number of pods (pieces)	Number of seeds per pod (per/plant)
V1	103.0	4.40	7.07	778,7	19.685,1

This study was conducted in Yeniköy village, Babaeski district, Kırklareli province, and compared two different varieties of rapeseed (Brassica napus L.)—Agromar-Clavier CL and Dekalb-DK Exstorm—in terms of yield and yield components. According to the results of the study, statistically significant differences were determined between the varieties, particularly in terms of plant height, number of side branches, number of pods, and number of seeds per pod. The data obtained revealed noteworthy results when regional environmental conditions were taken into account.

Yeniköy village is located in the northwest of the Thrace Region and has a microclimate suitable for classic rapeseed cultivation in terms of average annual temperature and precipitation data. When examining the climate data for the 2022–2023 season in the region, it is observed that temperature and precipitation values above the long-term average were recorded, especially during the spring and summer months. This situation affected both the vegetative and generative development of the plants, particularly impacting yield components such as the number of pods and seeds.

Plant height is an important morphological characteristic that indicates the extent to which a plant benefits from environmental conditions (light, temperature, water, nutrients). In our study, the Dekalb-DK Exstorm variety had a taller plant height of 105.09 cm, and this difference was found to be statistically significant. Similarly, Vanlı et al. (2017) stated in their study that plant height is positively related to capsule number and seed yield. Furthermore, Canbaz and Arıoğlu (2009) stated that plant height showed a positive correlation with yield and that, especially under suitable ecological conditions, taller plants produced more side branches and capsules.

Furthermore, Rameeh (2014), in his rapeseed study conducted in Iran, reported that plant height is directly related to yield components and that taller plants have the potential to bear more capsules. At the Yeniköy location, vegetative growth was supported by suitable temperature increases and adequate moisture, which may have enhanced the height advantage of Dekalb-DK Exstorm.

The number of carob pods and the number of seeds per pod are direct factors affecting total seed yield. In the Dekalb-DK Exstorm variety, an average of 1,201.2 pods and 33,182.3 total seeds per pod were obtained, which are significantly higher results than those obtained in the Agromar-Clavier CL variety for these parameters. These findings have also been reported similarly in rapeseed genotype comparisons conducted by Aytar et al. (2020). Their study emphasized that parameters such as pod number and seed number are key factors determining yield. Additionally, Tunçtürk and Çiftçi (2007) reported that the number of capsules (pods) and the number of seeds per capsule are among the main components that directly affect yield in different rapeseed varieties. Similarly, Shirani Rad et al. (2011) also noted that the number of capsules and seeds is decisive, especially in varieties with high yield potential.

In terms of lateral branch count, the Agromar-Clavier CL variety (7.07 branches) was found to be significantly higher than Dekalb-DK Exstorm (4.17 branches). However, this superiority did not have the same positive effect on yield components. This is because an increase in lateral branch count does not always directly result in an increase in pod and seed count. In a study conducted by Ünveren and Karakuş (2013), it was reported that an excessive number of side branches in rapeseed plants could negatively affect the distribution of energy and resources, and that this situation could limit grain yield, especially in low-yield environments. Similarly, Tayo and Morgan (1975) reported that main stem yield components are more productive than side branches and that an increase in the number of side branches does not always contribute to yield. Furthermore, Van et al. (2007) found that excessive branching can reduce pod yield in some cases.

No significant difference was found between the two varieties in terms of thousand-seed weight (TSW). This finding is consistent with some studies in the literature. For example, Türkyılmaz and Yavuz (2015) stated that thousand-seed weight showed less genetic variability between varieties and that differences in seed yield were often due to factors such as seed size and seed number. Rameeh (2011) stated in his study conducted in Iran that although BDA is a factor affecting yield, it did not show high variation between varieties and that seed yield was explained more by components such as capsule number and seed number. Furthermore, Malhi et al. (2007) reported that BDA is less affected by environmental factors and generally remains constant.

The above data show that the Dekalb-DK Exstorm variety is better adapted to the conditions in Yeniköy village and exhibits superior performance in terms of yield components. In particular, increases in capsule and seed numbers have contributed to this variety's total seed yield. However, since these results are based on a single year and location, it is recommended that trials be conducted in different years and under different environmental conditions before generalizing.

CONCLUSIONS AND RECOMMENDATIONS

In this study conducted in Yeniköy village, Babaeski district, Kırklareli province, although the Dekalb-DK EXSTORM variety evaluated was inferior to the Agromar-CLAVIER CL variety in terms of the number of side branches, it showed higher values in components directly related to yield, such as plant height, thousand-seed weight, pod number, and number of seeds per pod. These findings reveal that the Dekalb-DK EXSTORM variety has a higher yield potential under regional conditions.

In this regard, it is recommended that agricultural producers in the region plant the Dekalb-DK EXSTORM variety under the ecological conditions of Kırklareli/Babaeski-Yeniköy. Considering its superiority in terms of yield and yield components, it is believed that this variety can contribute to regional agriculture. Future studies, supported by trials in different environmental conditions and on a larger scale, will further strengthen this recommendation.

ÖZET

Çayır ve mera ekosistemleri, atmosferdeki karbondioksitin tutulması, toprakta uzun süreli depolanması ve küresel karbon döngüsünün düzenlenmesinde önemli işlevler üstlenen doğal karbon yutak alanlarıdır. Bu ekosistemlerde bulunan bitki örtüsü, fotosentez süreci aracılığıyla atmosferden karbon alarak biyokütlede depolamaktadır. Özellikle kök gelişimi yoluyla bu karbonun önemli bir kısmı toprak altı karbon havuzlarına aktarılmaktadır. Çok yıllık, derin köklü ve tür çeşitliliği yüksek bitki toplulukları, toprak organik karbonunun birikimini destekleyerek çayır ve meraların karbon tutma kapasitesini artırmaktadır. Sürdürülebilir otlatma sistemlerinin uygulanması, mera ıslahı ve ekolojik restorasyon çalışmaları ise bitki örtüsünün yeniden güçlenmesini sağlayarak hem toprak sağlığını iyileştirmekte hem de karbon depolama kapasitesini artırmaktadır. Bu uygulamalar, biyolojik çeşitliliğin korunmasına, su tutma kapasitesinin artmasına ve ekosistem dayanıklılığının güçlenmesine katkı sunarken, iklim değişikliğiyle mücadelede doğa temelli çözümler arasında öne çıkmaktadır. Ayrıca çayır ve meralar, hayvansal üretimin sürdürülebilirliği ve kırsal ekonominin devamlılığı açısından da stratejik öneme sahiptir. Sonuç olarak, doğru planlanmış ve bilimsel temellere dayalı yönetim yaklaşımlarıyla desteklenen çayır ve mera ekosistemleri hem ekolojik hem de ekonomik işlevleriyle karbon döngüsünün dengelenmesinde ve iklim değişikliğinin olumsuz etkilerinin azaltılmasında kilit rol oynayan doğal ekosistemler olarak değerlendirilmektedir.

Anahtar kelimeler: Karbon yutak alanı, çayır, mera, ekosistem hizmetleri, iklim değişikliği

GRASSLANDS AND RANGELANDS AS CARBON SINK AREAS

ABSTRACT

Grassland and rangeland ecosystems are natural carbon sink areas that play a crucial role in the sequestration of atmospheric carbon dioxide, its long-term storage in soils, and the regulation of the global carbon cycle. Vegetation in these ecosystems captures carbon from the atmosphere through the process of photosynthesis and stores it in biomass; a significant portion of this carbon is transferred to belowground carbon pools, particularly through root development. Plant communities characterized by perennial species, deep root systems, and high species diversity promote the accumulation of soil organic carbon, thereby enhancing the carbon sequestration capacity of grasslands and rangelands. The implementation of sustainable grazing systems, rangeland improvement, and ecological restoration practices strengthens vegetation cover, improves soil health, and increases carbon storage capacity. These practices contribute to the conservation of biodiversity, enhancement of soil water-holding capacity, and increased ecosystem resilience, while also standing out as nature-based solutions in the fight against climate change. In addition, grasslands and rangelands are of strategic importance for the sustainability of livestock production and the continuity of rural economies. In conclusion, grassland and rangeland ecosystems supported by well-planned, scientifically based management approaches are key natural systems that play a vital role in balancing the carbon cycle and mitigating the adverse impacts of climate change through their ecological and economic functions.

Keywords: Carbon sink, grassland, rangeland, ecosystem services, climate change

1. Giriş

İklim değişikliği, atmosferdeki sera gazı birikiminin artması sonucu ortaya çıkan ve küresel ölçekte sıcaklık, yağış rejimleri ve ekosistemler üzerinde önemli etkiler oluşturan bir süreçtir (Malhi ve ark., 2020). Bu sürecin temelinde karbon döngüsündeki dengenin bozulması yer almaktadır. Karbon döngüsü; karbonun atmosfer, biyosfer, hidrosfer ve litosfer arasında sürekli olarak dolaşımını ifade eder (Friedlingstein, 2015). Fotosentez, solunum, ayrışma ve yanma gibi doğal süreçler karbonun bu döngü içindeki hareketini belirler (Rao, 2017). Sanayi devriminden itibaren fosil yakıt kullanımı, arazi kullanım değişiklikleri ve ormansızlaşma gibi insan faaliyetleri, atmosfere salınan karbondioksit (CO_2) miktarını önemli ölçüde artırmıştır (Le Quere ve ark., 2019). Bu durum, karbon döngüsünün doğal denge mekanizmalarını zorlayarak atmosferde karbon birikimine ve buna bağlı olarak küresel ısınmaya yol açmaktadır (Mehmood ve ark., 2020). Bu noktada karbon yutak alanları, iklim değişikliğinin etkilerini azaltmada kritik bir rol üstlenmektedir. Karbon yutakları; atmosferden aldıkları karbonu bitki biyokütlesinde ve özellikle toprakta depolayabilen ekosistemlerdir (Ussiri ve Lal, 2017). Ormanlar ve çayır ve mera ekosistemleri de geniş kök sistemleri ve yüksek toprak organik madde içerikleri sayesinde önemli karbon yutak alanları arasında yer almaktadır (Conant ve ark., 2017). Bu alanların korunması ve sürdürülebilir yönetimi, karbon döngüsünün dengelenmesine katkı sağlayarak iklim değişikliğiyle mücadelede etkili bir araç sunmaktadır (Ussiri ve Lal, 2017). Çayır ve meralar, geniş yüzey alanları ve kök sistemleri sayesinde karbonun toprakta depolanmasına katkıda bulunmakta, aynı zamanda biyolojik çeşitliliğin korunması ve sürdürülebilir hayvancılık faaliyetleri için temel kaynak oluşturmaktadır. Bu alanların karbon yutak kapasitesinin anlaşılması hem ekolojik dengeyi korumak hem de iklim değişikliğiyle mücadelede etkili politikalar geliştirmek açısından büyük önem taşımaktadır (Conant ve ark., 2017). Dolayısıyla, çayır ve mera ekosistemlerinin karbon yutak alanı olarak değerlendirilmesi, yalnızca çevresel sürdürülebilirlik açısından değil, aynı zamanda sosyo-ekonomik boyutlarıyla da ele alınması gereken bir konudur (Chang ve ark., 2021). Bu derleme çalışması, çayır mera ekosistemlerinin karbon depolama potansiyelini inceleyerek iklim değişikliğiyle mücadeledeki rollerini ortaya koymayı amaçlamaktadır.

2) Karbon yutak alanları

Karbon yutak alanları, atmosferde bulunan karbondioksit (CO_2) ve diğer karbon bileşiklerini doğal süreçler aracılığıyla bünyesine alarak uzun süreli depolama kapasitesine sahip ekosistemlerdir (Pan ve ark., 2018). Bu ekosistemler, fotosentez ve biyokimyasal döngüler sayesinde karbonu bitki örtüsünde, canlı organizmalarda ve özellikle toprakta tutarak atmosferdeki sera gazı birikiminin artışını sınırlar (Smith ve ak., 2019). Başlıca karbon yutak alanları arasında ormanlar, çayır ve meralar, sulak alanlar ve okyanuslar yer almakta olup, her biri farklı mekanizmalarla karbon depolama işlevi görmektedir. Karbon yutak alanlarının önemi, iklim değişikliğinin etkilerini azaltma (mitigasyon) potansiyellerinden kaynaklanmaktadır (Griscom ve ark., 2017). Atmosferden karbonun uzaklaştırılması, sera etkisinin zayıflatılmasına ve küresel sıcaklık artışının yavaşlatılmasına doğrudan katkı sağlar (Smith ve ark., 2016). Özellikle toprakta depolanan karbon, uzun vadeli ve nispeten stabil bir karbon havuzu oluşturarak iklim sistemi açısından kritik bir rol üstlenir (Minasny ve ark., 2017). Bu nedenle toprak karbonu, ekosistemlerin iklim düzenleyici işlevlerinin en güvenilir göstergelerinden biri olarak kabul edilmektedir (Lal, 2016). Bununla birlikte karbon yutak alanlarının işlevi yalnızca karbon depolama ile sınırlı değildir (Anderson ve ark., 2019). Bu ekosistemler; biyolojik çeşitliliğin korunması, habitat sürekliliğinin sağlanması, toprak verimliliğinin artırılması, su döngüsünün düzenlenmesi ve erozyonun azaltılması gibi çok yönlü ekosistem hizmetleri sunar (Díaz ve ark., 2018; Costanza ve ark., 2017). Dolayısıyla karbon yutak alanlarının korunması ve sürdürülebilir şekilde yönetilmesi hem iklim değişikliğiyle mücadelede hem de doğal kaynakların devamlılığında stratejik bir gereklilik olarak öne

çıkmaktadır (Watson ve ark., 2018). Sonuç olarak, karbon yutak alanlarının ekolojik, ekonomik ve sosyal boyutlarıyla ele alınması; iklim politikalarının etkinliğini artırmak ve sürdürülebilir kalkınma hedeflerine ulaşmak açısından vazgeçilmezdir (Chausson ve ark., 2020).

3) Karbon tutma mekanizmaları

Karbon tutma mekanizmaları, atmosferdeki karbondioksitin (CO_2) doğal süreçler aracılığıyla ekosistemler tarafından alınarak farklı karbon havuzlarında depolanmasını ifade eder (Minx ve ark., 2018). Başlıca karbon tutma mekanizmaları şunlardır:

3.1) Fotosentez yoluyla karbon alımı

Bitkiler fotosentez sırasında atmosferdeki CO_2'yi alarak organik karbon bileşiklerine dönüştürür. Bu karbon, bitkinin gövde, yaprak ve özellikle kök dokularında depolanır. Çayır ve mera ekosistemlerinde bitkilerin geniş ve derin kök sistemleri, karbonun toprak altına taşınmasını sağlayarak uzun süreli depolamaya katkıda bulunur (Chang ve ark., 2016). Bu özellik, çayır ve meraları ormanlarla birlikte en önemli karasal karbon yutaklarından biri haline getirir.

3.2) Toprak organik karbonunun oluşumu

Bitki artıklarının (yaprak, kök, sap) toprakta ayrışması sonucu organik madde oluşur. Bu organik madde, toprak agregatları içinde korunarak uzun yıllar boyunca karbonun toprakta tutulmasını sağlar (Lehmann ve Kleber, 2015). Toprak mikroorganizmaları bu süreçte önemli bir rol oynar; ayrışma sırasında karbonun daha stabil formlara dönüşmesine ve mineral yüzeylere bağlanmasına katkı sağlar. Böylece toprak, uzun vadeli bir karbon rezervuarı işlevi görür (Cotrufo ve ark., 2019).

3.3) Kök döngüsü ve rizosfer süreçleri

Bitkilerin köklerinin sürekli büyümesi, ölmesi ve yenilenmesi, toprağa düzenli karbon girişi sağlar (Pausch ve Kuzyakov, 2018). Rizosferde gerçekleşen mikrobiyal faaliyetler, karbonun toprak mineral yüzeylerine bağlanmasını ve daha kalıcı hale gelmesini destekler (Liang ve ark., 2017). Bu süreç, özellikle çayır ve meralarda yoğun kök sistemleri sayesinde daha etkin bir şekilde işler (Chang ve ark., 2016).

3.4) Toprak yapısının korunması

Sağlıklı ve bozulmamış toprak yapısı, karbonun oksijenle temasını azaltarak ayrışma hızını düşürür (Cotrufo ve ark., 2019). Özellikle iyi yönetilen çayır ve meralarda toprak sıkışmasının ve erozyonun azalması, karbon kaybını sınırlar (Conant ve ark., 2017). Bu durum hem karbon depolama kapasitesini artırır hem de ekosistem hizmetlerinin sürekliliğini sağlar (Griscom ve ark., 2017).

Bu mekanizmaların etkinliği; arazi kullanımı, bitki türleri, iklim koşulları ve yönetim uygulamalarına bağlı olarak değişmektedir (Smith ve ark., 2019). Dolayısıyla karbon tutma kapasitesinin artırılması için çayır ve mera ekosistemlerinin sürdürülebilir şekilde yönetilmesi büyük önem taşımaktadır (Chang ve ark., 2016).

4) Ormanlar, sulak alanlar, çayır ve meraların karşılaştırılması

Ormanlar, sulak alanlar, çayır ve meralar, karbon yutak alanları arasında yer almakla birlikte, karbon tutma biçimleri, depolama süreleri ve ekosistem işlevleri açısından birbirlerinden farklılık göstermektedir (Mitsch ve Gosselink, 2015). Ormanlarda depolanan karbonun önemli bir kısmı yer üstü biyokütlesinde bulunur. Orman ekosistemleri, karbonu büyük ölçüde ağaçların gövde, dal ve yapraklarında depolar (Erb ve ark., 2017). Yüksek biyokütleleri sayesinde kısa ve orta vadede önemli miktarda karbon tutabilirler (Bai ve Cotrufo, 2022). Ancak

orman yangınları, hastalıklar ve arazi kullanım değişiklikleri gibi faktörler, depolanan karbonun hızla atmosfere geri salınmasına neden olabilmektedir (Harris ve ark., 2021).

Sulak alanlar, özellikle bataklıklar ve turbalıklar, karbonu büyük ölçüde toprakta ve organik tortularda depolayan ekosistemlerdir (Mitsch ve ark., 2015). Oksijensiz (anaerobik) koşullar, organik maddenin ayrışmasını yavaşlatarak karbonun binlerce yıl boyunca tutulmasını sağlar (Leifeld ve ark., 2019). Bu yönüyle sulak alanlar, uzun vadeli ve oldukça güçlü karbon yutaklarıdır (Mitsch ve ark., 2015). Ancak kurutulmaları veya bozulmaları durumunda büyük miktarda sera gazı salımı gerçekleşebilir (Xu ve ark., 2018).

Çayır ve mera ekosistemleri ise karbonu ağırlıklı olarak toprak altı biyokütlesinde ve toprak organik maddesinde depolar. Toprak üstü biyokütleleri ormanlara kıyasla daha düşük olsa da derin ve yoğun kök sistemleri sayesinde karbonun daha stabil ve uzun süreli olarak toprakta tutulmasını sağlarlar (Bai ve Cotrufo, 2022). Ayrıca yangın ve biçim gibi ani karbon kaybına yol açan riskler çayır ve meralarda nispeten daha düşüktür (Conant ve ark., 2017). Karşılaştırıldığında; ormanlar hızlı karbon birikimi, sulak alanlar uzun vadeli ve yüksek stabilite, çayır ve meralar ise dayanıklı ve sürdürülebilir toprak karbonu açısından öne çıkmaktadır. Bu nedenle iklim değişikliğiyle mücadelede tek bir ekosisteme odaklanmak yerine, farklı karbon yutak alanlarının birlikte korunması ve yönetilmesi bütüncül bir yaklaşım açısından büyük önem taşımaktadır (Erb ve ark., 2017).

5) Çayır ve mera ekosistemlerinin küresel ve bölgesel önemi

Çayır ve mera ekosistemleri, dünya kara yüzeyinin önemli bir bölümünü kaplayan ve hem doğal denge hem de insan yaşamı açısından kritik işlevlere sahip ekosistemlerdir (Conant ve ark., 2017). Küresel ölçekte bu alanlar, geniş yayılışları ve güçlü kök sistemlerine sahip bitki örtüleri sayesinde büyük miktarda karbonu özellikle toprakta depolayarak önemli karbon yutak alanları olarak işlev görür (Chang ve ark., 2016). Orman ekosistemlerine kıyasla toprak altı biyokütlesinin yüksek olması, çayır ve meraların uzun vadeli karbon depolama potansiyelini artırmaktadır (Dong ve ark., 2025). Ayrıca bu ekosistemler, çok sayıda bitki ve hayvan türüne habitat sağlayarak küresel biyolojik çeşitliliğin korunmasına katkıda bulunur (Sala ve ark., 2017).

Bölgesel ölçekte ise çayır ve mera ekosistemleri, özellikle yarı kurak ve kurak bölgelerde ekolojik ve sosyo-ekonomik açıdan hayati öneme sahiptir (Eldridge ve ark., 2017). Bu alanlar, hayvancılığın temel besin kaynağını oluşturarak kırsal geçim sistemlerini destekler ve gıda güvenliğine katkı sağlar. Aynı zamanda toprak yapısını koruyarak erozyonu önler, suyun toprakta tutulmasını artırır ve bölgesel iklim koşullarının dengelenmesine yardımcı olur (Herrero ve ark., 2016). Bu nedenle, çayır ve mera ekosistemlerinin korunması ve bilinçli yönetimi, küresel ve bölgesel çevre politikalarının temel unsurlarından biri olmalıdır.

6) Çayır ve meraların karbon yutak olarak rolü (toprakta karbon depolama kapasitesi)

Çayır ve meralar, toprakta karbon depolama kapasitesi açısından en etkili karasal ekosistemlerden biri olarak kabul edilmektedir (Sharma ve ark., 2023). Bu ekosistemlerde karbonun büyük bölümü, yer üstü biyokütlesinden ziyade toprak organik karbonu şeklinde depolanır. Özellikle çok yıllık otsu bitkilerin sahip olduğu yoğun ve derin kök sistemleri, karbonun sürekli olarak toprağa taşınmasını sağlayarak uzun vadeli bir karbon havuzu oluşturur (Paustian ve ark., 2016). Çayır ve mera bitkilerinin kökleri düzenli olarak yenilenir; ölen kök dokuları ve bitki artıkları toprakta ayrışarak organik maddeye dönüşür (Leifeld ve ark., 2015). Bu süreç, toprak mikroorganizmalarının faaliyetleriyle desteklenir ve karbonun daha stabil formlara bağlanmasını sağlar (Cotrufo ve ark., 2015). Ayrıca çayır ve meralarda toprak genellikle sürülmediği için, toprak yapısı korunur ve karbonun oksijenle temas ederek hızla

parçalanması sınırlandırılır (Rumpel ve Chabbi, 2019). Toprak agregatlarının güçlü olması, organik karbonun fiziksel olarak korunmasına katkıda bulunur (Dignac ve ark., 2017). Bu durum, çayır ve meralarda depolanan karbonun uzun yıllar hatta on yıllar boyunca toprakta kalabilmesini mümkün kılar. Araştırmalar, iyi yönetilen çayır ve meraların, bozulmuş veya tarım alanına dönüştürülmüş arazilere kıyasla daha yüksek toprak organik karbon içeriğine sahip olduğunu göstermektedir (Poeplau ve Don, 2015). Sonuç olarak, çayır ve meraların toprakta karbon depolama kapasitesi; bitki tür çeşitliliği, kök yapısı, iklim koşulları ve yönetim uygulamalarıyla yakından ilişkilidir (Conant ve ark., 2017). Bu alanların korunması ve sürdürülebilir otlatma sistemleriyle yönetilmesi hem toprak verimliliğinin artırılması hem de iklim değişikliğiyle mücadelede önemli bir katkı sağlamaktadır.

7) Çayır ve meraların kök sistemlerinin karbon tutmadaki önemi

Toprak, atmosferden daha fazla karbon depolayabilir ve iklim değişikliğini azaltmada önemli bir araçtır. Çayır ve meraların kök sistemleri, bu ekosistemlerin karbon tutma kapasitesinin temel belirleyicilerinden biridir. Tarımsal uygulamalar (örneğin azaltılmış toprak işleme, organik gübre kullanımı, örtü bitkileri) karbon tutulumunu artırabilir. Toprak karbonu yönetimi hem gıda güvenliği hem de iklim politikaları açısından stratejik öneme sahiptir (Lal ve ark., 2015). Çayır ve mera bitkileri genellikle çok yıllık ve otsu türlerden oluşur ve bu bitkiler, toprak altında geniş, yoğun ve derin kök ağları geliştirir. Atmosferden fotosentez yoluyla alınan karbonun önemli bir kısmı, bu kök sistemleri aracılığıyla doğrudan toprağa aktarılır. Otlatma yoğunluğu, gübreleme ve biçme gibi uygulamalar toprak karbon stoklarını artırabilir veya azaltabilir. Azot ve fosfor gibi besin elementlerinin mevcudiyeti, karbon döngüsünü doğrudan etkiler. Çayır yönetimi, karbon girişleri (litter, kök salgıları) ve çıkışları (respirasyon, ayrışma) arasındaki dengeyi belirler. İklim değişikliği, aşırı otlatma veya yanlış yönetim, karbon stoklarını hızla azaltabilir. Bozulmuş çayırların yeniden yönetilmesi, karbon depolama kapasitesini geri kazandırabilir (Rumpel ve Chabbi, 2019). Bitkiler tarafından tutulan karbon, yalnızca köklerde depolanma yoluyla değil, aynı zamanda mikrobiyal süreçleri uyararak toprak organik maddesinin oluşumuna katkıda bulunan kök salgıları aracılığıyla da toprağa girer. Çözünür ve kolay ayrışan bileşikler mikrobiyal ürünlere dönüşürken, daha dirençli yapısal bileşikler fiziksel yollarla toprağa karışır. Organik maddelerin mineral yüzeylere bağlanması, karbonun uzun süreli depolanmasını sağlar. Solucanlar ve diğer toprak faunası, ölü döküntü bitkisel aksamların parçalanmasını hızlandırarak fiziksel yollarla organik madde oluşumunu destekler (Cotrufo ve ark., 2015).

Toprakların sera gazı emisyonlarını azaltma kapasitesi uzun süre göz ardı edilmiştir. Emisyonların ve azaltımların doğru şekilde ölçülmesi hâlâ büyük bir zorluktur. Bilgi teknolojilerindeki gelişmeler, toprakların sera gazı politikalarına daha geniş ölçekte dahil edilmesini mümkün kılabilir. Kökler yalnızca karbonu depolamakla kalmaz, aynı zamanda karbonun toprak organik maddesine dönüşmesini sağlayan süreçleri de tetikler (Paustian ve ark., 2016). Köklerin büyümesi, ölmesi ve yeniden oluşması (kök döngüsü), toprağa sürekli karbon girdisi sağlar. Ölen kök dokuları ayrışarak toprakta daha stabil ve uzun ömürlü karbon bileşiklerine dönüşür. Solucanlar, bitkilerden kopan parçalardan kaynaklı karbonun toprak profiline taşınmasında kritik rol oynar. (Novara ve ark., 2015). Bu durum, çayır ve meralarda karbonun kısa süreli değil, uzun vadeli olarak depolanmasına olanak tanır. Ayrıca köklerin çevresindeki rizosfer bölgesinde yoğun mikrobiyal faaliyetler gerçekleşir. Bu mikroorganizmalar, kök salgıları sayesinde karbonu mineral yüzeylere bağlayarak daha kalıcı hale getirir. Uzun süredir humik maddeler, toprak organik maddesinin temel ve kalıcı bileşenleri olarak görülüyordu. Alkali ekstraksiyonla elde edilen humik maddelerin doğal toprak yapısında bağımsız ve kalıcı bir bileşik grubu olarak bulunmadığını göstermektedir. Organik madde, farklı aşamalarda bozunan ve dönüşen bileşiklerin sürekliliği olarak görülmeli. Ayrıca Laboratuvar ekstraksiyonları, doğal toprak ortamındaki süreçleri tam olarak yansıtmaz. Bu yeni

bakış açısı, toprak karbonunun iklimle etkileşimini ve tarımsal yönetim stratejilerini yeniden düşünmeyi gerektiriyor (Kleber ve Lehmann, 2019).

Toprak atmosferden iki kat fazla karbon depolar. Fakat çoğu doğal ve tarımsal bitkinin kökleri yalnızca 1 metreye kadar uzanır, bu da karbon depolama kapasitesini sınırlar. Derin kök sistemleri, karbonun toprak alt katmanlarına taşınmasını sağladığından, yüzeydeki bozulmalardan ve hızlı ayrışma süreçlerinden daha az etkilenir. Modern tarımda kullanılan türler ve yöntemler kök derinliğini sınırlayarak karbon depolama kapasitesini azaltır. Daha derin köklü türlerin seçilmesi, karbonun daha uzun süreli ve güvenli şekilde depolanmasına katkı sağlar. Hem doğal hem de tarımsal ekosistemlerde köklerin rolü birlikte değerlendirilmelidir (Kell, 2015). Sonuç olarak, çayır ve meraların kök sistemleri; karbonun toprağa girişi, stabilizasyonu ve uzun süreli depolanması açısından kilit bir rol oynar. Bu nedenle kök gelişimini destekleyen sürdürülebilir otlatma ve mera yönetimi uygulamaları, çayır ve meraların karbon yutak alanı olarak işlevini güçlendirmede büyük önem taşımaktadır.

8) Ormanlara kıyasla çayır/meraların karbon yutak olarak rolü olarak avantajları

Çayır ve meralar, karbon yutak alanı olarak genellikle ormanların gölgesinde kalsa da bazı temel özellikleri sayesinde ormanlara kıyasla önemli ve özgün avantajlara sahiptir (Assan ve ark., 2025). Bu avantajlar özellikle karbonun depolanma biçimi, sürekliliği ve ekosistemin dayanıklılığı ile ilişkilidir. Öncelikle çayır ve meralarda karbonun büyük bölümü toprak altında depolanır. Ormanlarda karbonun önemli bir kısmı ağaçların gövde, dal ve yaprak gibi yer üstü biyokütlesinde bulunurken, çayır ve meralarda yoğun kök sistemleri sayesinde karbon daha stabil olan toprak organik karbonu şeklinde tutulur. Bu durum, depolanan karbonun uzun vadede atmosfere geri salınma riskini azaltır. İkinci olarak çayır ve meralar, yangın, böcek salgınları ve biçim gibi ani karbon kaybına yol açabilecek risklere karşı daha dayanıklıdır. Tarıma dönüştürme veya aşırı otlatma, karbon stoklarını azaltır. Çayırlar, kuraklık ve iklim değişikliğine karşı belirli bir direnç gösterir, ancak bu direnç yanlış yönetimle zayıflar. Tür çeşitliliği hem karbon depolama kapasitesini hem de ekosistem dayanıklılığını güçlendirir (White ve ark., 2015). Orman yangınları büyük miktarda karbonun kısa sürede atmosfere salınmasına neden olabilirken, çayır ve meralarda karbonun büyük kısmı toprak altında bulunduğu için bu tür olaylardan daha az etkilenir. Ayrıca çayır ve meralar, arazi kullanımına bağlı bozulmalara karşı daha hızlı toparlanma kapasitesine sahiptir. Otlatma yoğunluğu ve biçimi, bitki örtüsünün yapısını ve toprak karbonunu doğrudan etkiler (Sala ve ark., 2017). Toprak üstü biyokütle kaybı yaşansa bile kök sistemleri genellikle canlılığını korur ve karbon tutma işlevi kısa sürede yeniden başlar. Bu özellik, çayır ve meraları uzun vadede daha sürdürülebilir karbon yutakları haline getirir. Son olarak, çayır ve meraların yönetimi genellikle daha düşük maliyetlidir ve sürdürülebilir otlatma uygulamalarıyla karbon tutma kapasitesi artırılabilir. Otlatma, bazı durumlarda karbon kaybına yol açarken, uygun yoğunlukta yapıldığında karbon depolamayı destekleyebilir. Gübreleme, biçme ve otlatma düzenlemeleri karbon döngüsünü farklı şekillerde etkiler. Artan sıcaklıklar ve kuraklık, çayırların karbon depolama kapasitesini azaltabilir (Jordon ve ark., 2024). Bu yönleriyle çayır ve meralar, orman ekosistemlerini tamamlayan, dayanıklı ve uzun vadeli karbon yutak alanları olarak iklim değişikliğiyle mücadelede önemli bir role sahiptir.

9) Aşırı otlatma, sürdürülebilir otlatma sistemleri, mera ıslahı ve restorasyonu ve tarım alanına dönüştürmenin etkisi

Aşırı otlatma, çayır ve mera ekosistemlerinde karbon döngüsü üzerinde doğrudan ve olumsuz etkiler üreten bir faktördür. Bitki örtüsünün sürekli ve yoğun şekilde tüketilmesi, ekosistemdeki karbon tutma kapasitesini azaltır ve toprak altı karbon havuzlarının bozulmasına yol açar (Wang ve ark., 2015). Öncelikle aşırı otlatma, bitki biyokütlesinin azalmasına neden olur. Fotosentez yoluyla atmosferden alınan karbon miktarı düşer ve kök sistemleri zayıflar. Zayıf kökler, toprak

organik karbonunun düzenli olarak yenilenmesini sağlayamaz, bu da uzun vadede toprak altı karbonunun azalmasına yol açar. İkinci olarak, aşırı otlatma toprak yapısının bozulmasına ve erozyona yol açar. Bitki örtüsü azalınca toprak yüzeyinde çıplak alanlar artar, rüzgâr ve su erozyonu hızlanır ve topraktaki organik madde kaybı artar. Artan bitki örtüsü, yüzey akışını azaltarak erozyonu önemli ölçüde düşürür. Kökler, toprağı mekanik olarak tutarak parçalanmayı ve taşınmayı engeller. Bitki örtüsünün koruyucu etkisi, yağış şiddeti ve arazi eğimine bağlı olarak değişir. Çalılar, otlar ve karışık bitki örtüsü erozyonu farklı düzeylerde azaltır. Toprak dokusu ve organik madde içeriği, bitki örtüsünün erozyonu azaltma kapasitesini etkiler (Zhao ve ark., 2018). Bu durum, topraktaki karbonun atmosferle temas ederek ayrışmasını kolaylaştırır. Aşırı otlatmanın diğer bir etkisi de mikrobiyal aktivitenin değişmesidir. Toprakta organik madde miktarının azalması, mikrobiyal toplulukların dengesini bozabilir ve karbonun stabil formlara dönüşme sürecini yavaşlatır. Otlatmanın etkisi, yağış miktarı, toprak dokusu ve bitki türlerine göre değişir. C3 ve C4 bitkilerinin baskın olduğu ekosistemlerde otlatmanın etkisi farklıdır. İnce dokulu topraklarda otlatma, karbon depolamayı daha fazla destekleyebilir. Kurak bölgelerde otlatma, karbon depolamayı artırabilirken, nemli bölgelerde azaltıcı etki gösterebilir (McSherry ve Ritchie, 2017). Sonuç olarak, aşırı otlatma çayır ve meraların karbon yutak işlevini ciddi şekilde zayıflatır. Sürdürülebilir otlatma yöntemleri, mera istikrarının korunması ve toprağın sağlıklı yapısının desteklenmesi, karbon kaybını önlemenin ve çayır-meraların uzun vadeli karbon depolama kapasitesini korumanın temel yollarıdır.

Sürdürülebilir otlatma sistemleri, çayır ve mera ekosistemlerinde hem bitki örtüsünün sağlığını koruyan hem de karbon yutak kapasitesini artıran yönetim yaklaşımlarıdır (Jordon ve ark., 2024). Bu sistemler, aşırı otlatmanın önlenmesini, bitki çeşitliliğinin korunmasını ve toprak yapısının sürdürülebilirliğini hedefler. Öncelikle sürdürülebilir otlatma, bitki biyokütlesinin dengeli şekilde kullanılması ile karbon döngüsüne olumlu katkı sağlar. Bitkiler yeterince dinlenme fırsatı bulduklarında fotosentez yoluyla daha fazla karbon alır ve kök sistemleri güçlenir (Teague ve ark., 2016). Güçlü kökler, toprağa düzenli karbon girişi sağlar ve toprak altı karbon havuzlarının uzun vadeli depolanmasını destekler. İkinci olarak, sürdürülebilir otlatma toprak yapısının korunmasına yardımcı olur. Bitki örtüsü devamlılığı, erozyon riskini azaltır ve organik madde kaybını sınırlar. Sağlıklı toprak, karbonun stabil şekilde depolanmasını ve mikroorganizmalar aracılığıyla organik karbonun uzun süreli korunmasını sağlar (Lehmann ve Kleber, 2015). Ayrıca bu sistemler, biyoçeşitliliğin ve ekosistem fonksiyonlarının korunmasını sağlar. Farklı bitki türleri, farklı derinliklerde kök sistemleriyle karbonu toprağın çeşitli katmanlarına taşır ve toplam karbon tutma kapasitesini artırır. Sonuç olarak, sürdürülebilir otlatma sistemleri, çayır ve meraların hem kısa hem de uzun vadede karbon yutak işlevini güçlendirir. Bu uygulamalar, iklim değişikliğiyle mücadelede etkili bir strateji olmasının yanı sıra mera ekosistemlerinin ekolojik ve ekonomik sürdürülebilirliğini de destekler (Teague ve ark., 2016).

Mera ıslahı ve restorasyonu, çayır ve mera ekosistemlerinin karbon yutak kapasitesini artırmada kritik öneme sahip uygulamalardır. Bozulmuş veya aşırı otlatılmış meraların yeniden sağlıklı hale getirilmesi hem bitki örtüsünün hem de toprak yapısının iyileştirilmesini sağlar, bu da uzun vadeli karbon depolamasını destekler. Öncelikle mera ıslahı ve restorasyonu, bitki biyokütlesinin ve kök sistemlerinin güçlenmesini sağlar (Briske ve ark., 2015). Yeni veya yerel uyumlu bitki türlerinin ekimi, toprak örtüsünün yoğunlaşmasını ve köklerin derinleşmesini teşvik eder (Havrilla ve ark., 2021). Bu süreç, toprağa sürekli karbon girişi sağlar ve organik madde miktarını artırır. İkinci olarak, restorasyon çalışmaları toprak yapısının iyileştirilmesine ve erozyonun azaltılmasına yardımcı olur (Mekuria ve Aynekulu, 2016). Toprak sağlığı iyileştikçe, karbonun toprakta stabil olarak tutulma süresi uzar ve yüzeyde meydana gelebilecek kayıplar minimize edilir. Ayrıca mera ıslahı, biyoçeşitliliği artırarak ekosistem fonksiyonlarını

güçlendirir (Prangel ve ark., 2023). Farklı bitki türlerinin varlığı, karbonun çeşitli toprak derinliklerine taşınmasını sağlayarak toplam karbon depolama kapasitesini yükseltir (Cong ve ark., 2015). Sonuç olarak, mera ıslahı ve restorasyonu, bozulmuş alanların yeniden karbon yutak alanı haline gelmesini sağlayan sürdürülebilir bir yönetim stratejisidir. Bu uygulamalar, hem iklim değişikliğiyle mücadeleye katkı sağlar hem de hayvancılık ve kırsal ekonomi açısından meraların ekolojik ve ekonomik değerini artırır.

Tarım alanına dönüştürme, doğal çayır ve mera ekosistemlerinin karbon dengesi üzerinde genellikle olumsuz etkilere yol açar (Chang ve ark., 2018). Bu süreç, ekosistemde depolanmış karbonun büyük bir kısmının atmosfere geri salınmasına ve karbon yutak kapasitesinin azalmasına neden olur. Öncelikle doğal çayır ve meraların toprakları, uzun yıllar boyunca organik madde biriktirmiş ve stabil karbon havuzları oluşturmuştur (Lugato ve ark., 2015). Tarıma açma sürecinde toprak işlenir, sürülür veya drenaj yapılır; bu durum, toprak yapısının bozulmasına ve organik maddenin hızla ayrışmasına yol açar (Smith ve ark., 2019). Sonuç olarak toprak altı karbonu atmosfere CO_2 olarak salınır. İkinci olarak, doğal bitki örtüsünün yok edilmesi, fotosentez yoluyla karbon alımını azaltır. Tarla bitkileri genellikle tek yıllık ve yüzeysel kök sistemine sahiptir; bu nedenle kök yoluyla toprak altına karbon aktarımı sınırlıdır (Glover ve ark., 2015). Toprakta depolanan karbon miktarı azalır ve toplam karbon yutak kapasitesi düşer. Ayrıca tarıma dönüştürme, toprak erozyonunu artırabilir. Bitki örtüsü azaldığında rüzgâr ve su erozyonu hızlanır, toprak organik maddesi kaybolur ve karbon kaybı daha da büyür (Li ve ark., 2016). Tarımda kullanılan gübre ve mekanik işlemler, organik karbonun ayrışma hızını artırarak ekosistemin karbon dengesi üzerinde ek baskı oluşturur (Oldfield ve ark., 2019). Sonuç olarak, çayır ve mera alanlarının tarım arazisine dönüştürülmesi hem karbon yutak kapasitesini azaltır hem de atmosfere karbon salınımını artırır. Bu nedenle iklim değişikliğiyle mücadelede, doğal meraların korunması ve sürdürülebilir arazi kullanımının teşvik edilmesi büyük önem taşımaktadır.

10) Uygulama örnekleri ve politika önerileri

Gitau ve ark. (2025), Afrika'nın Laikipia Bölgesi, Kenya'daki yarı-kurak mera ekosistemlerinde kontrollü otlatma ile sürekli otlatma arasındaki farkları karşılaştırmıştır. Topraktaki iki ana karbon fraksiyonu incelenmiştir: 1) toprak minerallerine güçlü bağlanmış organik karbon (Mineral-Associated Organic Carbon, MAOC) ve 2) daha kolay ayrışabilir organik parçacık karbonu (Particulate Organic Carbon, POC). Kontrollü otlatma yapılan alanlarda MAOC ve POC değerleri sürekli otlatmaya göre anlamlı şekilde daha yüksek bulunmuş, özellikle POC (toprakta daha aktif organik karbon fraksiyonu), kontrollü otlatmada belirgin şekilde artmıştır. Bu artış, kontrollü otlatma sayesinde bitki örtüsünün iyileşmesi, toprak bozulmasının azalması ve organik madde girişinin artmasıyla ilişkilendirilmiştir.

Deng ve ark. (2017) tarafından Çin'in Loess Platosu'nda bozulan mera alanlarında yürütülen restorasyon ve yeniden bitkilendirme projeleri, yerel ve çok yıllık bitki türlerinin kullanılmasıyla gerçekleştirilmiştir. Restorasyon sonrası toprak organik karbon içeriğinde anlamlı artışlar sağlanmış, alanlar karbon kaynağı olmaktan çıkıp karbon yutağına dönüşmüştür.

Oduor ve ark. (2018) tarafından yürütülen çalışmada, Kenya'nın yarı-kurak mera alanlarında bozulan toprakların iyileştirilmesi için mera kapatma uygulaması değerlendirilmiştir. Bozulmuş mera alanlarında otlatmanın kontrol altına alınması için çitlerle çevrilmiş mera parçaları oluşturulmuştur. Sürekli otlatmaya açık alanlar referans olarak kullanılmıştır. Toprak analizi 0-40 cm derinlikte yapılmış. Mera kapalı alanlarda toprak organik karbonu (SOC), partikül organik karbon (POC) ve mikrobiyal karbon (MBC) değerleri, sürekli otlatılan açık alanlara göre istatistiksel olarak anlamlı şekilde daha yüksek bulunmuştur. Özellikle POC ve MBC artışları, toprak sağlığının ve mikroorganizma etkinliğinin iyileştiğini göstermiştir. Toprak

sıkışmasının azalması, organik madde birikiminin artması ve mikroorganizmaların aktif karbon dönüşümünü artırması, karbon tutma potansiyelini yükseltmiştir. Bu çalışma, toprak sağlığını iyileştiren mera kapatma yaklaşımlarının, bozulmuş mera topraklarını yeniden yapılandırarak toprak organik karbon stoklarını artırdığını göstermiştir.

Silvopastoral sistemlerin ve kalan orman parçalarının yüksek hayvan yoğunluklu alanlarda karbon depolama kapasitesini nasıl etkilediğini inceleyen Sotomayor-Castellanos ve ark. (2022), Meksika'daki bir merada bu sistemlerin karbon depolama etkisini nicel olarak ortaya koymuşlardır. Çalışmada farklı arazi kullanımı tipleri karşılaştırılmışlardır: sıradan açık mera, ağaçlı mera, entegre ağaç-mera sistemleri, canlı çitler, yem bitkisi üretim alanları, ikincil ve doğal orman. Silvopastoral sistemler ve orman kalıntıları, açık mera alanlarına göre çok daha fazla karbon depolamıştır. Silvopastoral uygulamalar, açık meralara göre %27-163 daha fazla toplam karbon stoğu göstermiştir. Arazi kullanımı türleri arasında ağaç biyokütlesi (özellikle odunsu bitkiler) ile toprak organik karbon (SOC) arasındaki pozitif ilişkinin güçlü olduğu bulunmuştur; yani ağaçların varlığı hem toprak üstü hem de toprak altı karbon stoklarını artırmıştır. SOC değerleri, arazinin kullanım geçmişi ve toprak yoğunluğu gibi faktörlere bağlı olarak bölgesel farklılıklar gösterse de entegre sistemler açık meralara göre genel olarak daha yüksek karbon depolamıştır.

ABD ve AB ülkelerinde mera sağlığı ve toprak karbonu, uzaktan algılama ve arazi ölçümlerinin birlikte kullanıldığı MRV sistemleri (İzleme, Raporlama ve Doğrulama) ile izlenmektedir. Bu sistemler, karbon yutak kapasitesinin nicel olarak değerlendirilmesine ve politika etkinliğinin ölçülmesine olanak sağlamaktadır (Smith ve ark., 2020).

Avrupa Birliği Ortak Tarım Politikası (CAP) kapsamında uygulanan eko-şartlı destekler, sürdürülebilir mera yönetimi uygulamalarını teşvik etmektedir. Çiftçiler, çevresel performans karşılığında ekonomik destek alarak karbon dostu uygulamalara yönelmektedir (Peer ve ark., 2020).

Bu uygulama ve politika yaklaşımları birlikte ele alındığında, çayır ve mera ekosistemlerinin karbon yutak kapasitesi artırılabilir; aynı zamanda ekosistem sağlığı, hayvansal üretim ve kırsal geçim kaynakları güvence altına alınabilir. Bu yönüyle çayır ve meralar, iklim değişikliğiyle mücadelede düşük maliyetli, uzun vadeli ve çok faydalı doğa temelli çözümler sunmaktadır.

11) Sonuç ve Öneriler

Otlakların etkin yönetimi, otlatma sistemleri ve arazi kullanımı modelleri, toprak organik karbonun artırılmasında kritik bir rol oynar ve bu sayede iklim değişikliği etkilerinin azaltılmasına katkı sağlar. Agro-silvo pastoralizm ve karma hayvancılık sistemleri gibi sürdürülebilir uygulamalar, karbon tutulumunu artırabilir, toprağın organik karbon depolamasını artırabilir ve insan kaynaklı CO_2 emisyonlarını azaltabilir. Arazi kullanımı değişiklikleri çevresel etkiler ve karbon dengesi üzerinde büyük etki yapar. Bitki örtüsü restorasyonu ve sürdürülebilir arazi yönetimi, karbon kaybını azaltıp karbon birikimini artırmada önemlidir. Bitki çeşitliliğinin artırılması, bitkiden toprağa karbon girişini ve mikrobiyal nekromass katkısını artırarak toprak organik karbon birikimini destekler. İklim değişikliği, bitki karbon girdileri ile mikrobiyal süreçler üzerindeki etkileri nedeniyle toprak organik karbon stoklarını etkiler ve bu nedenle gelecekteki karbon dengesini belirsizleştirir. Mera alanların karbon tutma potansiyeli yüksektir, ancak bunu gerçekleştirmek için uygun arazi yönetimi, biyolojik çeşitliliğin korunması ve iklim değişikliğine uyum stratejileri gereklidir. Bu alanlarda daha fazla araştırma ve uygulama odaklı çalışmalar önerilmektedir.

Sayı : E-18977135-200-710598 18.07.2025
Konu : ISPEC 18.Uluslararası Tarım, Hayvancılık ve Kırsal Kalkınma Kongresi

EREĞLİ ZİRAAT FAKÜLTESİ DEKANLIĞINA

İlgi : 18.07.2025 tarih ve E-64328326-200-709955 sayılı yazınız.

Fakülteniz ev sahipliğinde 24-26 Ekim 2025 tarihleri arasında gerçekleştirilecek olan "ISPEC 18.Uluslararası Tarım, Hayvancılık ve Kırsal Kalkınma Kongresi" başlıklı bilimsel toplantıya Fakülteniz Dekanı Prof. Dr. Yaşar KARADAĞ'ın düzenleme kurulu başkanı olarak görevlendirilmesi Rektörlüğümüzce uygun görülmüştür.
Bilgilerini rica ederim.

Prof. Dr. Cem ZORLU
Rektör
