TOTAL ACCEPTED ARTICLES: 317

The Number of Accepted Papers from Türkiye: 152
The Number of Accepted Full Papers from Other Countries: 165

Conference Honorary President

Prof. Dr. Cem ZORLU
Rector of the Necmettin Erbakan University

Chairperson of the Organizing Board

Prof. Dr. Yaşar KARADAĞ
Dean of the Ereğli Faculty of Agriculture, Necmettin Erbakan University

Conference Secretary

Assoc. Prof. Dr. Sevim Seda YAMAÇ
Ereğli Faculty of Agriculture, Necmettin Erbakan University

Conference Coordinator

Dr. Seyithan SEYDOŞOĞLU
Siirt University

Organizing Board Members

Prof. Dr. Aydın AKKAYA – Muş Alparslan University

Prof. Dr. Rüştü HATİPOĞLU – Kırşehir Ahi Evran University

Prof. Dr. Selahattin ÇINAR – Kırşehir Ahi Evran University

Prof. Dr. Sabri GÖKMEN – Selçuk University

Prof. Dr. Güngör YILLMAZ – Bozok University

Prof. Dr. Tekin ŞAHİN – Siirt University

Prof. Dr. Hidayet OĞUZ – Necmettin Erbakan University

Prof. Dr. Zeki BAYRAMOĞLU – Selçuk University

Prof. Dr. İsa TELCİ – Isparta Uygulamalı Bilimler University

Prof. Dr. Mehmet Ali SAKİN – Tokat Gaziosmanpaşa University

Prof. Dr. Ahmet ŞEKEROĞLU – Niğde Ömer Halisdemir University

Prof. Dr. Mustafa AVCI – Niğde Ömer Halisdemir University

Prof. Dr. Metin ARMAĞAN –Necmettin Erbakan University

Prof. Dr. Kağan KÖKTEN – Sivas Bilim ve Teknoloji University

Prof. Dr. Ramazan GÖNENCİ - Necmettin Erbakan University

Prof. Dr. Nuri ALTUĞ – Necmettin Erbakan University

Doç. Dr. Aras TÜRKOĞLU – Necmettin Erbakan University

Doç. Dr. Sevim Seda YAMAÇ – Necmettin Erbakan University

Doç. Dr. Ahmet KINAY – Tokat Gaziosmanpaşa University

Dr. Öğr. Üyesi Mehmet Zahit MALASLI – Necmettin Erbakan University

Dr. Öğr. Üyesi Çetin PALTA – Necmettin Erbakan University

Dr. Öğr. Üyesi Hasan CAN – Necmettin Erbakan University

Dr. Öğr. Üyesi Furkan Ömer KANARYA – Necmettin Erbakan University

Dr. Öğr. Üyesi Yılmaz AKGÜNEY- Necmettin Erbakan University

Dr. Öğr. Üyesi Seda GÜNAYDIN – Necmettin Erbakan University

Dr. Öğr. Üyesi Mahir ÖZKURT – Muş Alparslan University

Dr. Şerafettin ÇAKAL – General Directorate of Agricultural Research and Policies

Dr. Fatih ÖZDEMİR – General Directorate of Agricultural Research and Policies

SCIENCE COMMITTEE

Prof. Dr. Ahmet YILDIRIM – International University of Sarajevo – IUS, BOSNIA and HERZEGOVINA

Prof. Dr. Hayrettin OKUT – Kansas University, USA

Prof. Dr. Abdulchaudhry – New Castle University, UK

Prof. Dr. Muhammed Katica – Internationl University of Sarajevo-IUS, BOSNIA and HERZEGOVINA

Prof. Dr. Yong Suk Chung - Jeju National University, SOUTH KOREA

Prof. Dr. Muhammad Qasim Shahid – South China Agricultural University, CHINA

Prof. Dr. Allah Bakhsh – Punjab University – PAKISTAN

Prof. Dr. Surendra BARPETE – ICARDA, INDIA

Prof. Dr. Ndomelele Ndiko LUDIDI - University of Mpunalanga, SOUTH AFRICA

Prof. Dr. Rashidova Dilbar Karimovna – Cotton Breeding, Seed Production and Agro Technologies Research Insitute, UZBEKISTAN

Prof. Dr. Tursunov Ibrohimjon Abduhalimovich - Andijan Institute of Agriculture and Agrotechnologies, UZBEKISTAN

Prof. Dr. Juraev Akmaljon Normukhamadovich - Andijan Institute of Agriculture and Agrotechnologies, UZBEKISTAN

Prof. Dr. Jumabaev Zukhriddin Muminovich - Andijan Institute of Agriculture and Agrotechnologies, UZBEKISTAN

Prof. Dr. Ebrahim Amiri - Islamic Azad University, IRAN

Prof. Dr. Ahmet TAMKOÇ - Selçuk University, TÜRKİYE

Prof. Dr. Ali TOPAL - Selçuk University, TÜRKİYE

Prof. Dr. Bayram SADE - Selçuk University, TÜRKİYE

Prof. Dr. Cengiz SANCAK - Ankara University, TÜRKİYE
Prof. Dr. Ersin CAN - Hatay Mustafa Kemal University, TÜRKİYE
Prof. Dr. Esvet AÇIKGÖZ – Bursa Uludağ University, TÜRKİYE
Prof. Dr. Mehmet SİNCİK – Bursa Uludağ University, TÜRKİYE
Prof. Dr. İlhan TURGUT – Bursa Uludağ University, TÜRKİYE
Prof. Dr. Abdurrahim Tanju GÖKSOY – Bursa Uludağ University, TÜRKİYE
Prof. Dr. Nazan DAĞÜSTÜ – Bursa Uludağ University, TÜRKİYE
Prof. Dr. Abdullah KARASU – Bursa Uludağ University, TÜRKİYE
Prof. Dr. Fahri SÖNMEZ - Tokat Gaziosmanpaşa University, TÜRKİYE
Prof. Dr. Güngör YILMAZ - Yozgat Bozok University, TÜRKİYE
Prof. Dr. Hasan Gökhan DOĞAN - Kırşehir Ahi Evran University, TÜRKİYE
Prof. Dr. Arda YILDIRIM – Tokat Gaziosmanpaşa University, TÜRKİYE
Prof. Dr. Resul GERÇEKCİOĞLU – Tokat Gaziosmanpaşa University, TÜRKİYE
Prof. Dr. İsa TELCİ - Isparta Uygulamalı Bilimler University, TÜRKİYE
Prof. Dr. Kağan KÖKTEN – Sivas Bilim ve Teknoloji University, TÜRKİYE
Prof. Dr. Mahmut KAPLAN - Erciyes University, TÜRKİYE
Prof. Dr. Mehmet Ali SAKİN - Tokat Gaziosmanpaşa University, TÜRKİYE
Prof. Dr. Mustafa AVCI - Niğde Ömer Halisdemir University, TÜRKİYE
Prof. Dr. Mustafa ÖNDER - Selçuk University, TÜRKİYE
Prof. Dr. Mustafa YILDIRIM - Kahramanmaraş Sütçü İmam University, TÜRKİYE
Prof. Dr. Nafiz ÇELİKTAŞ - Hatay Mustafa Kemal University, TÜRKİYE
Prof. Dr. Nejdet KANDEMİR – Hacı Bayram Veli University, TÜRKİYE
Prof. Dr. Rıza AVCIOĞLU - Ege University, TÜRKİYE
Prof. Dr. Rüştü HATİPOĞLU - Kırşehir Ahi Evran University, TÜRKİYE
Prof. Dr. Sabri GÖKMEN - Selçuk University, TÜRKİYE
Prof. Dr. Süleyman SOYLU - Selçuk University, TÜRKİYE
Prof. Dr. Tolga KARAKÖY - Sivas Bilim ve Teknoloji University, TÜRKİYE
Doç. Dr. Hakan KIR - Kırşehir Ahi Evran University, TÜRKİYE
Dr. Mesut KESER - ICARDA, TÜRKİYE
Prof. Dr. Mustafa TAN – Trakya University, TÜRKİYE
Prof. Dr. Rüstem CANGİ – Tokat Gaziosmanpaşa University, TÜRKİYE
Prof. Dr. Metin TUNA – Tekirdağ Namık Kemal University, TÜRKİYE
Prof. Dr. Gazanfer ERGÜNEŞ – Tokat Gaziosmanpaşa University, TÜRKİYE
Prof. Dr. Sedat KARAMAN – Tokat Gaziosmanpaşa University, TÜRKİYE
Prof. Dr. Kadri YÜREKLİ – Tokat Gaziosmanpaşa University, TÜRKİYE
Prof. Dr. Engin ÖZGÖZ – Tokat Gaziosmanpaşa University, TÜRKİYE
Prof. Dr. Zafer ULUTAŞ – Samsun 19 Mayıs University, TÜRKİYE
Prof. Dr. Ramazan GÖNENCİ – Necmettin Erbakan University, TÜRKİYE
Prof. Dr. Nuri ALTUĞ – Necmettin Erbakan University, TÜRKİYE
Prof. Dr. Şenay SARICA – Tokat Gaziosmanpaşa University, TÜRKİYE
Prof. Dr. Ahmet GÖKKUŞ – Çanakkale Onsekiz Mart University, TÜRKİYE

Prof. Dr. Zeki ACAR – Samsun Ondokuz Mayıs University, TÜRKİYE
Prof. Dr. İlknur AYAN – Samsun Ondokuz Mayıs University, TÜRKİYE
Prof. Dr. Ferat UZUN – Samsun Ondokuz Mayıs University, TÜRKİYE
Prof. Dr. Tamer YAVUZ – Kırşehir Ahi Evran University, TÜRKİYE
Prof. Dr. Mevlüt TÜRK – Kırşehir Ahi Evran University, TÜRKİYE
Prof. Dr. Canan TUNA – Tekirdağ Namık Kemal University, TÜRKİYE
Prof. Dr. Adnan ORAK – Tekirdağ Namık Kemal University, TÜRKİYE
Prof. Dr. Ali KOÇ – Eskişehir Osman Gazi University, TÜRKİYE
Prof. Dr. Mustafa SÜRMEN – Aydın Adnan Menderes University, TÜRKİYE
Prof. Dr. ALİ ÖZTÜRK – Atatürk University, TÜRKİYE
Prof. Dr. Hakan ÖZER – Atatürk University, TÜRKİYE
Prof. Dr. Suzan ALTINOK – Ankara University, TÜRKİYE
Prof. Dr. Cafer Sırrı SEVİMAY – Ankara University, TÜRKİYE
Prof. Dr. Mehmet Salih SAYAR – Dicle University, TÜRKİYE
Prof. Dr. Mehmet Kerim GÜLLAP – Atatürk University, TÜRKİYE
Prof. Dr. Aysen KOÇ – Yozgat Bozok University, TÜRKİYE
Prof. Dr. Belgin Coşge ŞENKAL – Yozgat Bozok University, TÜRKİYE
Prof. Dr. Emine Sema ÇETİN – Yozgat Bozok University, TÜRKİYE
Prof. Dr. Tuğrul YAKUPOĞLU – Yozgat Bozok University, TÜRKİYE
Prof. Dr. Tanzer ERYILMAZ – Yozgat Bozok University, TÜRKİYE
Prof. Dr. Uğur BAŞARAN – Yozgat Bozok University, TÜRKİYE
Prof. Dr. Ercan CEYHAN – Selçuk University, TÜRKİYE
Prof. Dr. Duran YAVUZ – Selçuk University, TÜRKİYE
Prof. Dr. Duran KATAR – Eskişehir Osman Gazi University, TÜRKİYE
Prof. Dr. Bilal ACAR – Selçuk University, TÜRKİYE
Prof. Dr. Nevzat AYDIN – Karamanoğlu Mehmetbey University, TÜRKİYE
Prof. Dr. Metin SEZER – Karamanoğlu Mehmetbey University, TÜRKİYE
Prof. Dr. Özlem SAVAŞ – Karamanoğlu Mehmetbey University, TÜRKİYE
Prof. Dr. Mehmet GÜNEŞ – Tokat Gaziosmanpaşa University, TÜRKİYE
Prof. Dr. Kadri YÜREKLİ – Tokat Gaziosmanpaşa University, TÜRKİYE
Prof. Dr. Necdettin SAĞLAM – Tokat Gaziosmanpaşa University, TÜRKİYE
Prof. Dr. Naif GEBOLOĞLU – Tokat Gaziosmanpaşa University, TÜRKİYE
Prof. Dr. Ebubekir ALTINTAŞ – Tokat Gaziosmanpaşa University, TÜRKİYE
Prof. Dr. Kenan YILDIZ - Tokat Gaziosmanpaşa University, TÜRKİYE
Prof. Dr. Yusuf YANAR – Tokat Gaziosmanpaşa University, TÜRKİYE

Prof. Dr. Kenan KARA – Tokat Gaziosmanpaşa University, TÜRKİYE
Prof. Dr. Halit ÇAM – Tokat Gaziosmanpaşa University, TÜRKİYE
Prof. Dr. Gülistan ERDAL – Tokat Gaziosmanpaşa University, TÜRKİYE
Prof. Dr. Tekin ÖZTEKİN – Tokat Gaziosmanpaşa University, TÜRKİYE
Prof. Dr. Adnan ÇİÇEK – Tokat Gaziosmanpaşa University, TÜRKİYE
Prof. Dr. Esin ORUÇ – Tokat Gaziosmanpaşa University, TÜRKİYE
Prof. Dr. Nuri YILMAZ – Ordu University, TÜRKİYE
Prof. Dr. Nihat YEŞİLAYER – Tokat Gaziosmanpaşa University, TÜRKİYE
Prof. Dr. Mehmet Emin ÇALIŞKAN – Niğde Ömer Halisdemir University, TÜRKİYE
Prof. Dr. Süleyman TEMEL – Iğdır University, TÜRKİYE
Prof. Dr. Çetin ÇEKİÇ – Tokat Gaziosmanpaşa University, TÜRKİYE

Assist. Prof. Dr. Onur ŞAHİN – Muş Alparslan University, TÜRKİYE

Assist. Prof. Dr. Feyza Döndü BİLGİN - Aydın Adnan Menderes University, TÜRKİYE

Dr. Kurbonov Abrojon Yorkinovich – Cotton Breeding, Seed Production and Agro Technologies Research Institute, UZBEKISTAN

Dr. Avliyoqulov Mirzoolim Avazovich – Cotton Breeding, Seed Production and Agro Technologies Research Insitute, UZBEKISTAN

Lect. Kuziboev Shukhratjon Tursinaliyevich - Andijan Institute of Agriculture and Agrotechnologies, UZBEKISTAN

Res. Assist. Abdullaev Oybek Shakirjanovich - Andijan Institute of Agriculture and Agrotechnologies, UZBEKISTAN

Assist. Prof. Dr. Zuhair Hashain - Pir Mehr Ali Shah Arid Agriculture University, PAKISTAN

Dr. Ishfaq Ahmad - Asian Development Bank, PAKISTAN

Dr. Asmat Ullah - Agronomic Research Station, PAKISTAN

Dr. Abdul Khaliq (University of Agriculture, Department of Agronomy, Faisalabad, PAKISTAN)

Dr. Adnan Abbas (Nanjing university of information science and technology, nanjing CHINA).

Dr. Ali Mekki (University of Sfax, Biological Engineering-Environmental Bioprocesses and Soil Science, Sfax-TUNISIA)

Dr. Ajar Nath Yadav (Eternal University, Department of Biotechnology, Himachal Pradesh-INDIA)

Dr. Ashokkumar Vallabhbhai Rajani (Junagadh Agricultural University, College of Agricultuew, Dept. of Agril. Chem. & Soil Science, Gujarat-INDIA)

Dr. Barbara Wiśniowska-Kielian (University of Agriculture in Krakow, Faculty of Agriculture and Economics, Department of Agricultural and Environmental Chemistry, Krakow-POLAND)

Dr. Babak SAFAEI (Tsinghua University, CHINA)

Dr. Blend Ibrahim (School of Tourism and Hospitality Management. Department of Tourism Girne American University, CYPRUS)

Dr. hab. Barbara Sawicka (University of Life Sciences in Lublin, Faculty of Agrobioengineering, Department of Plant Production Technology and Commodity Sciences, Lublin-POLAND)

M.Sc. Benjamin Bantchina (Bursa Uludag University, Faculty of Agriculture, Department of Biosystems Engineering, Bursa-TÜRKİYE)

Dr. Brygida Klemens (Opole University of Technology, Faculty of Economics and Management, Opole-POLAND)

Dr. Derya Timuçin, (School of Tourism and Hospitality Management. Department of Tourism Girne American University, CYPRUS)

Dr. Elham Matallebi, Islamic Azad University, Garmsar, IRAN

Dr. Grzegorz Pączka (Rzeszów University, Department of Natural Theories of Agriculture and Environmental Education, Rzeszów, POLAND)

Dr. Fahrurrozi Fahrurrozi (University of Bengkulu, Faculty of Agriculture, Dept. of Crop Production, Bengkulu-INDONESIA)

Dr. Faisal SULTAN (Hazara University, PAKISTAN)

Dr. Francesco Nocera, (University of Catania, ITALY)

Dr. Herák David, (Czech University of Life Sciences Prague, CZECH REPUBLIC)

Dr. Hüseyin Bozdağlar (Girne American University, School of Tourism and Hospitality Cyprus)

Dr. Irshad Bibi (University of Agriculture, Faculty of Agriculture, Institute of Soil and Environmental Sciences, Faisalabad-PAKISTAN)

Dr. Iwan Setiawan, S.P., M.Si. (Department of Agricultural Economics, Agricultural Faculty. Universitas Padjadjaran. Jl. Raya Bandung-Sumedang km 21. Jatinangor. West Java. INDONESIA)

Dr. İsmet Esenyel (Girne American University, School of Tourism and Hospitality, CYPRUS)

Dr. Jam Nazeer Ahmad University of Agriculture, Faculty of Agriculture, Department of Entomology, Faisalabad-PAKISTAN)

Dr. Jasmin Latoviç (Southern Federal Üniversitesi, RUSSIA)

Dr. Khalid Hussain (University of Agriculture, Faculty of Agriculture, Department of Agronomy, Faisalabad-PAKISTAN)

Ph.D. Kusumiyati KUSUMIYATI, SP, M Agr. Sc.,. (Agronomy Department, Faculty of Agriculture, Universitas Padjadjaran Jl. Raya Bandung-Sumedang km 21. Jatinangor. West Java, INDONESIA)

Dr. Mazhar Rafique (University of Haripur, Faculty of Agriculture Sciences, Department of Soil & Climate Sciences-PAKİSTAN)

Dr. Medeuova Galiya (Kazakh National Women's Pedagogical Universty, KAZAKHISTAN)

Dr. Md. Iqbal HOSSAIN (Bangladesh University, BANGLADESH)

Dr. Muhammad Arshad (University of Agriculture, Faculty of Agriculture, Department of Entomology, Faisalabad-PAKISTAN)

Dr. Muhammad Shahbaz Naeem (University of Agriculture, Faculty of Agriculture, Department of Agronomy, Faisalabad-PAKISTAN)

Dr. Mohammad Mehdizadeh (Univesity of Mohaghegh, Department of Agronomy and Plant Breeding, Ardabili-IRAN)

Dr. Muhammad Zahid Ihsan (Islamia Univeristy of Bahawalpur, Cholistan Institute of Desert Studies, Bahawalpur-PAKISTAN)

Dr. Muhammad Adnan (University of Swabi, Department of Agriculture, Swabi-PAKISTAN)

Dr. Muhammad Zubair Siddiqi (Hankyong National University, Department of Biotechnology, SOUTH KOREA)

Dr. Muhammad Nurdin YUSUF (Agribusiness Department. Agricultrural Faculty. University of Galuh. Jl. R.E. Martadinata No. 150. Mekarjaya, Kec. Baregbeg. Kab. Ciamis. West Java 46274. INDONESIA)

Dr. Mushtaque Ahmed Jatoi, (University of Zagreb, Department of Pomology, Zagreb, Croatia, Beijing, CHINA)

Dr. Murat Akkaya (Girne American Universty, Vocatıonal School, CYPRUS)

Dr. Nabeel Khan Niazi (University of Agriculture, Faculty of Agriculture, Institute of Soil and Environmental Sciences, Faisalabad-PAKISTAN)

Dr. Niteesh Kumar Upadhyay (Galgotias University and South Ural State University RUSSIA)

Dr. Rana Nadeem Abbas (University of Agriculture, Faculty of Agriculture, Department of Agronomy, Faisalabad-PAKISTAN)

Dr. Rakesh GUPTA (Delhi University, INDIA)

Dr. Ristina Siti Sundari (University of Perjuangan Tasikmalaya, Faculty of Agriculture, Department of Agribusiness, Wezt Jawa-INDONESİA)

Dr. Safdar Bashir (Ghazi University, Faculty of Agricultural Sciences, Department of Soil and Environmental Sciences, Dera Ghazi Khan-PAKISTAN)

Dr. Sardar Alam Cheema (University of Agriculture, Faculty of Agriculture, Department of Agronomy, Faisalabad-PAKISTAN)

Dr. Shah Fahad (University of Haripur, Department of Agronomy, Haripur-PAKISTAN)

Dr. Saddam Hussain (University of Agriculture, Faculty of Agriculture, Department of Agronomy, Faisalabad-PAKISTAN)

Dr. Somayyeh Razzaghı (Sivas Science and Technology University, Faculty of Agriculture Science and Technology, TÜRKİYE)

Dr. Shitnaan E. Wapmuk (University Of Jos, Plateau State, Nigeria)

M.Sc. Setyo Budi Kurniawan (Universiti Kebangsaan Malaysia, Faculty of Engineering & Built Environment, Department of Chemical and Process Engineering, MALAYSIA)

Dr. Tahir Igbal, (Arid Agriculture University, Rawalpindi, PAKISTAN)

Dr. Wan Taek Im (Hankyong National University, Department of Biotechnology, SOUTH KOREA)

Dr. Viliana Vasileva (Agricultural Academy, Institute of Forage Crops, Forage Production and Livestock Department, Pleven-BULGARIA)

Dr. Yar Zar Chit (Sagaing University MYANMAR)

Dr. Zhongbing Chen (Czech University of Life Sciences Prague, Faculty of Environmental Sciences, Prague-CZECH REPUBLIC)

Dr. Zizis Vryzas (Democritus University, Thrace School of Agricultural & Forestry Sciences, Department of Agricultural Development, Orestiada-GREECE)

Dr. Zulfiqar Ahmad Dasti (University of Agriculture, Faculty of Agriculture, Institute of Soil and Environmental Sciences, Faisalabad-PAKISTAN)

Dr. Zubair Aslam (University of Agriculture, Faculty of Agriculture, Department of Agronomy, Faisalabad-PAKISTAN)

18. INTERNATIONAL CONFERENCE ON AGRICULTURE, ANIMAL SCIENCE & RURAL DEVELOPMENT

OCTOBER 24-26, 2025 / EREGLI, KONYA, TÜRKIYE

Necmettin Erbakan University
Eregli Faculty of Agriculture

Conference Topics

Agricultural Biotechnology, Agricultural Economics, Agricultural Employment, Agricultural Energy Systems, Agricultural Engineering, Agricultural Machinery, Agricultural Policies, Agricultural Structures, Animal Science, Artificial Intelligence in Agriculture, Banking and Agricultural Loans, Bees and Bee Products, Biosystems Engineering, Climate Smart Agriculture, Environment, Food Science and Engineering, Field Crops, Fisheries, Horticulture, Irrigation Systems, Landscape Architecture, Meat and Dairy Technology, Nanotechnology in Agriculture, Occupational Safety and Health in Agriculture, Plant Protection, Precision Farming, Producer Unions and Cooperatives, Regenerative Agriculture, Renewable Energy, Robotic Systems in Agriculture, Rural Development, Seafood, Soil Science and Plant Nutrition, Sustainable Agriculture, Sustainable Resource Allocation, Veterinary Science, Viticulture, Waste Management

CONFERENCE PROGRAM

In-person & Online

Zoom Meeting ID: 897 0755 8402 / Zoom Passcode: 181818
https://us02web.zoom.us/j/89707558402?pwd=zPbvq6JR6UGaPJEkDATUrNx53tLu2s.1

Necmettin Erbakan Üniversitesi Ereğli Ziraat Fakültesi Orhaniye Mah. Üniversite Cad. No:15 PK:42310 Ereğli/Konya

ispecconference@gmail.com www.ispeco.org

Face to Face / Necmettin Erbakan University, Faculty of Agriculture	
24.10.2025	HALL-1 / SESSION-1
ANKARA LOCAL TIME: 14:30-17:00	

HEAD OF SESSION: Prof. Dr. Mustafa Avcı

Authors	Affiliation	Presentation Title
Yunus Arzik	*Aksaray University*	Machine-learning gwas maps genomic architecture of coccidiosis resistance in sheep
Sedat Behrem Yunus Arzik	*Aksaray University*	Variations in the myostatin (GDF-8) gene and their effects on muscle development
Dr. Öğr. Üyesi Elif Çatıkkaş Said Efe Dost	*Karamanoğlu Mehmetbey University*	Seed nano-priming: a new approach for sustainable agriculture
Said Efe Dost Yilmaz Sesli Dr. Öğr. Üyesi Elif Çatıkkaş	*Karamanoğlu Mehmetbey University*	Effect of drought stress on pink lady and jeromine apple cultivars
Gülten Kaçar Avci	*Potato Research Institute*	Plant-parasitic nematodes in potatoes (*Solanum tuberosum* L.) and control methods
Esengül Demirel	*MORYEM Agricultural R&D Industry and Trade Ltd. Co.*	Seeking solutions to the global protein deficit: preliminary findings from alternative feed formulations and moringa studies
Müjgan Güney Hakan Keles Murat Güney	*Yozgat Bozok University*	Application of chromatographic techniques in the analysis of bioactive compounds in horticultural crops
Müjgan Güney Selcan Özyalin Gökçe Aydöner Çoban Hakan Keles	*Yozgat Bozok University*	Role of volatile compounds in determining aroma and flavor of horticultural crops
Muhammet Tarhan Asiye Sena Çavdar Adnan Gökten Recep İrfan Nazli Hasan Beytullah Dönmez	*Cukurova University*	The effects of different seeding ratios of gelemen clover and barley mixtures on forage yield, quality traits, and weed suppression

(All speakers required to be connected to the session 10 min before the session starts)
Moderator is responsible for ensuring the smooth running of the presentation, managing the group discussion and dynamics.

Face to Face / Necmettin Erbakan University, Faculty of Agriculture	
24.10.2025	HALL-2 / SESSION-1
ANKARA LOCAL TIME: 14:30-17:00	

HEAD OF SESSION: Prof. Dr. Rüştü HATİPOĞLU

Authors	Affiliation	Presentation Title
İsmail Çinkaya Osman Çağirgan Şafak Ceylan Durmuş Ali Kipritci Sinan Süheri	*Konya Soil, Water and Combating Desertification Research Institute Directorate*	Early wheat yield prediction using multispectral vegetation indices: statistical analysis of variety responses under water stress
Hakan Keles Servet Aras Müjgan Güney Selcan Özyalin	*Yozgat Bozok University*	Humic and fulvic acids in agricultural production: utilization potentials and recent studies
Hakan Keles Selcan Özyalin Servet Aras Müjgan Güney	*Yozgat Bozok University*	Hawthorn (*Crataegus* spp.): potentıals and future perspectıves as an alternatıve specıes
Murat Güney Selcan Özyalin Hakan Keles Servet Aras	*Yozgat Bozok University*	Advances, challenges, and solution strategies in tissue culture applications of fruit species
Murat Güney Hakan Keles Selcan Özyalin Gökçe Aydöner Çoban	*Yozgat Bozok University*	Recent advances in molecular marker-based determination of disease resistance in fruit genotypes
Emine Sema Çetin Nazife Çiğdem Ermiş Berna Keles	*Yozgat Bozok University*	Investigation of the effects of *Ascophyllum nodosum* applications on secondary metabolite accumulation in berries in michele palieri grape variety
Hilmi Yeter Orhan Ermetin	*Yozgat Bozok University*	Investigation of milk yield and reproductive parameters of holstein cattle raised in yozgat province
Orhan Ermetin	*Yozgat Bozok University*	Impact of prepartum body condition management on reproductive performance of dairy cows

(All speakers required to be connected to the session 10 min before the session starts)
Moderator is responsible for ensuring the smooth running of the presentation, managing the group discussion and dynamics.

Face to Face / Necmettin Erbakan University, Faculty of Agriculture	
24.10.2025	HALL-3 / SESSION-1
ANKARA LOCAL TIME: 14:30-17:00	

HEAD OF SESSION: Prof. Dr. Selahattin ÇINAR

Authors	Affiliation	Presentation Title
Selahattin Çinar	*Kırşehir Ahi Evran University*	Problems and solutions emerging in the applications of range law in türkiye
Melek Kurt Rüştü Hatipoğlu	*Kırşehir Ahi Evran University*	Vegetation studies conducted in the rangelands of the central anatolia region
Aysen Koç Haydar Yilmaz	*Yozgat Bozok University*	Effect of different iba doses and bacterial applications on rooting of black mulberry (*Morus nigra* L.) wood cuttings
Mustafa Alper Savaş Selahattin Çinar	*Kırşehir Ahi Evran University*	Rangeland vegetation survey studies conducted in turkey
Fathimah Azzahra Haydar Haciseferogullari	*Selçuk University*	Biomass potential from agricultural residues in indonesia
Deniz Sevilmiş Ayşe Nuran Çil Y. Ahu A*f*şaban	*Eastern Mediterranean Agricultural Research Institute*	Speed breeding: a current status review
Gülizar Kurtoğlu Akkaya N. Berk Bıtrak Kâmil Ekinci	*Necmettin Erbakan University*	Energy conversion of hemp biomass through anaerobic fermentation: perspectives on biogas and biomethane
Şaban Işik Şükrü Doğan Seydi Aydoğan Murat Küçükçongar	*Bahri Dağdaş International Agricultural Research Institute Directorate*	Determination of growth performances of weaned lambs of different sheep breed on artificial pastures
Korhan Özceylan Özgül Görmüş	*Çukurova University*	Evaluation of agronomic and fiber traits of cotton genotypes (*Gossypium* spp.) for breeding potential in the cukurova region
Ayşegül Faydaci Isa Telci	*Isparta University of Applied Sciences*	Determination of the phenological, agronomic, and quality characteristics of black cumin (*Nigella sativa* L.) genotypes under Isparta conditions

(All speakers required to be connected to the session 10 min before the session starts)
Moderator is responsible for ensuring the smooth running of the presentation, managing the group discussion and dynamics.

Face to Face / Necmettin Erbakan University, Faculty of Agriculture	
25.10.2025	HALL-1 / SESSION-1
ANKARA LOCAL TIME: 14:00-16:30	

HEAD OF SESSION: Prof. Dr. Yaşar Karadağ

Authors	Affiliation	Presentation Title
Hasan Hüseyin Şenyüz Gökhan Şen Ramazan Ayaş Ali Karapinar Ali Ersin Gümüş	*Necmettin Erbakan University*	Effects of shredlange and conventional methods on nutrient content and in vitro digestibility of corn silage
Sadiye Ayşe Çelik Gülbahar Babaoğlan	*Selçuk University*	Current perspectives on the use of essential oils against root rot disease in peanut
Sadiye Ayşe Çelik Tuba Özkan Ay	*Selçuk University*	Evaluation of the use of essential oils as an alternative to chemical methods in egg disinfection and sterilization
Mehmet Ali Avci Emir Yavaş Melike Mavi	*Selçuk University*	Area coverage performance and ecological turf applications of some wheaten forage crops that can be used in green areas
Seda Günaydın Işıl Kılıç	*Necmettin Erbakan University*	Determination of the influence of different pre-treatments and microwave drying method on co 2 emissions in the drying of red plum (*Prunus domestica*) slices
Sadiye Ayşe Çelik Emir Yavaş Selim Derman Küçükmaraş	*Selçuk University*	Effects of pgpr and mycorrhiza combinations on yield, active compound content, and stress tolerance in medicinal and aromatic plants
Havva Nur Demir Deveci Tahir Külahcı Ramazan Topak	*Necmettin Erbakan University*	A review on the effects of irrigation on lavender (*L. angustifolia* mill.) yield and oil quality
Beyza Yilmaz Ayhan Ceyhan	*Niğde Ömer Halisdemir University*	The effect of climate change on sheep breeding: heat stress, performance, adaptation strategies

(All speakers required to be connected to the session 10 min before the session starts)
Moderator is responsible for ensuring the smooth running of the presentation, managing the group discussion and dynamics.

25.10.2025 / SESSION-1 / HALL-1

Ankara Local Time: 10:00-12:00 Online Session (Zoom Meeting)

Zoom Meeting ID: 897 0755 8402 / Zoom Passcode: 181818

HEAD OF SESSION: Prof. Dr. Metin Armağan

Authors	Affiliation	Presentation Title
Atakan Özalp İsmet Başer Damla Balaban Göcmen	*Tekirdağ Namık Kemal Universitesi*	Effect of different irrigation practices on quality criteria in sorghum and corn
E. Mevliyaoğulları S. Doğan S. Göncü	Başkent *Universitesi*	Changes in blood parameters from birth to weaning in male and female holstein calves
Bekir Demirtaş Fatma Can Alkan	*Hatay Mustafa Kemal Universitesi*	Determination of input utilisation level and agricultural credit needs of olive producers in Hatay-altinözü district
Başak Boztok Özgermen	*Aksaray Universitesi*	Radiographic assessment of cardiac dimensions in healthy dogs: vertebral heart scale (VHS) and vertebral left atrial size (VLAS)
Canan Kop Bozbay Melike Vural Zeynep Geçili Nuri Can Karaoğlu	*Eskisehir Osmangazi University*	Effects of in ovo honey feeding on hatching performance and response to delayed access to feed and water in anadolu-t broiler chicks
Canan Kop Bozbay Berkay Kaya Yiğit Battal Akarsu Kürşat Selman Ovali Miraç Mert Yildirim	*Eskisehir Osmangazi University*	Effects of different doses of in ovo colostrum powder administration on hatching performance and blood parameters of anadolu-t broiler chicks
Mustafa Demirkaya	*Kayseri Universitesi*	Physiological changes occur in white pumpkin seeds during ageing
Mert Acar	*Çukurova Universitesi*	Relationships between aggregate stability and organic matter content in different soil series

(All speakers required to be connected to the session 10 min before the session starts)
Moderator is responsible for ensuring the smooth running of the presentation, managing the group discussion and dynamics.

25.10.2025 / SESSION-1 / HALL-2

Ankara Local Time: 10:00-12:00 Online Session (Zoom Meeting)

Zoom Meeting ID: 897 0755 8402 / Zoom Passcode: 181818

HEAD OF SESSION: Assoc. Prof. Dr. Aras Türkoğlu

Authors	Affiliation	Presentation Title
Şahin Aydin	*Işık University*	Ai-based approaches for regional analysis and forecasting of livestock numbers
Serdar Dizman	*Recep Tayyip Erdogan University*	Detection of natural radioactive isotopes in chestnuts and radiological risk assessment for human health
Ahmet Özden Yusuf Cufadar	*Ministry of Agriculture and Forestry*	Current situation in livestock and new support model
Songül Yildiz Yeşim Öztürk Yilmaz Zeynep Bayramoğlu	*Recep Tayyip Erdoğan University*	Effects of tea vinegar applications on the growth of tea seedlings (*Camellia sinensis* L.)
Songül Yildiz Fatma Kesimal Zeynep Bayramoğlu	*Recep Tayyip Erdoğan University*	Effects of microbial fertilizer and tea waste applications on yield and quality in aronia (*Aronia melanocarpa*) cultivation
Caner Öztürk Neşe Hayat Aksoy Erkan Özkan Ramazan Arslan	*Aksaray University*	Effects of meloxicam on sperm parameters in rats - a preliminary study
Merve Kahraman Abdurrahman Sami Koca	*Bolu Abant İzzet Baysal University*	Seasonal population dynamics of palpita unionalis hubner (lepidoptera: pyralidae) in olive orchards of akhisar district (Manisa, Türkiye)
Arzu Üçtepe Antonios Kominakis	*Isparta University of Applied Sciences*	Estimation of heritability and common environmental effects of egg traits in the blue-breasted quail (*Synoicus chinensis*)
Koray Genç	*Ordu University*	Green business practices focused on the sustainability of agricultural production: a comparative analysis of second wave coffee chains in Turkey

(All speakers required to be connected to the session 10 min before the session starts)
Moderator is responsible for ensuring the smooth running of the presentation, managing the group discussion and dynamics.

25.10.2025 / SESSION-1 / HALL-3

Ankara Local Time: 10:00-12:00 Online Session (Zoom Meeting)

Zoom Meeting ID: 897 0755 8402 / Zoom Passcode: 181818

HEAD OF SESSION: Assoc. Prof. Dr. Sevim Seda Yamaç

Authors	Affiliation	Presentation Title
Mederbek Zhaanbaev	*Kyrgyz-Turkish Manas University*	Identification of Promising Genotypes Among The Wild Pistachio (Pistacia vera L.) Population Growing in Kazak Uulu Village of Osh Province in Kyrgyzstan
Rotimi-Williams Bello Pius A. Owolawi Chunling Tu Etienne A. van Wyk Mojisola Abosede Oladipo	*Tshwane University of Technology*	Livestock localization using real-time internet-of-things architecture
Oluwadamilola Peace Agoi Moses Adeolu Agoi Solomon Abraham Ukpanah Samuel Olayiwola Ajaga Oluwanifemi Opeyemi Agoi	*Federal University of Agriculture Abeokuta*	Xr-supported decision making in agro-ecosystem design: an evaluative empirical perspective
Saju Abraham	*Newman College*	Climate change and oxidative stress in plants: a phytochemical perspective on resilience
Mederbek Zhaanbaev Aibiike Borubaeva	*Kyrgyz-Turkish Manas University*	Some Fruit Characteristics of Naturally Grown Hawthorns (Crataegus spp.) in Uzgen District, Osh Region, Kyrgyzstan.
Moses Adeolu Agoi Samuel Olayiwola Ajaga Solomon Abraham Ukpanah Oluwadamilola Peace Agoi	*Lagos State University of Education*	Collaborative robots (cobots) for precision pruning and crop management in glass houses
Mamta Sharma Sandeep Kumar Sharma	*University of Delhi*	Integrated Assessment of Desertification, Land-Use Change, and Ecological Degradation – A Case Study of Rewari Industrial Area, Delhi-NCR
Adelmonim Zeroual Mohammed Mitache Bacar Abdallah Abderemane Aziz Baidani Omar Idrissi	*National Institute of Agricultural Research*	Genetic diversity for agronomic traits in a mediterranean lentil collection: towards the development of high yielding climate-change ready cultivars

(All speakers required to be connected to the session 10 min before the session starts)
Moderator is responsible for ensuring the smooth running of the presentation, managing the group discussion and dynamics.

25.10.2025 / SESSION-1 / HALL-4

Ankara Local Time: 10:00-12:00 Online Session (Zoom Meeting)

Zoom Meeting ID: 897 0755 8402 / Zoom Passcode: 181818

HEAD OF SESSION: Assist. Prof. Dr. Çetin Palta

Authors	Affiliation	Presentation Title
Adelmonim Zeroual Aziz Baidani Bacar Abdallah Abderemane Mohammed Mitache Omar Idrissi	*National Institute of Agricultural Research*	Evaluation of lentil genotypes for mechanical harvesting suitability
Vilma Salkauskiene	*Lietuvos Inzinerijos Kolegija Higher Education Institution*	Assessment of protected and recreational areas in the southwestern part of lithuania relief
S. Kalaiselvan G. Janaki R. Suganya G. Kowsalya R.Sumathi	*Rathinam Technical Campus*	Connecting Advanced Mathematical Applications for Transforming Contemporary Agriculture through Precision, Prediction, and Sustainability
Gunasekar G	*Tamil Nadu Agricultural University*	Life table construction and analysis for evaluating bio-control agents
Jatin Vats, Ajesh Chauhan Chetan Vashisht	*Hindu College of Pharmacy Sonepat*	Revealing the Therapeutic Value of Biodegradable Cellulose Fibers: Novel Developments and Strategies in Skin Tissue Regeneration
Shoumen Dhar Bappy Chowdhury Mehenaj Musa Abdur Rahman Mahima Ranjan Acharjee Sreebash Chandra Bhattacharjee	*Chattogram Veterinary and Animal Sciences University*	Nutritionally Optimized Baby Food from Indigenous Ingredients: Safety, Functionality, and Acceptability for Sustainable Infant Nutrition
Bruno, Ibeabuchi Anwuri Gbara, Uloma Celestine Ogunbayo, Oluwatoyin Glory	*Federal College of Education*	Artificial intelligence and national economic growth: exploring the role of stem education in workforce transformation in nigeria.
Saira Malik Syed Mohsan Raza Shah Uniza Fatima bukhari Tasawar Fatima bukhari Iqra	*University of Education, Lahore*	Leaf structural and functional modification of Ipomoea carnea Jacq. an invasive plant species, under diverse salinity gradient
Giorgi Shtenberg Divagar Muthukumar	*Institute of Agricultural Engineering*	Multiplex pathogenic bacteria detection in milk with the nanoparticle-assisted porous silicon-based sers microarray biosensor

(All speakers required to be connected to the session 10 min before the session starts)
Moderator is responsible for ensuring the smooth running of the presentation, managing the group discussion and dynamics.

25.10.2025 / SESSION-1 / HALL-5

Ankara Local Time: 10:00-12:00 Online Session (Zoom Meeting)

Zoom Meeting ID: 897 0755 8402 / Zoom Passcode: 181818

HEAD OF SESSION: Assoc. Prof. Dr. Derya KARATAŞ

Authors	Affiliation	Presentation Title
Iram Liaqat	*Government College University*	QS inhibition by algal compounds against marine biofilms
Voroneanu-Popa Rareș-Vasile Richard Constantinescu	*Grigore T. Popa University of Medicine and Pharmacy of Iași*	Possible perspectives of european union policies on the development of the agricultural sector
Bruno, Ibeabuchi Anwuri Ogunbayo, Oluwatoyin Glory Oreke, Obusor Happiness Ajie, Uloma Glory	*Federal College of Education*	Artificial intelligence for individualized remediation of misconceptions in biology concep
Anandhavalli Muniasamy	*King Khalid University*	Plant seedling identification using pretrained deep transfer learning models
Shehu, N.M. Zakari, N. Kabir I.A. Shehu, A.U.	*Federal University*	Flood vulnerability and its impacts on agricultural systems, livestock, and rural development: a comprehensive review
Skender Demaku Muhamet Kiqina Arbnorë Aliu Donika Sylejmani	*University of Prishtina "Hasan Prishtina"*	Chemical analysis of atmospheric dust around the kishnica area in the municipality of gracanica
R. Thiruchelvi	*Vels Vidhyalaya School*	Synthesizing entrepreneurial stem education: a review of theoretical foundations, pedagogical practices, and future directions
Drobchenko N.V.	*Samarkand State University of Architecture and Civil Engineering named after Mirzo Ulugbek*	Ecological rehabilitation of the aral sea region: phytomelioration as a sustainable tool for land restoration
Vijayakumaran Shobana K. Sujatha Tatireddy Omsai Reddy N.P.G. Bhavani	*Institute Chennai*	ECG-based sleep apnea detection using convolutional and long short-term memory networks

(All speakers required to be connected to the session 10 min before the session starts)
Moderator is responsible for ensuring the smooth running of the presentation, managing the group discussion and dynamics.

25.10.2025 / SESSION-2 / HALL-1

Ankara Local Time: 12:30-14:30 Online Session (Zoom Meeting)

Zoom Meeting ID: 897 0755 8402 / Zoom Passcode: 181818

HEAD OF SESSION: Assist. Prof. Dr. Hasan Can

Authors	Affiliation	Presentation Title
İlhan Yandi	*Recep Tayyip Erdoğan University*	In-situ degradation of offshore aquaculture mooring ropes: a depth-wise analysis of plastic emission rates
İlhan Yandi	*Recep Tayyip Erdoğan University*	From experiment to ecosystem: estimating the macro-impact of plastic emissions from black sea offshore aquaculture mooring systems
Tansu Uskutoğlu Rıdvan Uçar	*Pamukkale University*	Clary sage (*Salvia sclarea* L.): cultivation, uses, and potential
Rıdvan Uçar Tansu Uskutoğlu	*Pamukkale University*	Evaluation of the beekeeping potential of denizli oregano
Serpil Aygörmez Mushap Kuru Mustafa Makav	*Kafkas University*	Changes in serum paraoxonase-1 and some oxidative status markers during anoestrus and estrus in abaza and gürcü goats
Sinan Akbal	*Pamukkale University*	Effect of lactic acid bacteria on yeast/mold spoilage in the dairy industry
Sinan Akbal	*Pamukkale University*	Effect of use of plant-based proteases in dairy technology on technological and bioactive properties
Onur Sefa Alkaç	*Tokat Gaziosman Paşa University*	Effects of different planting times and plant density on growth and quality in ornamental sunflowers
Mehmet Ali Dündar Ramazan Topak	*Bahri Dağdaş International Agricultural Research Institute Directorate*	Planning of linear move irrigation systems

(All speakers required to be connected to the session 10 min before the session starts)
Moderator is responsible for ensuring the smooth running of the presentation, managing the group discussion and dynamics.

25.10.2025 / SESSION-2 / HALL-2

Ankara Local Time: 12:30-14:30 Online Session (Zoom Meeting)

Zoom Meeting ID: 897 0755 8402 / Zoom Passcode: 181818

HEAD OF SESSION: Assoc. Prof. Dr. Mahir ÖZKURT

Authors	Affiliation	Presentation Title
Bekir Atar	*Isparta Uygulamalı Bilimler University*	Use of paclobutrazol (pbz) in wheat production
Murat Durmuş	*Cukurova University*	A way to increase marketable milk in goat breeding: use of milk replacers
Orhan Yalçin Recep Gümüş	*Sivas Cumhuriyet Üniversitesi*	The effects of postpartum oral propylene glycol administration on body condition score in dairy cows
Ecenur Aliş Deniz Dinçel	*Bursa Uludağ University*	Genetic basis of heat stress response: novel perspectives on molecular adaptation in cattle
Berna Efe Seçil Candaş Özkan Recep Kirbaş Erol Karakurt	*Central Research Institute for Field Crops*	Morphologic, physiologic and agronomic traits of cold-tolerant common vetch hybrid lines
Şamil Gülaydın Murat Ali Turan	*Bursa Uludağ University*	Effects of nitrogen and sulfur applications on fruit quality in banana plants
Muhammet Cemil Ejderoğlu Murat Ali Turan	*Bursa Uludağ University*	Effect of calcium and boron applications on development of pepper plant
Merve Dilek Karataş	*Van Yüzüncü Yıl University*	Effect of deficit irrigation on the expression of slnced1 and sldreb2 genes in tomato
Mehmet Halil ÖZSÜER Melike OĞUZ Burak TOLU Onur ÖKSÜZ Fatih KARABULUT	*Gübretaş*	Investigation of the effects of microbial fertilizer formulations created with bacterial strains isolated from Turkish soils on grain corn *(zea mays l.)* plants under greenhouse conditions
Mehmet Halil ÖZSÜER Melike OĞUZ Burak TOLU Onur ÖKSÜZ Fatih KARABULUT	*Gübretaş*	Investigation of the effects of microbial fertilizer formulations created wıth bacterial strains isolated from Turkish soils on green pepper *(capsicum annuum l.) Plants* under greenhouse conditions.
Muazzez Yeşilyurt Özgül Gülaydin	*Siirt University*	Chronic respiratory system infection (crd) in poultry

(All speakers required to be connected to the session 10 min before the session starts)
Moderator is responsible for ensuring the smooth running of the presentation, managing the group discussion and dynamics.

25.10.2025 / SESSION-2 / HALL-3

Ankara Local Time: 12:30-14:30 Online Session (Zoom Meeting)

Zoom Meeting ID: 897 0755 8402 / Zoom Passcode: 181818

HEAD OF SESSION: Prof. Dr. Metin Armağan

Authors	Affiliation	Presentation Title
Rawia Nasri Mohamed Faouzi Zid	*University of Tunis El Manar*	Solar light driven photocatalytic degradation of toxic azo dyes using synthesized molybdate catalyst
Mohanapriya P Chamundeeswari M	*St. Joseph's College of Engineering*	Green synthesized iron nanoparticle based detection of microplastics from aqueous environment
Abdullahi Umar	*Ahmadu Bello University*	The use of glutamic acid as a green alternative for corrotion inhibition in HCL solution
Akinleye, Abiodun Olamilekan	*The Federal Polytechnic*	Performance evaluation of wireless sensor networks for smart agriculture using opnet
Ugwuoke Chukwuchebe Obiajulu	*University of Nigeria*	Benefits of agro forestry land use in nsukka local government area, enugu state, nigeria
Y. Sarayu Reddy S. Suji	*R.M.K. Engineering College*	Impact of sustainable agricultural practices on environmental conservation
Chidimma Lilian Asadu Robert Ikechukwu Uroko Stanley Mary Ubenyi	*Esut College of Medicine*	Evaluation of spermatozoa quality, differential sperm morphology and gonadosomatic indices of benign prostatic hyperplasia induced rats treated with polyherbal extract
R.Thiruchelvi P.Saravanan	*St. Joseph's College of Engineering*	Valorization of fruit waste through reutilization approach: a comprehensive review
Sadik Dani Hassane Abd-Dada Aziz Ezzine Ahmed El Annaoui Atman Adiba Abdelmajid Haddioui Said Bouda	*Sultan Moulay Slimane University*	Morphological characterization of the genetic resources of moroccan white mulberry (*Morus alba* L.)

(All speakers required to be connected to the session 10 min before the session starts)
Moderator is responsible for ensuring the smooth running of the presentation, managing the group discussion and dynamics.

25.10.2025 / SESSION-2 / HALL-4

Ankara Local Time: 12:30-14:30 Online Session (Zoom Meeting)

Zoom Meeting ID: 897 0755 8402 / Zoom Passcode: 181818

HEAD OF SESSION: Assoc. Prof. Dr. Aras Türkoğlu

Authors	Affiliation	Presentation Title
Sunil Agrawal	*People's Institute of Management and Research*	A comparative analysis of municipal solid waste management in urban and rural settings
Nesrine Benkhaira Saad Ibnsouda Koraichi Kawtar Fikri-Benbrahim	*Sidi Mohamed Ben Abdellah University*	Exploring the bioactive components and pharmacological benefits of a northern moroccan traditional herb
Faiza Baghida Mourad Boughrara	*Moulay Ismail University*	Structural, electronic, and thermoelectric properties of Cu_2Se were investigated using first-principles calculations within the DFT-PBE framework.
Ghizlane Rahil Imane Rahil Mustapha Oujaoura Walid Bouarifi	*Mathematical Team and Information Processing National school of applied sciences Safi*	Deep motion track: real-time human pose and action recognition using video streams
Emmanuel Ugochukwu Anaso	*Federal University of Agriculture Mubi*	Immunological responses and adaptation of kano brown buckling goats fed diets containing pleurotus ostreatus biodegraded sugarcane scrapings
Jatau T, K. Sani H	*Federal College of Education*	Attitude of the society towards hiv/aids patients in kontagora, niger state, Nigeria
Faisal Nazir	*The University of Agriculture*	Production and characterization of carbon nanotubes from biochar under microwave irradiation
Chlaih Soumaya	*Cadi Ayyad University*	Development and optimization of low-cost clay-based membranes for textile wastewater microfiltration
Sadiq, Mohammed Sanusi Singh, Invinder Paul Ahmad, Muhammad Makarfi Nazifi, Idris Khalid Sani, Bashir Sanyinna	*Department of Agricultural Economics and Agribusiness*	Leaders, laggards, and stalled giants: a typology of frontier technology readiness in selected african economies

(All speakers required to be connected to the session 10 min before the session starts)
Moderator is responsible for ensuring the smooth running of the presentation, managing the group discussion and dynamics.

Ameur Zaghouani Ayoub Hadjeb Sarra Benaissa Mohamed Rami Berbache Chaima Chetioui Amina Hammadi Kawther Bourezzane Yahia Ammari Habiba Hachani	*University of Biskra*	Effect of dietary substitution on some production parameters of red tilapia (*Oreochromis* sp.) in the Biskra region.
Babita Gupta	*Institute of Technology and Management*	Construction feature and regulatory aspects of organ chip for drug delivery application
Aliza Naeem Muhammad Bilal Hussain Marwa Waheed Sawera Asif Mariam Islam Maha Atiq	*Government College University Faisalabad*	Sustainable food packaging technologies: innovation for a greener consumer future
Alexandra Raluca Borșa Andrei Borșa Melinda Fogarasi Floricuţa Ranga Anda Elena Tanislav Vlad Mureșan Cristina Anamaria Semeniuc	*University of Agricultural Sciences and Veterinary Medicine Cluj-Napoca*	Sustainable valorization of rosehip by-products as functional additives in pork sausages: functional and quality perspectives
D.Aravindhan N.Arshad Ahamed K.Dinesh Rajan	*Bharath Institute of Higher Education and Research*	Food safety regulations and consumer awareness

(All speakers required to be connected to the session 10 min before the session starts)
Moderator is responsible for ensuring the smooth running of the presentation, managing the group discussion and dynamics.

26.10.2025 / SESSION-2 / HALL-4

Ankara Local Time: 12:30-14:30 Online Session (Zoom Meeting)

Zoom Meeting ID: 897 0755 8402 / Zoom Passcode: 181818

HEAD OF SESSION: Dr. Wasiu Olatunde Oladapo

Authors	Affiliation	Presentation Title
Boucherdoud Ahmed Abdelkarime Seghier Bendjelloul Meriem	*University of Relizane*	Self-deposited copper oxide on polyaniline nanocomposite catalysts for the photodegradation of organic dyes
Karima Jmaili Khawla Waddi Mohamed Lahrairi Meriem Mahmoudi Bouchaib Bahlaouan Alla Silkina Nadia Boutaleb	*Hassan II University of Casablanca*	From cream to green: unlocking the biostimulant power of whey in sustainable crop growth
Hira Zainab Rimsha Imran Maha Tariq	*Lahore College for Women University*	Threads of escape: adaptive reuse of trains
Akinlade, O. O, Akinlade, O. O. Alausa, O.J. Ojo, R.O. Alabi, S.J.	*Animal Production Technology,*	Reproductive performance of pullet fed oyster mushroom as a replacement to antibiotics
Afshin Tavasoli Farsheh Zahra Masoomi	*Islamic Azad University*	Application of nanomaterials to improve the properties of pet waste bottle sheet: a review
Afshin Tavasoli Farsheh Arezoo Sadat Khafi	*Islamic Azad University*	Recent advances towards the pet environmentally friendly bottles techniques: a review
Wasiu Olatunde Oladapo	*Lagos State University of Education*	AI for agrarian transformation: unlocking the potential of machine learning for crop yield prediction, disease detection, and smart farming
Mohamed Fardouch Rana Choukri Mohamed Faize Mourad Baghour	*University Mohammed I*	Yield, fruit quality, na^+ and k^+ accumulation in tomato fruits grown in intercropping with maize
Thanh-Dung Nguyen Mai-Uyen Nguyen	*Can Tho University*	Evaluation of the antimicrobial activity and characterization of the bioactive secondary meta bolites produced by bacillus velezensis SB4R5 against escherichia coli AND staphylococcus aureus

(All speakers required to be connected to the session 10 min before the session starts)
Moderator is responsible for ensuring the smooth running of the presentation, managing the group discussion and dynamics.

26.10.2025 / SESSION-2 / HALL-5

Ankara Local Time: 12:30-14:30 Online Session (Zoom Meeting)

Zoom Meeting ID: 897 0755 8402 / Zoom Passcode: 181818

HEAD OF SESSION: Dr. Halid Sheriff Adegbusi

Authors	Affiliation	Presentation Title
K. Dinesh Rajan D.Aravindhan N. Arshad Ahamed	*Bharath Institute of Higher Education and Research*	Role of pharmacy in rural development and public healthcare
Rohit Kumar Singh Giorgi Shtenberg	*Institute of Agricultural and Biosystems Engineering ARO*	A nanostructured microarray-based sers sensor targeted at multiplex mycotoxin detection in food and feedstuff using a handheld apparatus
Ajayi, Mercy Adenike Adesanmi, Moses Ademola	*Federal Polytechnic*	A lexical-semantic reading of agricultural terms in two of Niyi Osundare's poems
S Indhu G Priya Murugesan Kamaraj	*SRM Institute of Science and Technology*	A mechanistic multi-omics and ecological risk assessment on ecological safety and non-target effects of biopesticides and microbial inoculants in agroecosystems
Tsegmid N. Zayatogtokh B.	*Mongolian University of Life Sciences*	Sightings of birds in oil production areas (Mongolia)
Biswarup Mukherjee	*Brainware University*	AI-enhanced solar-powered water pumping system for sustainable irrigation in Rural West Bengal
Moniruzzaman Rabiul Awal Moshiur Rahman Harunor Rashid Anuradha Bhadra	*Bangladesh Fisheries Research Institute*	Bottom-clean aquaculture maximizes growth, survival, and profit of high-valued catfish

(All speakers required to be connected to the session 10 min before the session starts)
Moderator is responsible for ensuring the smooth running of the presentation, managing the group discussion and dynamics.

26.10.2025 / SESSION-2 / HALL-6

Ankara Local Time: 12:30-14:30 Online Session (Zoom Meeting)

Zoom Meeting ID: 897 0755 8402 / Zoom Passcode: 181818

HEAD OF SESSION: Dr. Aliyu Hassan

Authors	Affiliation	Presentation Title
Keerthana.V, Meenatchi.S Kishore.R R. Saravanan	*Bharath Institute of Higher Education and Research*	Green pharmacy: a sustainable approach to drug development
Mobarok Hosen Mokarroma Syed Imad Zaman Pias Ahmed Sahadat Hossain Airin Jahan Urmi Upoma Shobnom Raicha Mahbub Alam	*University of Rajshahi*	Unlocking the economic potential of mustard cultivation in bangladesh: profitability, inefficiencies, and institutional gaps
Aliyu Hassan	*Air Force Institute of Technology*	Urban renewal approaches for the revitalization of tudun nupawa neighborhood, Kaduna, Nigeria
Auwal Mohammed Adamu Olufunmilayo Temitope Afolayan	*The Federal Polytechnic*	Leveraging on technical and vocational training (TVET) for achieving food security in nigeria: a study of ogun state
K.Vaishnavi R.Sriarasuvasan V.Keerthana S.Rubinthara R.Kishore K.Deepak	*Bharath Institute of Higher Education and Research*	"Giving voice to the voiceless"— the rise of animal–computer interaction
Boucherdoud Ahmed Douinat Oukacha Bendjelloul Meriem Seghier Abdelkarim Elandaloussi Elhadj.	*University of Relizane*	Synthesis of an activated carbon-nanocomposite for the treatment of pollutants
Yuldashow Bahadir Annamyradow Dowlet Yollyyewa Ayna Yollyyew Hydyrgeldi	*University of Relizane*	Innovation method of the obtainig electric energy from drainage water in Turkmenistan
Ruhul Amin Tasmia Islam Kanta Mosfiq Momtasir Neloy Shahjahan	*Bangladesh Agricultural University*	Combined effects of microplastics and mercury on survivability, hematology, tissue morphology, accumulation, oxidative stress, immune response and GH/IGF axis in Nile tilapia (*Oreochromis niloticus*)
Abdullahi Adamu Kiri Naziru Nura Zaharaddini Haruna Musa Zakari Muhammad	*Jigawa State Polytechnics for Information and Communication Technology*	An artificial fish swarm search algorithm (AFSSA) based on hybrid behavior

(All speakers required to be connected to the session 10 min before the session starts)
Moderator is responsible for ensuring the smooth running of the presentation, managing the group discussion and dynamics.

26.10.2025 / SESSION-3 / HALL-1

Ankara Local Time: 15:00-17:00 Online Session (Zoom Meeting)

Zoom Meeting ID: 897 0755 8402 / Zoom Passcode: 181818

HEAD OF SESSION: Prof. Dr. Cemal Budağ

Authors	Affiliation	Presentation Title
Tülin Güven Gökmen Hatice Yazgan	*Cukurova University*	Crispr-based rapid diagnostic tests: a new era in microbiology and clinical applications
Mehmet Kulu Alper Döyen Muhammed Emre Keskin	*Konya Teknik University*	Investigation of geothermal greenhouse usage in peri-urban agriculture
Aybike Ayfer Karadağ Demet Demiroğlu	*Düzce University*	An assessment of the potential impacts of the turkish climate law on agricultural landscapes
Demet Demiroğlu Aybike Ayfer Karadağ	*Düzce University*	The legal vulnerability of agricultural areas: turkiye example
Levent Taşeri Ersin Karacabey Gamze Uysal Seçkin	*Tekirdağ Viticulture Research Institute Directorate*	Investigation of drying kinetics of walnut dried with different methods in tekirdağ conditions
Ergül Ay Hüseyin Özpinar Hülya Okkaoğlu Melek Akça Pelen Erseven Ulus Süleyman Çağir Ceylan Büyükkileci	*Aegean Agricultural Research Institute Directorate*	Determination of yield and quality traits of some silage maize (*Zea mays* L.) genotypes in izmir conditions
Cemal Budağ	*Van Yüzüncü Yıl University*	Quality characteristics of drinking water for ruminant animals
Cemal Budağ	*Van Yüzüncü Yıl University*	Current approaches to ruminant drinking water quality: chemical, microbiological and emerging contaminants, digital monitoring and policy perspectives
Mehtap Güney	*Van Yüzüncü Yıl Üniversitesi*	Methane production and rumen microbiotas in ruminants

(All speakers required to be connected to the session 10 min before the session starts)
Moderator is responsible for ensuring the smooth running of the presentation, managing the group discussion and dynamics.

26.10.2025 / SESSION-3 / HALL-2

Ankara Local Time: 15:00-17:00 Online Session (Zoom Meeting)

Zoom Meeting ID: 897 0755 8402 / Zoom Passcode: 181818

HEAD OF SESSION: Assoc. Prof. Dr. Mehmet Karaman

Authors	Affiliation	Presentation Title
Mehmet Karaman	*Muş Alparslan Üniversitesi*	Evaluation of some bread wheat (*Triticum aestivum* L.) genotypes in terms of yield and quality under supplementary irrigation conditions
Mehmet Karaman	*Muş Alparslan Üniversitesi*	Evaluation of red lentil (*Lens culinaris* Medik.) varieties registered in turkey in terms of yield and some morphological characteristics in conditions of muş province
Zübeyde Albayram Doğan Dr.Tuncay Topdemir Sinan Aras Gülay Yilmaz Gözen Yüceerim Alican Eren Nuri Candan Vural Karagül Şener Özçelik Murat Çağatay Keçeci	*Uluslararası Tarımsal Araştırma ve Eğitim Merkezi Müdürlüğü*	Farmer approach on salinity as a challenge; menemen plain case
Ibrahim Halil Şindak Adem Gökçöl Sıdıka Ekren	*Ege University*	Improving seed germination in *Lavandula angustifolia* Mill. With priming and phytohormone applications
Soner Çolak Oğuz Bilgin Damla Balaban Göcmen	*Tekirdağ Namık Kemal Universitesi*	Examination of mutant lines subjected to salinity stress during germination
Samet Aşkin Yaşar Karadağ Mahir Özkurt	*Muş Alparslan Üniversitesi*	Determination of yield caracteristics of alfalfa (*Medicago sativa* L.) genotype cultured in mus plain
Ece Taşyumru Süzer Umut Süzer Sıdıka Ekren	*Ege University*	Comparison of yield and yield components of two different rapeseed (*Brassica napus* L.) varieties under Kırklareli/Babaeski-Yeniköy conditions
Merve Usal	*Kırklareli University*	Phenolic content and antioxidant activity of honeysuckle flower (*Lonicera japonica*) extracts obtained using different solvents
Mehmet Zeki Koçak	*Igdır University*	Comparative analysis of oil yield and fatty acid composition in local and foreign flax (*Linum usitatissimum* L.) cultivars

(All speakers required to be connected to the session 10 min before the session starts)
Moderator is responsible for ensuring the smooth running of the presentation, managing the group discussion and dynamics.

26.10.2025 / SESSION-3 / HALL-3

Ankara Local Time: 15:00-17:00 Online Session (Zoom Meeting)

Zoom Meeting ID: 897 0755 8402 / Zoom Passcode: 181818

HEAD OF SESSION: Dr. Murat TURAN

Authors	Affiliation	Presentation Title
Çağrı Melikşah Sakar Burak Artut Hasan Hüseyin Şenyüz	*International Center for Livestock Research and Training*	The relationship between cow activity behaviors and climate
Zeynep Gürbüz Kaçan	*Atatürk University*	Migration of phthalate acid esters from plastic packaging into butter: a literature-based perspective
Erkal Ertem Erhan Akkuzu	*Ege University*	Determination of the relationship between stomatal conductance and tc-ta obtained from thermal images in olive trees
Yavuz Şahin Turgut Yakup Kenan Koca	*Çukurova University*	Long-term analysis of land use changes and establishment of a soil database: the case of yumurtalik
Ilyas Dayan Özlem Çakmakci	*Van Yüzüncü Yıl University*	The effect of nano-silver application under saline water on some growth and yield parameters in tomato seedlings
Murat Turan	*Van Yüzüncü Yıl University*	The effects of behavior in cattle on productivity
Efecan Iştipliler Fikret Öndes	*İzmir Katip Çelebi Üniversitesi*	Effects of hook size, hook type, and bait on catch per unit effort and fish size in recreational fisheries of the aegean sea: implications for fisheries management
Aysel Gülbandilar Barkın Koçer Rumeysa Bozkurt Sıla Gönül	*Eskişehir Osmangazi Üniversitesi*	Determination of the physicochemical and microbiological properties of kefirs enriched with different concentrations of *Spirulina platensis* and P*istachio flavor*
Murat Turan Irfan Inan Halit Deniz Şireli Müzeyyen Buse Karaman	*Van Yüzüncü Yıl University*	Innovative approaches in morphological measurements in cattle and sheep breeding

(All speakers required to be connected to the session 10 min before the session starts)
Moderator is responsible for ensuring the smooth running of the presentation, managing the group discussion and dynamics.

26.10.2025 / SESSION-3 / HALL-4

Ankara Local Time: 15:00-17:00 Online Session (Zoom Meeting)

Zoom Meeting ID: 897 0755 8402 / Zoom Passcode: 181818

HEAD OF SESSION: Dr. Mezerket Amina

Authors	Affiliation	Presentation Title
Musfiqur Rahman Abdul Baree Bhowmik Shimu Akhi Khatun	*University of Rajshahi*	Effect of planting time and nitrogen dose on growth and yield of cabbage
Ameilia Zuliyanti Siregar Liana Dwi Sri Hastuti Nismah Panjaitan Evawaty Sri Ulina	*University of Sumatera Utara*	Application of salted fish, crab and shrimp variations with organic attractants to control brown plant pests in rice plants in serdang bedagai
Asbai Zakaria Nadia Boutaleb Said El Antri Bouchaib Bahlaouan	*Hassan 2 University of Casablanca*	Valorization of agro-industrial wastes for the sustainable development of controlled-release organomineral fertilizers
Amina Bigzad	*Ahlul bayt international university iran.*	The role of agriculture in the economies of developing countries: a framework of participation, challenges, and pathways to sustainability.
Mezerket Amina	*Ecole Normale Supérieure (ENS) Kouba Algiers*	Impact of phytochemicals on the hatching ability of Meloidogyne incognita
Ali Aguerd Fatima Chegdani Faiza Bennis	*University Hassan II*	Food-based strategies for neurodegenerative disease prevention: an in silico study using parkinson's disease as a model
Bismillah Iftikhar	*Essentials Healthcare Lahore*	Optimizing vitamin d3 bioavailability: development of high-dose oral shot formulation (VOL-D)
Umar Mudi Ahmad Umar Sani Harun Ibrahim Khalil Zakariyya Uba Zango	*Al-Qalam University*	Synthesis, characterization, cytotoxicity and antimicrobial studies on mn(ii) and co(ii) complexes of schiff base derived from Acetophenone and o-Aminophenol

(All speakers required to be connected to the session 10 min before the session starts)
Moderator is responsible for ensuring the smooth running of the presentation, managing the group discussion and dynamics.

26.10.2025 / SESSION-3 / HALL-5

Ankara Local Time: 15:00-17:00 Online Session (Zoom Meeting)

Zoom Meeting ID: 897 0755 8402 / Zoom Passcode: 181818

HEAD OF SESSION: Dr. Halid Sheriff Adegbusi

Authors	Affiliation	Presentation Title
Halid Sheriff Adegbusi	*Nigeria Police Academy Wudil*	Food irradiation for mitigating post-harvest losses in Nigeria
Halid Sheriff Adegbusi	*Nigeria Police Academy Wudil*	Nutritional assessment of complementary foods made from
Aruwa Abdulhafiz Bawa Muhammad Yusuf Muhammad Abdullahi Ubana	*Nasarawa State University*	Biosorption of hexavalent chromium by sulphuric acid modified cucumeropsis manii peel

ABSTRACTS

Said Efe Dost Yilmaz Sesli Elif Çatikkaş	Effect of drought stress on pink lady and jeromine apple cultivars	**1**
Gülten Kaçar Avci	Plant-parasitic nematodes in potatoes (*Solanum tuberosum* L.) and control methods	**3**
İsmail Çinkaya Osman Çağirgan Şafak Ceylan Durmuş Ali Kipritci Sinan Süheri	Early wheat yield prediction using multispectral vegetation indices: statistical analysis of variety responses under water stress	**5**
Hakan Keles Servet Aras Müjgan Güney Selcan Özyalin	Humic and fulvic acids in agricultural production: utilization potentials and recent studies	**8**
Hakan Keles Selcan Özyalin Servet Aras Müjgan Güney	Hawthorn (*Crataegus* spp.): potentıals and future perspectıves as an alternatıve specıes	**10**
Emine Sema Çetin Nazife Çiğdem Ermiş Berna Keles	Investigation of the effects of *Ascophyllum nodosum* applications on secondary metabolite accumulation in berries in michele palieri grape variety	**13**
Fathimah Azzahra Haydar Haciseferogullari	Biomass potential from agricultural residues in indonesia	**15**
Ayşegül Faydaci Isa Telci	Determination of the phenological, agronomic, and quality characteristics of black cumin (*Nigella sativa* L.) genotypes under Isparta conditions	**17**
Hasan Hüseyin Şenyüz Gökhan Şen Ramazan Ayaş Ali Karapinar Ali Ersin Gümüş	Effects of shredlange and conventional methods on nutrient content and in vitro digestibility of corn silage	**19**
Sadiye Ayşe Çelik Gülbahar Babaoğlan	Current perspectives on the use of essential oils against root rot disease in peanut	**20**
Sadiye Ayşe Çelik Tuba Özkan Ay	Evaluation of the use of essential oils as an alternative to chemical methods in egg disinfection and sterilization	**22**
Mehmet Ali Avci Emir Yavaş Melike Mavi	Area coverage performance and ecological turf applications of some wheaten forage crops that can be used in green areas	**24**
Seda Günaydın Işıl Kılıç	Determination of the influence of different pre-treatments and microwave drying method on co 2 emissions in the drying of red plum (*Prunus domestica*) slices	**27**
Sadiye Ayşe Çelik Emir Yavaş Selim Derman Küçükmaraş	Effects of pgpr and mycorrhiza combinations on yield, active compound content, and stress tolerance in medicinal and aromatic plants	**28**
Havva Nur Demir Deveci Tahir Külahcı Ramazan Topak	A review on the effects of irrigation on lavender (*L. angustifolia* mill.) yield and oil quality	**30**
Mert Acar	Relationships between aggregate stability and organic matter content in different soil series	**32**
Şahin Aydin	Ai-based approaches for regional analysis and forecasting of livestock numbers	**34**

Serdar Dizman	Detection of natural radioactive isotopes in chestnuts and radiological risk assessment for human health	**36**
Songül Yildiz Fatma Kesimal Zeynep Bayramoğlu	Effects of microbial fertilizer and tea waste applications on yield and quality in aronia (*Aronia melanocarpa*) cultivation	**37**
Songül Yildiz Yeşim Öztürk Yilmaz Zeynep Bayramoğlu	Effects of tea vinegar applications on the growth of tea seedlings (*Camellia sinensis* L.)	**39**
Merve Kahraman Abdurrahman Sami Koca	Seasonal population dynamics of palpita unionalis hubner (lepidoptera: pyralidae) in olive orchards of akhisar district (Manisa, Türkiye)	**41**
Arzu Üçtepe Antonios Kominakis	Estimation of heritability and common environmental effects of egg traits in the blue-breasted quail (*Synoicus chinensis*)	**43**
Mederbek Zhaanbaev	Identification of Promising Genotypes Among The Wild Pistachio (Pistacia vera L.) Population Growing in Kazak Uulu Village of Osh Province in Kyrgyzstan	**45**
Mederbek Zhaanbaev Aibiike Borubaeva	Some Fruit Characteristics of Naturally Grown Hawthorns (Crataegus spp.) in Uzgen District, Osh Region, Kyrgyzstan.	**46**
Adelmonim Zeroual Mohammed Mitache Bacar Abdallah Abderemane Aziz Baidani Omar Idrissi	Genetic diversity for agronomic traits in a mediterranean lentil collection: towards the development of high yielding climate-change ready cultivars	**48**
Adelmonim Zeroual Aziz Baidani Bacar Abdallah Abderemane Mohammed Mitache	Evaluation of lentil genotypes for mechanical harvesting suitability	**49**
S. Kalaiselvan G. Janaki R. Suganya G. Kowsalya R.Sumathi	Connecting Advanced Mathematical Applications for Transforming Contemporary Agriculture through Precision, Prediction, and Sustainability	**50**
Gunasekar G	Life table construction and analysis for evaluating bio-control agents	**51**
Jatin Vats, Ajesh Chauhan Chetan Vashisht	Revealing the Therapeutic Value of Biodegradable Cellulose Fibers: Novel Developments and Strategies in Skin Tissue Regeneration	**52**
Shoumen Dhar Bappy Chowdhury Mehenaj Musa Abdur Rahman Mahima Ranjan Acharjee Sreebash Chandra Bhattacharjee	Nutritionally Optimized Baby Food from Indigenous Ingredients: Safety, Functionality, and Acceptability for Sustainable Infant Nutrition	**53**
Bruno, Ibeabuchi Anwuri Gbara, Uloma Celestine Ogunbayo, Oluwatoyin Glory	Artificial intelligence and national economic growth: exploring the role of stem education in workforce transformation in nigeria.	**54**
Saira Malik Syed Mohsan Raza Shah Uniza Fatima bukhari Tasawar Fatima bukhari Iqra	Leaf structural and functional modification of Ipomoea carnea Jacq. an invasive plant species, under diverse salinity gradient	**55**
Giorgi Shtenberg Divagar Muthukumar	Multiplex pathogenic bacteria detection in milk with the nanoparticle-assisted porous silicon-based sers microarray biosensor	**55**
Voroneanu-Popa Rareș-Vasile Richard Constantinescu	Possible perspectives of european union policies on the development of the agricultural sector	**57**

Bruno, Ibeabuchi Anwuri Ogunbayo, Oluwatoyin Glory Oreke, Obusor Happiness Ajie, Uloma Glory	Artificial intelligence for individualized remediation of misconceptions in biology concep	**58**
Anandhavalli Muniasamy	Plant seedling identification using pretrained deep transfer learning models	**59**
Shehu, N.M. Zakari, N. Kabir I.A. Shehu, A.U.	Flood vulnerability and its impacts on agricultural systems, livestock, and rural development: a comprehensive review	**60**
Skender Demaku Muhamet Kiqina Arbnorë Aliu Donika Sylejmani	Chemical analysis of atmospheric dust around the kishnica area in the municipality of gracanica	**61**
R. Thiruchelvi	Synthesizing entrepreneurial stem education: a review of theoretical foundations, pedagogical practices, and future directions	**62**
Drobchenko N.V.	Ecological rehabilitation of the aral sea region: phytomelioration as a sustainable tool for land restoration	**63**
Vijayakumaran Shobana K. Sujatha Tatireddy Omsai Reddy N.P.G. Bhavani	ECG-based sleep apnea detection using convolutional and long short-term memory networks	**65**
İlhan Yandi	In-situ degradation of offshore aquaculture mooring ropes: a depth-wise analysis of plastic emission rates	**66**
İlhan Yandi	From experiment to ecosystem: estimating the macro-impact of plastic emissions from black sea offshore aquaculture mooring systems	**68**
Bekir Atar	Use of paclobutrazol (pbz) in wheat production	**70**
Ecenur Aliş Deniz Dinçel	Genetic basis of heat stress response: novel perspectives on molecular adaptation in cattle	**73**
Berna Efe Seçil Candaş Özkan Recep Kirbaş Erol Karakurt	Morphologic, physiologic and agronomic traits of cold-tolerant common vetch hybrid lines	**76**
Şamil Gülaydın Murat Ali Turan	Effects of nitrogen and sulfur applications on fruit quality in banana plants	**79**
Muhammet Cemil Ejderoğlu Murat Ali Turan	Effect of calcium and boron applications on development of pepper plant	**81**
Mohanapriya P Chamundeeswari M	Green synthesized iron nanoparticle based detection of microplastics from aqueous environment	**83**
Abdullahi Umar	The use of glutamic acid as a green alternative for corrotion inhibition in HCL solution	**84**
Akinleye, Abiodun Olamilekan	Performance evaluation of wireless sensor networks for smart agriculture using opnet	**85**
Y. Sarayu Reddy S. Suji	Impact of sustainable agricultural practices on environmental conservation	**86**
Ugwuoke Chukwuchebe Obiajulu	Benefits of agro forestry land use in nsukka local government area, enugu state, nigeria	**87**
Chidimma Lilian Asadu Robert Ikechukwu Uroko Stanley Mary Ubenyi	Evaluation of spermatozoa quality, differential sperm morphology and gonadosomatic indices of benign prostatic hyperplasia induced rats treated with polyherbal extract	**88**
R.Thiruchelvi P.Saravanan	Valorization of fruit waste through reutilization approach: a comprehensive review	**89**

Sadik Dani Hassane Abd-Dada Aziz Ezzine Ahmed El Annaoui Atman Adiba Abdelmajid Haddioui Said Bouda	Morphological characterization of the genetic resources of moroccan white mulberry (*Morus alba* L.)	**90**
Jatau T. K. Sani H.	Attıtude of the socıety towards hıv/aıds patıents ın Kontagora, Nıger state, Nıgerıa	**91**
Sunil Agrawal	A comparative analysis of municipal solid waste management in urban and rural settings	**92**
Nesrine Benkhaira Saad Ibnsouda Koraichi Kawtar Fikri-Benbrahim	Exploring the bioactive components and pharmacological benefits of a northern moroccan traditional herb	**93**
Faiza Baghida Mourad Boughrara	Structural, electronic, and thermoelectric properties of Cu_2Se were investigated using first-principles calculations within the DFT-PBE framework.	**94**
Faisal Nazir	Production and characterization of carbon nanotubes from biochar under microwave irradiation	**95**
Chlaih Soumaya	Development and optimization of low-cost clay-based membranes for textile wastewater microfiltration	**96**
Khatami Salma El Haimeur Bouchra Bouhallaoui Mina Errhif Ahmed	From bioassays to sediment quality indices: an integrated approach to assess the environmental status of coastal ecosystems.	**97**
Musrat Shaheen Akbar Ali Burhan Khalid Hafiza Zara Saeed	Mechanistic Understanding of Peptoid Formation from Dithiane Precursors via Multicomponent Reactions: A DFT Study	**98**
Rajaa Dianya Said Kerraj Mohamed Kadour Atouailaad Ahmed Arifd Abdelkhalk Aboulouard Mustapha Boulghalat Abdessamad Tounsi Mohammed Salah Mohammed El idrissi	Enhancing the electronic and optical performance of dye-sensitized solar cells with alizarin-based dyes: DFT/TD-DFT investigations	**99**
Felipe Taiti Ukai Gerson Araujo de Medeiros	Environmental impacts of small-scale interbasin water transfer on the water quality in Southeast Brazil	**100**
Chokri Bayoudh Hedil Gaaya Afifa Majdoub Taoufik Bettaieb	Preliminary trials of optimizing in vitro propagation of the hybrid pistachio rootstock ucb-1 (*Pistacia atlantica* x *Pistacia integerrima*) by bioreactors	**101**
El Handaoui El Mehdi Abderrahim Jrifi Omar Fanidi	Exploring the Potential of Moringa Oleifera for Sustainable Wastewater Remediation	**102**
Güngör Yilmaz Şaziye Dökülen Semra DEMİRLER	The effect of different nitrogen doses on some yield and quality characteristics in camelina plant [*Camelina sativa* (L.) Crantz]	**103**
Ersin Karacabey R. Oğuzhan Soltekin M. Sacit Inan Ahmet Candemir	Effects of a low-rate solar energy concentration system on drying kinetics of grape	**105**
Servet Sami Ipek Ilknur Alibaş Aysel Arslan	Determination of energy efficiency in pear (*Pyrus communis*) production in Türkiye	**108**
Önder Volkan Bayraktar	Changes in red meat prices in türkiye in recent years and factors affecting producer price formation	**109**

ÖZET

Bu çalışma, yaz ayları sıcak ve kurak geçen, yağış miktarı düşük olan Karaman ili koşullarında, Karamanoğlu Mehmetbey Üniversitesi Elmacılık Araştırma ve Uygulama Merkezi bünyesinde 2019 yılında kurulan deneme parselinde yürütülmüştür. Araştırmada M9 anacı üzerine aşılı Pink Lady ve Jeromine elma çeşitleri 2023–2024 yılları gelişme sezonu boyunca değerlendirilmiştir. Çalışmanın amacı, kuraklık stresinin meyve ve yapraklarda fenolik bileşikler, antioksidan aktivite ve bazı kalite parametreleri üzerine etkilerini belirlemektir. Bu amaçla iki farklı sulama rejimi uygulanmıştır: kontrol ağaçlarına 5 gün aralıklarla 5 L su, stres uygulanan ağaçlara ise 15 gün aralıklarla 5 L su verilmiştir. Sulama öncesinde 15. günün sonunda yaprak ve meyve örnekleri alınarak analiz edilmiştir. Elde edilen tüm veriler istatistiksel olarak anlamlı bulunmuştur. Su stresi altında, suda çözünebilir kuru madde (SÇKM) ve titre edilebilir asitlik (TA) değerleri kontrol ağaçlarına göre daha yüksek kaydedilmiştir. En yüksek SÇKM değerleri Pink Lady çeşidinde 2023'te %14,7 ve 2024'te %15,1, en yüksek TA değerleri ise yine Pink Lady'de %0,74 ve %0,76 olarak belirlenmiştir. Meyve eti ve kabukta toplam fenolik (220,4 mg GAE/100 g) ve antioksidan (159,1 µM Trolox/100 g) değerleri ile yapraklarda toplam fenolik (10,04 mg GAE/g DW), antioksidan (18,21 mg/g TEAC 100 g DW) ve prolin (1,58 µmol/g FW) düzeyleri de Pink Lady çeşidinde en yüksek bulunmuştur. Sonuç olarak, her iki çeşit de kuraklık koşullarına oldukça duyarlı olup, su stresi bitki gelişimi ve ürün kalitesini olumsuz etkilemiştir. Bununla birlikte, fenolik ve antioksidan birikimi, bitkinin su kaybını telafi etmeye yönelik adaptif bir yanıt olarak değerlendirilmektedir.

Anahtar Kelimeler: Elma (Malus domestica), Kuraklık stresi, Prolin, Fenolik ve Antioksidan bileşikler

EFFECT OF DROUGHT STRESS ON PINK LADY AND JEROMINE APPLE CULTİVARS

ABSTRACT

This study was conducted under the hot and dry summer conditions with low precipitation in Karaman, Turkey, at the Apple Research and Application Center of Karamanoğlu Mehmetbey University, in an orchard established in 2019. Pink Lady and Jeromine apple cultivars grafted onto M9 rootstock were evaluated during the 2023–2024 growing seasons. The aim was to determine the effects of drought stress on phenolic compounds, antioxidant activity, and selected fruit quality parameters. Two irrigation regimes were applied: control trees received 5 L of water every 5 days, while stressed trees received 5 L every 15 days. Leaf and fruit samples were collected at the end of each 15-day irrigation cycle. All results were statistically significant. Under drought stress, soluble solid content (SSC) and titratable acidity (TA) values were higher than in control trees. The highest SSC values were obtained in Pink Lady (14.7% in 2023 and 15.1% in 2024), while the highest TA values were also found in Pink Lady (0.74% and 0.76%). In fruit, the highest total phenolic content (220.4 mg GAE/100 g) and antioxidant activity (159.1 µM Trolox/100 g) were recorded in Pink Lady. In leaves, the highest total phenolics (10.04 mg GAE/g DW), antioxidants (18.21 mg/g TEAC 100 g DW), and proline (1.58 µmol/g FW) were also observed in Pink Lady under drought stress. Overall, both cultivars were highly sensitive to water deficit, which negatively affected plant growth and fruit quality. However, the accumulation of phenolic and antioxidant compounds suggests an adaptive response mechanism aimed at mitigating water loss.

Keywords: Apple (Malus domestica), Drought Stress, Proline, Phenolic-Antioxidant Compounds

PATATESTE (*Solanum tuberosum l.*) BİTKİ PARAZİTİ NEMATODLAR VE MÜCADELE YÖNTEMLERİ

Dr. Gülten Kaçar Avcı
Patates Araştırma Enstitüsü
Email: gkacaravci@gmail.com
ORCID: 0009-0002-6859-4792

ÖZET

Patates, ülkemiz tarımı ve ekonomisinde çok önemli bir bitkidir. Türkiye genelinde yetiştirilen patates bitkisinin Doğu Anadolu, Ege ve Marmara Bölgeleri'nde de üretimi yapılmaktadır. Ülkemizde patates üretiminin en yoğun olduğu il Niğde'dir. Ekonomik önem taşıyan patates bitkisinde birim alandan fazla ve kaliteli ürün elde etmek için zararlılar ve hastalıklarla etkin mücadele edilmelidir. Patates bitkisinin yumrularıyla çoğaltılması, hastalık ve zararlılardan daha çok etkilenmesine neden olmaktadır. Bitki paraziti nematodlar, tarımsal üretimde bitkilerde zarar yapan etmenlerdendir ve ciddi verim kayıplarına neden olurlar. Bitki paraziti nematod türlerinin patates bitkisinde verdiği zarar ve mücadele yöntemleri farklılık göstermektedir. Nematodların toprak kökenli patojenler olması ve bazı türlerin dayanıklı yapı olan kistler halinde uzun yıllar toprakta varlığını sürdürmesi nedeniyle birçok türüne karşı etkin kimyasal mücadele yöntemi mevcut değildir. Patates bitkisinde Kök ur nematodları gibi türlerde kimyasal mücadele uygulamaları yapılmaktadır. Kist nematodlarının mücadelesinde dayanıklı çeşitlerin kullanılması tüm dünyada başarı ile uygulanmaktadır. Kist nematodları (Globodera spp.), Kök ur nematodları (Meloidgoyne spp.), Patates çürüklük nematodu (Ditylenchus destructor) Thorne, Soğan-sak nematodu (Ditylenchus dipsaci) Kühn, patates bitkisinde zarar yapan nematodların en önemlileridir. Altın Kist Nematodu (G. rostochiensis) ülkemizde ilk tespiti Bolu ili Dörtdivan ilçesinde patates üretiminin yapıldığı alanda yapılmış ve bölge karantina altına alınmıştır. Son zamanlarda yapılan çalışmalarda Kök lezyon nematodu (Pratylenchus spp.) türlerinin de patates bitkisinde önemli oranda zarar yaptığı tespit edilmiştir. Bu çalışmada patates bitkisinde verim kaybına neden olan nematodlar ve mücadele yöntemleri hakkında bilgi verilmiştir.

Anahtar Kelimeler: Patates, bitki paraziti nematodlar, mücadele, sebze.

PLANT-PARASITIC NEMATODES IN POTATOES (*solanum tuberosum l.)* AND CONTROL METHODS

ABSTRACT

Potato is a very important crop in our country's agriculture and economy. Potato is grown throughout Türkiye, but they are also produced in the Eastern Anatolia, Aegean, and Marmara regions. Niğde is the province with the highest potato production in Turkey. In order to obtain more and higher quality products per unit area in the potato plant, which is economically important in our country, pests and diseases must be effectively combated.

Propagation of potato plants by tubers makes them more susceptible to diseases and pests. Plant-parasitic nematodes are among the factors that cause plant damage in agricultural production and cause significant yield losses. The damage caused by plant parasitic nematode species on potato plants and the control methods vary. Because nematodes are soil-borne pathogens and some species persist in the soil for many years as resistant cysts, there are no effective chemical control methods against many species. Chemical control applications are carried out against species such as root knot nematodes in potato plants. The use of resistant varieties to control cyst nematodes is successfully implemented worldwide.

Cyst nematodes (Globodera spp.), root-knot nematodes (Meloidgoyne spp.), potato rot nematode (Ditylenchus destructor), Thorne, stem and bulb (Ditylenchus dipsaci) Kühn, nematode are the most important nematodes that damage potato plants. The first detection of the Golden Cyst Nematode (G. rostochiensis) in our country was made in the potato production area of Dörtdivan district of Bolu province, and the area was quarantined. Recent studies have also identified root-lesion nematodes (Pratylenchus spp.) as causing significant damage to potato in the field. In this study, information is given about nematodes that cause yield loss in potato plants and their control methods.

Key Words: Potato, plant parasitic nematodes, control, vegetable.

ÖZET

Küresel iklim değişikliği ve artan dünya nüfusu, su kaynaklarının etkin yönetimini tarımsal üretimde kritik hale getirmiştir. Bu bağlamda, bitki sağlığı ve gelişimini izleyerek sulama kararlarını destekleyecek hızlı ve doğru yöntemler büyük önem taşımaktadır. Bu çalışmanın amacı, dört farklı buğday çeşidinde uygulanan dört farklı sulama seviyesinin (1.0, 0.70, 0.40 ET0, yağışa bağlı) buğday verimi üzerindeki etkisini incelemek ve bu verimi, deneme süresince periyodik olarak alınan drone tabanlı multispektral görüntülerden elde edilen bitki indisleri (NDVI ve EVI) ile tahmin etmektir. Çalışma, tesadüf blokları deneme desenine göre üç tekerrürlü olarak kurulmuş olup, toplam 48 parselde yürütülmüştür. Elde edilen drone tabanlı indisler, el tipi NDVI ölçümleriyle de karşılaştırılmıştır.

Araştırmada farklı buğday çeşitleri ve sulama uygulamaları arasındaki etkileşimi kapsayacak şekilde tasarlanmıştır. Sulama seviyeleri, bölge için belirlenen referans evapotranspirasyon değerlerine göre ayarlanmıştır. Çalışma süresince, kritik büyüme dönemlerinde multispektral drone görüntüleri alınarak her parsel için NDVI (Normalize Edilmiş Fark Bitki İndeksi) ve EVI (Geliştirilmiş Bitki İndeksi) değerleri hesaplanmıştır. Elde edilen indis değerleri ile hasat sonrası belirlenen buğday verimleri arasındaki ilişki, çeşit ve sulama seviyelerine göre ayrı ayrı ve genel ortalamalar üzerinden regresyon analizleri ile incelenmiştir. Bu analizlerle, verimi en

yüksek doğrulukla tahmin eden indis türü ve optimum ölçüm zamanı tespit edilmeye çalışılmıştır.

Yapılan regresyon analizleri sonucunda, drone tabanlı NDVI'nin buğday verimini tahmin etmede en güçlü ilişkiyi sunduğu tespit edilmiştir. Tüm çeşitlerin ve sulama seviyelerinin ortalamaları dikkate alındığında, drone NDVI, hasattan 30 gün önce alınan ölçümlerle R2 =0.76 gibi yüksek bir belirleme katsayısı ile verimi başarılı bir şekilde açıklamıştır. Sulama seviyeleri özelinde incelendiğinde ise, yağışa bağlı (0.00 Et) sulama koşulundaki verim, daha erken bir tarihte, hasattan 60 gün önce alınan drone NDVI ölçümleriyle yine R2 =0.76 doğrulukla tahmin edilebilmiştir. Bu sonuçlar, drone teknolojisinin ve multispektral bitki indislerinin, farklı buğday çeşitleri ve su stresi koşullarında bile, buğday verimini hasattan önemli ölçüde önce ve yüksek güvenilirlikle tahmin edebilen bir araç olduğunu göstermektedir. Bu erken tahmin yeteneği, çiftçilere ve karar vericilere sulama ve besleme gibi konularda proaktif yönetim stratejileri geliştirme fırsatı sunmaktadır.

Anahtar Kelimeler: NDVI, EVI, verim tahmini, su kısıtı, sulama, multispektral görüntüleme

EARLY WHEAT YIELD PREDICTION USING MULTISPECTRAL VEGETATION INDICES: STATISTICAL ANALYSIS OF VARIETY RESPONSES UNDER WATER STRESS

ABSTRACT

Global climate change and a growing world population have made the efficient management of water resources critical in agricultural production. In this context, rapid and accurate methods to monitor plant health and development, thereby supporting irrigation scheduling decisions, are of paramount importance. The objective of this study was to investigate the effect of four different irrigation levels (1.0, 0.70, 0.40 ET, and rainfed) applied to four different wheat cultivars on wheat yield, and to predict this yield using vegetation indices (NDVI and EVI) derived from drone-based multispectral imagery periodically acquired throughout the growing season. The study was established in a Randomized Complete Block Design (RCBD) with three replications, comprising a total of 48 plots. The derived drone-based indices were also compared with handheld NDVI measurements.

The experiment was designed to capture the interaction between different wheat cultivars and irrigation applications. Irrigation levels were set according to the reference evapotranspiration (ET0) values determined for the region. During the study, multispectral drone images were captured during critical growth stages, and NDVI (Normalized Difference Vegetation Index) and EVI (Enhanced Vegetation Index) values were calculated for each plot. The relationship between the obtained index values and the post-harvest wheat yields was investigated using regression analyses, both separately for each cultivar and irrigation level, and based on overall means. These analyses aimed to identify the index type and the optimum measurement timing that predicted yield with the highest accuracy.

The regression analyses revealed that drone-based NDVI provided the strongest relationship for predicting wheat yield. Considering the overall averages of all cultivars and irrigation levels, the drone NDVI successfully explained the yield with a high coefficient of determination, $R2=0.76$, from measurements taken 30 days before harvest. When focusing specifically on irrigation levels, the yield under rainfed (0.00 ET) conditions could be predicted with the same accuracy, $R2=0.76$, from drone NDVI measurements taken at an earlier date, 60 days before harvest. These results demonstrate that drone technology and multispectral vegetation indices serve as a tool capable of predicting wheat yield significantly earlier and with high reliability, even across different wheat cultivars and under water stress conditions. This early prediction capability offers farmers and decision-makers the opportunity to develop proactive management strategies regarding irrigation and nutrient application.

Keywords: NDVI, EVI, yield estimation, water stress, irrigation, multispectral imaging

ÖZET

Tarım, Türkiye gibi gelişmekte olan ülkelerin kalkınmasında önemli bir rol oynayan, gelişmiş ülkelerin ekonomilerinin ise temelini oluşturan bir sektördür. Plansız kentleşme ve nüfus artışı, gün geçtikçe yoğunlaşan sanayileşme ile azalan tarım alanlarına rağmen üretim kaygısı devamlı artış göstermiştir. Artan nüfusun besin ihtiyacını azalan tarımsal alanlarla karşılamak amacıyla tarımsal teknikler gün geçtikçe gelişmiş, bu gelişme ile birlikte özellikle ilaç, gübre gibi kimyasal ürünlerin kullanımı artmıştır. Birim alandan daha yüksek verim kaygısı ile kullanımı kontrolsüz bir şekilde artan kimyasal girdilerin bir süre sonra bazı zararları tespit edilmiştir. Bu girdilerin kullanımı ürün veriminde her ne kadar artış sağlasa da çevreye ve toprağa verdiği zararlar bazı çözümleri zorunlu kılmıştır. Toprak yapısının, organik içeriğinin ve canlı florasının bozulması konularının çözümü amacıyla organik temelli ürünlerin kullanımı çözüm için önemli çıkış kapıları olmuşlardır. Toprak organik maddesinin artırılması, toprakların kimyasal ve fiziksel yapılarının onarılması ve hatta toprakta canlı mevcudiyetinin artırılması için en önemli çözüm yolu olarak yaygınlaşmaya başlamıştır. Ayrıca yapılan bilimsel çalışmaların ışığında tüketiciler ve üreticilerde artan bilinç kimyasal girdilerin dozunda kullanımını ve organik ürünlerin yetiştiricilikte girdi olarak daha fazla yer almasını sağlamıştır.

Son yıllarda artan bilinç organik temelli ürünlerin kullanımında önemli bir artış sağlamıştır. Bu sayede ürün çeşitliliği de artarak devam etmiş ve günümüzde bu ürünler piyasada önemli bir yer almaya başlamışlardır. Humik ve Fulvik Asit içerikli girdiler bu ürünlerin en önemlilerinden birisidir. Bu ürünlerin kullanımı yalnızca toprak yapısının iyileştirilmesini ve bitkilerin besin maddelerinden daha iyi faydalanmasını sağlamaz, aynı zamanda ürün gelişimini de destekleyerek verim ve gelir artışını da önemli oranda destekler. Bu ürünlerin kullanımı ağır metalleri sabitleyebilir ve organik kirleticileri parçalayabilir.

Bu çalışmada, humik ve fulvik asit temelli organik ürünlerin tarımsal amaçla kullanım olanakları sunularak yapılan güncel araştırmalar derlenecektir.

Anahtar Kelimeler: Humik, Fulvik, Organik, Tarım

HUMIC AND FULVIC ACIDS IN AGRICULTURAL PRODUCTION: UTILIZATION POTENTIALS AND RECENT STUDIES

ABSTRACT

Agriculture is a sector that plays a vital role in the development of emerging economies such as Türkiye, while serving as the foundation of the economies of developed nations. Despite declining agricultural lands due to unplanned urbanization, population growth, and accelerating industrialization, the concern for maintaining and increasing agricultural production has persisted. To meet the nutritional demands of a growing population with shrinking agricultural resources, agricultural technologies have steadily advanced. However, this progress has also led to a substantial increase in the use of chemical inputs such as fertilizers and pesticides. Over time, the uncontrolled application of these chemicals, initially aimed at maximizing yield per unit area, has revealed several detrimental effects. Although such inputs contribute to yield enhancement, their adverse impacts on the environment and soil health have necessitated alternative solutions. The degradation of soil structure, organic content, and microbial diversity has prompted the search for sustainable remedies, among which the use of organic-based products has emerged as a promising approach. Increasing soil organic matter, improving the chemical and physical properties of soils, and enhancing microbial activity are now regarded as key strategies for sustainable soil management.

Furthermore, growing awareness among consumers and producers, supported by scientific research, has led to a more measured use of chemical inputs and a rising adoption of organic products in agricultural production systems. In recent years, this increasing awareness has significantly boosted the utilization of organic-based materials, resulting in expanding product diversity and a growing market presence. Among these, inputs containing humic and fulvic acids stand out as particularly important. Their use not only improves soil structure and enhances the uptake of nutrients by plants, but also promotes plant growth, thereby contributing to higher yields and increased economic returns. Additionally, these substances can immobilize heavy metals and decompose organic pollutants, further supporting environmental sustainability.

In this review, recent studies on the agricultural applications and potential uses of humic and fulvic acid–based organic products will be compiled and evaluated.

ÖZET

Gelişmiş toplumlar kalkınma hedeflerine ulaşmak için ekonomilerinin temellerini sağlam bir zemine oturtmuşlardır. Bu temeli oluştururken de ilk adım tarımsal üretim ile başlamıştır. Ekonomilerde genel kalınmanın en önemli yolu kırsal kalkınmadan geçmektedir. Bunu başarabilmek ise doğru planlama sonucunda birim alandan elde edilecek gelirin artırılmasından geçmektedir. Türkiye' de gelişmekte olan ülkeler arasında yer almakla birlikte tarımsal kalkınma sürecini tam anlamıyla tamamlayamamıştır. Özellikle planlamada yaşanan problemler bu sürecin uzamasında önemli bir rol oynamaktadır.

Meyvecilik önemli bir tarımsal faaliyet alanıdır. Tarla ürünlerine oranla birim alandan getirisi yüksek bir üretim koludur. Türkiye bu üretim kolunda önemli bir yerdedir. Ancak karasal iklime sahip bölgelerinde ve uygun olmayan toprak koşullarından bu faaliyet alanından yararlanmak oldukça zordur. Yapılan faaliyetlerden ise başarı elde edilememekle birlikte harcanan zaman ve para da çoğu zaman boşa gitmektedir.

Türkiye bitki gen kaynakları bakımından önemli bir konumdadır. Birçok yabani türün gen merkezidir. Alıç (Crataegus spp.) bu türlerin en önemlilerindendir. Yetiştiricilik özellikleri ve piyasada alıcı bulduğu fiyat düşünüldüğünde yüksek bir potansiyele sahiptir. Alıç meyveleri ülkemizde geleneksel anlamda önemli görülmekle birlikte, son yıllarda alıç meyvelerinden üretilen marmelat, sirke ve turşu gibi ürünler de yoğun talep görmektedir. Farkı türlerinin bulunduğu alıç ayrıca peyzaj bitkisi olarak da değerlendirilebilmektedir. Günümüzde taze olarak 200-300 TL/kg fiyatlara alıcı bulabilmektedir. Ayrıca alıcın farklı bitki kısımları da çay olarak değerlendirilebilmektedir. Alıcın alternatif bir tür olarak potansiyel göstermesinin

yanında akraba türlere (elma, armut, ayva vb.) anaç olma potansiyeli de ayrıca önem arz etmektedir. Sebepler değerlendirildiğinde alıcın mevcut meyve türlerine alternatif bir tür olarak değerlendirilmesi üzerinde durulması gereken bir konu olarak karşımıza çıkmaktadır.

Bu çalışmada, alıcın özellikleri, güncel çalışmalar ve endüstriyel potansiyeli tartışılarak ülkemizin doğal bitkisi olan bu türün mevcut meyve türlerine alternatif bir tür olarak kullanılması üzerine önerilerde bulunulacaktır.

HAWTHORN (CRATAEGUS SPP.): POTENTIALS AND FUTURE PERSPECTIVES AS AN ALTERNATIVE SPECIES

ABSTRACT

Developed societies have established their economies on solid foundations to achieve their development goals, and the first step in building this foundation has traditionally been agricultural production. Sustainable economic development largely depends on rural development, which in turn requires proper planning and the optimization of income obtained per unit area. Although Türkiye is classified among developing countries, it has not yet fully completed its agricultural development process. Problems encountered in agricultural planning have played a major role in prolonging this process.

Fruit growing is an important field of agricultural production and offers higher economic returns per unit area compared to field crops. Türkiye holds a significant position in this sector; however, in regions characterized by a continental climate and unfavorable soil conditions, fruit cultivation faces considerable challenges. As a result, many attempts in these areas have failed to achieve success, leading to significant losses of both time and financial resources.

Türkiye possesses remarkable plant genetic diversity and serves as a gene center for many wild species. Among these, hawthorn (Crataegus spp.) stands out as one of the most important. Considering its cultivation characteristics and the prices it can fetch in the market, hawthorn exhibits high potential as a valuable crop. While hawthorn fruits have traditionally been appreciated in Türkiye, there has been increasing demand in recent years for value-added products such as marmalade, vinegar, and pickles made from hawthorn. In addition, various species of hawthorn can be utilized as ornamental plants in landscaping. Fresh fruits can currently be sold at prices ranging from 200 to 300 TL per kilogram. Moreover, different parts of the plant are also used to produce herbal teas. Beyond its potential as an alternative fruit species, hawthorn's possible use as a rootstock for related species such as apple, pear, and quince further increases its importance. Considering these factors, the evaluation of hawthorn as an alternative fruit species represents a promising area for future agricultural development.

This study aims to discuss the characteristics, recent research findings, and industrial potential of hawthorn (Crataegus spp.), while providing recommendations for its use as an alternative fruit species native to Türkiye.

Keywords: Hawthorn, Crataegus, Potential, Alternative

MICHELE PALIERI ÜZÜM ÇEŞİDİNDE *Ascophyllum nodosum* UYGULAMALARININ TANELERDE SEKONDER METOBOLİT BİRİKİMİ ÜZERİNE ETKİLERİNİN İNCELENMESİ

ORCID: 0000-0002-6723-283X

ÖZET

Sekonder metabolitler bilindiği gibi bitkilerden elde edilen, onların yaşamsal fonksiyonları üzerinde primer metabolitler gibi etkileri bulunmayan bileşiklerdir. Bitkilerin kendilerini savunma amacıyla ürettikleri bu bileşiklerin daha sonra antioksidan, antifungal ve antibakteriyel özelliklerinin ortaya çıkarılmış olması nedeniyle günümüzde kanser, kardivasküler hastalıklar, tip II diyabet gibi pek çok hastalık üzerine olumlu etkiler gösterdiği bilinmektedir. Dolayısıyla başta ilaç sanayi olmak üzere gıda ve kozmetik sektörlerinde de farklı kullanım amaçlarının olması bu bileşiklere duyulan ilgiyi daha da artmıştır.

Bu araştırma ile de Michele Palieri üzüm çeşidinde Ascophyllum nodosum uygulamalarının tanelerde birer sekonder metabolit olan fenolik bileşikler ile yine bitkinin savunma mekanizmasında etkin rol oynayan ve aynı zamanda birer fitohormon olan indol asetik asit, gibberellik asit, zeatin, absisik asit ve salisilik asit birikimi üzerine etkileri incelenmiştir. Uygulamalar fenolojik gözlemler baz alınarak tanelerin koruk safhasında, ben düşme döneminde ve hasattan 10 gün önce olacak şekilde 3 ayrı dönemde yapılmıştır. Uygulamalarda ticari bir firmanın sıvı formdaki A. nodosum solüsyonu kullanılmıştır. Tüm omca pülverizatör ile ıslatılmış, kontrol bitkilerine sadece saf su uygulaması yapılmıştır. A. nodosum, 1/10; 1/15 ve 1/20 dozlarında uygulanmıştır. Araştırma sonucunda spektrofotometrik olarak belirlenen fenolik bileşik miktarları ile HPLC ile belirlenen fenolik bileşenler, bitkisel hormonlar ve organik asit içerikleri değerlendirildiğinde genel olarak A. nodosum uygulamalarının bu bileşenleri artırmada olumlu etkiler gösterdikleri anlaşılmaktadır. Bu durum hem tane kompozisyonunun içeriğinin zenginleştirilmesi hem de bileşenlerin çoğunun doğal savunma bileşenleri olması bakımından önemlidir.

Anahtar Kelimeler: Asma, Üzüm, Sekonder Metabolit, Ascophyllum nodosum, Hormon, Organik Asit

INVESTIGATION OF THE EFFECTS OF *Ascophyllum nodosum* APPLICATIONS ON SECONDARY METABOLITE ACCUMULATION IN BERRIES IN MICHELE PALIERI GRAPE VARIETY

ABSTRACT

Secondary metabolites are compounds derived from plants that do not have the same effects on their vital functions as primary metabolites. These compounds, produced by plants for self-defense, have been later identified for their antioxidant, antifungal, and antibacterial properties, and are now known to have positive effects on many diseases, including cancer, cardiovascular diseases, and type II diabetes. Consequently, their diverse uses, particularly in the pharmaceutical industry, as well as in the food and cosmetic sectors, have further increased interest in these compounds.

This study investigated the effects of Ascophyllum nodosum treatments on the Michele Palieri grape variety on the accumulation of phenolic compounds, which are secondary metabolites, as well as phytohormones such as indole acetic acid, gibberellic acid, zeatin, abscisic acid, and salicylic acid, which play an active role in the plant's defense mechanism. Applications were made at three different times: unripe grape stage, during veraison, and 10 days before harvest, based on phenological observations. A liquid A. nodosum solution from a commercial company was used in the applications. All vines were sprayed, while control plants were treated with pure water only. A. nodosum was applied at doses of 1/10, 1/15, and 1/20. The results of the study indicate that A. nodosum applications generally have positive effects in increasing these compounds, as determined by spectrophotometric methods and by HPLC, as measured by phenolic compounds, plant hormones, and organic acid contents. This is important both for enriching the berry composition and for the fact that many of the components are natural defense components.

ÖZET

Biyokütle, çevreye ve insan sağlığına önemli ölçüde zarar veren fosil yakıt tüketimine bir alternatif olarak kullanılabilir. Tarım ülkesi olan Endonezya, önemli bir biyokütle enerji potansiyeline sahiptir. Bu çalışma, son beş yıl içinde temel gıda ve plantasyon bitkilerden elde edilen biyokütle potansiyelini tahmin etmeyi ve bu potansiyelin ülkenin 38 eyaletine göre dağılım haritasını sunmayı amaçlamaktadır. Çalışmada pirinç, mısır, şeker kamışı, hindistan cevizi ve yağ palmiyesi artıklarının değerlendirilmesi yapılmıştır. Tarımsal artıkların biyokütle potansiyelinin tahmini, 2020–2024 yıllarına ait ilgili ürünlerin ortalama üretim verileri kullanılarak ve önceki literatürlerde yer alan denklemler temel alınarak hesaplanmıştır. Çalışma sonucunda, söz konusu beş ürünün artıklarından elde edilebilecek toplam tarımsal biyokütle artığı potansiyeli (ABP) 55.79 milyon ton olarak hesaplanmış, toplam ısıl değeri (THV) ise yaklaşık 857.44 PJ olarak bulunmuştur. Pirinç, mısır ve yağ palmiyesi artıklarından elde edilen biyokütle potansiyeli toplam tahmini potansiyelin yaklaşık %98.23'ünü (842.31 PJ) oluşturmaktadır. Gıda ürünleri arasında, pirinç artıklarından en yüksek biyokütle potansiyeline sahip eyaletler Doğu Cava, Orta Cava ve Batı Cava iken; mısır artıklarında Doğu Cava ve Orta Cava öne çıkmaktadır. Plantasyon bitkilerde ise, şeker kamışı artıklarından Doğu Cava ve Lampung; hindistan cevizi artıklarından Riau ve Kuzey Sulawesi; yağ palmiyesi artıklarından ise Riau, Orta Kalimantan ve Batı Kalimantan eyaletleri en yüksek biyokütle potansiyeline sahiptir. Bu çalışmanın, Endonezya'daki her eyalette tarımsal artıkların biyokütle enerji üretiminde değerlendirilmesine katkı sağlaması ve biyokütle kullanılabilirliğinin artırılmasının, ülkede sürdürülebilir tarım ve enerji yönetimini daha da desteklemesi beklenmektedir.

Anahtar Kelimeler: Tarımsal artık, Biyokütle potansiyeli, Yenilenebilir enerji, Endonezya.

BIOMASS POTENTIAL FROM AGRICULTURAL RESIDUES IN INDONESIA

ABSTRACT

Biomass can serve as an alternative to fossil fuel consumption which causes significant harm to the environment and human health. Indonesia, being an agricultural country, possesses a substantial biomass energy potential. This study aimed to estimate the biomass potential derived from major food and plantation crops in over the past five years and present its distribution map across the country's 38 provinces. Residues from paddy, corn, sugarcane, coconut, and oil palm are considered. The estimation of biomass potential from agricultural residues was calculated based on the average of 2020-2024 production data of related crops using equations from previous literatures. As a result of the study, the total available agricultural biomass residue potential (ABP) from these five crops residues was calculated to be 55.79 million tons, with a total heating value (THV) of approximately 857.44 PJ. The biomass potential from paddy, corn, and oil palm residues holds the highest value, approximately 98.23% (842.31 PJ) of the total estimated biomass potential. Among food crops, provinces with the highest biomass potential from paddy residues are East Java, Central Java, and West Java, while from corn residues, East Java and Central Java are prominent. For plantation crops, East Java and Lampung lead in biomass potential from sugarcane residues; Riau and North Sulawesi from coconut residues; also Riau, Central Kalimantan, and West Kalimantan from oil palm residues. It is expected that this study will contribute to the development of biomass energy utilization from agricultural residues in each province in Indonesia and that enhancing biomass availability could further promote sustainable agriculture and energy management in Indonesia.

Keywords: Agricultural residue, Biomass potential, Renewable energy, Indonesia.

ISPARTA KOŞULLARINDA ÇÖREK OTU GENOTİPLERİNİN FENOLOJİK AGRONOMİK VE KALİTE ÖZELLİKLERİNİN BELİRLENMESİ*

ORCID: 0000-0002-3651-1641

ÖZET

Bu çalışma Isparta ekolojik koşullarında bazı çörek otu genotiplerinin fenolojik, agronomik ve kalite özelliklerinin belirlenmesi amacıyla yapılmıştır. Çalışmada kullanılan çörek otu genotiplerinden 9 tanesi Nigella sativa, biri ise N. damascena türüne ait olmak üzere 10 farklı çörek otu genotipi araştırılmıştır. Deneme, tesadüf blokları deneme desenine göre yürütülmüştür. Çalışmada; bitki boyu (cm), dal sayısı (adet/bitki), kapsül sayısı (adet/bitki), bin tane ağırlığı (g), tohum verimi (kg/da), biyolojik verim (kg/da) gibi agronomik özellikler ile yağ oranı ve yağ asitleri kompozisyonu (%) gibi kalite özellikleri incelenmiştir. Çalışmada çörek otu genotiplerinin iki yıllık ortalamalarını incelediğimizde fenolojik bakımdan iki (erkenci geçci) farklı gurbun belirlendiği tarımsal özeliklerden bitki boyu 34.5-54.0 cm, dal sayısı 3.5-6.2 adet/bitki, kapsül sayısı 4.8-7.1 adet/bitki, 1000 tane ağırlığı 1.7-3.1 g, biyolojik verim 235.3-341.1 kg/da, tohum verimi 36.0-109.9 kg/da, aralıklarında değiştiği belirleniştir. Çalışmada en yüksek tohum verimleri iki yıl ortalamasına göre Hindistan (109 kg/da) orijinli genotipte elde edilmiş ve bunu Suriye ve Hatay genotipleri izlemiştir. Çörek otunda en fazla bulunan yağ asitleri sırasıyla linoleik, oleik ve palmitik (%42.3-%55.8, %20.1-%26.5, %11.4-%14.7) yağ asitleri olduğu belirlenmiştir. En yüksek linoleik asit oranı Çameli çeşidinden (%55.8) elde edilmiştir. Çalışma sonucunda bölgede kuru koşullarda Hatay, Suriye ve Hindistan orijinli erkenci genotiplerin yüksek verim verdiği ve bölgede üreticilerine tavsiye edilebileceği belirlenmiştir.

Anahtar Kelimeler: Çörek out, Nigella, verim, sabit yağ

DETERMINATION OF THE PHENOLOGICAL, AGRONOMIC, AND QUALITY CHARACTERISTICS OF BLACK CUMIN (NIGELLA SATIVA L.) GENOTYPES UNDER ISPARTA CONDITIONS

ABSTRACT

This study was conducted to determine the phenological, agronomic, and quality characteristics of some black cumin (Nigella sativa L.) genotypes under the ecological conditions of Isparta. A total of ten black cumin genotypes were investigated, nine belonging to Nigella sativa and one to N. damascena. The experiment was carried out according to the randomized complete block design. In the study, agronomic traits such as plant height (cm), number of branches (number/plant), number of capsules (number/plant), thousand-seed weight (g), seed yield (kg/da), and biological yield (kg/da) were examined, along with quality characteristics including oil content and fatty acid composition (%). According to the two-year average data, the genotypes were grouped into two phenological categories (early and late maturing). Among the agronomic traits, plant height ranged from 34.5 to 54.0 cm, number of branches from 3.5 to 6.2 per plant, number of capsules from 4.8 to 7.1 per plant, thousand-seed weight from 1.7 to 3.1 g, biological yield from 235.3 to 341.1 kg/da, and seed yield from 36.0 to 109.9 kg/da. The highest seed yield, according to the two-year average, was obtained from the Indian-origin genotype (109 kg/da), followed by the Syrian and Hatay genotypes. The predominant fatty acids identified in black cumin were linoleic, oleic, and palmitic acids, ranging between 42.3–55.8%, 20.1–26.5%, and 11.4–14.7%, respectively. The highest linoleic acid content (55.8%) was found in the Çameli variety.As a result, it was determined that the early-maturing genotypes originating from Hatay, Syria, and India produced high yields under dry conditions in the region and could be recommended to local farmers.

Keywords: Black cumin, Nigella, yield, seed oil

EFFECTS OF SHREDLANGE AND CONVENTIONAL METHODS ON NUTRIENT CONTENT AND IN VITRO DIGESTIBILITY OF CORN SILAGE

ABSTRACT

Corn silage is the most important roughage in the diet of dairy cattle. Studies on quality improvements are still ongoing. Physical processing techniques of silage during harvest affect its quality. One of these techniques is shredding. During this harvest, the nutrient content of shredded and conventional corn silage was compared, as were those collected by IVTD and fleig. For this purpose, corn silage grown under the same conditions was harvested on the same day and shredded using conventional and shredding machines. Samples were ensiled in 1 L glass jars in a laboratory environment. After 45 days of fermentation, the silages were opened, and their pH properties and flexibility were measured. The pH was lower in conventional silage (3.96±0.02-4.22±0.02). The flexibility values for conventional and shredded silage classes were 111.32±0.22 and 104.79±0.67, respectively ($p<0.05$). DM, CP, NDF and ADF values in silages were determined as 32.36±0.11-33.05±0.13, 7.17±0.13-7.87±0.03 ($p<0.05$), 40.57±0.77-31.17±2.06 ($p<0.05$), 22.19±0.35-16.09±1.27 ($p<0.05$), respectively. IVTD values of silages tend to be high with shredding type ($p=0.06$) (74.03±0.60-79.19±2.14). As a result of the study, it was determined that the shredding method increased the CP value and decreased the NDF and ADF values, resulting in positive improvement in digestibility. The digestibility of shredded corn silage was increased by 5%. It would be beneficial to use the shredding method in corn silage harvest.

Key Words: Corn silage, digestibility, shredlage.

YER FISTIĞINDA KÖK ÇÜRÜKLÜĞÜ HASTALIĞINA KARŞI UÇUCU YAĞLARIN KULLANIMINDA GÜNCEL YAKLAŞIMLAR

ÖZET

Yer fıstığı (Arachis hypogaea L.), yağ ve protein içeriği açısından önemli bir endüstri bitkisi olup Türkiye'nin özellikle Akdeniz ve Güneydoğu Anadolu bölgelerinde yaygın olarak yetiştirilmektedir. Ancak üretim alanlarında kök çürüklüğü etmenleri, özellikle Rhizoctonia solani ve Sclerotium rolfsii, fide döneminden itibaren bitkide solgunluk, kök sisteminde kahverengileşme ve çürüme gibi belirtiler oluşturarak verim ve kaliteyi önemli ölçüde düşürmektedir. Bu patojenlerin kontrolünde uzun yıllardır kimyasal fungisitler kullanılmakla birlikte, bu uygulamalar çevresel kirlilik, kalıntı sorunları, toprak mikrobiyotasında dengesizlik ve patojenlerde direnç gelişimi gibi ciddi olumsuzluklara yol açmaktadır. Bu nedenle, sürdürülebilir ve çevre dostu alternatif mücadele yöntemlerinin geliştirilmesi önem kazanmıştır.

Son yıllarda tıbbi ve aromatik bitkilerden elde edilen uçucu yağlar, içeriklerindeki biyolojik olarak aktif sekonder metabolitler sayesinde önemli antifungal özellikler göstermekte ve bitki hastalıklarının kontrolünde umut verici biyofungisit adayları olarak değerlendirilmektedir. Yer fıstığında kök çürüklüğü hastalığına karşı en yaygın olarak test edilen uçucu yağlar arasında kekik (Thymus vulgaris), tarçın (Cinnamomum zeylanicum), biberiye (Rosmarinus officinalis), sarımsak (Allium sativum), nane (Mentha spp.) ve okaliptüs (Eucalyptus spp.) yer almaktadır. Bu yağların özellikle timol, karvakrol, eugenol ve 1,8-sineol gibi bileşenleri, misel gelişimini baskılama, hücre zarını bozma ve enzimatik aktiviteleri inhibe etme yoluyla patojenleri etkisiz hale getirmektedir.

Bununla birlikte, defne, karanfil, lemongrass, rezene, anason ve lavanta yağları gibi bazı türlerin yer fıstığı kök çürüklüğü etmenlerine karşı antifungal potansiyelleri henüz yeterince araştırılmamıştır. Bu derlemede, yer fıstığında kök çürüklüğü hastalığına karşı uçucu yağların kullanımına ilişkin güncel literatür sistematik biçimde değerlendirilmekte; mevcut bilgi birikimi, biyolojik etki mekanizmaları ve gelecekteki araştırma alanları bilimsel temeller doğrultusunda tartışılmaktadır.

Anahtar Kelimeler: Yer Fıstığı, Kök Çürüklüğü, Uçucu Yağ, Arachis hypogaea L.

CURRENT PERSPECTIVES ON THE USE OF ESSENTIAL OILS AGAINST ROOT ROT DISEASE IN PEANUT

ABSTRACT

Peanut (Arachis hypogaea L.) is an important industrial crop due to its high oil and protein content and is widely cultivated in the Mediterranean and Southeastern Anatolia regions of Türkiye. However, soil-borne fungal pathogens, particularly Rhizoctonia solani and Sclerotium rolfsii, cause root rot disease, leading to symptoms such as wilting, browning, and decay of the root system from the seedling stage onward, resulting in significant yield and quality losses. Chemical fungicides have long been the primary control strategy against these pathogens. Nevertheless, their extensive and continuous use has raised serious concerns, including environmental pollution, residue accumulation, disruption of soil microbiota, and the emergence of resistant pathogen populations. Consequently, the development of sustainable and eco-friendly alternative control methods has gained increasing importance.

In recent years, essential oils derived from medicinal and aromatic plants have attracted considerable attention as promising biofungicide candidates due to their rich content of biologically active secondary metabolites with strong antifungal properties. Among the essential oils tested against peanut root rot pathogens, thyme (Thymus vulgaris), cinnamon (Cinnamomum zeylanicum), rosemary (Rosmarinus officinalis), garlic (Allium sativum), mint (Mentha spp.), and eucalyptus (Eucalyptus spp.) are the most commonly studied. Active constituents such as thymol, carvacrol, eugenol, and 1,8-cineole have been shown to inhibit mycelial growth and interfere with fungal cell membranes and enzymatic activities.

However, essential oils such as bay laurel (Laurus nobilis), clove (Syzygium aromaticum), lemongrass (Cymbopogon citratus), fennel (Foeniculum vulgare), anise (Pimpinella anisum), and lavender (Lavandula spp.) have not yet been adequately investigated against peanut root rot pathogens, despite their well-documented antifungal activities on other plant pathogens. This review systematically evaluates the current literature on the use of essential oils against peanut root rot disease, discusses their biological modes of action, and highlights future research perspectives within the framework of sustainable plant disease management.

Keywords: Peanut, Root Rot, Essential Oil, Arachis hypogaea L.

YUMURTALARDA STERİLİZASYON VE DEZENFEKSİYON UYGULAMALARINDA KİMYASAL YÖNTEMLER YERİNE UÇUCU YAĞLARIN KULLANIMININ DEĞERLENDİRİLMESİ

ÖZET

Yumurta kabuğu, üretim ve depolama süreçlerinde çevresel mikroorganizmalarla kolaylıkla kontamine olabilmektedir. Salmonella spp., Escherichia coli, küf ve maya türleri gibi patojenler, sofralık yumurtalarda gıda güvenliği açısından ciddi riskler oluştururken, kuluçkalık yumurtalarda embriyonik gelişimi olumsuz etkileyerek ekonomik kayıplara yol açmaktadır. Bu nedenle yumurta kabuğunun etkin bir şekilde dezenfekte edilmesi hem gıda güvenliği hem de kuluçkahane hijyeni açısından kritik bir aşamadır. Günümüzde özellikle kuluçkalık yumurtalarda en yaygın kullanılan yöntem formaldehit fumigasyonudur. Ancak formaldehitin toksik ve kanserojen etkileri hem insan sağlığı hem de çevre açısından önemli riskler taşıdığı için kullanımı birçok ülkede sınırlandırılmış ve daha güvenli, kalıntısız ve çevre dostu alternatif yöntemlere olan ilgi artmıştır.

Son yıllarda tıbbi ve aromatik bitkilerden elde edilen uçucu yağlar, içeriklerindeki timol, karvakrol, eugenol ve 1,8-sineol gibi biyoaktif sekonder metabolitler sayesinde güçlü antimikrobiyal ve antifungal etkilere sahiptir. Yapılan çalışmalar, kekik, karanfil, tarçın, biberiye, nane ve limon otu gibi uçucu yağların hem in vitro koşullarda hem de uygulamalı denemelerde yumurta kabuğu üzerindeki mikrobiyal yükü önemli ölçüde azalttığını ortaya koymuştur. Özellikle karanfil ve kekik yağlarının uygun konsantrasyonlarda ve doğru uygulama yöntemleriyle kullanıldığında formaldehit fumigasyonuna benzer düzeyde mikrobiyal inaktivasyon sağladığı, embriyo gelişimini ya da yumurta kalitesini olumsuz etkilemediği belirtilmektedir. Tarçın ve limon otu gibi diğer uçucu yağlar da dikkate değer antimikrobiyal etkilere sahip olmakla birlikte, uygulama protokollerinin standartlaştırılması ve doz optimizasyonu konularında daha fazla araştırmaya ihtiyaç duyulmaktadır.

Bu derlemede, yumurtalarda sterilizasyon ve dezenfeksiyon amacıyla uçucu yağların kullanımına ilişkin güncel bilgiler sistematik bir şekilde değerlendirilmekte; kullanılan bitki türleri, uygulama yöntemleri, mikrobiyal etkinlikleri, avantajları ve kimyasal yöntemlerle karşılaştırmaları ele alınmaktadır. Ayrıca, uçucu yağ temelli dezenfeksiyon yaklaşımlarının sürdürülebilir, güvenli ve çevre dostu alternatifler olarak gelecekteki uygulamalardaki potansiyelleri vurgulanmaktadır.

Anahtar Kelimeler: Yumurta, Sterlizasyon, Dezenfeksiyon, Uçucu Yağlar

EVALUATION OF THE USE OF ESSENTIAL OILS AS AN ALTERNATIVE TO CHEMICAL METHODS IN EGG DISINFECTION AND STERILIZATION

ABSTRACT

Eggshells are easily contaminated with environmental microorganisms during production and storage. Pathogens such as Salmonella spp., Escherichia coli, molds, and yeasts pose significant risks to food safety in table eggs and can negatively affect embryonic development in hatching eggs, leading to considerable economic losses. Therefore, effective disinfection of the eggshell surface is a critical step for ensuring both food safety and hatchery hygiene. Formaldehyde fumigation has traditionally been the most common disinfection method, particularly for hatching eggs. However, due to its toxic and carcinogenic effects on human health and the environment, the use of formaldehyde has become increasingly restricted, which has intensified the search for safe, residue-free, and environmentally friendly alternatives.

In recent years, essential oils derived from medicinal and aromatic plants have attracted attention as promising natural disinfectants. Their strong antimicrobial and antifungal properties are mainly attributed to bioactive secondary metabolites such as thymol, carvacrol, eugenol, and 1,8-cineole. Studies evaluating the use of essential oils for egg disinfection have reported that thyme, clove, cinnamon, rosemary, mint, and lemongrass oils significantly reduce microbial loads on eggshells under both in vitro and field conditions. Clove and thyme essential oils, when applied at appropriate concentrations and using suitable methods (e.g., spraying, fumigation, nanoemulsion), have demonstrated microbial inactivation levels comparable to formaldehyde without adverse effects on embryo development or egg quality. Other essential oils, including cinnamon and lemongrass, have also shown notable antimicrobial effects, though further research is needed to standardize application protocols and determine optimal dosages.

This review systematically evaluates current knowledge on the use of essential oils in egg disinfection and sterilization. Plant species used, modes of application, antimicrobial efficacy, advantages, and comparisons with conventional chemical methods are discussed. Furthermore, the potential role of essential oil-based approaches as sustainable, safe, and effective alternatives in future disinfection strategies is highlighted.

ÖZET

Dünyada ve ülkemizde hızlı nüfus artışı, kentlerin gelişmesine ve buna bağlı olarak yoğun yapılaşmanın artmasına neden olmuştur. Bu durum, doğal alanların tahrip edilerek yok olma tehlikesiyle karşı karşıya kalmasına yol açmıştır. Teknoloji ürünü betonun sert ve soğuk görünümünün yumuşatılması ve yapı çevresi teknolojilerinin insan yaşamı açısından iyileştirilmesi, günümüz kentlerinin temel gereksinimleri arasında yer almıştır. Daha yaşanabilir ortamlar oluşturmak amacıyla kentlerde park ve bahçeler tesis edilmiştir. Park ve bahçelerde en önemli unsurlardan biri de çim alanlardır. Yeşil alanların kullanım amacına uygun çim tohumlarının belirlenmesi, çim tesislerinin uzun ömürlü olması için temel koşullardan biridir. Bu nedenle, kullanılacağı yerin iklimine, zamana ve amaca uygun çim tohumunun seçiminde; hastalık, zararlı ve yabancı otlara karşı dayanıklılık, soğuk, sıcak ve kuraklık toleransı, homojen yapı ve üniform görünüm gibi özelliklere dikkat edilmiştir.

Bu kapsamda, Prof. Dr. Mehmet Ali AVCI tarafından sentetik varyete ıslahı yöntemiyle geliştirilen dört farklı buğdaygil çim bitkisinin hem yalın ekimleri hem de karışımlardaki performansları, mevcut çeşitlerle karşılaştırmalı olarak araştırmada yer almıştır. Deneme alanında materyal olarak çok yıllık çim (Lolium perenne), kamışsı yumak (Festuca arundinacea), çayır salkım otu (Poa pratensis), tavus otu (Agrostis spp.) ve domuz ayrığı (Dactylis glomerata) olmak üzere beş farklı buğdaygil yem bitkisi kullanılmıştır. Araştırma kapsamında, Konya Büyükşehir Stadyumu'nda kullanılan 14 farklı buğdaygil çim çeşidi ile stadyum çimlendirilmesinde kullanılan iki farklı karışımdan oluşan bitki gruplarının ekimi yapılmıştır. Ayrıca, 14 farklı çim çeşidinin yanında ıslah yoluyla geliştirilen dört farklı hattın yalın ekimleri ile bu bitkilerin iki ve üçlü karışımları oluşturularak Orta Anadolu koşullarında en uygun çim karışımları belirlenmiştir. Buna göre deneme, 18 çim bitkisinden oluşan yalın ekim, dörder adet iki ve üçlü karışım ile iki adet beşli karışım olmak üzere üç tekerrürlü olmak üzere toplam 84 parselden oluşmuştur. Araştırma, Selçuk Üniversitesi Ziraat Fakültesi Tarla Bitkileri Bölümü Prof. Dr. Abdulkadir AKÇİN Araştırma ve Uygulama Arazisi'nde yürütülmüştür. Parsel ebatları 1 m × 1 m olacak şekilde dizayn edilmiştir. Denemede, UPOV kriterlerine göre çıkış hızı (gün), alan kaplama hızı (gün), kaplama derecesi (1–9), yaprak rengi

(1–9), yaprak dokusu (mm), yenilenme gücü (1–5), kardeş sayısı (adet), genel görünüm (1–9) ve seyrekleşme derecesi (1–9) gibi özellikler morfolojik olarak değerlendirilmiştir.

Elde edilen veriler sonucunda, alan kaplama hızı, alan kaplama derecesi ve yenilenme gücü gibi kriterlerin yanı sıra su tüketimi açısından da düşük maliyetli ve sürdürülebilir çim alanları oluşturma potansiyeli ortaya konmuştur. Bu özelliklerin incelenmesi, su kaynaklarının etkin kullanımıyla uyumlu çim bitkisi seçimlerine katkı sağlamıştır.

AREA COVERAGE PERFORMANCE AND ECOLOGICAL TURF APPLICATIONS OF SOME WHEATEN FORAGE CROPS THAT CAN BE USED IN GREEN AREAS

ABSTRACT

The rapid population growth in both the world and Turkey has led to the expansion of cities and, consequently, to an increase in urban construction. This process has resulted in the destruction and near extinction of natural areas. Softening the harsh and cold appearance of concrete, a product of modern technology, and improving the built environment in terms of human well-being have become essential requirements of contemporary cities. In order to create more livable environments, parks and gardens have been established in urban areas. One of the most important elements in parks and gardens is turfgrass areas. Determining turfgrass seeds suitable for the intended use of green spaces is one of the key prerequisites for establishing long-lasting lawns. Therefore, in selecting turfgrass seeds appropriate for the climate, time, and purpose of the area, attention has been paid to resistance against diseases, pests, and weeds, tolerance to cold, heat, and drought, as well as homogeneity and uniform appearance.

Within this scope, four different forage grass varieties developed through synthetic variety breeding by Prof. Dr. Mehmet Ali AVCI were included in the study to compare their performance in both pure sowing and mixtures with existing commercial varieties. The experimental materials consisted of five different forage grasses: perennial ryegrass (Lolium perenne), tall fescue (Festuca arundinacea), Kentucky bluegrass (Poa pratensis), bentgrass (Agrostis spp.), and orchardgrass (Dactylis glomerata). In addition, the study included the sowing of 14 different forage grass varieties currently used at Konya Metropolitan Stadium, along with two turf mixtures used for stadium turf establishment. Furthermore, pure sowings of four improved breeding lines and their binary and ternary mixtures with these varieties were evaluated to determine the most suitable turf mixtures under Central Anatolian conditions. Accordingly, the experiment consisted of 18 turfgrass varieties in pure sowings, four binary mixtures, four ternary mixtures, and two quinary mixtures, with three replications, making a total of 84 plots. The study was conducted at the experimental and research fields of the Department of Field Crops, Faculty of Agriculture, Selçuk University (Prof. Dr. Abdulkadir AKÇİN Research and Application Area). Plot dimensions were designed as 1 m × 1 m. The following traits were evaluated morphologically according to UPOV criteria: emergence rate (days), ground coverage rate (days), ground coverage degree (1–9), leaf color (1–9), leaf texture (mm), regeneration capacity (1–5), number of tillers (per plant), general appearance (1–9), and degree of thinning (1–9).

Based on the data obtained, the potential for establishing low-cost and sustainable turf areas was demonstrated, particularly in terms of coverage rate, coverage degree, regeneration capacity, and water consumption. Examination of these traits contributed to the selection of turfgrass species compatible with efficient water use.

ABSTRACT

Red plum (Prunus domestica) is a fruit with numerous health benefits. Due to its high moisture content, it spoils quickly after harvest and becomes inedible. Therefore, preserving it through drying is very important. The aim of this study is to evaluate and compare the effects of various pre-treatment applications and microwave drying methods on CO2 emissions caused by specific energy consumption during the drying process of red plum slices. Microwave drying was performed at power levels of 100, 200, 300, and 600 W, with three different pretreatments (gum arabic, ascorbic acid, and citric acid) and without pretreatment (control). Carbon dioxide (CO_2) emissions from various drying methods were calculated for power plants using wind, solar, hydroelectric, and geothermal energy sources. The wind power plant produced the lowest CO_2 emissions (0.271 g kg-1), while the geothermal power plant produced the highest (260.074 g kg-1). The study also revealed that increasing the microwave level decreased CO2 emissions due to a reduction in the SEC value. Pre-treatment applications reduced the dryer's energy consumption and consequently significantly reduced CO_2 emissions. Therefore, it is recommended to use ascorbic acid, citric acid, and gum arabic pretreatment applications in drying processes to reduce CO_2 emissions caused by drying systems and to develop drying systems that are more environmentally friendly in terms of CO_2 emissions.

Keywords: CO2 emission, microwave drying, red plum, pretreatment

PGPR VE MIKORIZA KOMBİNASYONLARININ TIBBI–AROMATİK BİTKİLERDE VERİM, ETKEN MADDE İÇERİĞİ VE STRES TOLERANSINA ETKİLERİ

ÖZET

Tıbbi ve aromatik bitkiler (TAB), içeriklerinde bulunan uçucu yağlar, fenolik bileşikler, flavonoidler, alkaloidler gibi sekonder metabolitler sayesinde farmasötik, kozmetik, gıda ve aromaterapi endüstrilerinde önemli bir yer tutmaktadır. Artan çevresel stres faktörleri, kuraklık, toprak tuzluluğu ve kimyasal girdi kullanımının yol açtığı sorunlar, bu bitkilerin sürdürülebilir ve kaliteli üretiminde biyolojik çözümlerin önemini artırmıştır. Bu bağlamda, bitki gelişimini teşvik eden rizobakteriler (PGPR) ve arbusküler mikoriza mantarları (AMF), ekolojik üretim sistemlerinde önemli biyolojik girdiler olarak öne çıkmaktadır. PGPR uygulamaları; azot fiksasyonu, fosfor çözündürme, bitki büyüme hormonları (IAA) üretimi, siderofor sentezi ve ACC deaminaz aktivitesi yoluyla kök gelişimini, besin alımını ve stres toleransını artırmaktadır. Mikoriza mantarları ise kök yüzey alanını artırarak özellikle fosfor, çinko ve su alımında avantaj sağlamakta, aynı zamanda bitkilerde sekonder metabolit sentezini uyararak uçucu yağ ve fenolik madde içeriğini yükseltmektedir.

Son yıllarda yapılan araştırmalar, PGPR ve mikorizanın birlikte uygulanmasının, lavanta (Lavandula angustifolia), kekik (Thymus vulgaris), adaçayı (Salvia officinalis), biberiye (Rosmarinus officinalis) ve ekinezya (Echinacea purpurea) gibi tıbbi bitkilerde verim, biyokütle ve kalite parametrelerinde tek başına uygulamalara kıyasla daha üstün sonuçlar verdiğini ortaya koymuştur. Kombinasyon uygulamaları, bitkilerin hem biyotik hem de abiyotik stres koşullarına karşı dayanıklılığını artırmakta, su kullanım etkinliğini yükseltmekte ve kimyasal gübre ihtiyacını azaltarak sürdürülebilir üretime katkı sağlamaktadır. Bu nedenle, PGPR ve mikoriza kombinasyonlarının TAB yetiştiriciliğinde kullanımı, güncel ve geleceğe yönelik yüksek potansiyelli bir araştırma konusudur. Bu bildiride, bu biyolojik ajanların etki mekanizmaları, uygulama yöntemleri ve tıbbi bitkilerde verim–kalite parametreleri üzerine etkileri literatür temelli olarak ele alınmıştır.

Anahtar Kelimeler: PGPR, Mikoriza, Tıbbi Bitkiler, Aromatik Bitkiler.

EFFECTS OF PGPR AND MYCORRHIZA COMBINATIONS ON YIELD, ACTIVE COMPOUND CONTENT, AND STRESS TOLERANCE IN MEDICINAL AND AROMATIC PLANTS

ABSTRACT

Medicinal and aromatic plants (MAPs) play a crucial role in the pharmaceutical, cosmetic, food, and aromatherapy industries due to their rich content of secondary metabolites such as essential oils, phenolic compounds, flavonoids, and alkaloids. Increasing environmental stress factors—including drought, soil salinity, and problems arising from intensive chemical input use—have heightened the importance of biological solutions for the sustainable and high-quality production of MAPs. In this context, Plant Growth Promoting Rhizobacteria (PGPR) and arbuscular mycorrhizal fungi (AMF) have emerged as key biological inputs within ecological production systems. PGPR applications enhance root growth, nutrient uptake, and stress tolerance through mechanisms such as nitrogen fixation, phosphorus solubilization, production of plant growth hormones (IAA), siderophore synthesis, and ACC deaminase activity. Mycorrhizal fungi, by increasing root surface area, improve the uptake of relatively immobile nutrients such as phosphorus and zinc as well as water, while also stimulating the biosynthesis of secondary metabolites, leading to higher levels of essential oils and phenolic compounds.

Recent studies have demonstrated that the combined application of PGPR and AMF produces superior results compared to single applications in terms of yield, biomass, and quality parameters in medicinal plants such as lavender (Lavandula angustifolia), thyme (Thymus vulgaris), sage (Salvia officinalis), rosemary (Rosmarinus officinalis), and echinacea (Echinacea purpurea). The combination improves plant tolerance to both biotic and abiotic stresses, enhances water use efficiency, and contributes to sustainable production by reducing the need for chemical fertilizers. Therefore, the use of PGPR and AMF combinations in MAP cultivation represents a highly relevant and promising research topic for the future. This paper presents a literature-based evaluation of their mechanisms of action, application methods, and impacts on yield and quality parameters in medicinal and aromatic plants.

ÖZET

Tarım kültürüne alınması, tıbbi ve aromatik bitkilerin dünyada varlığını sürdürmesinde çok önemli bir rol oynamıştır. Tıbbi ve aromatik bitkilerin ekseriyeti kuraklığa töleranslı olup, hem yağışa dayalı ve hem de suluda yetiştirilmektedir. Özellikle kurak bölgelerde, yağışa dayalı üretim için bu bitkilerin tarımı tercih edilebilmektedir. Sulama, kurak alanlarda su stresini azaltmak ve ürün verimini artırmak için en etkili önlemdir. Dolayısıyla tıbbi ve aromatik bitkilerde de sulama kaçınılmazdır. Tıbbi ve aromatik bitki olan lavanta, kurağa dayanıklı olup, uçucu yağı için üretilmektedir. Bu çalışma, lavantada sulama üzerine yapılan bazı araştırmaların değerlendirilmesi amacıyla yapılmıştır. Bu kapsamda, bu bildiride, yakın geçmişte yapılan ve farklı sulama programlarının lavantanın ot ve uçucu yağ verimi ile uçucu yağ kalitesi üzerindeki etkisini ortaya koyan bazı çalışmaların bir analizi sunulmuştur. Sonuç olarak, kurak bölgelerde sulama işlemi lavantanın ürün verimini önemli ölçüde artırmaktadır. Dolayısıyla su kıtlığı olan bölgelerde lavanta tarımı için de yüksek sulama suyu üretkenliği sağlayan sulama programlarının geliştirilmesine ihtiyaç duyulmaktadır.

A REVIEW ON THE EFFECTS OF IRRIGATION ON LAVENDER *(l. angustifolia mill.)* YIELD AND OIL QUALITY

ABSTRACT

Their inclusion in agricultural culture has played a very important role in the survival of medicinal and aromatic plants around the world. The majority of medicinal and aromatic plants are drought-tolerant and are grown both rain-fed and irrigated. Especially in arid regions, the cultivation of these plants is preferred for rain-fed production. Irrigation is the most effective measure to reduce water stress and increase crop yields in arid areas. Therefore, irrigation is inevitable for medicinal and aromatic plants as well. Lavender, a medicinal and aromatic plant, is drought-tolerant and is cultivated for its essential oil. This study was conducted to evaluate some research on irrigation in lavender. Within this scope, this paper presents an analysis of recent studies that have demonstrated the effect of different irrigation practices on the herb and essential oil yield and essential oil quality of lavender. Consequently, irrigation significantly increases lavender yield in arid regions. Therefore, there is a need to develop irrigation schedules that provide high irrigation water productivity for lavender cultivation in regions experiencing water scarcity.

Keywords: Lavender; Irrigation Management; Essential Oil Yield; Oil Quality

FARKLI TOPRAK SERİLERİNDE AGREGAT STABİLİTESİ VE ORGANİK MADDE İÇERİĞİ ARASINDAKİ İLİŞKİLER

Dr. Mert Acar

Çukurova Üniversitesi, Ziraat Fakültesi

Email: macar@cu.edu.tr

ORCID: 0000-0002-9971-4470

ÖZET

Agregat stabilitesi ve organik madde, tarımsal üretkenlik ve ekosistem sürdürülebilirliği açısından önemli göstergelerdir. Agregat stabilitesi, erozyona karşı dayanıklılığın ve yapısal bütünlüğün bir göstergesi olup, organik madde ile yakından oldukça ilişkilidir. Agregat oluşumunda ve stabilitesinde organik maddenin bağlayıcı/birleştirici etkisi bulunmakla birlikte organik maddenin korunmasında da mevcut agregatlar önemli bir rol oynamaktadır. Bu bakımdan agregat stabilitesi ile organik madde arasındaki bu ilişki, iki yönlüdür.

Bu çalışmada, farklı arazi kullanımlarına ve karakteristik özelliklere sahip toprak serilerinde (Arık, Balcalı, Baraj, Hurma, Kabaktepe, Karaburun, Kızıltapır, Menzilat ve Mutlu) agregat stabilitesi (AS) ve toprak organik madde (SOM) içeriklerindeki değişimler ile aralarındaki ilişkiler analiz edilmiştir. Bu amaçla, 25 Haziran 2025 tarihinde Çukurova Üniversitesi Kampüsü içerisinde, ilgili serilere ait profillerde veya bu profillere en yakın uygun alanlarda toprak örneklemeleri yapılmıştır. Alınan toprak örneklerinde AS ve OM analiz edilmiştir.

Sonuçlar, toprak serileri arasında hem AS hem de SOM açısından önemli farklılıklar olduğunu ve aralarındaki ilişkinin istatistiksel olarak önemli olduğunu ($p<0.01$) göstermiştir. En yüksek AS değerleri Baraj (%72,6) ve Kızıltapır (%71,2) serilerinde gözlenirken, en düşük değer Arık serisinde (%22,3) belirlenmiştir. SOM içerikleri açısından ise Kızıltapır serisi (%7,83) belirgin şekilde öne çıkarken, en düşük SOM Kabaktepe serisinde (%1,49) belirlenmiştir. Genel olarak, yüksek SOM içeriği olan serilerde AS değerleri de daha yüksek bulunmuş, bu durum organik maddenin agregat oluşumunda ve stabilitesinde kritik rol oynadığını ortaya koymuştur. Ayrıca, en yüksek AS ve SOM değerleri bahçe tarımı yapılan veya orman örtüsü altındaki serilerde belirlenirken, işlemeli tarımın uygulandığı serilerde daha düşük değerler tespit edilmiştir. Bu bulgular, toprak yönetiminde organik madde artırıcı uygulamaların önemini vurgulamaktadır. Ayrıca, düşük SOM ve AS değerlerine sahip serilerin sürdürülebilir kullanım için özel yönetim stratejilerine ihtiyaç duyduğu sonucuna varılmıştır.

Anahtar Kelimeler: Toprak serisi, Agregat, Organik Madde, Sürdürülebilirlik

RELATIONSHIPS BETWEEN AGGREGATE STABILITY AND ORGANIC MATTER CONTENT IN DIFFERENT SOIL SERIES

ABSTRACT

Aggregate stability and soil organic matter are key indicators of agricultural productivity and ecosystem sustainability. Aggregate stability serves as an indicator of resistance to erosion and structural integrity, and it is strongly associated with organic matter. Soil organic matter exerts a binding and aggregating effect in aggregate formation and stability, existing aggregates also play an important role in the protection of organic matter. Therefore, the relationship between aggregate stability and organic matter is bidirectional.

In this study, variations in aggregate stability (AS) and soil organic matter (SOM) content, as well as their interrelationship, were analyzed across soil series with different land uses and distinct characteristics (Arık, Balcalı, Baraj, Hurma, Kabaktepe, Karaburun, Kızıltapır, Menzilat, and Mutlu). For this purpose, on June 25, 2025, soil samples were collected within the Çukurova University Campus from the profiles of the respective soil series or from the nearest appropriate locations to these profiles. The collected soil samples were analyzed for AS and SOM.

The results revealed significant differences among the soil series in terms of both AS and SOM, and their relationship was found to be statistically significant ($p < 0.01$). The highest AS values were observed in Baraj (72.6%) and Kızıltapır (71.2%) series, whereas the lowest value was recorded in the Arık series (22.3%). Kızıltapır series was particularly notable for its high SOM content (7.83%), while the lowest SOM was found in the Kabaktepe series (1.49%). Overall, soil series with higher SOM content showed higher AS values, indicating the critical role of organic matter in aggregate formation and stability. Moreover, the highest AS and SOM values were observed in soil series under horticulture or forest cover, whereas lower values were recorded in series subjected to conventional tillage. These findings highlight the importance of organic matter-enhancing practices in soil management. Furthermore, soil series with low SOM and AS values require specific management strategies to ensure sustainable use.

Keywords: Soil Series, Aggregate, Organic Matter, Sustainability

YAPAY ZEKÂ TABANLI YAKLAŞIMLAR İLE CANLI HAYVAN SAYILARININ BÖLGESEL ANALİZİ VE ÖNGÖRÜLMESİ

Dr. Şahin AYDIN

Işık Üniversitesi, İktisadi, İdari ve Sosyal Bilimler Fakültesi

Email: sahin.aydin@isikun.edu.tr

ORCID: 0000-0001-7355-5339

ÖZET

Hayvancılık, Türkiye tarım ekonomisinin temel taşlarından biri olup gıda güvenliği, kırsal kalkınma ve ulusal ekonomi açısından kritik bir rol oynamaktadır. Talep yapısındaki değişimler, üretim pratiklerindeki dönüşümler ve iklim kaynaklı belirsizlikler karşısında, canlı hayvan sayılarının güvenilir şekilde öngörülmesi her zamankinden daha önemli hale gelmiştir. Ancak geleneksel tahmin yöntemleri, hayvancılığın bölgesel farklılıklarını ve doğrusal olmayan dinamiklerini yakalamada çoğu zaman yetersiz kalmaktadır. Bu çalışmada, Türkiye'de canlı hayvan sayılarının bölgesel analizi ve geleceğe yönelik projeksiyonlarının oluşturulmasında yapay zekâ tabanlı yaklaşımların potansiyeli araştırılmaktadır.

Çalışmada kullanılan veri seti, resmi istatistiklerden elde edilen ve uzun yılları kapsayan bölgesel canlı hayvan sayılarından oluşmaktadır. Öncelikle Exponential Smoothing ve ARIMA gibi klasik zaman serisi modelleri temel senaryo olarak uygulanmış, ardından elde edilen sonuçlar yapay zekâ tabanlı yöntemlerle karşılaştırılmıştır. Random Forest algoritması ile doğrusal olmayan ilişkilerin yakalanması, LSTM (Long Short-Term Memory) modeli ile de zaman serilerindeki uzun dönem bağımlılıkların öğrenilmesi hedeflenmiştir. Tahmin performansı RMSE ve MAPE hata metrikleriyle değerlendirilmiştir.

Bulgular, Türkiye'de canlı hayvan sayılarının bölgeler arasında belirgin farklılıklar gösterdiğini ortaya koymaktadır. Batı bölgelerinde sürekli artış eğilimleri gözlemlenirken, bazı bölgelerde durağanlık öne çıkmıştır. Yapay zekâ tabanlı modeller, kısa, orta ve uzun vadeli öngörülerde geleneksel yöntemlere kıyasla daha yüksek doğruluk sağlamıştır. Çalışma, yapay zekânın öngörü doğruluğunu artırarak sürdürülebilir hayvancılık yönetimine ve kırsal kalkınmaya yönelik kanıta dayalı politika geliştirme süreçlerine katkı sağlayabileceğini göstermektedir.

AI-BASED APPROACHES FOR REGIONAL ANALYSIS AND FORECASTING OF LIVESTOCK NUMBERS

ABSTRACT

Livestock production constitutes one of the essential pillars of Türkiye's agricultural sector, with significant contributions to food security, rural livelihoods, and the national economy. Reliable forecasting of livestock numbers is increasingly important in the face of rapid changes in demand, production practices, and climate-related uncertainties. Despite the importance of this field, conventional forecasting approaches often fail to capture the nonlinear dynamics and regional disparities inherent in livestock production. This study therefore aims to explore the potential of artificial intelligence (AI)-based methods for the regional analysis and forecasting of livestock numbers in Türkiye.

The dataset used in this study consists of annual livestock numbers collected from official statistics with a regional breakdown over a multi-decade horizon. Initially, classical time series models such as Exponential Smoothing and ARIMA were employed as baseline forecasting techniques. These models were then compared with AI-based approaches, including Random Forest and Long Short-Term Memory (LSTM) networks, which are well suited to capture nonlinear and temporal dependencies. Forecasting accuracy was evaluated through standard error metrics, including Root Mean Square Error (RMSE) and Mean Absolute Percentage Error (MAPE).

The empirical findings reveal pronounced regional disparities in livestock development. While some regions, particularly in western Türkiye, exhibit sustained growth in livestock numbers, others remain relatively stagnant. AI-based models consistently outperformed traditional methods by providing more accurate short-, medium-, and long-term projections. The results highlight the capacity of AI to serve as a decision-support tool for policymakers and producers by offering reliable projections under uncertainty. Ultimately, this study contributes to the literature by demonstrating how AI-based forecasting can strengthen evidence-based strategies for sustainable livestock management and rural development.

DETECTION OF NATURAL RADIOACTIVE ISOTOPES IN CHESTNUTS AND RADIOLOGICAL RISK ASSESSMENT FOR HUMAN HEALTH

Doç. Dr. Serdar Dizman

Recep Tayyip Erdogan University, Faculty of Art and Sciences, Department of Physics

Email: serdar.dizman@erdogan.edu.tr

ORCID: 0000-0002-6511-9526

ABSTRACT

Chestnut (Castanea sativa) is an important food source both in our country and worldwide, with its high carbohydrate content, rich mineral composition, and energy-providing properties, making it valuable in human nutrition. The significance of foods lies not only in their nutritional properties but also in their safety, which is critical for public health. Due to environmental factors, nuclear accidents, and the presence of natural radioisotopes, determining radioactivity levels in foods is essential for food safety. Therefore, the determination of radioactivity in chestnuts is important for both protecting consumer health and ensuring the sustainability of food safety. In this study, the background levels of some natural radioisotopes (238U, 232Th and 40K) in some chestnut samples were determined before the operation of the nuclear power plant to be established in Sinop province, and the determined levels were compared with the limit values recommended by international organizations. 238U, 232Th and 40K concentrations in the collected chestnut samples were measured using a High-Purity Germanium detector (HPGe). It was observed that the activity values of 238U were between 1.03 Bq/kg and 3.26 Bq/kg; the activity values of 232Th were between 0.67 Bq/kg and 4.72 Bq/kg; the activity values of 40K were between 25.64 Bq/kg and 67.98 Bq/kg in the chestnut samples. To evaluate the radiological hazards arising from natural radionuclides in the chestnut samples examined, the daily radioactive intake (Dint), the annual effective dose equivalent (AEDE) and lifetime cancer risk (ELCR) values were calculated and compared with world average values. In conclusion, this study demonstrated that the consumption of the chestnut samples examined does not pose a radiological risk to human health.

ÖZET

Aronya *(Aronia melanocarpa),* son yıllarda artan besin değeri ve sağlık üzerindeki olumlu etkileri nedeniyle önemli bir meyve türü haline gelmiştir. Doğu Karadeniz Bölgesinde özellikle Rize ili, aronya yetiştiriciliği için uygun iklim ve ekolojik koşullara sahiptir. Yoğun olarak kullanılan kimyasal gübreler bitki verimini artırmakla birlikte, bilinçsiz ve aşırı uygulamaları insan sağlığı ve çevre üzerinde olumsuz etkiler yaratabilmektedir. Bu nedenle, bitki gelişimini destekleyen mikrobiyal gübrelerin kullanımı çevre dostu tarım uygulamaları açısından kritik öneme sahiptir. Ayrıca, çay lifi gibi tarımsal atıkların değerlendirilmesi, çevresel kirliliğin azaltılmasına katkı sağlarken sürdürülebilir tarım uygulamalarını desteklemektedir.

Bu çalışma, 2024 yılında Recep Tayyip Erdoğan Üniversitesi bünyesindeki seralarda, tesadüf parselleri deneme desenine göre 3 yaşındaki Aronia (Aronia melanocarpa) Viking çeşidi üzerinde yürütülmüştür. Çalışma, yalnızca toprak içeren kontrol grubu (T), sadece çay atığı içeren ortam (Ç), %50 toprak + %50 çay atığı karışımı (T+Ç), toprak ortamına uygulanan mikrobiyal gübre 1 (MG1: Ss-Super Root), ve mikrobiyal gübre 2 (MG2: Biogreen Fabio) olacak şekilde beş farklı uygulamadan oluşmaktadır. Mikrobiyal gübrelerin uygulanması on gün aralıklarla tekrarlanmıştır.

Meyve verimi (g) ve meyve eni (mm) MG2, meyve boyu (mm) MG1, klorofil içeriği (SPAD) T, pH değeri Ç, titre edilebilir asit T+Ç, suda çözünür kuru madde içeriği (%) MG1, toplam fenolik madde (mg GAE/mL) T ve antioksidan aktivitesi (mg/mL) T+Ç uygulamalarında yüksek olarak belirlenmiştir.

Toprak ortamına mikrobiyal gübrenin düzenli olarak uygulanması ve toprak + çay atığı karışımlarının (T+Ç) aronya yetiştiriciliğinde kullanımı, verim ve kalite açısından artış sağlamıştır. Özellikle Doğu Karadeniz Bölgesi'nde, toprak ve çay atığı karışımında yetiştirilen aronya bitkisine düzenli mikrobiyal gübre uygulaması, verim ve kaliteyi artırıcı bir etki gösterebileceği sonucuna ulaşılmıştır.

Anahtar Kelimeler: Aronya, Çay atığı, Mikrobiyal gübre, Küresel ısınma

EFFECTS OF MICROBIAL FERTILIZER AND TEA WASTE APPLICATIONS ON YIELD AND QUALITY IN ARONIA (*Aronia melanocarpa)* CULTIVATION

ABSTRACT

Aronia (*Aronia melanocarpa)* has become an important fruit species in recent years due to its increased nutritional value and positive health effects. Rize province, in particular, in the Eastern Black Sea Region, has the ideal climatic and ecological conditions for aronia cultivation. While intensive use of chemical fertilizers increases plant yields, their indiscriminate and excessive application can have negative effects on human health and the environment. Therefore, the use of microbial fertilizers that support plant growth is critical for environmentally friendly agricultural practices. Furthermore, the utilization of agricultural wastes such as tea fiber contributes to the reduction of environmental pollution and supports sustainable agricultural practices.

This study was conducted in greenhouses at Recep Tayyip Erdoğan University in 2024 using a randomized plot design on 3 year old Aronia (Aronia melanocarpa) Viking. The study consisted of five different treatments: soil-only control (T), tea waste-only medium (C), a 50% soil + 50% tea waste mixture (T+C), microbial fertilizer 1 (MG1: Ss-Super Root), and microbial fertilizer 2 (MG2: Biogreen Fabio) applied to the soil medium. Applications of microbial fertilizers were repeated at ten-day intervals.

Fruit yield (g) and fruit width (mm) were found to be higher in MG2, fruit length (mm) in MG1, chlorophyll content (SPAD) in T, pH value in Ç, titratable acidity in T+Ç, water-soluble solids content (%) in MG1, total phenolic content (mg GAE/mL) in T, and antioxidant activity (mg/mL) in T+Ç treatments.

Regular application of microbial fertilizer to the soil and the use of soil and tea waste mixtures (T+Ç) in aronia cultivation resulted in increased yield and quality. It was concluded that regular application of microbial fertilizer to aronia plants grown in soil and tea waste mixtures, particularly in the Eastern Black Sea Region, could have an increasing effect on yield and quality.

ÖZET

Doğu Karadeniz Bölgesi'nde tarımsal üretim açısından stratejik bir öneme sahip olan çay *(Camellia sinensis L.*), bölge üreticileri için temel bir geçim kaynağı olmasının yanı sıra, sanayi sektörü bakımından da kritik bir değer taşımaktadır. Çay işleme süreçleri sonucunda ortaya çıkan atık çay liflerinin odun kömürü üretiminde kullanılmasıyla, piroliz yöntemi aracılığıyla elde edilen önemli yan ürünlerden biri ise odun sirkesidir.

Bu çalışmada amaç, yaş çay üretiminde sentetik gübre kullanımının azaltılmasına katkı sağlayabilecek alternatif bir girdi olarak çay odun sirkesinin çay fidanı gelişiminde en uygun konsantrasyonu belirlemektir. Bu çalışma, 2025 yılında Recep Tayyip Erdoğan Üniversitesi bünyesindeki serada tesadüf parselleri deneme desenine göre üç tekerrürlü olarak yürütülmüştür. Uygulamalar, saksı ortamında (3:1 oranında torf: vermikülit) iki yaşındaki Zihni Derin çeşidi çay fidanlarına 10 gün aralıklarla uygulanarak gerçekleştirilmiştir. Çalışmada kontrol 1 (K1, uygulama yapılmamış), kontrol 2 (K2, ticari odun sirkesi) ve beş farklı çay odunu sirkesi dozu (1/500, 1/1000, 1/1500, 1/2000 ve 1/2500) karşılaştırma yapılmıştır.

Yapılan uygulamalar sonucunda, bitkilerin morfolojik ve fizyolojik özellikleri üzerinde belirgin farklılıklar gözlemlenmiştir. Özellikle sürgün gelişimi açısından, en yüksek sürgün boyu (22,1 cm) ve sürgün çapı (3,3 cm) 1/500 dozunda, yaprak sayısı (15,3 adet) ve yan sürgün sayısı (3,3 adet) 1/1000 dozunda gerçekleştirilen uygulamada belirlenmiştir. Klorofil içeriği 1/2500 dozunda (33,8 SPAD), yaprak alanı ise K2 uygulamasında (14,2 cm^2) ile en yüksek seviyede ölçülmüştür.

Aşırı sentetik gübre kullanımının yol açtığı toprak kirliliği ve biyolojik aktivite kayıplarının azaltılması ile küresel ısınma üzerindeki olumsuz etkilerin hafifletilmesinde, 1/1000 oranında seyreltilmiş odun sirkesi uygulamasının diğer dozlara kıyasla çayda hasat edilecek sürgün miktarını artırmada daha etkili olabileceği sonucuna varılmıştır.

EFFECTS OF TEA VINEGAR APPLICATIONS ON THE GROWTH OF TEA SEEDLINGS (*Camellia sinensis L.)*

ABSTRACT

Tea (*Camellia sinensis L.),* which holds strategic importance for agricultural production in the Eastern Black Sea Region, is not only a primary source of income for regional producers but also holds critical industrial value. One of the important byproducts of pyrolysis, which utilizes waste tea fibers from tea processing to produce charcoal, is wood vinegar.

The aim of this study was to determine the optimum concentration of tea wood vinegar on tea seedling development as an alternative input that could contribute to reducing the use of synthetic fertilizers in fresh tea production. This study was conducted in the greenhouse of Recep Tayyip Erdoğan University in 2025 using a randomized plot design with three replications. Applications were made at 10-day intervals to two-year-old tea seedlings of the Zihni Derin variety in potted medium (peat:vermiculite ratio of 3:1). Control 1 (K1, untreated), control 2 (K2, commercial wood vinegar), and five different tea wood vinegar doses (1/500, 1/1000, 1/1500, 1/2000, and 1/2500) were compared.

Significant differences were observed in the morphological and physiological characteristics of the plants as a result of the treatments. Specifically, in terms of shoot development, the highest shoot length (22.1 cm) and shoot diameter (3.3 cm) were observed at the 1/500 dose, while the highest leaf count (15.3) and lateral shoot count (3.3) were observed at the 1/1000 dose. Chlorophyll content (33.8 SPAD) was measured at the 1/2500 dose, and leaf area (14.2 cm^2) was measured at the K2 treatment.

It was concluded that the application of 1/1000 diluted wood vinegar may be more effective in increasing the amount of shoots to be harvested in tea compared to other doses in mitigating the negative effects on global warming by reducing soil pollution and biological activity losses caused by excessive use of synthetic fertilizers.

ÖZET

Zeytin fidan tırtılı, Palpita unionalis Hübner (Lepidoptera: Pyralidae), birçok bölgede zeytin üretimini tehdit eden önemli bir zararlıdır. Bu tür, larvalarının yaprakları örerek ve tüketerek beslenmesi sonucunda önemli yaprak dökümüne neden olmakta ve meyve kalitesini düşürerek zeytin verimi üzerinde olumsuz etki yapmaktadır. Özellikle Türkiye gibi Akdeniz ülkelerinde zeytinin ekonomik önemi göz önünde bulundurulduğunda, P. unionalis'in neden olduğu bulaşmalar sürdürülebilir zeytin üretimi için ciddi bir tehdit oluşturmaktadır. Bu çalışmada, 2024 yılında Akhisar ilçesindeki üç farklı lokasyonda (Yenice, Kadıdağı ve Hasköy) P. unionalis'in mevsimsel popülasyon dinamikleri belirlenmiştir. Ergin popülasyonları, her bahçeye üç adet yerleştirilen feromon tuzakları ile izlenmiş ve Haziran–Kasım ayları arasında haftalık kontroller yapılmıştır. İlk ergin bireyler 14 Haziran'da Yenice ve Hasköy'de, 17 Haziran'da ise Kadıdağı'nda yakalanmıştır. Zararlının popülasyonları Hasköy'de iki kez tepe noktası oluşturmuş olup sırasıyla 23 Haziran'da 11 adet ergin/tuzak ve 24 Ağustos'ta 8 adet ergin/tuzak tespit edilmiştir. Yenice lokasyonunda da benzer tarihlerde iki kez popülasyonlar tepe noktasına ulaşmış ve her iki tarihte de ortalama 6 adet ergin tuzaklarda yakalanmıştır. Kadıdağı'nda ise 25 Haziran (10 adet ergin/tuzak) ve 18 Ağustos (9 adet ergin/tuzak) tarihlerinde zararlının popülasyonları tepe noktasına ulaşmıştır. Popülasyonların tepe noktalarına ulaşmasının ardından tüm bahçelerde ergin yoğunluğunda kademeli bir azalma gözlenmiştir. Son ergin bireyler 26 Ekim'de zeytin bahçelerinde kaydedilmiştir. Elde edilen sonuçlar, P. unionalis'in mevsimsel dağılımı ve uçuş dönemleri hakkında bilgiler sunmakta ve zararlı ile mücadelede uygun zamanlamanın belirlenmesi için düzenli popülasyon takibin önemini vurgulamaktadır. Bu gözlemler, P. unionalis'in popülasyon dinamiklerinin daha iyi anlaşılmasına katkıda bulunmakta ve bölgede zararlı yönetimi yaklaşımlarının geliştirilmesine yardımcı olabilecek veriler sağlamaktadır.

SEASONAL POPULATION DYNAMICS OF *Palpita unionalis hubner* (LEPIDOPTERA: PYRALIDAE) IN OLIVE ORCHARDS OF AKHISAR DISTRICT (MANISA, TURKIYE)

ABSTRACT

The olive leaf moth, Palpita unionalis Hübner (Lepidoptera: Pyralidae), is a significant pest that threatens olive production in many regions. This species has a harmful impact on olive crop yields, causing substantial defoliation and reducing fruit quality through larval feeding habits that involve webbing and consuming leaves. Given the economic importance of olives, particularly in Mediterranean countries such as Türkiye, infestations by P. unionalis pose a serious challenge to sustainable olive production. This study investigated the seasonal population dynamics of P. unionalis in three different locations (Yenice, Kadıdağı, and Hasköy) in the Akhisar district during 2024. Adult populations were monitored using pheromone traps, with three traps per orchard, and weekly inspections conducted between June and November. The first adult captures occurred on 14 June in Yenice and Hasköy, and on 17 June in Kadıdağı. The pest populations in Hasköy exhibited two distinct peaks, with 11 adults per trap recorded on 23 June and 8 adults per trap on 24 August. Similarly, in the Yenice location, population peaks occurred twice around the same periods, with an average of 6 adults per trap detected on both dates. In Kadıdağı, the population reached its peaks on 25 June (10 adults per trap) and 18 August (9 adults per trap). Following these peaks a gradual decline in adult population density was observed across all orchards. The last occurrence of adults was recorded on 26 October in olive orchards. The results provide valuable insights into the temporal distribution and activity patterns of P. unionalis, emphasizing the importance of regular monitoring for the optimal timing of pest management practices. These observations contribute to a better understanding of the population dynamics of P. unionalis and may assist in refining pest management approaches in the region.

ÖZET

Mavi-göğüslü bıldırcın (Synoicus chinensis), küçük yapısı ve hızlı üreme döngüsü sayesinde yumurta özelliklerinin genetik analizi için uygun bir modeldir. Yumurta ağırlığı, uzunluğu, genişliği ve bu ölçümlere dayalı diğer özellikler; hem embriyo gelişimi hem de genetik ıslah programlarının başarısı açısından kritik öneme sahiptir. Bu çalışmada, mavi-göğüslü bıldırcınlarda ölçülen ve türetilmiş yumurta özelliklerine ait kalıtım dereceleri ile ortak çevre etkilerinin belirlenmesi amaçlanmıştır. Araştırmada, 49-402 günlük yaş aralığında bulunan 104 dişi bireyden elde edilen toplam 6.602 yumurtaya ait ağırlık, uzunluk ve genişlik kayıtları kullanılmıştır. Türetilmiş özellikler olarak şekil indeksi, hacim, yüzey alanı, yoğunluk ve yüzey-hacim indeksi hesaplanmıştır. Eklemeli genetik, ortak çevresel ve hata etkilerine ilişkin varyans bileşenleri Bayesian tek değişkenli hayvan modelleriyle tahmin edilmiş; jenerasyon, kuluçka grubu, yıl, ay ve yaş sabit etkiler olarak modele dahil edilmiştir. Kalıtım derecesi (h^2) en yüksek yüzey-hacim indeksi (0,54) ve yoğunluk (0,47) için; orta düzeyde (0,23–0,26) ağırlık, genişlik, hacim ve yüzey-hacim indeksi için; en düşük ise uzunluk (0,15) ve şekil indeksi (0,08) için tahmin edilmiştir. Ortak çevre etkilerine (c^2) ait tahminler 0,23 ile 0,43 arasında değişmiş olup, en yüksek varyans payı yüzey-hacim indeksi ve yoğunlukta (0,38) gözlenmiştir. Kısmi korelasyonlar, ağırlık ile uzunluk (r=0,75), genişlik (r=0,85), hacim (r=0,93) ve yüzey alanı (r=0,93) arasında güçlü pozitif ilişkiler olduğunu, şekil indeksinin ise yüzey-hacim indeksi ile neredeyse mükemmel negatif kısmi korelasyona sahip olduğunu (r=−0,99) ortaya koymuştur; ayrıca, yoğunluk, hacim (r=−0,25) ve yüzey-hacim indeksi (r=−0,05) ile zayıf ancak anlamlı negatif kısmi korelasyonlar göstermiştir. Bu bulgular, farklı özellikler için beklenen seleksiyon etkinliği açısından önemli olup, ıslah programlarında güvenilirlik ve uygulanabilirliği artıracak şekilde daha geniş veri setleriyle desteklenmesi büyük katkı sağlayacaktır.

Anahtar Kelimeler: Mavi-Göğüslü Bıldırcın, Yumurta Özellikleri, Kalıtım Derecesi, Eklemeli Genetik Etkiler, Ortak Çevre Etkileri

ESTIMATION OF HERITABILITY AND COMMON ENVIRONMENTAL EFFECTS OF EGG TRAITS IN THE BLUE-BREASTED QUAIL *(synoicus chinensis)*

ABSTRACT

The blue-breasted quail (Synoicus chinensis), owing to its small body size and rapid reproductive cycle, represents a suitable model for the genetic analysis of egg traits. Egg weight, length, width, and other traits derived from these measurements are of critical importance for both embryonic development and the success of genetic improvement programs. This study aimed to estimate heritability and common environmental effects for measured and derived egg traits in blue-breasted quail. A total of 6,602 individual records of egg weight, length, and width were collected from 104 female quails between 49 and 402 days of age. Derived traits included shape index, volume, surface area, density, and surface-volume index. Variance components for additive genetic, common environmental, and residual effects were obtained using Bayesian univariate animal models, with generation, incubation, year, month, and age fitted as fixed effects. Heritability (h^2) estimates were highest for surface-volume index (0.54) and density (0.47), moderate (0.23–0.26) for weight, width, volume, and surface area, and lowest for length (0.15) and shape index (0.08). Estimates of common environmental effects (c^2) varied between 0.23 and 0.43, with the largest contributions observed for surface-volume index and density (0.38). Partial correlations indicated markedly strong positive relationships of weight with length (r=0.75), width (r=0.85), volume (r=0.93), and surface area (r=0.93), while shape index showed an almost perfect negative partial correlation with the surface-volume index (r=−0.99); additionally, density exhibited weak but significant negative partial correlations with volume (r=−0.25) and surface-volume index (r=−0.05). These findings are important for the expected selection efficiency of different traits and will substantially contribute to enhancing the reliability and applicability of breeding programs when supported by larger datasets.

ABSTRACT

There are 11 species in the genus Pistacia. Of these species, Pistacia vera is the only one with edible nuts and economic significance. In Kyrgyzstan, only the Pistacia vera L. species of the Pistacia genus grows naturally on an area of more than 30,000 hectares. Kyrgyzstan's rich genetic diversity provides substantial opportunities for the development of new pistachio cultivars in terms of quality, production, and resistance to pests, diseases, and drought. This study was conducted between 2021 and 2025 in a pistachio orchard near the village of Kazak uulu in the Kara-Suu district of Osh province, Kyrgyzstan, where pistachios were grown from seed without grafting. In the study, 24 trees with large fruit and high cracking rates were selected, and fruit samples were collected in 2021 and 2024 based on periodicity. The collected samples underwent pomological measurements under laboratory conditions. According to the average values of the two years, length was 15.14-18.16 mm, width 8.80-11.21 mm, thickness 7.01-10.89 mm and shell thickness 0.62-1.43 mm. Nut weight ranged between 0.52-0.92 g, while kernel weight ranged between 0.26-0.41 g. Additionally, the splitting rate, which is a very important characteristic of pistachios, ranges from 0.00% to 28.90%, while the kernel rate varies between 35.79-50.74%. As a result of the weighted evaluation, four types of pistachios (K-U 7, K-U 8, K-U 9, K-U 10) received high scores and were determined to be promising. Further phenological measurements were made in the spring of 2025, and it was established that type K-U 9 flowered the later of the different types.

ÖZET

Bu araştırma 2024-2025 yıllar arasında Kırgızistan'ın Oş iline bağlı Özgen ilçesinde kurak ve yarı-kurak koşullarda doğal olarak yetişen bazı alıç türlerinde verimli ve iri meyveli tipleri seçmek amacıyla gerçekleştirilmiştir. Yürütülen bu çalışmada 500 civarında ağaç gözden geçirilmiştir ve onların içerisinden 5'i sarı 8'i ise kırmızı renkli meyveye sahip toplamda 13 alıç tipinden meyve örnekleri toplanmıştır. Alınan meyve örnekleri laboratuvara getirilerek ölçümler yapılmıştır. Çalışmada meyve ve çekirdek ağırlığı (g), meyve eni ve meyve boyu (mm), 100 dane meyve ağırlığı, meyve et oranı (%), meyve şekil indeksi, sap uzunluğu (mm), sap kalınlığı (mm), çekirdek sayısı (adet), meyvenin dış ve iç renk özellikleri (L*, a*, b*) incelenmiştir. Ayrıca, bu tiplerde tomurcuk kabarma ve tomurcuk patlama tarihi, ilk çiçeklenme gibi fenolojik özellikler de incelenmiştir. Sonuç olarak tiplerinin meyve ağırlığı 0.69-5.61 g, meyve boyu 10.23-23.88 mm, meyve eni 10.92- 21.49 mm, çekirdek sayısı 1-2.5 adet, çekirdek ağırlığı 0.15-0.97 g, 100 dane meyve ağırlığı 56-556 g, meyve et oranı %63.76-88.44, meyve şekil indeksi 0.94-1.12 arasında değişim göstermiştir. Sap uzunluğu 9.34-16.38 mm, sap kalınlığı 0.44-0.69 mm, dış meyve rengi L, a, b değerleri sırasıyla 13.22-59.62, 15.21-32.55, 5.09-40.88, iç meyve rengi L, a, b değerleri sırasıyla 15.88-44.06, 3.87-21.51, 2.43-26.12 arasında değişim gösterdiği tespit edilmiştir. Meyve özellikleri bakımından Tip-13 diğer tiplere kıyasla daha üstün özelliklere sahip olduğu belirlenmiştir. Özgen iklim şartlarında sarı meyve rengine sahip alıçların kırmızı meyvelilerden yaklaşık 10 gün geç uyandığı tespit edilmiştir. Sonuçlardaki geniş varyasyonun sebebi meyve örneklerinin farklı alıç türlerinden toplanmasından kaynaklı olduğu düşünülmektedir ve bu alanın daha detaylı araştırmaların yapılması önerilmektedir.

SOME FRUIT CHARACTERISTICS OF NATURALLY GROWN HAWTHORNS (*crataegus spp.)* IN UZGEN DISTRICT, OSH REGION, KYRGYZSTAN.

Mederbek Zhaanbaev

Aibiike Borubaeva

ABSTRACT

This research was conducted between 2024 and 2025 in the Uzgen District of Osh Region, Kyrgyzstan, under arid and semi-arid conditions, with the aim of selecting high-yielding and large-fruited types among naturally growing hawthorn (Crataegus spp.) species. Approximately 500 trees were surveyed during the study, and a total of 13 hawthorn types were selected, with 5 having yellow and 8 having red fruit color, from which fruit samples were collected. The collected fruit samples were brought to the laboratory for measurements. The characteristics examined in this study included fruit weight and seed weight (g), fruit width and fruit length (mm), 100-fruit weight (g), fruit flesh ratio (%), fruit shape index, pedicel length (mm), pedicel thickness (mm), number of seeds (count), and the external and internal color characteristics (L^*, a^*, b^*) of the fruit. Furthermore, phenological characteristics such as bud swell, bud burst dates, and the date of first flowering were also investigated for these types. The results showed that fruit weight ranged from 0.69 to 5.61 g, fruit length from 10.23 to 23.88 mm, fruit width from 10.92 to 21.49 mm, seed count from 1 to 2.5, seed weight from 0.15 to 0.97 g, 100-fruit weight from 56 to 556 g, fruit flesh ratio from 63.76% to 88.44%, and fruit shape index from 0.94 to 1.12. Pedicel length varied between 9.34 and 16.38 mm, pedicel thickness between 0.44 and 0.69 mm. The external fruit color L, a, b values ranged from 13.22–59.62, 15.21–32.55, and 5.09–40.88, respectively, while the internal fruit color L, a, b values ranged from 15.88–44.06, 3.87–21.51, and 2.43–26.12, respectively. In terms of fruit characteristics, Type-13 was identified as having superior traits compared to the other types. It was determined that yellow-fruited hawthorns in the climate conditions of Uzgen wake up approximately 10 days later than the red-fruited ones. The wide variation observed in the results is thought to be due to the fruit samples being collected from different Crataegus species, and more detailed research in this area is recommended.

ABSTRACT

Lentil is an essential legume crop in the Mediterranean region, valued for its nutritional benefits and role in sustainable agriculture. However, climate change, particularly increasing drought and heat stress, poses significant challenges to its productivity. This study aimed to assess genetic variation for key agronomic traits in a Mediterranean lentil collection and identify promising genotypes for breeding climate-resilient cultivars. A total of 120 accessions—comprising improved varieties, landraces, local cultivars, and advanced breeding lines—were evaluated under conventional and no-till tillage systems. Agronomic traits including days to 50% flowering, grain yield, and 100-seed weight were recorded. Significant genetic variation was observed across accessions. High heritability estimates were obtained for flowering time (89.76%) and 100-seed weight (85.49%) under conventional tillage, and for 100-seed weight (73.61%) and grain yield (67.36%) under no-till. Several genotypes showed superior performance across systems, representing valuable material for breeding high-yielding, climate-adapted lentil cultivars for Mediterranean environments.

ABSTRACT

Lentil is a nutritionally-rich staple crop that provides high-quality protein (20–35 g/100 g), slowly digestible carbohydrates, and essential micronutrients. It is naturally low in fat and rich in lysine, with moderate levels of methionine and cysteine, making it a valuable protein source in plant-based diets. Additionally, lentil contributes to sustainable agriculture through its capacity to fix atmospheric nitrogen in symbiosis with rhizobia, reducing dependence on synthetic nitrogen fertilizers.

Despite its nutritional and agro-ecological benefits, lentil production remains limited by several challenges. In many lentil-producing countries, the lack of varieties suitable for mechanical harvesting increases labor costs and reduces profitability. Lodging, a major constraint to mechanization, is particularly problematic. Breeding for lodging resistance and other traits that facilitate mechanical harvesting is essential for improving productivity and reducing production costs.

In this study, 50 lentil genotypes were evaluated across diverse Moroccan environments for lodging resistance and agro-morphological traits. Significant genotypic variation was observed, and high heritability was recorded for lodging resistance (70%), indicating strong potential for genetic improvement. Several promising genotypes suitable for mechanical harvesting were identified, offering valuable options to enhance lentil production and profitability in systems currently dependent on manual harvesting.

Keywords: Lentil, lodging resistance, mechanical harvesting, genetic variability.

CONNECTING ADVANCED MATHEMATICAL APPLICATIONS FOR TRANSFORMING CONTEMPORARY AGRICULTURE THROUGH PRECISION, PREDICTION, AND SUSTAINABILITY

ABSTRACT

Advanced mathematical applications have become integral to modern agriculture, driving efficiency, sustainability, and data-driven decision-making. Mathematical modeling, statistical analysis, and computational simulations are used to optimize crop growth, irrigation scheduling, pest control, and nutrient management. Predictive algorithms enable accurate forecasting of weather patterns, soil moisture dynamics, and crop yield, supporting precision farming practices. Differential equations and optimization models assist in understanding plant–environment interactions and resource allocation. Furthermore, machine learning–integrated mathematical frameworks enhance disease prediction and real-time monitoring through sensor and satellite data analysis. These quantitative approaches contribute to minimizing waste, improving productivity, and ensuring environmental sustainability. The convergence of mathematics, agronomy, and technology is reshaping agriculture into a more predictive and adaptive science, ensuring food security and efficient resource utilization in the face of global challenges.

ABSTRACT

Life table construction and analysis is a fundamental demographic technique used in applied ecology to rigorously evaluate the efficacy and ecological fitness of biological control agents (BCAs). The method involves meticulously tracking the age-specific survival (lx) and age-specific fecundity (mx) of a BCA population, typically a parasitoid or predator, under controlled or semi-field conditions. From these raw data, researchers calculate key demographic parameters crucial for predicting biocontrol success: the Net Reproductive Rate (R0), which indicates the potential for population growth; the Generation Time (T); and, most importantly, the Intrinsic Rate of Increase (rm). The rm is the most robust measure of an agent's performance, summarizing its ability to increase its population size per unit of time. A higher rm suggests a more promising candidate for successful field establishment and pest suppression. This quantitative approach is invaluable for selecting the best BCA species or strain, determining optimal mass-rearing conditions, assessing potential non-target impacts, and providing solid parameters for predictive population dynamics models, ultimately serving as the scientific backbone for effective Integrated Pest Management (IPM) programs.

ABSTRACT

Biodegradable cellulose has garnered significant attention in the past several years since it has its exceptional attributes, including hydrophilicity, mechanical durability, degradability, biocompatibility, availability, and low cytotoxicity. Biodegradable cellulose (BC), a cellulose obtained from biodegradable sources, is a versatile biomaterial with considerable potential in tissue regeneration, owing to its favourable mechanical properties, enhanced hydrophilicity, crystallinity, and integrity of structure. Tissue regeneration is a multiple disciplines domain focused on the repair, augmentation, and substitution of damaged tissues. The objective is to reinstate the inherent useful characteristics of the cellular tissues by the integration of scaffolds, viable cells, and growth factors. The rising desire for efficient repairing damaged tissue has led to a notable surge in interest in tissue regeneration techniques for both flexible and stiff cellular tissues during the last two decades. Skin tissue regeneration is a critical field that facilitates the repair of skin abnormalities utilizing scaffolds. This study examines current studies designed to evaluate and investigate the possible uses of cellulose and its derived substances in tissue biological regeneration. The current paper examines the tissue regeneration technique, the therapeutic management of various skin abnormalities, and the experiences of tissue regeneration in several organ components alongside the application of biodegradable cellulose. The conclusion here focused on biodegradable cellulose-based polymer suitable for tissue regeneration and repair.

Keywords: Biodegradable cellulose, Hydrophilicity, Biocompatibility, Tissue regeneration, Polymer, Crystallinity.

NUTRITIONALLY OPTIMIZED BABY FOOD FROM INDIGENOUS INGREDIENTS: SAFETY, FUNCTIONALITY, AND ACCEPTABILITY FOR SUSTAINABLE INFANT NUTRITION

ABSTRACT

In low-income countries like Bangladesh, malnutrition remains a significant challenge for infants, as conventional foods often fail to meet their nutritional needs after six months of age. This study developed and assessed three baby food formulations (F1, F2, F3) containing indigenous raw materials- broken rice, carrot, soybean, peanuts, cowpea, and skim milk powder to confront this issue. The proximate analysis demonstrated F2 as the most nutrient-dense, with 19.92± 1.58 %protein and 9.01 ± 0.10 % fat, while F3 delivered the highest carbohydrate content 63.55 ± 1.79 % for energy. Furthermore, based on the minerals and vitamins profiles of the formulations, F2 contained elevated level of iron (4.86 ± 0.03 mg/100 g), calcium (270.26 ± 0.03 mg/100 g), and vitamin A (0.92 ± 0.02 mg/100 g) which are essential for resisting deficiencies and supporting immune and skeletal health. Additionally, the absence of heavy metal in the formulations, ensuring the safety for consumption. Moreover,functional tests indicated F2's superior water absorption (3.27 ± 0.06 g/g) and viscosity (2103.33 ± 5.77 cP), increasing feeding suitability, whereas F3 scored highest in sensory appeal (overall acceptability: 8.5/9). Microbial stability was confirmed respectively, remaining within permissible limits, while no coliforms, *Salmonella* spp., and*Listeria monocytogenes* were detected in any formulation.These findings contribute to tackling infant malnutrition in low-resource settings and support global nutrition initiatives. Overall, this approach offers a promising strategy for improving infant nutrition and reducing the burden of malnutrition in vulnerable populations.

ABSTRACT

Artificial Intelligence (AI) is rapidly transforming global economies, reshaping labor markets, and redefining national competitiveness. Nations that strategically integrate AI into Science, Technology, Engineering, and Mathematics (STEM) education systems are better positioned to foster innovation, create jobs, and achieve sustainable economic growth. In Nigeria, where unemployment and underemployment remain persistent challenges, AI adoption represents a potential pathway to economic diversification and workforce transformation. However, the country faces significant barriers, including weak STEM curricula, inadequate infrastructure, limited AI literacy, and poor industry-academia collaboration.

This study investigates the relationship between AI adoption, STEM education, and economic growth in Nigeria using an empirical approach. The objectives were to: (1) examine how AI adoption influences economic growth through STEM-driven sectors, (2) evaluate the role of STEM education in preparing Nigeria's workforce for AI-driven transformations, and (3) analyze the challenges and opportunities of integrating AI into STEM education for sustainable development. Three research questions guided the study, with statistical analysis conducted using descriptive and inferential methods to assess the relationship between variables.

Findings reveal that AI adoption significantly contributes to national productivity in agriculture, healthcare, and manufacturing, with a reported increase of up to **25% in sectoral efficiency** when combined with STEM-driven innovations. The study also finds that Nigeria's current STEM education framework remains insufficient in preparing graduates for AI-related labor markets, leading to skill mismatches and heightened unemployment. Nevertheless, opportunities exist in policy reforms, teacher retraining, digital literacy programs, and investment in research and development to strengthen the AI-STEM nexus.

The study concludes that AI adoption, when strategically aligned with STEM education, has the potential to transform Nigeria's workforce and accelerate economic growth. Recommendations include strengthening STEM curricula with AI components, fostering industry-academia partnerships, and implementing targeted government policies to support AI-driven innovation. By addressing these gaps, Nigeria can harness AI not only as a technological tool but also as an engine for sustainable national development.

LEAF STRUCTURAL AND FUNCTIONAL MODIFICATION OF *IPOMOEA CARNEA* JACQ. AN INVASIVE PLANT SPECIES, UNDER DIVERSE SALINITY GRADIENT

Saira Malik[1], Syed Mohsan Raza Shah[1], Uniza Fatima bukhari[1], Tasawar Fatima bukhari[1], Iqra

[1]Department of Botany, Division of Science and Technology, University of Education, Lahore, Pakistan

*authors e-mails: Sairamalik.dgk12@gmail.com

ABSTRACT

The role of structural and functional plasticity of *Ipomoea carnea* for invasion in diverse saline environments was investigated. The populations were collected from 30 different habitats of Pakistan. The populations were divided into 3 groups based on the extent of salinity in their natural habitat. The non-saline habitats (ECe>4 dS m^{-1}) were Kohala, Islamabad, Pahari Nala, Pir Kot, Nerian Sharif, Daska, Dhir Kot, Namal, Lower Jhelum and Majuhan. Moderately saline habitats (ECe 4-8 dS m^{-1}) were Mong Depo, Pasrur, Layyah, Mana Wala, Phularwan Roadside, Kharian Wala, Phulrwan canal, Rasool, Puran and Shah Kot. Highly saline habitats (<8 dS m^{-1}) included Gunjal, Gutwala, Skindar Pura, Choa Sadien Shah, Phid, Buchal, Kallar Kahar, Cholistan Desert, Sangla Hills and Sahian Wala. The hyper-saline population accumulated more compatible solutes like total soluble sugars, phenolics and flavonoids linked to osmoprotection. Increased sclerifcation and phloem thickness in hyper-saline and moderately saline populations. Increased density of trichomes and salt excretory glands prevented water loss and excreted toxic ions through leaf surface. In conclusion, *I. carnea* populations adopted different strategies like water conservation via water storage in parenchymatous tissues, accumulation of compatible solutes (total soluble sugars) and allelochemicals (flavonoids and phenolics) for chemical defense. All these aspects were key factors for survival and invasive success in a variety of habitat types and environmental conditions.

Keywords: Environmental heterogeneity, Invasive species, *Ipomoea carnea*, Sclerifcation, Trichomes.

MULTIPLEX PATHOGENIC BACTERIA DETECTION IN MILK WITH THE NANOPARTICLE-ASSISTED POROUS SILICON-BASED SERS MICROARRAY BIOSENSOR

ABSTRACT

The ongoing threat of milk-related pathogens poses a substantial risk to human health, necessitating the development of efficient detection methods. This study explores the creation of a SERS-based multiplex biosensor to meet the demand for simultaneous detection of multiple pathogens, thereby reducing measurement time and enhancing food safety. The biosensor utilizes an indirect immunoassay, leveraging gold nanoparticles as selective Raman reporters and a silver nanoparticle-modified porous silicon microarray (Ag-pSi) as the SERS substrate. In the initial phase, experiments focused on optimizing physical parameters and conditions, leading to the successful construction of an assay capable of detecting bacterial cells, specifically E. coli, S. aureus, and B. cereus, within the concentration range of log 1 to log 5 CFU/mL, with detection limits of 5 CFU/mL, respectively. The assay's selectivity was validated through experiments involving common interfering pathogens. Subsequently, the developed assay was applied to detect specified bacterial cells spiked in various milk qualities and presented recovery values ranging from 85% to 105%. Notably, the overall assay timing was maintained under 90 minutes. These findings underscore the efficacy of the multiplex detection approach for bacterial pathogens in diverse samples, representing a significant advancement toward the realization of a portable SERS biosensor.

POSSIBLE PERSPECTIVES OF EUROPEAN UNION POLICIES ON THE DEVELOPMENT OF THE AGRICULTURAL SECTOR

Voroneanu-Popa Rareș-Vasile

Grigore T. Popa University of Medicine and Pharmacy of Iași

Richard Constantinescu

Grigore T. Popa University of Medicine and Pharmacy of Iași

ABSTRACT

The agricultural sector represents an area of major interest for the European Union. In recent years, a series of comprehensive plans have been designed with the aim of increasing production within the agricultural sphere. Moreover, programs such as the “Green Deal–driven CAP” and the “Recalibrated CAP” establish important frameworks for the sustainable development of agriculture.

In addition, a significant number of citizens within the European Community are actively engaged in agricultural work on a daily basis. Consequently, this sector constitutes a vital pillar for ensuring the material well-being of the population.

Other strategies proposed by the European Union are grounded in key priorities such as biodiversity, the preservation of natural ecosystems, and soil health. Likewise, specific agreements and frameworks have been introduced to monitor soil quality and to manage contaminated sites in an efficient and sustainable manner.

ARTIFICIAL INTELLIGENCE FOR INDIVIDUALIZED REMEDIATION OF MISCONCEPTIONS IN BIOLOGY CONCEP

Bruno, Ibeabuchi Anwuri, Ogunbayo, Oluwatoyin Glory, Oreke, Obusor Happiness, & Ajıe, Uloma Glory.

ABSTRACT

Persistent misconceptions remain a major barrier to effective learning in biology education. Traditional teaching approaches often fail to address these misconceptions, leading to poor conceptual understanding and performance. This study investigates the role of Artificial Intelligence (AI) in individualized remediation of biology misconceptions among secondary school students. A quasi-experimental design was adopted using 120 Senior Secondary II students in Rivers State, Nigeria, divided into experimental and control groups. Data were collected using the Biology Misconception Diagnostic Test (BMDT) and analyzed with descriptive and inferential statistics. Findings revealed that AI-powered interventions significantly improved students' conceptual understanding ($p < 0.05$) compared to conventional instruction. Teachers and students also perceived AI as effective for individualized learning support. The study recommends integrating AI-based tools into biology education, enhancing teacher training in AI applications, and investing in AI infrastructure for schools.

PLANT SEEDLING IDENTIFICATION USING PRETRAINED DEEP TRANSFER LEARNING MODELS

Anandhavalli Muniasamy

Department of Informatics and Computer Systems

College of Computer Science, King Khalid University, Saudi Arabia

Email: anandhavalli.dr@gmail.com

ABSTRACT

For biodiversity conservation, it is highly important to define plant seedlings accurately. Additionally, traditional methods for the identification of plant seedlings are relatively complicated, time-consuming, and error prone. Consequently, one should address these problems and present automatic identification methodologies based on deep-learning techniques to enhance recognition precision and efficiency. This study mainly focused on the effective identification of various plan seedlings using the various CNN based transfer learning models—including SqueezeNet, EfficientNetB0, ResNet50, InceptionV3, and MobileNetV2. This study employed a systematic approach to detect and categorize plant seedlings. The dataset was initially loaded, and thereafter, preprocessing was conducted to eliminate noisy data. Data augmentation then was used to improve model accuracy. Five pretrained models were utilized to train the CNN model, taking advantage of their learning capabilities, and subsequently. The support vector machine (SVM) has been utilized to extract only the pertinent information for the subsequent classification of plant seedlings. The EfficientNetB0 CNN model achieved a very good accuracy of 99.9%.

ABSTRACT

Flood Vulnerability and its Impacts on Agricultural Systems, Livestock, and Rural Development: A Comprehensive Review Abstract Flooding poses a catastrophic threat not just to urban centers but profoundly to the backbone of many economies: the agricultural sector and rural communities. This literature review synthesizes current research on flood vulnerability, recasting its implications specifically for agriculture, animal science, and rural development. It explores how floods devastate crops, endanger livestock, and erode the livelihoods of rural populations, thereby undermining food security and sustainable development. The review highlights integrated assessment methodologies, including Geographic Information Systems (GIS) and multi-criteria decision-making, as vital tools for identifying vulnerable agricultural zones and rural systems. The findings emphasized the urgent need for adaptive, climate-resilient farming practices, robust veterinary infrastructure, and rural development policies that prioritize flood risk management to safeguard food systems and strengthen community resilience.

CHEMICAL ANALYSIS OF ATMOSPHERIC DUST AROUND THE KISHNICA AREA IN THE MUNICIPALITY OF GRACANICA

Prof. Assoc. Skender Demaku

Msc. Muhamet Kiqina

Msc. Arbnorë Aliu

Msc. Donika Sylejmani

Faculty of Natural and Mathematical Science, University of Prishtina "Hasan Prishtina"
Department of Chemistry and Biology, Prishtina -Kosovo

ABSTRACT

Kosovo is a very specific country, geographically, surrounded by all sides with the range, which is fundamentally protected, however, from The influence of the global climate, but in fact, how can this be defined when in many cases we encounter Pristina, as a city that has the primate. In the world, of the day-to-day pollution of the environment, what is it that causes all this contamination, with a weak economy, why all this contamination, we have them, they are too weak filters (or have not installed them at all), then old vehicles, forest cutting, lakes contamination, Above all, our awareness of a clean environment is lacking, almost `will be ours. Therefore, in this project, we will present our findings, based on Chemical analysis, in the cities; Prishtina, Gracanica, the cities considered as the most polluted, therefore, the impact on the health of residents and many other environmental impacts, in the areas analyzed will bring a realistic picture of environmental pollution, a perimeter of approximately 30km, including a triangle of the three cities analyzed.

SYNTHESIZING ENTREPRENEURIAL STEM EDUCATION: A REVIEW OF THEORETICAL FOUNDATIONS, PEDAGOGICAL PRACTICES, AND FUTURE DIRECTIONS

R.Thıruchelvı

Bıology Teacher, Vels Vıdhyalaya School, Indıa

Email: thiruchelvi13892gmail.com

ORCID: 0000-0001-5532-8597

ABSTRACT

This review article synthesizes current research and discourse on Entrepreneurial STEM (E-STEM) education, a burgeoning field that integrates entrepreneurial mindsets and capabilities into Science, Technology, Engineering, and Mathematics learning. Drawing from a special issue editorial that outlines the field's conceptual landscape and an empirical study investigating skill development in students, this paper examines the core tenets of E-STEM. We explore the foundational concepts of values and risk as central to the entrepreneurial dimension, arguing that E-STEM moves beyond utilitarian economics to foster broad human capabilities. The review highlights key entrepreneurial frameworks, such as the QAA guidelines and the EntreComp model, which outline skills, behaviors, and competencies like resourcefulness, problem-solving, resilience, and strategic thinking. Empirical evidence demonstrates that while short-term E-STEM interventions can significantly enhance specific sub-skills—such as emotional control, behavioral planning, and a proactive approach to problems—long-term, systemic implementation is crucial for holistic development. The article also addresses critical implementation challenges, including teacher professional development, curriculum design, and strategies for fostering inclusive participation, particularly for women in STEM. We conclude that E-STEM education represents a paradigm shift, positioning STEM not merely as disciplines of knowledge but as a vehicle for developing agile, value-driven individuals capable of navigating and innovating within a complex, risk-filled society. Recommendations for future research and practice are discussed

Keywords: Entrepreneurial STEM Education, Enterprise Capabilities, Problem-Solving, Resourcefulness, Risk Society, Values, Teacher Development, Curriculum Integration

ECOLOGICAL REHABILITATION OF THE ARAL SEA REGION: PHYTOMELIORATION AS A SUSTAINABLE TOOL FOR LAND RESTORATION

Drobchenko N.V.
Samarkand State University of Architecture and Civil Engineering named after Mirzo Ulugbek, Samarkand, Uzbekistan

Email: drobchenko.natalya@samdaqu.edu.uz

ABSTRACT

The Aral Sea region is among the most severely degraded ecological zones in Central Asia, where extensive landscape transformation, water scarcity, and soil salinization have produced profound environmental, social, and economic impacts. The dramatic shrinkage of the Aral Sea has led to the formation of vast areas of dry seabed, accelerating desertification processes, intensifying dust storms, and creating transboundary environmental challenges. These processes have directly affected agricultural productivity, human health, and biodiversity conservation. Under conditions of climate change, the development and implementation of nature-based solutions aimed at restoring degraded landscapes and supporting local livelihoods are becoming increasingly urgent.

The aim of this study is to evaluate and demonstrate the effectiveness of phytomelioration techniques based on native, climate-resilient plant species for soil stabilization, dust reduction, and ecosystem restoration in the Aral Sea region. The research focuses on developing an adaptive ecological rehabilitation model that integrates traditional land management practices with modern environmental technologies.

The methodological framework combines field observations, geobotanical assessments, remote sensing and GIS analysis, and comparative evaluation of sites with different degradation levels. These methods make it possible to track vegetation dynamics, assess soil properties, and identify the most effective species and planting schemes for sustainable restoration of degraded lands.

Expected results include an increase in vegetation cover, improvement of soil quality indicators, reduction of airborne dust emissions, and the establishment of ecological buffer zones that strengthen the region's green infrastructure. These outcomes are expected to contribute to long-term ecological stability, support sustainable agriculture, and enhance climate change adaptation. The findings can be used by policymakers, environmental organizations, and local communities to implement cost-effective and environmentally sound restoration strategies.

Keywords: Aral Sea region, phytomelioration, land degradation, ecosystem restoration, sustainable agriculture, climate adaptation.

ABSTRACT

Sleep apnea, which is one of the most common sleep disorders that can lead to undesirable health outcomes if not treated and requires PSG as a standard diagnostic test forthe diagnosis. Among the physiological parameters monitored by PSG during sleep are brain activity eye movement muscle activities heart rate and airflow. All of this makes it possible to identify apnea periods in sleep, which is a key symptom for sleep apnea diagnosis. Although PSG is acknowledged as a gold standard, there are other research interests in non-invasive diagnostic tools. One of such methods focuses on the possible role as single-signal ECG may play in sleep apnea diagnosis. One of the most important tools for measuring heart activity is ECG, giving useful information on what happens in a human being's heart. The suggested method is the segmentation of ECG signals and then features extraction from them. This means that we might even be able to find sleep apnea markers without the intense long-term PSG monitoring. Lastly, the accuracy of our model at testing phase was determined to be 86.18% that suggests it an easy-to-use and effective diagnostic tool for sleep apnea cases.

OFFSHORE BALIK YETİŞTİRİCİLİĞİ MOORİNG HALATLARININ IN-SITU BOZUNMASI: DERİNLİĞE GÖRE PLASTİK SALINIM ORANLARININ ANALİZİ

Doç. Dr. İlhan YANDI

Recep Tayyip Erdoğan Üniversitesi, Turgut Kıran Denizcilik Fakültesi

Email: ilhan.yandi@erdogan.edu.tr

ORCID: 0000-0003-1780-3654

ÖZET

Mevcut araştırmalar, su ürünleri yetiştiriciliğine özgü yüzer halatların sistematik incelenmesi ve özellikle deniz ortamında in-situ koşullar altında plastik salınım oranlarının nicel olarak belirlenmesi konusunda belirgin bir bilgi boşluğunu ortaya koymaktadır. Bu eksiklik, hidrolojik dolaşımın sınırlı olduğu ve dolayısıyla kirleticilerin kalış süresinin uzadığı kapalı veya yarı kapalı deniz sistemleri açısından özellikle önem taşımaktadır. Bu çalışmada, Batı Karadeniz'de yürütülen ve gerçek saha koşullarında polipropilen (PP) ile polietilen (PE) su ürünleri yetiştiriciliği yüzer halatlarının bozunma süreçlerini doğrudan ölçmeyi amaçlayan kapsamlı bir yıllık saha deneyi sunulmaktadır.

Yöntem kapsamında, özenle hazırlanmış halat örnekleri yüzeyden 40 metre derinliğe kadar farklı seviyelere asılmış ve dalga, akıntı ile sıcaklık, tuzluluk ve ışık şiddeti gibi değişken fiziko-kimyasal koşullara on iki ay boyunca maruz bırakılmıştır. Bu süreçte belirli aralıklarla yapılan ayrıntılı ağırlık ölçümleri ile kümülatif kütle kaybı değerlendirilmiştir. Ayrıca, su kolonundaki mevsimsel tabakalaşma değişimlerini izleyen çevresel ölçümler, bozunma oranlarının yorumlanmasına bağlamsal bir temel sağlamıştır.

Elde edilen bulgular, derinliğe bağlı belirgin bir bozunma eğilimine işaret etmektedir: Ağırlık kaybı yüzeyde en yüksek düzeyde gerçekleşmiş (PP için %1,81; PE için %1,73) ve derinlikle birlikte azalarak 30–40 metre aralığında yaklaşık %0,30'a düşmüştür. Bu eğilim, özellikle üst su kolonundaki yüksek sıcaklık, güçlü türbülans ve daha yoğun ışık penetrasyonu ile güçlü biçimde korelasyon göstermektedir. Sonuç olarak, ultraviyole (UV) radyasyonu, mekanik aşınma ve sıcaklık dalgalanmalarının sinerjik etkisinin ilk 10 metreyi yüzer halatlardan mikroplastik üretiminin temel odağı hâline getirdiği ortaya konmuş ve su ürünleri yetiştiriciliği kaynaklı plastik kirliliğinin azaltılmasına yönelik politika ve stratejiler için kritik nicel veriler sağlanmıştır.

IN-SITU DEGRADATION OF OFFSHORE AQUACULTURE MOORING ROPES: A DEPTH-WISE ANALYSIS OF PLASTIC EMISSION RATES

ABSTRACT

The current body of research exhibits a pronounced knowledge gap regarding the systematic study of aquaculture-specific mooring ropes, particularly in quantifying their plastic release rates under true in-situ marine conditions. This shortcoming is especially relevant for enclosed or semi-enclosed marine systems, which are characterized by limited hydrological circulation and, therefore, extended pollutant residence times that can amplify ecological impacts. Addressing this gap, the present study reports on a comprehensive year-long field experiment conducted in the western Black Sea to directly measure the degradation of polypropylene (PP) and polyethylene (PE) aquaculture mooring ropes under real-world operational conditions.

Our methodology involved suspending carefully prepared rope segments at multiple depths ranging from the surface to 40 meters and performing meticulous, periodic weight measurements to determine cumulative loss after 12 months of exposure to natural waves, currents, and variable physicochemical factors such as temperature, salinity, and light intensity. Complementary environmental monitoring captured seasonal changes in water column stratification, providing context for interpreting degradation rates.

The key finding reveals a clear depth-dependent pattern of rope deterioration: weight loss was greatest near the surface (1.81 % for PP and 1.73 % for PE) and declined steadily with depth, reaching a minimum of roughly 0.30 % at 30–40 meters. This trend correlates strongly with environmental parameters, particularly higher temperature, stronger turbulence, and greater light penetration in the upper water column. We conclude that the combined influence of ultraviolet radiation, mechanical abrasion, and fluctuating thermal conditions within the top ten meters creates the primary hotspot for microplastic generation from mooring ropes, offering critical, quantitative evidence to guide mitigation strategies and policy development aimed at reducing plastic pollution in aquaculture operations.

ORCID: 0000-0003-1780-3654

ÖZET

Avrupa Komisyonu'nun son raporları, Karadeniz'in Avrupa'nın kayıt altına alınmış en yüksek yüzer plastik atık yoğunluğuna sahip olduğunu tespit etmekte ve bu durum kritik bir çevre sorununa işaret etmektedir. Bu tespite ve ayrıca Türkiye Karadenizi'ndeki yüzey suları, sedimentler ve yabani deniz organizmalarında mikroplastik kirliliğini değerlendiren çok sayıda çalışmaya rağmen, mevcut araştırmalar bu yaygın kirliliğin belirli bölümlerini henüz net bir şekilde su ürünleri yetiştiriciliğinden kaynaklanan emisyonlara atfedememiştir. Bu sunum, bu nedenle, Türkiye'nin Karadeniz'deki offshore su ürünleri yetiştiricilik sektöründen kaynaklanan toplam plastik kirliliğini tespit etmek amacıyla ayrıntılı deneysel verilerimizin ölçeğini belirlemektedir. Derinliğe özgü bozunma oranlarımızı, yaklaşık 1.392 km bağlama halatı kullanan 97 açık deniz çiftliğini belgeleyen kapsamlı bir bölgesel envanter ile entegre ettik. Geliştirdiğimiz kütle dengesi modeli, bu altyapıdan gerçekçi deniz koşullarında salınan plastik atığın yıllık kütlesini hesaplamaktadır.

Yalnızca halat bozunmasından yıllık 22,1 ton plastik salındığını ve bu miktarın diğer kaynaklardan bağımsız önemli bir değer olduğunu tahmin etmekteyiz. Kirliliğin dikey dağılımına ilişkin çarpıcı bir bulgu ise şudur: Ekolojik açıdan hayati önem taşıyan 0-10 metre tabakası, plastiğin ezici çoğunluğunu (%73,2 veya 16.180 kg) içerirken, doğrudan yüzey katmanı yalnızca %2,6'lık bir paya sahiptir. Polipropilen (PP) halatlar, toplam salımın %88,5'ini (19.577 kg) oluşturarak sektördeki baskınlıklarını ve çevre üzerindeki özel etkilerini yansıtmaktadır.

Bu çalışma, bölgedeki su ürünleri yetiştiriciliği bağlama sistemlerinden kaynaklanan plastik emisyonlarına yönelik ilk kesin atfı ve hassas niceliğini sağlamakta, onları daha önce hesaba katılmamış büyük bir deniz kirliliği kaynağı olarak tespit etmektedir. Elde edilen bu bulgular, politika yapıcılar ve sektör paydaşları için, bu önemli emisyon kaynağını AB Deniz Stratejisi Çerçeve Direktifi gibi çevresel izleme programlarına ve düzenleyici çerçevelere entegre etmek, böylece doğru kirlilik bütçeleri oluşturmak ve ekosistem koruması için sürdürülebilir uygulamaların geliştirilmesine rehberlik etmek konusunda güçlü bir zorunluluk oluşturmaktadır.

FROM EXPERIMENT TO ECOSYSTEM: ESTIMATING THE MACRO-IMPACT OF PLASTIC EMISSIONS FROM BLACK SEA OFFSHORE AQUACULTURE MOORING SYSTEMS

ABSTRACT

Recent European Commission reports identify the Black Sea as holding Europe's highest recorded density of floating plastic debris, highlighting a critical environmental challenge. Notwithstanding this finding, and despite numerous studies assessing microplastic contamination in the Turkish Black Sea across surface waters, sediments, and wild marine organisms, research has yet to clearly attribute specific portions of this widespread pollution to aquaculture-derived emissions. This presentation therefore scales our detailed experimental data to quantify the total plastic pollution originating from Türkiye's Black Sea offshore aquaculture sector. We integrated our depth-specific degradation rates with a comprehensive regional inventory, documenting 97 offshore farms using approximately 1,392 km of mooring ropes. Our mass-balance model calculates the annual mass of plastic debris released from this infrastructure under real-world marine conditions.

We estimate that 22.1 metric tons of plastic are emitted annually from rope degradation alone, a substantial quantity independent of other sources. A crucial finding is the vertical distribution of this pollution: the ecologically vital 0-10 meter layer contains the overwhelming majority, 73.2% (16,180 kg), while the immediate surface holds only 2.6%. Polypropylene (PP) ropes constitute 88.5% of this release (19,577 kg), reflecting their industry dominance and particular environmental impact.

This study provides the first conclusive attribution and precise quantification of plastic emissions from aquaculture mooring systems in the region, establishing them as a major, previously unaccounted source of marine pollution. These findings create a strong imperative for policymakers and industry stakeholders to integrate this significant emission vector into environmental monitoring programs and regulatory frameworks like the EU Marine Strategy Framework Directive, thereby ensuring accurate pollution budgets and guiding the development of sustainable practices for ecosystem protection.

ORCID: 0000-0002-1446-5699

ÖZET

Paclobutrazol (PBZ), triazol grubu bir bitki büyüme düzenleyicisi olup büyümeyi geciktirici özellik göstermektedir. Ticari olarak Bonzi, Clipper, Cultar ve Parsley isimleriyle bilinmektedir. Triazol bileşikleri, gibberellinler ve oksinler üzerinde antagonistik etki göstererek GA_3 biyosentezini inhibe eder; böylece hücre uzaması ve bölünmesi azalır. Gibberellin sentezinin engellenmesi, terpenoid yolunda daha fazla öncü madde birikimine neden olur ve bu durum absisik asit (ABA) üretimini artırır. Ayrıca PBZ'nin ABA'nın normal katabolizmasını (parçalanmasını) inhibe ettiği bildirilmiştir. Stres koşullara dayanıklılığı ABA sentezini artırarak gerçekleştiriyor olabilir.

PBZ, sitokinin sentezini de teşvik eder; bu durum kloroplast farklılaşmasını ve klorofil biyosentezini artırırken klorofil bozulmasını geciktirir. Aynı zamanda etilen sentezini azaltarak senesensi (yaşlanma sürecini) yavaşlatır. Prolin içeriğini artırarak kuraklık stresine karşı koruyucu etki sağlar. PBZ uygulamaları, klorofil içeriği ve antioksidan enzim seviyelerini yükseltmekte; aktif oksijen türlerinin detoksifikasyonunu destekleyerek oksidatif stresin azaltılmasına yardımcı olmaktadır. Sterol biyosentezini inhibe eden bir triazol olarak, PBZ fungusit olarak yaygın şekilde kullanılmaktadır.

Genel olarak triazol bileşikleri, bitkilerin çeşitli abiyotik stres faktörlerine (soğuk, kuraklık, yüksek sıcaklık, su baskını, tuzluluk, hava kirleticileri ve ağır metaller) ve biyotik stres etmenlerine (fungal patojenler ve diğer hastalık etmenleri) karşı toleransını artırmaktadır.

Morfolojik ve fizyolojik etkileri; bitki boyunun ve ağırlık merkezinin azalmasına (internod uzunluğunun kısalması) neden olurken, sap çapı ile sap duvar kalınlığını artırmaktadır. Ayrıca kök uzunluğunda ve lateral kök sayısında artışa yol açmakta, kök biyokütlesini yükseltmektedir. Bu yapısal değişiklikler, sap kırılma direncini ve yatmaya karşı dayanıklılığı önemli ölçüde artırmaktadır. Ayrıca fotosentetik kapasitede (klorofil içeriğinin) artış, yaprak alanında azalma, yaprak kalınlığında artış, kardeşlenmeyi teşvik, kök-gövde oranında ve fide kuru ağırlığında artış, CO_2 asimilasyon fizyolojisinde iyileşme sayılabilir. Ek olarak toprağa uygulandığında besin alım dinamiklerinde ve rizosferdeki toprak bakteri yoğunluklarında değişikliklere yol açmaktadır.

Potansiyel olumsuz etkileri arasında; yüksek doz uygulamalarında toksik etki göstererek çimlenme oranında azalmaya neden olması, çıkış sürecinde gecikmelere yol açması ve birincil yaprakların uzamasını olumsuz yönde etkilemesi yer almaktadır.

Uygulama yöntemleri arasında tohum ön işlemesi (priming), sulama yoluyla uygulama ve yapraktan sprey şeklinde uygulama yer almaktadır. Paclobutrazol (PBZ), floemde sınırlı hareket kabiliyetine sahipken, esas olarak ksilem üzerinden taşınmaktadır. Bu nedenle, uygulama yöntemi PBZ'nin bitki üzerindeki etkilerini önemli ölçüde belirlemekte ve fizyolojik yanıtlar uygulama şekline göre farklılık gösterebilmektedir..

Uygulama dozu açısından, tohumdan uygulamalarda oldukça farklı konsantrasyonlar denenmiştir. Ancak 200 ppm'in üzerindeki dozlar toksik etki göstererek çimlenme ve gelişim üzerinde olumsuz sonuçlara yol açabilmekte, dolayısıyla verimi azaltabilmektedir. Paclobutrazol (PBZ), düşük dozlarda dahi etkili olabilen bir büyüme düzenleyicidir. Buğday için 22–100 mg L^{-1} aralığı uygun görünmektedir.

Buğday üretiminde, tohum uygulamaları ile sap kalkma veya başaklanma dönemlerinde yapraktan uygulamalar, verimin korunmasına ve artırılmasına önemli katkılar sağlamaktadır. Paclobutrazol (PBZ), yüksek dozlar kullanılmadığı sürece toksik etki göstermemekte ve ürün üzerinde kalıntı bırakmamaktadır. Bu yönüyle, uygun doz ve zamanlamayla yapılan uygulamalar, bitki gelişimini düzenleyerek agronomik performansı iyileştirmektedir.

Anahtar Kelimeler: Buğday, Paclobutrazol (PBZ), Priming

USE OF PACLOBUTRAZOL (PBZ) IN WHEAT PRODUCTION

ABSTRACT

Paclobutrazol (PBZ) is a plant growth regulator belonging to the triazole group, known for its growth-retarding properties. It is commercially available under the names Bonzi, Clipper, Cultar, and Parsley. Triazole compounds exhibit antagonistic effects on gibberellins and auxins by inhibiting GA_3 biosynthesis, thereby reducing cell elongation and division. Inhibition of gibberellin synthesis leads to the accumulation of precursor molecules in the terpenoid pathway, which in turn enhances abscisic acid (ABA) production. Additionally, PBZ has been reported to inhibit the normal catabolism of ABA, suggesting that its role in stress tolerance may be mediated through increased ABA synthesis.

PBZ also promotes cytokinin synthesis, which enhances chloroplast differentiation and chlorophyll biosynthesis while delaying chlorophyll degradation. It reduces ethylene synthesis, thereby delaying senescence. By increasing proline content, PBZ contributes to drought stress tolerance. Applications of PBZ have been shown to elevate chlorophyll content and antioxidant enzyme levels, supporting the detoxification of reactive oxygen species and mitigating oxidative stress. As a triazole that inhibits sterol biosynthesis, PBZ also exhibits fungicidal activity.

In general, triazole compounds improve plant tolerance to various abiotic stress factors (cold, drought, high temperature, flooding, salinity, air pollutants, and heavy metals) as well as biotic stress agents (fungal pathogens and other disease-causing organisms).

Morphological and physiological effects of PBZ include reduced plant height and center of gravity (due to shortened internodes), increased stem diameter and wall thickness, enhanced root length and lateral root number, and elevated root biomass. These structural changes significantly improve stem strength and lodging resistance. Additional effects include increased photosynthetic capacity (chlorophyll content), reduced leaf area, increased leaf thickness, stimulated tillering, improved root-to-shoot ratio, and higher seedling dry weight. PBZ also enhances CO_2 assimilation physiology. When applied to soil, it alters nutrient uptake dynamics and affects rhizosphere bacterial density.

Potential adverse effects include toxicity at high doses, leading to reduced germination rates, delayed emergence, and inhibited elongation of primary leaves.

Application methods include seed priming, soil drenching, and foliar spraying. PBZ exhibits limited mobility in the phloem and is primarily transported via the xylem. Therefore, the physiological responses to PBZ vary significantly depending on the method of application.

Regarding dosage, a wide range of concentrations has been tested for seed treatments. However, doses exceeding 200 ppm may induce toxicity and negatively affect germination and growth, ultimately reducing yield. PBZ is effective even at low concentrations, and for wheat, seed treatments in the range of 22–100 mg L^{-1} appear to be suitable.

In wheat production, seed applications and foliar treatments during stem elongation or heading stages contribute significantly to yield preservation and enhancement. PBZ does not exhibit toxicity or leave residues when applied at appropriate doses and timings. Thus, it serves as a valuable tool for regulating plant growth and improving agronomic performance.

ÖZET

Ruminantlar, zorlu çevre koşullarına belirli bir adaptasyon kabiliyeti göstermelerine rağmen, bu süreçte ortaya çıkan fizyolojik stres tepkileri genellikle hayvan refahı ve verimliliğini olumsuz etkilemektedir. Küresel iklim değişikliği ve artan sıcaklık öngörüleri, sıcak stresini özellikle sığır yetiştiriciliği başta olmak üzere hayvancılık sektöründe büyüyen bir tehdit haline getirmiştir. Bu çalışmanın amacı, sığırlarda sıcak stresine karşı oluşan moleküler yanıtların değerlendirilmesi, bu yanıtlarda rol oynayan temel genetik mekanizmalar ile güncel bilgilerin derlenmesi ve termal stresle başa çıkmak için geliştirilen stratejilerin sürdürülebilirlik açısından irdelenmesidir. Bu kapsamda; gen ekspresyon analizleri, GWAS çalışmaları ve genetik varyantların işlevsel açıklamaları incelenerek termal toleransla ilişkili genler ve biyolojik süreçler değerlendirilmiştir.

Sıcak stresine maruz kalan sığırlarda; süt verimi, döl verimi, embriyonik gelişim, bağışıklık yanıtı ve genel sağlık durumu ciddi şekilde etkilemektedir. Fizyolojik süreçte ve verim özelliklerinde meydana gelen bu etkinin moleküler mekanizmaların etkisi altında olduğu ve bu mekanizmaların bireysel farklar ortaya çıkardığı bilinmektedir. Büyük ölçekli GWAS analizleri de rektal sıcaklık, solunum skoru ve süt bileşenleri gibi fenotiplerle ilişkili gen bölgelerini ortaya çıkararak termotoleransla bağlantılı genetik çeşitliliğin haritalanmasına olanak sağlarken; SNP analizleriyle de sıcaklığa duyarlı ya da dirençli genetik varyantlar tanımlanmıştır.

Moleküler düzeyde, sıcak stresine yanıt olarak *HSP70*, *HSP90*, *HSF1* gibi ısı şoku proteinleri ön plandadır. Gerek kültür gerekse yerli ırklarda yapılan çalışmalarda, sıcak stresine karşı yanıtta *DNAJB1, HSPA1A, EIF2A, HIF1A, PAEP, FASN, ITPR2, HSP90AB1, SNORA19, RFWD2, SCARNA3, GOT1, KBTBD2, RFWD12, IL6, IL10, TNF-α, NOS2, LSM5* ve *U1* genlerinin önemli bir rol üstlendiği tespit edilmiştir.

Sıcak stresinin hayvan refahı, sağlık ve verimlilik üzerindeki olumsuz etkileri göz önüne alındığında, çevresel müdahale yöntemlerinin (gölgelik, fan, su püskürtme, rasyon düzenlemeleri) geçici fayda sağladığı, uzun vadede ekonomik olmamakla birlikte mücadelede sınırlı kaldığı görülmüştür. Buna karşılık ıslah programlarında genetik belirteçler ile termal toleransı yüksek bireylerin seçilmesi ruminant yetiştiriciliği açısından kalıcı ve sürdürülebilir bir çözüm sunmaktadır. Bu yaklaşım, iklim değişikliğine adaptif hayvancılık sistemlerinin oluşturulması açısından oldukça stratejiktir. Gelecekte genetik / epigenetik faktörler ile

bağırsak mikrobiyotası gibi fizyolojik bulguların entegrasyonunun ve CRISPR/Cas9 gibi rekombinant teknolojiler ile moleküler çalışmaların derinleştirilmesinin gerekliliği açıktır. Sıcak stresine dirençli, sürdürülebilir bir hayvancılık için bu doğrultuda yapılacak olan bilimsel temelli genetik araştırmaların kilit rol oynayacağı öngörülmektedir.

Anahtar Kelimeler: Sığır, iklim değişikliği, sıcak stresi, genomik seleksiyon, termotolerans genleri*, HSP70/90*, *HSF1, DNAJB1*

GENETIC BASIS OF HEAT STRESS RESPONSE: NOVEL PERSPECTIVES ON MOLECULAR ADAPTATION IN CATTLE

ABSTRACT

Although ruminants exhibit a certain capacity for adaptation to harsh environmental conditions, the physiological stress responses arising during this process often have negative effects on animal welfare and productivity. Global climate change and rising temperature projections have made heat stress an increasing threat to the livestock sector, particularly in cattle farming. The aim of this study is to evaluate the molecular responses to heat stress in cattle, to review current knowledge on the key genetic mechanisms involved in these responses, and to assess strategies developed to cope with thermal stress in terms of sustainability. In this context, gene expression analyses, GWAS studies, and functional interpretations of genetic variants were reviewed to identify genes and biological processes associated with thermal tolerance.

In cattle exposed to heat stress, milk yield, fertility, embryonic development, immune responses, and overall health status are severely affected. It is known that the impacts on physiological processes and production traits are driven by molecular mechanisms, which also account for individual differences. Large-scale GWAS analyses have identified genomic regions associated with phenotypes such as rectal temperature, respiration score, and milk components, thereby enabling the mapping of genetic diversity linked to thermotolerance. Moreover, SNP analyses have allowed the identification of genetic variants that are either sensitive or resistant to elevated temperatures.

At the molecular level, heat shock proteins such as *HSP70, HSP90*, and *HSF1* play a crucial role in the response to heat stress. Studies conducted in both commercial and indigenous breeds have demonstrated that genes including *DNAJB1, HSPA1A, EIF2A, HIF1A, PAEP, FASN, ITPR2, HSP90AB1, SNORA19, RFWD2, SCARNA3, GOT1, KBTBD2, RFWD12, IL6, IL10, TNF-α, NOS2, LSM5,* and *U1* are significantly involved in the adaptive response to elevated temperatures.

Considering the adverse effects of heat stress on animal welfare, health, and productivity, environmental intervention methods (such as shading, fans, sprinklers, and dietary adjustments) provide only temporary benefits, are not economically sustainable in the long term, and remain limited in their effectiveness. In contrast, the use of genetic markers in breeding programs to select individuals with high thermal tolerance offers a permanent and sustainable solution for ruminant production. This approach is highly strategic in establishing climate-adaptive livestock systems. In the future, the necessity of integrating genetic and epigenetic factors with physiological findings such as the gut microbiota, as well as advancing molecular studies through recombinant technologies such as CRISPR/Cas9, is clear. Scientific, genetics-based research carried out in this direction is expected to play a key role in developing sustainable livestock systems resistant to heat stress.

Keywords: Cattle, climate change, heat stress, genomic selection, thermotolerant genes, *HSP70/90, HSF1, DNAJB1.*

ÖZET

Yaygın fiğ (*Vicia sativa* L.), Türkiye'nin Orta Anadolu Bölgesi'nde yaygın olarak yetiştirilen bir baklagil yem bitkisidir. Bu bölge, yarı kurak, kurak iklim ve zayıf toprak yapısı ile karakterize edilmektedir. Bu zorlu ortamda, yaygın fiğ yetiştiriciliği genellikle yazlık olarak gerçekleştirilir, ancak bölgeye uyumlu kışlık çeşitler de geliştirilmiştir. Ancak, bu çeşitlerin yazlık çeşitlere kıyasla nispeten daha düşük tane verimi sergilediği gözlemlenmiştir. Bu dezavantajı aşmanın en etkili yöntemi, kışa toleranslı, biyolojik verimi ve tane verimi yüksek yeni çeşitler üretmektir. İstenilen özelliklere sahip bu yeni çeşitleri elde etmek için şimdiye kadar yapılan araştırmalarda çeşitli genetik kaynaklar kullanılmıştır. Ayaz-08 çeşidi soğuğa toleranslı, erken olgunlaşan ve biyolojik verimi yüksek bir çeşittir. Mutant Toplesa çeşidi, soğuğa hassas, geç olgunlaşan ve yüksek tane verimine sahip bir çeşittir. Ayaz-08'de, baklalar bitkinin tabanından tepesine doğru dizilmiş olup, alt baklalar önce olgunlaşır. Buna karşılık, Toplesa, baklaların bitkinin tepesinde kümelenmiş olduğu bir mutant özelliği sergiler. Bu nedenle, hasat sırasında verim kaybı azaldığından, Toplesa'nın tane verimi yüksektir. Toplesa ile ıslah çalışmaları, Ayaz-08'in tane verimini artırmak amacıyla 2014 yılında Tarla Bitkileri Merkezi Araştırma Enstitüsü'nde başlatılmıştır. Yüksek verim potansiyeline sahip, soğuğa toleranslı, erken olgunlaşan bir çeşit elde etmek için 2014-2023 yılları arasında bir dizi ıslah ve seleksiyon prosedürü uygulanmıştır. 2024 yılında, yaygın fiğ melez hatları, iki kontrol çeşidi

(Ayaz-08 ve Toplesa) ile 2 m²'lik parsellere, augmented deneme deseni kullanılarak ekildi. Elde edilen veriler daha sonra aşağıdaki parametreler kullanılarak kapsamlı bir değerlendirmeye tabi tutulmuştur: çiçeklenme zamanı (FT), bitki boyu (PH), sap kalınlığı (SD), sap sayısı (NS), ilk bakla yüksekliği (FPH), bitkideki bakla sayısı (PPP), bakladaki tane sayısı (SPP), 1000 tane ağırlığı (SW), biyolojik verim (BY) ve tane verimi (GY). Korelasyon analizi, FPH'nin BY ve GY ile yüksek korelasyon gösterdiğini ortaya koymuştur. FT, FPH, BY ve GY'ye dayalı temel bileşen analizinde (PCA), genotipler gruplandırılmıştır. Analiz, toplam varyasyonun %79.7'sinin ilk temel bileşen (PC1) tarafından %50.4'ünün, ikinci temel bileşen (PC2) tarafından %29.3'ünün açıklandığını ortaya koymuştur. AT-23, AT-25, AT-31, AT-32, AT-33, AT-53, AT-54, AT-55, AT-56, AT-57, AT-61, AT-63, AT-64 ve AT-68 hatlarının hem BY hem de GY açısından potansiyel öneme sahip olduğu belirlenmiştir.

Anahtar Kelimeler: Melezleme, İlk Bakla Yüksekliği, Biyolojik Verim, Tane Verimi, PCA.

MORPHOLOGIC, PHYSIOLOGIC AND AGRONOMIC TRAITS OF COLD-TOLERANT COMMON VETCH HYBRID LINES

ABSTRACT

Common vetch (*Vicia sativa* L.) is a forage legume widely cultivated in the Central Anatolia Region of Türkiye. This region is characterized by a semi-arid, arid climate and poor soil structure. In this harsh environment, common vetch cultivation is generally carried out as a summer crop, although winter cultivars adapted to the region have also been developed. However, these cultivars have been observed to exhibit a comparatively lower grain yield in comparison to those classified as summer cultivars. The most effective method of overcoming this disadvantage is to breed new cultivars with high winter hardiness, biological and grain yield. Various genetic resources have been used during the research conducted so far in order to obtain these new cultivars with the desired characteristics. Ayaz-08 cultivar is cold-tolerant, early maturing, and has high biological yield. The mutant Toplesa cultivar is a cold-sensitive, late-maturing cultivar with high grain yield. In the Ayaz-08, the pods are arranged from the base to the apex of the plant, with the lower pods maturing first. In contrast, the Toplesa exhibits a mutant characteristic wherein the pods are observed to be clustered at the apex of the plant. Therefore, as yield loss is reduced during harvesting, the grain yield of the Toplesa is high. Breeding studies with the Toplesa were initiated in 2014 at the Central Research Institute for Field Crops with the objective of enhancing the grain yield of the Ayaz-08. A series of breeding and selection procedures were conducted from 2014 to 2023 to obtain a cold-tolerant, early-maturing cultivar with high yield potential. In 2024, the common vetch hybrid lines were sown in 2 m² plots with two check cultivars (Ayaz-08 and Toplesa) using an augmented experimental design. The resulting data were then subjected to a comprehensive evaluation, using the following parameters: flowering time (FT), plant height (PH), stem diameter (SD), stem number (NS), first pod height (FPH), number of pods per plant (PPP), number of seeds per pod (SPP), seed weight (SW), biological yield (BY), and grain yield (GY). Correlation analysis showed that FPH was highly correlated with BY and GY. In the principal component analysis (PCA) based on FT, FPH, BY and GY, genotypes were grouped. The analysis explained that 79.7% of the total variation, 50.4% by the first principal component (PC1) and 29.3% by the second principal component (PC2). It has been determined that the AT-23, AT-25, AT-31, AT-32, AT-33, AT-53, AT-54, AT-55, AT-56, AT-57, AT-61, AT-63, AT-64 and AT-68 lines have potential significance in terms of both BY and GY.

Keywords: Crossbreeding, First Pod Height, Biological Yield, Grain Yield, PCA.

MUZ BİTKİSİNDE AZOT VE KÜKÜRT UYGULAMALARININ MEYVE KALİTESİ ÜZERİNE ETKİLERİ

ÖZET

Bu çalışma, sera koşullarında yetiştirilen muz bitkilerinde (Musa spp.) elementel kükürt (ES) uygulamalarının bazı kalite parametreleri üzerine etkilerini belirlemek amacıyla yürütülmüştür. Araştırma, Antalya ili Manavgat ilçesi Sağırin mevkiinde yer alan ticari bir muz serasında gerçekleştirilmiştir. Araştırma kapsamında kurulan sera denemesinde elementel kükürt artan oranlarda uygulanmıştır. Uygulamalar fide dikiminden bir ay sonra ve dört ay sonra olmak üzere iki kez tekrarlanmış, topraktan elemental kükürt uygulamaları ES_1: 0g/ağaç, ES_2: 50 g/ağaç, ES_3: 100 g/ağaç, ES_4: 200 g/ağaç ve ES_5: 400 g/ağaç dozlarında yapılmıştır. Toprağa uygulanacak elementel kükürt miktarları hesaplanarak ağaç etrafına çapa yardımı ile karıştırılmıştır. Çalışma boyunca, elementel kükürdün etkilerini belirleyebilmek için kükürt içeren gübreler kullanılmamıştır. Elde edilen bulgular, elementel kükürdün muzun kalite parametreleri üzerine önemli etkilerinin olduğunu göstermiştir. Artan kükürt dozlarıyla birlikte bitkide kükürt birikiminin arttığı belirlenmiştir. Bitki kükürt içerikleri ES1 uygulamasında %0,24, ES2 ve ES3 uygulamalarında %0,29, ES4 uygulamasında %0,32 ve ES5 uygulamasında %0,34 olarak tespit edilmiştir. Kontrol uygulamasıyla (ES1) karşılaştırıldığında ES5 dozu, bitki kükürt içeriğinde %41,66 oranında bir artış sağlamıştır. Bunun yanı sıra, meyve kalite parametreleri de uygulamalardan etkilenmiştir. Kontrol uygulamasında (ES1) hevenk başına parmak sayısı sırasıyla üst, orta ve alt kısımlarda 19–20–18 adet, hevenk ağırlığı ise 21,3 kg olarak belirlenmiştir. Buna karşın ES5 uygulamasında parmak sayısı 18–18–17 adet olarak belirlenmiş, hevenk ağırlığı ise 24,8 kg'a yükselmiştir. Genel değerlendirme sonucunda, elementel kükürt uygulamalarının tüm dozlarda hevenk ağırlığını artırdığı belirlenmiştir. En yüksek artış, %7,98 ile ES5 dozunda elde edilmiştir. Bulgular, elementel kükürdün yalnızca kükürt alımını artırmakla kalmayıp aynı zamanda meyve ağırlığına doğrudan katkı sağladığını ortaya koymaktadır.

Anahtar Kelimeler: Muz, elementel kükürt, kalite, verim

EFFECTS OF NITROGEN AND SULFUR APPLICATIONS ON FRUIT QUALITY IN BANANA PLANTS

ABSTRACT

This study was conducted to determine the effects of elemental sulfur (ES) applications on some quality parameters in banana plants (Musa spp) grown under greenhouse conditions. The study was conducted in a commercial banana greenhouse located in the Sağırin area of the Manavgat district of Antalya province. In the greenhouse trial established for the study, elemental sulfur was applied at increasing rates. Applications were repeated twice, one month and four months after seedling planting. The soil application doses were ES1: 0g/tree, ES2: 50g/tree, ES3: 100g/tree, ES4: 200g/tree, and ES5: 400g/tree. The amount of elemental sulfur to be applied to the soil was calculated and mixed around the trees using a hoe. Sulfur-containing fertilizers were not used throughout the study to determine the effects of elemental sulfur. The results showed that elemental sulfur has significant effects on banana quality parameters. It was determined that sulfur accumulation in the plant samples increased with increasing sulfur doses. Plant sulfur (S) contents were determined as 0.24% in ES1 treatment, 0.29% in ES2 and ES3 treatments, 0.32% in ES4 treatment, and 0.34% in ES5 treatment. Compared to the control treatment (ES1), the ES5 dose caused a 41.66% increase in plant sulfur content. In addition, fruit quality parameters were also affected by the treatments. In the control treatment (ES1), the number of fingers per bunch was determined as 19–20–18 in the upper, middle, and lower parts respectively, and bunch weight was 21.3 kg. In contrast, in the ES5 treatment, the number of fingers was determined as 18–18–17, and bunch weight increased to 24.8 kg. The results showed that elemental sulfur applications increased bunch weight at all doses. The highest increase, 7.98% was achieved at the ES5 dose. The findings indicate that elemental sulfur not only increases sulfur uptake but also directly contributes to fruit weight.

ÖZET

Bu çalışmada topraktan artan dozlarda uygulanan kalsiyum (Ca) ve borun (B) biber bitkisinin gelişimi ve kimi bitki besin elementlerinin alınımı üzerine etkileri araştırılmıştır. Denemede biber bitkisinin gelişimi ve bitki besin elementi içeriğini araştırmak amacıyla bir sera denemesi kurulmuştur. Üç burun biber çeşidinin kullanıldığı denemede kalsiyum kaynağı olarak kalsiyum nitrat ($CaNO_3$) ve bor kaynağı olarak borik asit (H_3BO_3) kullanılmıştır. Denemede iki kalsiyum dozu (Ca_1 0 mg Ca kg^{-1} ve Ca_2 1000 mg Ca kg^{-1}) ve beş bor dozu (B_1 0 mg B kg^{-1}, B_2 2,5 mg B kg^{-1}, B_3 5 mg B kg^{-1}, B_4 7,5 mg B kg^{-1}, B_5 10 mg B kg^{-1}) kullanılmıştır. Bitki örneklerinde yapılan analizler sonucunda toprak üstü aksamda $CaNO_3$ uygulamaları sonucu, bitkilerin Ca içeriklerinde (Ca_1: % 2,06 ve Ca_2: % 2,38) ortalama % 15,53 oranında bir artış belirlenirken, bu artış kökte (Ca_1: % 2,80 ve Ca_2: % 4,47) ortalama % 59,64 oranında gerçekleşmiştir. Artan konsantrasyonlarda uygulanan borun (B) etkisi ile bitki örneklerinin B içerikleri toprak üstü aksamda Ca_1'de sırasıyla 11,70, 14,05, 17,38, 24,62 ve 34,47 mg B kg^{-1} ve Ca_2'de sırasıyla 16,48, 20,17, 25,96, 29,27 ve 41,39 mg B kg^{-1} olarak belirlenmiştir. Bitki kök aksamında ise bu durum Ca_1'de sırasıyla 0,30, 1,15, 3,53, 4,43, 8,61 mg B kg^{-1} ve Ca_2'de sırasıyla 0,32, 3,29, 4,85, 6,51, 8,43 mg B kg^{-1} olarak belirlenmiştir. Topraktan artan oranlarda H_3BO_3 ve $CaNO_3$ uygulaması bitkilerin kök ve toprak üstü aksamında B konsantrasyonunun artmasına neden olmuştur. Bunun sonucunda bitkilerin kök kuru madde içeriklerinde % 29,03 ve toprak üstü aksamında ise % 20,71 oranında bir azalmanın gerçekleştiği belirlenmiştir.

Anahtar Kelimeler: Biber, kalsiyum, bor

EFFECT OF CALCIUM AND BORON APPLICATIONS ON DEVELOPMENT OF PEPPER PLANT

ABSTRACT

In this study, the effects of increasing soil doses of calcium (Ca) and boron (B) on pepper plant development and the uptake of some plant nutrients were investigated. A greenhouse experiment was conducted to investigate pepper plant development and plant nutrient content. In the experiment calcium nitrate ($CaNO_3$) was used as the calcium source, and boric acid (H_3BO_3) was used as the boron source. Two calcium doses (Ca_1 0 mg Ca kg^{-1} and Ca_2 1000 mg Ca kg^{-1}) and five boron doses (B_1 0 mg B kg^{-1}, B_2 2.5 mg B kg^{-1}, B_3 5 mg B kg^{-1}, B_4 7.5 mg B kg^{-1}, B_5 10 mg B kg^{-1}) were used in the experiment. It was determined that an increase of 15.53% was determined in the Ca contents of shoot in $CaNO_3$ application (Ca_1: 2.06% and Ca_2: 2.38%), while this increase was realized as of 59.64% in the root (Ca_1: 2.80% and Ca_2: 4.47%). In boron applications, B contents of the plant samples were determined as 11.70, 14.05, 17.38, 24.62 and 34.47 mg B kg^{-1} for Ca_1 in the shoot and 16.48, 20.17, 25.96, 29.27 and 41.39 mg B kg^{-1} for Ca_2 respectively. In plant root, this situation was determined as 0.30, 1.15, 3.53, 4.43, 8.61 mg B kg^{-1} for Ca_1 and 0.32, 3.29, 4.85, 6.51, 8.43 mg B kg^{-1} for Ca_2, respectively. Applications of H_3BO_3 and $CaNO_3$ in the soil caused an increase in B concentration in the root and shoot of the plants. As a result, it was determined that a decrease of 29.03% in the root dry matter content of the plants and a decrease of 20.71% in the shoot occurred.

ABSTRACT

Disposable polypropylene (PP) face masks pose substantial ecological risks due to their persistence and contribution to microplastic pollution. This study investigates a novel approach to accelerate PP biodegradation by combining soil-isolated plastic-degrading microorganisms with green-synthesized iron nanoparticles (FeNPs) as degradation enhancers. The FeNPs were synthesized via a green chemistry approach, using agro-friendly plant *Sesbania bispinosa* aqueous extract to control nanoparticle size through optimized parameters. The researchers have demonstrated that such biosynthesized FeNPs stimulate bacterial proliferation, organic matter mineralization, humidification, and compost maturation. Plastic-degrading strains were isolated from agricultural soil and screened for degradation activity. Laboratory-scale biodegradation assays were conducted using face mask films, degradation efficiency was quantified based on weight loss, and molecular changes were confirmed by FTIR, which revealed emergence of acetaldehyde and carbonyl peaks compared to untreated films. Biofilm formation by the microbial strains on the mask surfaces confirmed microbial colonization and attachment. The results indicate that the synergistic application of isolated soil microorganisms and green-synthesized FeNPs markedly improves the biodegradation of PP masks. This integrated strategy shows strong potential as an environmentally sustainable method for managing PP waste.

Key Words: Microplastics, soil microorganisms, biodegradation, Sustainability approach, Face mask

THE USE OF GLUTAMIC ACID AS A GREEN ALTERNATIVE FOR CORROTION INHIBITION IN HCL SOLUTION

ABDULLAHİ UMAR

ABSTRACT

The corrosion of aluminium in acidic environments, such as hydrochloric acid (HCl), poses significant challenges in various industrial applications. This study investigates the potential use of glutamic acid as a green corrosion inhibitor for aluminum in HCl solution through theoretical and computational approaches. Using Spartan software (Students version), the 3D structures of glutamic acid, aluminum, and HCl were constructed, and the geometry optimization was performed using the DFT method. Subsequent adsorption studies focused on the interactions between aluminum and the molecules, with both length calculations used to assess interaction strengths. Also, the energy ban gap (E-Gap) between the HOMO and LUMO of the adsorption complexes was evaluated to determine the stability and reactivity of the inhibitor. The results indicates that glutamic acid forms a more stable adsorption complex with aluminum, characterized by a smaller energy ban gap and stronger chemisorption compared to HCl. These findings suggest that glutamicacid exhibits a higher affinity for the aluminum surface, providing an effective barrier against corrosion. This study offers valuable insights into the potential application of glutamic acid as an eco-friendly corrosion inhibitor in acidic environments, contributing to sustainable corrosion management strategies.

PERFORMANCE EVALUATION OF WIRELESS SENSOR NETWORKS FOR SMART AGRICULTURE USING OPNET

AKINLEYE, Abiodun Olamilekan

ORCID: 0009-0004-2939-5066

ABSTRACT

The fast advancement of technology in the agricultural systems has resulted in adopting smart farming practices where the use of wireless communication network plays a significant role in data collection and analysis. This paper concentrates on the Performance Analysis of the Wireless Sensor Networks (WSNs) with Smart Agriculture with OPNET Modeler 14.5. The study will evaluate the efficiency of WSNs in measuring vital agronomical parameters like soil moisture, temperature and humidity that are vital in achieving best crop productions and environmental resource conservation. The sensor nodes, in the simulation, have been placed in a virtual farmland to gather and send the environmental data to a sink node in the middle, to be analyzed. The vital key performance indicators like network throughput, end-to-end delay, packet delivery ratio, and the energy consumption are tested with variations on the node densities and communication ranges. It is assumed the results will demonstrate the effects of network design on communication efficiency and reliability of data in smart agriculture systems. The results of this research will be used in creating the energy efficient and cost-effective network models to develop precision agriculture, hence, assist with sustainable agriculture and better environmental management. The study helps to address the gap between the agricultural production and the recent communication technologies.

ABSTRACT

Sustainable agriculture plays a crucial role in promoting environmental conservation while ensuring long-term food security. This study focuses on the impact of sustainable farming practices such as crop rotation, organic fertilization, integrated pest management, and efficient irrigation systems. These methods help maintain soil fertility, reduce greenhouse gas emissions, and preserve biodiversity. The paper highlights how sustainable practices minimize the overuse of chemical inputs and promote ecological balance. By adopting eco-friendly approaches, farmers can achieve productive yields while protecting natural resources. The study concludes that sustainable agricultural practices are essential for achieving a balance between productivity and environmental health, contributing significantly to global sustainability goals.

BENEFITS OF AGRO FORESTRY LAND USE IN NSUKKA LOCAL GOVERNMENT AREA, ENUGU STATE, NIGERIA

Ugwuoke Chukwuchebe Obiajulu

Department of Agricultural Economics, Faculty of Agriculture

University of Nigeria, Nsukka

ABSTRACT

The study analyzed benefits of Agro Forestry Land Use in Nsukka Local Government Area, Enugu State, Nigeria. Sampling was done using two stage random sampling technique. Data for this study was obtained from both primary and secondary sources. Data collected was analyzed using simple statistical description. Results showed that the farmer's perceived benefits include: all year round income (M=3.76), enrich soil with manure (M=3.74), fight soil erosion (M=3.38), increase land productivity (M=3.42), maintenance of gen diversity (M=3.34), ensure better land management (M=3.54),), provision of shade (M=3.48). The result also showed that farmers participate in agro forestry due to economic reasons (100%), more productivity (100%), as a source of income (100%), enriches the soil (100%), and encourages afforestation (100%). The identified major constraints of agro forestry land use were poor road/transport (M=3.64), theft (M=3.62), poor/hazardous working condition (M=3.54), poor harvest lost (M=3.49), inadequate storage facilities (M=3.48) poor access to capital (M=3.46), poor extension contact (M=3.44 etc. The land tenure system of the entire study area is largely (84%) by inheritance, and land use is determined by the male head which formed (60%) of the respondents and, on whom the right of usage is vested. Government should therefore investigate the possibilities of facilitating access to farm lands by reviewing the land tenure act. The government and concerned agencies should provide incentives to increase their adoption of agroforestry practices.

Key words: Benefits of Agro Forestry; Land Use

EVALUATION OF SPERMATOZOA QUALITY, DIFFERENTIAL SPERM MORPHOLOGY AND GONADOSOMATIC INDICES OF BENIGN PROSTATIC HYPERPLASIA INDUCED RATS TREATED WITH POLYHERBAL EXTRACT.

ABSTRACT

Introduction: The study of benign prostatic hyperplasia (BPH) is intricate and its complete understanding is yet to be achieved. The hormones testosterone and dihydrotestosterone have a permissive and important role in male fertility. Growth factors and other hormones like estrogens and factors that may contribute to the development of BPH.This study investigated the ameliorating potential of polyherbal leave extract of Stinging nesttle, Vernonia amygdalina, Milk thistle and roots of Musa Paradisiaca (SVMM) on Testosterone Propionate-Induced Benign prostatic hyperplasia in male wistar rats. Methods: A total of 36 male rats were used in this study. They were grouped into 6 groups of 6 rats each. Benign prostate hyperplasia was induced in the rats using the intraperitoneal administration of 5 mg/kg testosterone propionate injection subcutaneously and 1 hour later treated with polyherbal extract for 28 consecutive days. Semen sample was collected for spermatozoa quality, morphology and gonadosomatic indices using standard protocols. The study showed that the induction of BPH brought about some adverse effect on spermatozoa proportion, quality, normal spermatozoa and testicular and prostate weight relative to normal control. Sperm abnormalities like those with bent mid-piece were seen. The findings showed that the administration of SVMM extract had a significant positive impact on the sperm cell abnormalities, significant reduction in testicular and prostate weight thus, leading to the restoration of the sperm cell morphology and potentially improving fertility. These findings demonstrated that the use of SVMM can reduce the harmful effects of Testosterone Propionate-Induced Benign prostatic hyperplasia (BPH) and enhance fertility by restoring the quality semen and sperm morphology to their normal state in rats.

Head & Associate Professor, Chemistry, St. Joseph's College of Engineering, Chennai, India.

ABSTRACT

The shift towards a circular economy presents opportunities to minimize waste and maximize resource efficiency, particularly in the context of fruit waste. This review explores the innovative utilization of fruit waste globally, highlighting its potential to enhance sustainability. It discusses the types, quantities, and compositions of waste generated by the fruit industry. Current waste management practices, such as composting, biogas production, and their use as animal feed, are examined as important strategies for reducing environmental impact. The potential for fruit waste to create value-added products is explored in depth,

including applications in food packaging, agriculture, water purification, and the extraction of bioactive compounds for pharmaceutical and nutraceutical uses. The role of fruit waste in the food sector is also discussed, with particular attention to the utilization of bioactive compounds and incorporation into bakery products, illustrating its potential to improve food quality and sustainability. It further discusses emerging technologies, challenges, and policy frameworks in waste management. The importance of fruit waste utilization in fostering a sustainable future is highlighted, aligning with global efforts to reduce waste and promote resource circularity. By integrating innovative solutions and cross-sector collaborations, fruit waste can be transformed into a valuable resource in the circular economy.

Keywords: bioactive compounds, circular economy, environmental sustainability, fruit waste management , sustainable development

MORPHOLOGICAL CHARACTERIZATION OF THE GENETIC RESOURCES OF MOROCCAN WHITE MULBERRY (MORUS ALBA L.)

ABSTRACT

The White mulberry (*Morus alba L.*), also known as "Toot" in Arabic, is a member of the *Moraceae* family. The leaves of the white mulberry, which is widely grown all over the world, are the main food source for silkworms. It is cultivated for its fruit in North African nations, and it is also eaten as a vegetable in some European countries. The leaves are used to make tea and powdered juice in Japan. The plant's fruits, leaves, roots, branches, and bark are all used in traditional medical systems, for their potential to promote health and provide antioxidants.

White mulberry is abundant in bioactive compounds, including phenolic acids, flavonoids, flavanols, anthocyanins, as well as essential macronutrients, vitamins, minerals, and aromatic volatile compounds. These naturally occurring substances exhibit potent biological activity and provide notable pharmacological benefits in the prevention and treatment of various diseases.

This work characterised and assessed phenotypic variation within this species. Forty-Two qualitative and quantitative morphological characters pertaining to the tree, flowers, and fruit were evaluated across thirteen natural accessions sampled throughout its native Moroccan range. Significant intraspecific phenotypic variability was indicated by the analysis of variance, which showed significant variations between accessions for most characteristics. Moreover, the principal component analysis allowed for the classification of *M. alba* accessions into three distinct morphological categories. These observations reveal a great phenotypic diversity among the natural specimens of this species in Morocco. The study highlighted the phenotypic diversity that could serve as an attractive approach to consider the valorisation of this species in Morocco.

Key words: *Morus alba*; Morocco; Phenotypic diversity; Variability; Pomology

ATTITUDE OF THE SOCIETY TOWARDS HIV/AIDS PATIENTS IN KONTAGORA, NIGER STATE, NIGERIA

Jatau T, K.,

School of Sciences, Department of Biology Education/ Integrated Science, Federal College of Education,

Kontagora Niger State, Nigeria.

Sani H

School of Sciences, Department of Biology Education/ Integrated Science, Federal College of Education,

Kontagora Niger State, Nigeria.

ABSTRACT

The research was conducted on the attitude of the Society Towards HIV/AIDS Patients in Kontagora, Niger state, Nigeria. Fifty (50) questionnaires were distributed randomly and fifteen (15) respondents were interviewed. Five (5) areas were sampled; General Hospital, Federal Low-cost Kontagora, Sabon-Gari, Tudun Wada and Dadin-Kowa Kontagora. Ten (10) questionnaires were distributed to each sampled area. The methods used in analyzing the data collected from these areas are Simple Percentage (%) and Chi-square ($\times^2$) test. From the results, 4 (82%) of the respondents are HIV/AIDS negative and 9 (18%) are HIV/AIDS positive. 50 (100%) of the respondent disagree with the discrimination as the best way of caring for HIV/AIDS victims, while 1 (2%) agreed. It also showed that 49(98%) agreed that HIV/AIDS victims should be treated equally in the society and 1 (2%) of the respondent disagree. From the Chi-square ($\times^2$) test analysis, the $\times^2$ - cal = 169.9 and the $\times^2$ – tab = 221.7, also $\times^2$ =23.59 at probability level of 0.5 and degree of freedom (df) of 9. Since $\times^2$ – cal > $\times^2$ – tab, then there is significant difference in the attitude of the society towards HIV/AIDS patients. The study then recommends that; doctors should be educated on the interactions between social lives and health care as it would level out bias attitude towards HIV/AIDS patients. Hospitals should provide free access for counselling and test for HIV/AIDS among others.

"A COMPARATIVE ANALYSIS OF MUNICIPAL SOLID WASTE MANAGEMENT IN URBAN AND RURAL SETTINGS"

Prof. (Dr.) Sunil Agrawal

Professor, People's Institute of Management & Research

People's University, Bhopal, MP, INDIA

Email: drsuagrawal@gmail.com

ORCID: 0000-0002-2130-9694

ABSTRACT

Effective municipal solid waste management (MSWM) is essential for maintaining public health, environmental sustainability, and economic stability. However, significant disparities exist between urban and rural waste management systems due to differences in population density, infrastructure, financial resources, and governance capacity. This study presents a comparative analysis of MSWM practices in urban and rural settings, focusing on waste generation rates, collection efficiency, treatment methods, and community participation. Data were collected through field surveys, stakeholder interviews, and secondary reports from selected municipalities representing both settings. The findings reveal that urban areas generate substantially higher volumes of waste, dominated by plastics, paper, and packaging materials, while rural regions produce more organic and agricultural residues. Urban MSWM systems tend to rely on centralized collection and disposal methods, often involving engineered landfills and limited recycling initiatives. In contrast, rural communities depend on informal or community-based waste handling practices, with lower collection coverage but higher rates of organic waste reuse and composting. The study identifies critical challenges, including inadequate funding, weak policy enforcement, and low public awareness, which impede efficient waste management in both contexts. Comparative analysis underscores the need for context-specific strategies—such as decentralized composting in rural areas and enhanced recycling infrastructure in urban zones. The paper concludes by proposing an integrated MSWM framework that combines technological innovation, stakeholder engagement, and policy reform to promote sustainable waste management across diverse geographic and socio-economic settings.

Keywords: Municipal Solid Waste, Urban-Rural Comparison, Sustainability, Waste Management Practices, Environmental Policy.

EXPLORING THE BIOACTIVE COMPONENTS AND PHARMACOLOGICAL BENEFITS OF A NORTHERN MOROCCAN TRADITIONAL HERB

Nesrine Benkhaira[1,*] Saad Ibnsouda Koraichi[1], Kawtar Fikri-Benbrahim[1]

[1]Laboratory of Microbial Biotechnology and Bioactive Molecules, Faculty of Sciences and Technologies Faculty, Sidi Mohamed Ben Abdellah University, Fes, Morocco

Abstract

Ruta montana L., a medicinal herb in Moroccan folk medicine, has been used to treat infections, hyperglycemia, spasms, and fever. This study uses GC-MS to examine the bioactive constituents of RMEO and analyzes its antibacterial, antioxidant, and antidiabetic actions *in vitro* and using molecular docking approaches.

GC-MS identified 2-undecanone as the main compound of the essential oil. RMEO inhibited α-amylase (IC_{50} = 0.365 ± 0.11 mg/mL) and α-glucosidase (IC_{50} = 0.311 mg/mL), had significant antioxidant potential (FRAP EC_{50} = 188.61 ± 1.12 µg/mL; beta-carotene IC_{50} = 149.21 ± 1.12 µg/mL), and had potent antibacterial effects, particularly against *Micrococcus luteus* and *Staphylococcus aureus* (20.05 ± 0.98 and 18.11 ± 1.11 mm).

It demonstrated modest efficacy against *Candida albicans* (13.05 ± 0.5 mm), with MIC/MBC values ranging from 0.25 to 8% (v/v). Molecular docking and ADME tests confirmed these findings.
Overall, DVEO exhibits remarkable antioxidant, antibacterial, anticandidal, and antidiabetic effects, indicating a potential for natural therapeutic uses.

Keywords: volatile oil, *Ruta montana,* GC-MS, antibacterial, antiradical.

STRUCTURAL, ELECTRONIC, AND THERMOELECTRIC PROPERTIES OF CU_2SE WERE INVESTIGATED USING FIRST-PRINCIPLES CALCULATIONS WITHIN THE DFT-PBE FRAMEWORK.

Meknes, Morocco

ABSTRACT

The copper selenide is now being looked at as a possible way to meet the energy needs. Therefore, in this study, the structural and thermoelectric properties of Cu_2Se were investigated using both density functional and classical Boltzmann transport models. The structural. The Perdew-Burke-Ernzerhof (PBE) was utilised to determine the band gaps.We demonstrate a prototype thermal evolution path for liquid thermal conductivity in solids. Thermal evolution of b-Cu2Se shows large interstitial displacement of constituent atoms marked by glass-like transitions and an asymptotic liquid thermal transport. Using LAMMPS, we identify these transitions, and confirm them with in situ transmission electron microscopy and electron energy loss spectros copy. The thermal disorder of the Cu+ ions forms homopolar Cu–Cu bonds under a rigid Se framework, and at yet higher temperatures the Se framework undergoes thermal distortion. The non-equilibrium AIMD prediction of lattice thermal conductivity shows significant suppression of the phonon transport, in agreement with experiments and molecular behavior.

Keywords: DFT, Thermoelectric properties ,Electronic properties.

PRODUCTION AND CHARACTERIZATION OF CARBON NANOTUBES FROM BIOCHAR UNDER MICROWAVE IRRADIATION.

Faisal Nazir

ABSTRACT

Carbon nanotubes (CNTs) are widely used in a variety of fields to produce a diversity of products, including hydrogen storage systems, and field emitters. In the proposed study, CNTs synthesized via biochar under the microwave irradiation method. In this method, the combination of charcoal and ferrocene are used to synthesize CNTs from the biochar approach. Biochar samples for CNTs synthesis are made from pyrolyzed agro-industrial waste such as rapeseed cake, hazelnut hulls, wheat straw, and oat hulls at different temperatures. The biochar was produced from agro-industrial biomass. During experiments, 100g of biomass was placed in a microwave reactor. The samples were pyrolyzed at 400 °C to 600°C. SEM analysis was used to confirm the morphology of CNTs. SEM micrographs revealed the perfect structure of multiwall carbon nanotubes, while interlayers spacing was changed due to variation of catalysts and measured about 0.34nm. Further, the optical properties were examined by UV-visible spectroscopy. In the UV, one band is clear at 240 nm region due to resonance of nanotubes pi(π) electrons of carbon nanotubes. XRD was used to analyze the glassy structure of prepared CNTs under microwave revealed that the creation and growth of CNTs were mostly influenced by microwave irradiation and the ferrocene catalyst. The structure of CNTs was developed under microwave heating and in the presence of ferrocene catalyst. To research how nitrogen impurities adhere to CNTs, FTIR experiments were conducted in the 400–4000 cm^{-1} range. The sample's FTIR spectra exhibit prominent peaks that correspond to C-H and C=C, respectively.

DEVELOPMENT AND OPTIMIZATION OF LOW-COST CLAY-BASED MEMBRANES FOR TEXTILE WASTEWATER MICROFILTRATION

Chlaih Soumaya

Cadi Ayyad University, UCA, Faculty of Science Semlalia, FSSM, Laboratory of Physical Chemistry of Materials and Environment (LPCME)

Marrakech, Morocco

ABSTRACT

This study focuses on the development of a sustainable flat ceramic microfiltration membrane produced from low-cost and environmentally friendly raw materials. The membrane was synthesized and optimized using a statistical design approach to determine the most suitable processing conditions. The obtained material exhibited good mechanical strength, adequate porosity, and high filtration performance, demonstrating effective removal of turbidity and organic pollutants from industrial wastewater. These results confirm the potential of the proposed clay-based membrane as an efficient and eco-friendly solution for wastewater treatment applications.

Keywords: clay, membrane, microfiltration

FROM BIOASSAYS TO SEDIMENT QUALITY INDICES: AN INTEGRATED APPROACH TO ASSESS THE ENVIRONMENTAL STATUS OF COASTAL ECOSYSTEMS.

Khatamı Salma [1,2], El Haımeur Bouchra [2], Bouhallaouı Mına [2], Errhıf Ahmed [1*]

[1] Faculty of Sciences Ain Chock Casablanca.

ABSTRACT:

Discharging anthropogenic activities into aquatic environments raises significant environmental and health concerns, as they can lead to long-lasting degradation of these critical resources. Industrial effluents often contain a mix of contaminants and pollutants, necessitating a thorough assessment of their potential dangers and risks before release into aquatic ecosystems. However, the ecotoxicological approach is used to determine the toxic effects on organisms pertaining to various ecosystems and supplies information about the contaminants' bioavailability in different matrices, such as sediments.

The use of a single species for a correct evaluation of the toxicity levels can be reductive, concerning the complexity of the ecosystem. In this work, a bioassay battery consisting of three different species representing different trophic levels, algae *Tetraselmis suecica*, crustacean *Artemia salina*, and echinoids *Paracentrotus lividus*, has been used to assess the toxicity of sediment elutriate, porewater, and whole sediment. The sediment samples were collected from four sampling stations along the North Atlantic Coast of Morocco. The test battery used in this study allowed us to screen the ecotoxicological toxicity of the studied area. The species utilized for toxicity tests responded differently to the investigated samples, showing different sensitivity.

However, a difference in sediment toxicity is registered in different studied areas depending on the sedimentary phases. Indeed, the S3 recorded the maximum effect of embryo-larval malformation in the pore water phase. For the whole sediment, S2 recorded the maximum effect, while for the algal growth inhibition bioassay, S1 showed the most pronounced effect.

Keywords: Pollution; sediment; bioassays; elutriate; pore water.

MECHANISTIC UNDERSTANDING OF PEPTOID FORMATION FROM DITHIANE PRECURSORS VIA MULTICOMPONENT REACTIONS: A DFT STUDY

Musrat Shaheen[1]*, Akbar Ali[1], Burhan Khalid[2], Hafiza Zara Saeed[3]

[1]Department of Chemistry, Government College University, Faisalabad, Pakistan

[3]Department of Botany, Government College University Faisalabad, Pakistan

ABSTRACT

Peptoids are a type of peptidomimetic where the side chain is linked to the nitrogen atom of the amide group instead of the α-carbon. This modification in the backbone structure is highly prized because it imparts advantageous properties such as increased resistance to proteolysis, enhanced immunogenicity, improved biostability, and better bioavailability. In this study, we concentrated on synthesizing peptoids using a Ugi-4CR-based one-pot method, employing 1,4-dithiane-2,5-diol as the carbonyl component along with amine, carboxylic acid, and isocyanides. We successfully designed and synthesized four new peptoids in good chemical yields, and conducted DFT studies to explore their electronic properties. TD-DFT calculations were used to predict the electronic excitation and orbital contributions of four compounds. A natural bond order (NBO) analysis was performed to examine the electronic transitions of the newly synthesized peptoids, focusing on their charge distribution patterns. Additionally, MEP and NPA analyses were conducted to predict charge distribution in these compounds. The reactivity and stability of the targeted peptoids were assessed using global reactivity descriptors, determined through frontier molecular orbital analysis.

ENHANCING THE ELECTRONIC AND OPTICAL PERFORMANCE OF DYE-SENSITIZED SOLAR CELLS WITH ALIZARIN-BASED DYES: DFT/TD-DFT INVESTIGATIONS

ABSTRACT.

Dye-sensitized solar cells (DSSCs) offer several advantages over traditional silicon-based solar cells, such as lower cost, versatility, and transparency. Titanium dioxide (TiO_2) is widely used as a photocatalyst in DSSCs due to its chemical stability, high photocatalytic activity, photostability, and non-toxicity. This study provides a computational analysis of the geometric, electronic, optical, and photovoltaic properties of ten novel dyes using Density Functional Theory (DFT) and Time-Dependent DFT (TD-DFT). To our knowledge, these dyes have not been previously explored in the literature. Our findings indicate that structural modifications can significantly enhance the electronic, optical, and photovoltaic properties of these dyes. The B3LYP functional was identified as the most effective for predicting the geometric and electronic properties, while TD-DFT calculations with the CAM-B3LYP functional and the 6-31G(d,p) basis set accurately predicted the absorption properties. The absorption maxima of the dyes ranged from 427.82 nm to 755.93 nm, with strong UV-Vis absorption attributed to delocalized π-π* transitions. The calculated band gaps varied from 1.928 eV to 2.425 eV, showing that increased conjugation leads to reduced band gaps and improved dye performance. Open-circuit voltage (Voc) values for TiO_2 ranged from 0.893 eV to 1.38 eV, suggesting good potential for efficient electron injection into the TiO2 conduction band. In conclusion, the ten novel dyes studied exhibit significant potential for use in DSSCs, and the theoretical methods employed here offer a reliable framework for predicting the properties of other materials. This approach can guide the development of new materials designed to improve the performance of DSSCs.

ABSTRACT

Large-scale water transfer projects is an important alternative to face the water scarcity and adopted worldwide. Nevertheless, investments in massive infrastructure, negative environmental impacts and restrictive legislation have required from water managers to adopt new approaches, as small-scale interbasin water transfer (SSIWT), mainly in industrial and urbanized regions. Yet, there is a dearth of research addressing to environmental impacts assessment of SSIWT to support decision-making, especially in developing countries, like Brazil. The main goal of this research was to assess the environmental impacts of water transfer on the quality of surface water in Jundiaí-Mirim river basin, Southeast Brazil. Data from water quality reports carried out by Environmental Company of the State of São Paulo (CETESB) were analysed in the period from 2017 to 2024. During this period, the dates on which there was the water transfer were separated from those on which there was no transposition. The following total metals were analyzed: (Al, Cr, Cu, Fe, Mg, and Mn). Descriptive statistics were performed to test the hypothesis that there was an effect of SSWIT on water quality. The results showed impacts regarding to introducing of ions from Atibaia river in Jundiaí Mirim river and the degradation of banks which influenced significantly on Al, Fe, and Mg concentrations. Our findings give important information of environmental performance of small-scale hydraulic facilities to help the decision makers to establish strategies to reduce negative environmental impacts.

ABSTRACT

The hybrid pistachio rootstock UCB-1 (*Pistacia atlantica* × *P. integerima*) is a considerable commercial rootstock mostly used for the production of pistachio plants because of its greater growth, large productivity and high soil performance. *In vitro* propagation protocols of this rootstock were recently established for the rapid multiplication of high quality plants. Via these protocols, the multiplication step of vitroshoots was mainly performed on solid media (POM, MS and WPM basal media). The use of liquid media, with bioreactors or TIS (Temporary Immersion Systems) containers applied for the multiplication of many crops (Banana, date palm, eucalyptus, etc.) was with great benefits and has highly optimized this micropropagation step. Thus, trials to optimize the *in vitro* multiplication of UCB-1 rootstock by bioreactor was applied on liquid POM medium, enriched with 1 mg/l mT (metatopolin) and 0.2 mg/l IBA (Indole Butyric Acid). Preliminary results show that bioreactors have greatly increased the multiplication rate (MR) of UCB-1 shoots leading to a MR of 2.7, higher than that obtained on solid medium and optimized the vitroplants quality. The micropropagated shoots were with important vigor and height, increasing 2.0 mm in tall during two weeks. Furthermore, these apparatus regenerate vitroplants with less necrosis and are so practical for the professionals since they produce massively high quality plants with reduced costs.

Keyword: Bioreactors, liquid medium, multiplication rate, UCB-1, vitroshoots.

EXPLORING THE POTENTIAL OF *Moringa oleifera* FOR SUSTAINABLE WASTEWATER REMEDIATION

El HANDAOUI El Mehdi[1], Abderrahim JRIFI[1], Omar FANIDI[1]

[1] Laboratory of Intelligent Systems, Industrial and Mechanical Engineering (LISIME) – ENSAM Hassan II university, Casablanca, Morocco.

ABSTRACT

Water pollution by heavy metals such as lead (Pb^{2+}), cadmium (Cd^{2+}), and hexavalent chromium (Cr^{6+}), along with organic pollutants, is a major environmental and public health challenge. Conventional wastewater treatments, although effective, often require high costs, advanced infrastructure, and cause secondary impacts. This study explores the potential of Moringa oleifera seeds as a natural, low-cost, and eco-friendly bioadsorbent and coagulant. Seeds were dried, ground, and applied as powder to contaminated water. Heavy metal removal was evaluated using atomic absorption spectroscopy (AAS), while organic pollution was measured via biochemical oxygen demand over five days (BOD_5). Results showed removal efficiency above 85% for Pb^{2+} and Cd^{2+}, with significant reductions in Cr^{6+} and organic load. These findings confirm the effectiveness of Moringa seeds in improving water quality. Their abundance, biodegradability, and low cost make them suitable for resource-limited areas. This study supports the integration of plant-based materials into sustainable wastewater strategies. Further research is needed to optimize treatment parameters, assess long-term performance, and validate field applicability.

Key words: *Moringa oleifera,* bioadsorbent, Heavy metals, Wastewater, Natural coagulant, Organic pollutants.

KETENCİK BİTKİSİNDE [*Camelina sativa (l.) crantz*] FARKLI AZOT DOZLARININ BAZI VERİM VE KALİTE ÖZELLİKLERİNE ETKİSİ

ÖZET

Ketencik (*Camelina sativa* L. Crantz), Brassicaceae familyasına ait tek yıllık yağlı tohumlu bir bitkidir. Ketencik bitkisi yazlık ve kışlık olarak ekilebilmekte ve belli ölçüde kuraklığı toleransı yüksek olan bir bitki olarak bilinmektedir. Bu araştırma, farklı azot dozlarının ketencik bitkisinin verim ve kalite özelliklerine etkilerini belirlenmek amacıyla yapılmıştır. Çalışma, 2017-2018 ve 2018-2019 vejetasyon dönemlerinde Tokat-Kazova şartlarında kışlık ekilerek yürütülmüştür. Araştırma Tesadüf Blokları Deneme Desenine göre üç tekerrürlü olarak düzenlenmiştir. Çalışmada hektara 10 kg tohum hesabıyla Ames 26680 ketencik genotipi kullanılmış, 6 farklı azot (N) dozu (kontrol (0), 40, 80, 120, 160 ve 200 kg/ha) bulguları karşılaştırılmıştır.

Denemede; bitki boyu, bitki başına dal sayısı, bitki başına kapsül sayısı, kapsül başına tohum sayısı, bin tohum ağırlığı, tohum verimi, yağ oranı ve yağ verimi parametreleri incelenmiştir. Çalışmada incelenen özelliklerden kapsül başına tohum sayısı, bin tohum ağırlığı ve yağ oranı hariç diğer özelliklerde gübre dozları arasındaki farklılıklar istatistiki olarak önemli bulunmuştur. Araştırmadan elde edilen iki yıllık sonuçlara göre, bitki boyu 88.3-97.2 cm, dal sayısı 3.9-5.8 adet, bitkideki kapsül sayısı 147.9-187.1 adet, kapsül başına tohum sayısı 13.5-14.2 adet, bin tohum ağırlığı 0.863-0.918 g, tohum verimi 1208.5-1590.8 kg/ha, yağ oranı %32.5-34.4 ve yağ verimi 401.3-524.2 kg/ha arasında değişmiştir.

Tokat-Kazova'da sulama yapmaksızın ketencikte azot dozlarının etkisinin araştırıldığı bu çalışma sonucunda; dekara tohum ve yağ verimi bakımından 120-160 kg/ha azot dozlarının uygun olduğu, gübre tasarrufu dikkate alındığında 120 kg/ha azot dozunun ketencik yetiştiriciliği için yeterli bulunduğu sonucuna varılmıştır.

Anahtar Kelimeler: Azot, Ketencik, Tohum verimi, Yağ oranı

THE EFFECT OF DIFFERENT NITROGEN DOSES ON SOME YIELD AND QUALITY CHARACTERISTICS IN CAMELINA PLANT [*Camelina sativa (l.) crantz*]

ABSTRACT

Camelina (*Camelina sativa* L. Crantz) is an annual oilseed plant belonging to the Brassicaceae family. It can be cultivated both in spring and winter, and is known for its relatively high tolerance to drought. This study was carried out to determine the effects of different nitrogen doses on the yield and quality characteristics of camelina. The study was conducted in Tokat-Kazova during the 2017–2018 and 2018–2019 growing seasons under winter sowing conditions. The experiment was arranged in a Randomized Complete Block Design with three replications. In the study, the Ames 26680 camelina genotype was used with a seeding rate of 10 kg of seed per hectare, and six different nitrogen (N) doses (control (0), 40, 80, 120, 160, and 200 kg/ha) were compared.

The parameters evaluated in the experiment included plant height, number of branches per plant, number of capsules per plant, number of seeds per capsule, thousand seed weight, seed yield, oil content, and oil yield. Among the investigated traits, all parameters except the number of seeds per capsule, thousand seed weight, and oil content showed statistically significant differences between nitrogen doses. According to the two-year results obtained from the study, plant height ranged from 88.3 to 97.2 cm, number of branches per plant from 3.9 to 5.8, number of capsules per plant from 147.8 to 187.1, number of seeds per capsule from 13.5 to 14.2, thousand seed weight from 0.863 to 0.918 g, seed yield from 1208.5 to 1590.8 kg/ha, oil content from 32.5% to 34.4%, and oil yield from 401.3 to 524.2 kg/ha.

As a result of this study, which investigated the effect of nitrogen doses on camelina without irrigation in Tokat-Kazova conditions, it was concluded that nitrogen doses of 120-160 kg/ha were suitable in terms of seed and oil yield per decare, and considering fertilizer efficiency, a nitrogen dose of 120 kg/ha was found to be sufficient for camelina cultivation.

Keywords: Nitrogen, Camelina, Seed yield, Oil ratio

ÖZET

Açık alanda yapılan üzüm kurutma işleminde kuruma süresinin uzaması ürün kalitesi açısından birçok olumsuz etkiye sebep olmaktadır. Bu çalışmada açık alanda üzüm kurutma işleminde kuruma süresini kısaltma amacıyla bir düşük oranlı güneş enerjisi yoğunlaştırma sisteminin farklı çalışma pozisyonlarında nem içeriğine etkileri araştırılmıştır. Yoğunlaştırılmış güneş enerjisi sistemleri güneş ışığının akı yoğunluğunu artırma yolu ile yüksek sıcaklık ve yüksek enerji dönüşüm verimlerine ulaşmak ve bu şekilde ısıl enerji elde etmek için kullanılan bir enerji üretim yöntemidir. Güneş odaklama sistemlerinde güneş ışığı, çeşitli aynalar ve aynalara bağlı güneşi izleme sistemleri vasıtasıyla alıcıya yansıtılarak yüksek sıcaklıklarda ısı enerjisine farklı oranlarda çevrilebilmektedir. Bu çalışmada ise düşük oranlı yoğunlaştırıcı yüzey olarak üründe kararma bozulma vb. etkilere sebep olmamak amacıyla eloksal kaplamalı alüminyum malzeme kullanılmıştır. Eloksal elektrolitik yöntemle alüminyumun oksidasyonu işlemidir. Bu işlem aynı zamanda anodik oksidasyon veya anodizasyon olarak da tanımlanmaktadır. Kaplamanın amacı alüminyumun korozyon direncini arttırmak ve ona hem estetik hem de fonksiyonel değerler katmaktır. Otomotivden inşaat sektörüne kadar farklı alanlarda kullanılabilen eloksallı alüminyum yüzey bazı dalga boylarını emerken bazı dalga boylarını yansıtabilen niteliğe sahiptir. Bu çalışmada malzemenin bu özelliğinden tarımsal kurutmada yararlanılması hedeflenmiştir.

Denemeler Manisa İlinde Ekim ayında yoğunlaştırmalı sistemde 6 kg ve yoğunlaştırma olmayan kontrol grubunda 6 kg “Sultani Çekirdeksiz” üzüm çeşidi kullanılarak yürütülmüştür. Deneme sırasında yöney, yansıtıcı yüzeyin yatay olan açısı, ürünün yerden yüksekliği, yüzeyler

arası mesafe gibi varyasyonlar denenerek optimum çalışma noktası elde edilmeye çalışılmıştır. Yapılan denemeler sonucunda en etkili kurutmanın doğu-batı çift yöneyli, yatayla 47^{o} açı ve yüzeyler arasında 1,40 m mesafenin olduğu sistem ve güneye bakan tek yüzeyli, 47^{o} eğim açılı, ürünün yerden 30-40 cm yerden yukarıda olduğu sistemde gerçekleştiği belirlenmiştir. Tüm ölçümler sonunda Ekim ayı şartlarında %18 son nem değeri baz kabul edildiğinde yoğunlaştırma sisteminin kurutma süresinde %33 oranında kısalma sağladığı tespit edilmiştir.

Anahtar Kelimeler: Kurutma, Üzüm, Güneş Enerjisi, Yoğunlaştırma

EFFECTS OF A LOW-RATE SOLAR ENERGY CONCENTRATION SYSTEM ON DRYING KINETICS OF GRAPE

ABSTRACT

Prolongation of the drying time in open sun drying of grapes causes many negative effects in terms of product quality. In this study, the effects of a low-rate solar energy concentration system on moisture content under different operating positions were investigated in order to shorten the drying time in the open field drying process of grapes. Concentrated solar power systems are a method of energy production used to achieve high temperatures and high energy conversion efficiencies by increasing the flux density of sunlight, thereby generating thermal energy. In solar focusing systems, sunlight is reflected to a receiver by various mirrors and sun-tracking systems connected to the mirrors, which convert it into heat energy at different rates at high temperatures. In this study, anodized aluminum material was used to prevent the product from adverse effects such as darkening, deterioration as reflective surface. Anodizing is the electrolytic oxidation of aluminum. This process is also known as anodic oxidation or anodization. The purpose of the coating is to increase the aluminum's corrosion resistance and add both aesthetic and functional value. Anodized aluminum surfaces, which can be used in a variety of applications from the automotive to the construction industry, have the ability to absorb some wavelengths while reflecting others. This study aimed to utilize this property of the material in agricultural drying.

The experiments were carried out in Manisa Province in October, using 6 kg of Thompson seedless grape variety in the concentration system and 6 kg in the control group without concentrator. During the trial, variations such as direction, angle of the reflective surface with horizontal, height of the product from the ground, and distance between surfaces were tried to obtain the optimum operating point. As a result of the experiments, it was determined that the most effective drying occured in the system with an east-west bidirectional, 47o angle to the horizontal and a distance of 1.40 m between the surfaces, and in the system with a single surface facing south, with a 47o inclination angle, where the product is 30-40 cm above the ground. At the end of all measurements, it was determined that the concentration system provided a 33% reduction in drying time, considering the final moisture value of 18% in October conditions.

ÖZET

Türkiye'de armut (*P. communis)* üretimi TÜİK (Türkiye İstatistik Kurumu) 2014 ve 2024 yılları ortalama verilerine göre Bursa İli ve İnegöl İlçesinin Türkiye genelinde karşılaştırmalı armut üretim oranları , İnegöl İlçesi Türkiye'nin % 5,75'i, Bursa İlinin % 14,34'ü, Bursa İli ise Türkiye'nin % 40.20'sini karşılamaktadır. Armut insan sağlığı açısından düşük kalorili, besin değeri zengin, yüksek C ve K vitamin içeriği ile antioksidan özelliği gösteren, lifli bir yapıya sahip, kalp sağlığına pozitif etki eden özellikli bir meyvedir. Dünyada ve Türkiye'de armut tüketimi sırasıyla kişi başına yıllık yaklaşık 2021 yılı TÜİK verisinde 4,4 kg, FAO (Birleşmiş Milletler Gıda ve Tarım Örgütü) verisinde 2,2 kilogram olarak açıklanmıştır. Süregelen tarım uygulamaları enerji tüketim değerlerinin yüksek seviyelerde hesaplanması, üretimin tüm dallarında olduğu gibi armutta da enerji verimliliğinin önemli olduğunu göstermektedir. Bu araştırma; Türkiye genelinde armut üretiminde söz sahibi olan Bursa İli , İnegöl İlçesinde yürütülmüş, enerji bileşenlerinin ,tüm hatları ile ortaya çıkarılması amaçlanmıştır. Basit tesadüfi örnekleme yöntemiyle belirlenen 48 adet armut üreticisiyle 2024 ve 2025 yılları üretim sezonunda yapılan anket verileri değerlendirilmiştir. Armud'un enerji girdi ve çıktıları sırasıyla 114.113,225 MJ ha^{-1}, 291.227,491 MJ ha^{-1} dır. Enerji girdilerinin oransal değişimi büyükten küçüğe sırasıyla makine % 41, fungusit ve insektisitler % 26, dizel yakıt % 13 ve kimyasal gübreler % 11 olarak hesaplanmıştır. Enerji çıktıları sırasıyla meyve % 39,88, budanan dallar % 33,13, yapraklar % 26,98 oranında hesaplanmıştır. Doğrudan enerji ile yenilenebilir enerji sırasıyla % 55, % 56, dolaylı enerji ve yenilenemeyen enerji sırasıyla % 43, % 44 seviyelerinde oransal benzerlik göstermiştir. Enerji verimliliği, özgül enerji değerleri sırasıyla, 1,01, 2,55 ' dir. Enerji verimliliğinin 1,01 olması armut üretiminde enerji kazancının var olduğunu göstermektedir. Türkiye meyveciliğinde ortaya çıkan biyokütle çıktılarının oluşturduğu yenilenebilir enerji miktarları litaratür kaynaklarında ve bu çalışmada görüldüğü gibi dikkatle incelenmeli ve değerlendirilmelidir. Bu çalışma sonuçlarına göre Türkiye'de amut üretiminde belirlenen enerji etkinliği sonuçları, sürdürülebilir tarım için halihazırda ve gelecekte tavsiye edilmesi öngörülen bir meyve çeşiti olduğunu göstermektedir.

ÖZET

Bu çalışma, Türkiye'de son yıllarda kırmızı et fiyatlarındaki değişimlerin incelenmesi ve bu fiyat değişimlerini etkileyen faktörlerin belirlenmesi üzerine odaklanmaktadır. Kırmızı et, insan beslenmesinin temel bir bileşenlerinden olup, tüketici ve üreticiler için ekonomik ve sosyal öneme sahiptir. Bu nedenle, kırmızı et fiyatlarındaki değişimlerin nedenleri ve sonuçları, tüketicilerin ve üreticilerin yaşamları üzerinde önemli etkilere sahip olabilir. Kırmızı et fiyatlarındaki dalgalanmaların nedenlerini anlamak için çeşitli faktörler dikkate alınmalıdır. Nüfus artışı, gelir seviyelerindeki değişimler, tarım politikaları, hayvancılık sektöründeki gelişmeler ve dış etkiler gibi faktörler, fiyat oluşumunu etkileyebilecek potansiyele sahiptir. Bu çalışmanın amacı, Türkiye'deki kırmızı et fiyatlarındaki değişimleri ve üretici fiyat oluşumunu etkileyen faktörleri sistemli bir şekilde analiz etmektir. Elde edilen bulgular, kırmızı et sektörünün önemli bir bileşeni olan fiyatların zaman içinde önemli ölçüde değiştiğini göstermektedir. Türkiye'de kırmızı et fiyatlarının değişimine etki eden faktörler arasında arz ve talep dengesi, tarım politikaları, döviz kurları, uluslararası ticaret, hayvancılık sektöründeki yapısal değişiklikler ve tüketici tercihleri gibi unsurlar belirlenmiştir. Çalışmanın bulguları, kırmızı et sektöründeki paydaşlara, fiyat değişimlerini daha iyi anlama ve gelecekteki fiyat dalgalanmalarına hazırlıklı olma konusunda fikir sağlamaktadır. Özellikle tarım politikalarının kırmızı et fiyatları üzerindeki etkisi göz önünde bulundurularak, politika yapıcılar ve karar vericiler, sektörde istikrarı sağlamak ve tüketicilere uygun fiyatlar sunmak için stratejiler geliştirmelidir. Bununla birlikte, bu çalışma kırmızı et fiyatlarındaki değişimlerin tüm etkilerini kapsamamaktadır. Gelecekteki araştırmalar, daha derinlemesine analizlerle fiyat değişimlerini daha iyi anlamak için yapılabilir. Bu konuda tüketici davranışı ve tercihlerinin kırmızı et fiyatları üzerindeki etkisini daha detaylı inceleyen çalışmalara da ihtiyaç vardır. Bu çalışmanın sonuçları, kırmızı et sektöründeki paydaşlara, politika yapıcılara ve araştırmacılara önemli bir perspektif sunacaktır. Ayrıca, kırmızı et piyasasının sürdürülebilirliği için öneriler sunulacak ve ileriki çalışmalara ışık tutulacaktır.

Anahtar Kelimeler: Fiyat değişimi, kırmızı et, Türkiye, üretici fiyatı

SON YILLARDA TÜRKİYE'DE KIRMIZI ET FİYATLARINDA MEYDANA GELEN DEĞİŞİMLER VE ÜRETİCİ FİYATI OLUŞUMUNDA ETKİLİ OLAN FAKTÖRLER

ABSTRACT

This study focuses on examining the changes in red meat prices in Turkey in recent years and determining the factors affecting these price changes. Red meat is an essential component of human nutrition and has economic and social importance for both consumers and producers. Therefore, the causes and consequences of changes in red meat prices can significantly impact the lives of consumers and producers. Several factors must be considered to understand the reasons for fluctuations in red meat prices. Factors such as population growth, changes in income levels, agricultural policies, livestock sector developments, and external influences can influence price formation. This study aimed to systematically analyze the changes in red meat prices in Turkey and the factors affecting producer price formation. The findings show that prices, which are an important component of the red meat sector, change considerably over time. Among the factors affecting the change in red meat prices in Turkey, factors such as the supply and demand balance, agricultural policies, exchange rates, international trade, structural changes in the livestock sector, and consumer preferences have been determined. The study's findings provide insights for stakeholders in the red meat sector to better understand price changes and prepare for future price fluctuations. Considering the impact of agricultural policies on red meat prices, policymakers and decision-makers must develop strategies to ensure stability in the sector and offer affordable prices to consumers. However, this study did not cover all the effects of changes in red meat prices. Future research should be conducted to better understand price variations through more in-depth analyses. In this regard, studies that examine the effect of consumer behavior and preferences on red meat prices in more detail are needed. The results of this study will provide an important perspective for stakeholders, policymakers, and researchers in the red meat industry. In addition, suggestions for the sustainability of the red meat market and future studies are presented.

ÖZET

Asmanın anavatanı olan Anadolu'da binlerce yıldır yapılan bağcılık, zengin bir asma genetik çeşitliliğinin oluşmasını sağlamıştır. Hem yerli hem de yabancı birçok üzüm çeşidinin yetiştirildiği ülkemizde, üzüm genetik kaynakları materyalinin muhafazasından 1. derecede sorumlu olan kuruluş Tekirdağ Bağcılık Araştırma Enstitüsü'dür.

TÜBİTAK-TAGEM tarafından desteklenmiş olan (KAMAG Proje no:105G078) bu çalışmada, Tekirdağ Bağcılık Araştırma Enstitüsü Milli Koleksiyon Bağı'nda bulunan toplam 13 adet Amasya üzüm genotipi (2 adet referans: Cabernet Sauvignon (CS) ve Merlot (M) ile birlikte), kullanılmıştır. 19 adet SSR (simple sequence repeats-basit dizi tekrarları) lokusu kullanılarak, Amasya üzüm genotipleri arası genetik ilişkiler değerlendirilmiştir. Her bir SSR lokusuna ait primerler ile gerçekleştirilen PCR sonrası, amplifikasyon ürünlerinin Beckman CEQ TM 8800 Genetik Analiz Sistemi'nde kapiller elektroforezleri gerçekleştirilmiştir. Her bir SSR lokusundan elde edilen allel profillerine göre, genetik parametreler, Identity 1.0, benzerlik oranı indeksi Microsat, genetik ilişki dendogramı ise UPGMA yöntemi kullanılarak NTSYS (versiyon 2.02g, Exeter Software, Setauket, NY) programı ile oluşturulmuştur.

Analizler sonucunda, toplamda allel sayısı 110 olarak belirlenmiş olup, en yüksek allel, VVS2 ve VMC2h4 (9 allel) lokuslarından elde edilmiştir. Tüm lokuslardaki beklenen heterozigotluk (*He*) değerleri 0.275 ile 0.849, gözlenen heterozigotluk (*Ho*) değerleri ise; 0.230 ile 1.000 arasında belirlenmiş olup, en yüksek *He* değeri VVS2, en yüksek *Ho* değeri ise VVS2, VVMD27, VrZAG47 ve VMC2h4 SSR lokuslarında görülmüştür.

13 adet Amasya üzüm genotipinden, 2 adet grup aynı (identical) [(1. grup: 1-6-7 no'lu genotipler (Amasya), 2. grup: 2 ve 3 no'lu genotipler (Amasya)] olarak bulunmuştur. Diğer taraftan, 2 ve 3 no'lu genotipler (Amasya), 11 no'lu genotip (İstanbul Amasya) ile sinonim olurken, 9-10 no'lu genotipler (Beyaz Amasya) ve 4 no'lu genotip (Amasya), 1-2-3-6-7 no'lu genotipler (Amasya) ile birlikte homonimdir.

Amasya üzüm genotiplerinin genetik olarak birbirleri ile ilişkilendirilmesine yönelik elde edilen bu verilerin, yürütülecek çeşit tayini, bitki ıslahı, gen kaynaklarının kontrol ve yetiştiriciliği gibi alanlarda önemli katkılar sağlayacağı düşünülmektedir.

MOLECULAR CHARACTERIZATION OF AMASYA GRAPE GENOTYPES USING SSR MARKERS

ABSTRACT

Viticulture, practised for thousands of years in Anatolia, the homeland of the grapevine, has led to the development of a rich genetic diversity of grapevines. In our country, where many local and foreign grape varieties are cultivated, the Tekirdağ Viticulture Research Institute is primarily responsible for the preservation of grape genetic resources.

This study, supported by TUBITAK-TAGEM (KAMAG Project No: 105G078), was conducted using a total of 13 Amasya grape genotypes (together with 2 reference varieties: Cabernet Sauvignon (CS) and Merlot (M)) from the National Grapevine Collection Vineyard of the Tekirdağ Viticulture Research Institute. Genetic relationships among the genotypes were evaluated using 19 SSR (simple sequence repeats) loci. Following PCR performed with specific primers to each SSR locus, the amplification products were subjected to capillary electrophoresis using the Beckman CEQ™ 8800 Genetic Analysis System. Based on the allele profiles obtained from each locus, genetic parameters were calculated using Identity 1.0, the similarity index was determined with Microsat, and the genetic relationship dendrogram was constructed by the UPGMA method using the NTSYS software (version 2.02g, Exeter Software, Setauket, NY).

As a result of the analyses, a total of 110 alleles were identified, with the highest number of alleles (9) obtained from the loci VVS2 and VMC2h4. The expected heterozygosity (*He*) values across all loci ranged from 0.275 to 0.849, while the observed heterozygosity (*Ho*) values ranged from 0.230 to 1.000. The highest *He* value was detected at the VVS2 locus, whereas the highest Ho values were observed at the VVS2, VVMD27, VrZAG47, and VMC2h4 SSR loci.

13 Amasya grape genotypes were identified, with two groups being identical [(Group 1: genotypes 1, 6, and 7 (Amasya); Group 2: genotypes 2 and 3 (Amasya)]. On the other hand, genotypes 2 and 3 (Amasya) are synonymous with genotype 11 (İstanbul Amasya), Genotypes 9, and 10 (Beyaz Amasya) and genotype 4 (Amasya) are homonymous with genotypes 1, 2, 3, 6, and 7 (Amasya).

It is considered that the data obtained for the genetic characterization and relationship of Amasya grape genotypes will provide significant contributions to areas such as varietal identification, plant breeding, the management of genetic resources, and cultivation.

ÖZET

Bu çalışma, Kıl keçilerinde büyüme performans özelliklerinin klasik ve çok değişkenli istatistiksel yaklaşımlar kullanılarak değerlendirilmesini amaçlamıştır. Veriler, Osmaniye ilinde yürütülen Halk Elinde Küçükbaş Hayvan Islahı Projesi kapsamında 2019-2022 yılları arasında doğan 22.122 oğlaktan elde edilmiştir. Doğum ağırlığı (BW), sütten kesim ağırlığı (WW), günlük canlı ağırlık artışı (ADG) ve yaşama oranı (SR) gibi büyüme ile ilişkili özellikler; yıl, mevsim, cinsiyet, doğum tipi, ana yaşı, sürü büyüklüğü, sürü tipi ve rakım olmak üzere sekiz çevresel ve biyolojik faktörün etkisi altında incelenmiştir.

BW, WW ve ADG özellikleri için Genel Doğrusal Model (GLM), SR için ise ikili lojistik regresyon kullanılmıştır. Ayrıca, değişkenler ile faktör düzeyleri arasındaki çok boyutlu ilişkilerin görselleştirilmesi amacıyla Temel Bileşenler Analizi (PCA) Biplot yöntemi uygulanmıştır. GLM sonuçları, incelenen tüm faktörlerin BW, WW ve ADG üzerinde istatistiksel olarak anlamlı etkiler yarattığını göstermiştir ($p < 0.001$). Elit sürülerde, tek doğan, yaşlı analardan doğan ve erkek cinsiyete sahip oğlakların yaşama olasılıklarının daha yüksek olduğu belirlenmiştir ($p < 0.05$). Yıl, mevsim ve rakım özellikle erken dönem büyüme performansı üzerinde etkili bulunmuş; orta rakımlı bölgelerde ve ilkbaharda doğan oğlakların daha iyi performans gösterdiği tespit edilmiştir.

PCA Biplot analizi, çevresel koşullar, biyolojik özellikler ve büyüme sonuçları arasındaki ilişkileri başarılı bir şekilde görselleştirerek GLM bulgularını desteklemiştir. GLM ve PCA Biplot'un birlikte kullanımı, istatistiksel modelleme ile çok değişkenli grafiksel yorumun tamamlayıcı gücünü ortaya koymuş ve küçükbaş hayvan yetiştiriciliğinde büyüme ve yaşama performansının daha bütüncül biçimde anlaşılmasına katkı sağlamıştır.

Anahtar Kelimeler: Kıl keçisi, Büyüme performansı, Biplot

MULTIVARIATE ASSESSMENT OF GROWTH AND SURVIVAL TRAITS IN TURKISH HAIR GOATS USING GLM AND PCA-BIPLOT

ABSTRACT

This study aimed to evaluate growth performance traits in Turkish Hair goats using both classical and multivariate statistical approaches. Data were obtained from 22,122 kids born between 2019 and 2022 within the National Small Ruminant Breeding Project in Farmers' Hands conducted in Osmaniye, Türkiye. Growth-related traits including birth weight (BW), weaning weight (WW), average daily gain (ADG), and survival rate (SR) were analyzed to assess the effects of eight environmental and biological factors: year, season, gender, birth type, dam age, herd size, herd type, and altitude.

General Linear Models (GLM) were used for BW, WW, and ADG, while binary logistic regression was applied to SR. In addition, a Principal Component Analysis (PCA) Biplot was employed to visualize multivariate relationships among traits and factor levels. The GLM results showed that all examined factors significantly influenced BW, WW, and ADG ($p < 0.001$). Kids born in elite herds, as singletons, from older dams, and of male gender exhibited higher survival probabilities ($p < 0.05$). Year, season, and altitude were particularly influential on early growth traits, with kids raised at mid-altitude regions and born in spring demonstrating superior performance.

The PCA Biplot successfully illustrated associations between environmental conditions, biological characteristics, and growth outcomes, revealing underlying patterns consistent with GLM findings. The combined use of GLM and PCA Biplot emphasizes the value of integrating statistical modeling and graphical multivariate interpretation for animal breeding research.

This comprehensive evaluation contributes to the optimization of breeding and management strategies aimed at improving growth efficiency and kid survivability in small ruminant production systems.

ABSTRACT:

Neela Neera Soriyan (2024) marks a significant moment in Tamil cinema's evolving queer landscape by featuring real transgender individuals performing transgender roles, breaking away from the long-standing tradition of cisgender actors portraying transgender identities in comedic or marginal capacities. Through close textual analysis grounded in performance studies, this paper examines how the film redefines authenticity and self-representation by foregrounding trans bodies, voices, and lived experiences within the cinematic frame. The study explores how *Neela Neera Soriyan* visualises transformation not as a medicalised spectacle or physical transition, but as ongoing processes of emotional resilience, social belonging, and cultural affirmation. Drawing upon Judith Butler's theory of performativity and Susan Stryker's discourse on Tran's embodiment, the paper argues that the film constructs a space for visibility, resistance, and dignity. It further investigates how cinematic acknowledgement of real transgender actors destabilises the cisgender gaze and contributes to broader societal recognition of Trans lives in contemporary Tamil society. The film thus functions as both aesthetic intervention and political praxis, transforming cinematic representation into an instrument of Tran's empowerment and social inclusion.

Keywords: Real Transgender representation, Tamil cinema, performativity, queer embodiment, cisgender gaze, visibility.

ARTHROPODE PARASITES OF BEE – CONOPID FLIES AND EARWIGS

ABSTRACT

Conopid Flies also known as the thick-headed flie are endoparasitoids of bees. The females rest on flowers, awaiting passing bumble bees or honey bees. They then attack passing bees in flight or sometimes catch bees as they forage on flowers. Upon landing on the bee, the fly prises open a space between two of the bee's body segments, and inserts an egg into the soft body beneath the harder body cuticle. The egg hatches quite quickly inside the bee, and the emerging larvae feeds on the victim, eating it from the inside. Before dies the bee's behavior changes. It spends less time in the nest, and ultimately will no longer return at night, instead seeking cooler locations away from the nest. Whilst still able to forage, research has shown that bees parasitized by conopid flies have a reduced capacity to carry nectar. The conopid fly then overwinters under ground in the body of the host bee, and emerges the following year, now an adult conopid fly, ready to attack more bees and begin the cycle again.

Honey bees are harmed by common earwigs *Forficula auricularia*, garden earwigs *Forficula tomis* and coastal earwigs *Labidura riparia*. In bee colonies, these insects can occur throughout the beekeeping period, but active penetration into hives is observed in the second half of summer and autumn, especially in cool and rainy weather. A mass cluster of earwigs can be observed at the bottom of the hive from the outside, as well as on the inside of the hive cover, in the insulation material, crevices, and on honeycomb, where they feed on honey and perg, contaminating their surface with the products of vital activity, attack sick adult bees, spoil brood. Earwigs bring pathogens of American and European foulbrood into bee colonies and five types of viruses BQCV, DWV, IAPV, KBV and SBV.

ABSTRACT

Epilepsy is a widespread neurological disorder characterized by frequent seizures and affects millions of individuals worldwide. Despite the primary role of antiseizure drugs (ASDs) as therapeutics, about 30% of patients develop drug-resistant epilepsy (DRE). In DRE, seizures are not sufficiently controlled by the existing medications. This highlights the urgent need to develop new ASDs with greater efficacy and tolerability. The moieties 1,3,4-oxadiazole and carboxamide serve as significant pharmacological scaffolds, particularly in antiseizure drugs. In this pursuit, iso-nicotinic acid **(1)** was chemically modified to synthesize 1,3,4-oxadiazole coupled carbamothioate hybrid structures. A series of *N*-Arylated 5-(pyridin-4-yl)-1,3,4-oxadiazole-2-yl-2 sulfanyl carbamide compounds **(6a-6e)** were synthesized in significant yields (74-88%) by substituting the hydrogen atom in the SH group of the oxadiazole moiety **4** with different electrophiles under diverse reaction conditions. The resulting compound structures were verified using spectroscopic techniques such as ^{1}H & ^{13}C-NMR, FTIR, and EI-MS analysis. Later, the synthesized compounds **(6a-6e)** were tested for anticonvulsant potential through *in vivo* experimentation in 6 Hz (32 Hz) and PTZ (80 mg/kg)-induced seizure models. The neuroprotective effects observed in the acute PTZ test were further validated through video-encephalographic (vEEG) analysis. Among the series, compounds **6a** and **6e**, with electron-donating methoxy and ethoxy groups at para positions on the phenyl ring of *N*-substituted carbamides, demonstrated marked protection against seizure onset and progression in both models. Furthermore, pre-treatment with **6a** and **6e** led to a substantial reduction in the development of epileptiform spiking activity, revealing robust anticonvulsive potential.

UNVEILING ADAPTIVE COMPONENTS FOR ENVIRONMENTAL HETEROGENEITY IN *Ipomoea carnea* JACQ.

Muhammad Safdar[1], Syed Mohsan Raza Shah[1]

[1]Department of Botany, Division of Science and Technology, University of Education, Lahore, Pakistan

ABSTRACT

Environmental heterogeneity is an important factor that affects species richness and provides conditions for adaptation of existing species. Factors affecting the diversity gradient are climatic variation, biotic interactions, territory, ambient vigor, productivity, available water resources and some other factors that direct the historical process by the evaluation of climatic history and phylogeny of niche conversation. Naturally adapted populations of *Ipomoea carnea* Jacq. were collected from various ecological regions of Punjab province to investigate their adaptive components that have been developed under heterogeneous environmental conditions. Multivariate redundancy analysis (RDA) and correlation analysis were done to evaluate the association of soil physiochemical features with different morpho-anatomical and physiological characteristics. *I. carnea* is an invasive species that can rapidly grow, spread and adapt from xerophytic to aquatic habitats. This species showed better growth and biomass production near water bodies. Additionally, it also exhibited some specific anatomical modifications such as aerenchyma formation, sclerification, xylem ray thickness, leaf thickness and large metaxylem area that enable it to survive under harsh environmental conditions. Populations from highly saline habitats showed higher value of osmolytes and ionic contents (K^+ and Ca^{2+}). Furthermore, the populations from highly saline areas also exhibited the maximum uptake of Na^+ content and the lowest uptake of K^+ and Ca^{2+} content. In conclusion, *I. carnea* showed very specific modifications in morpho-anatomical and physiological traits that reveal its ecological success from aquatic to xerophytic habitats.

ABSTRACT:

Urease, a nickel-dependent enzyme presents in various organisms, facilitate the decomposition of urea, executing nitrogen metabolism by producing ammonia and carbamate. This process increases pH levels, promotes pathogen survival, and may result in infections, including gastric issues like ulcers and cancer in humans. *Helicobacter pylori* utilizes urease to endure the acidic conditions in stomach and facilitates in protein synthesis. To address these infections and prevent the growth of pathogens, it is essential to inhibit urease activity; thus, derivatives of 1-(3-nitropyridin-2-yl)piperazine were synthesized. All of these newly synthesized compounds were examined for their urease inhibition potential by *in vitro* inhibition protocols. The results showed that two compounds are the potent inhibitors, having IC_{50} values of 2.0 ± 0.73 and 2.24 ± 1.63µM, respectively that are lower than the IC_{50} value of the standard thiourea, 23.2 ± 11.0 µM. The hemolysis potential of all the synthesized compounds was also determined; two compounds demonstrated good biocompatibility in human blood cells. Both these potent inhibitors exhibited feasible interactions with the active site of urease, having binding energies of −8.0 and −8.1 kcal/mol, determined by *in silico* analysis. The binding energy of thiourea was −2.8kcal/mol. Consequently, both compounds can act as important inhibitors of urease.

PHYSICOCHEMICAL, NUTRITIONAL, AND SENSORY ATTRIBUTES OF HIGH FIBER FRUIT LEATHER OF RED DRAGON FRUIT-PEEL AND MANGO

U. Das [1*], M.A. Bin Hasan [1], T. Hussain [2], A. Rahman [2], A. Mahmood [3], S. Marma [1], J. Tasnia [2], S. Akter [1], S. Barua [1], N.S. Fabia [1]

ABSTRACT

Background: The growing demand for sustainable and health-conscious foods has led to innovative uses of fruit by-products. Dragon fruit peel, often discarded, is high in fiber and antioxidants, while mango pulp enhances taste and nutritional value. This study focused on developing a fiber-rich, sustainable fruit leather, assessing its physicochemical, nutritional, and sensory properties to evaluate its potential for commercialization.

Methods: Two fruit leather formulations were prepared: one with spices and one without. Their physicochemical properties including pH, total soluble solids (°Brix), water activity, and ascorbic acid content along with proximate composition (protein, fiber, fat, ash, and carbohydrate content) were assessed using standard methods. Sensory evaluation was conducted with 30 untrained panelists (15 male and 15 female) using a seven-point hedonic scale to assess appearance, odor, texture, taste, spiciness, chewiness, and overall acceptability. Quality parameters such as color, flavor, texture, and taste were also evaluated at 30-day intervals for four months by five trained panelists. Statistical analysis was performed using one-way ANOVA, with results reported as mean±Standard Deviation, using Minitab v21, with statistical significance set at $p<0.05$.

Results: The spiced formulation showed a pH of 4.03, total soluble solids of 35.2 °Brix, water activity of 0.641, and ascorbic acid content of 58.5 mg/100 g. Proximate analysis revealed moisture content of 13.76%, crude protein of 2.74%, crude fiber of 33.91%, crude fat of 0.54%, ash of 3.74%, and carbohydrate content of 20.58%, with an energy value of 98.14 kcal/100 g. Sensory evaluation indicated a preference for the spiced version due to enhanced flavor and aroma, achieving higher acceptability scores.

Conclusion: This research highlights the potential of repurposing dragon fruit peel into a commercially viable, high-fiber snack, contributing to waste reduction and functional food innovation. Additionally, mango further enhances the product's sensory appeal and nutritional profile.

HIGHLIGHTS

High fiber, low energy entirely organic fruit leather as synthetic ingredients were absent.

Honey slightly reduced the total soluble solids due to its water content, affecting texture.

Spices significantly influenced the taste and aroma of the fruit leather.

HYDROGEN PRODUCTION FROM SOLAR ENERGY: A SUSTAINABLE ALTERNATIVE FOR RURAL ENERGY SYSTEMS

Chaymae Denden

National School of Applied Sciences of Oujda(ENSAO),UMP

Email: chaymae.denden@ump.ac.ma

ORCID: 0009-0004-3739-862X

ABSTRACT

The growing global demand for clean and sustainable energy sources has accelerated the search for efficient alternatives to fossil fuels. Among these, hydrogen stands out as a promising energy carrier due to its high energy density and zero carbon emissions at the point of use. This study presents an overview of hydrogen production through water electrolysis powered by photovoltaic (PV) solar energy. The proposed approach highlights the potential of integrating solar PV systems with electrolyzers to generate green hydrogen for rural and agricultural applications. Such systems can provide a stable and renewable energy supply for irrigation, water pumping, and storage, especially in remote or off-grid areas. The paper emphasizes the environmental and economic benefits of solar hydrogen production as a key solution for sustainable rural development and the global energy transition.

Keywords: Hydrogen production, Solar energy, Photovoltaic systems, Electrolysis, Rural development, Sustainability.

THE CONTRIBUTION OF MULTISPECTRAL DRONES TO PRECISION AGRICULTURE IN THE TADLA PLAIN : EFFICIENCY, BENEFITS, AND CHALLENGES

Hasna JINNOU*, Said ARIF and Mohamed Achraf HASNAI*****

*Research Laboratory (Landscape Dynamics, Risks, and Heritage), Faculty of Letters and Human Sciences, Sultan Moulay Slimane University, Béni Mellal, Morocco.
**Professor of Geography at the Faculty of Letters and Human Sciences, Béni Mellal.
***Manager of Farmassist, an agricultural company specializing in agricultural service provision.

ABSTRACT

This study evaluates the use of multispectral drones in agricultural management, highlighting their contribution to optimizing agronomic practices. The experiment, conducted in the Tadla Plain, focused on various crops, including cereals, olive groves, and citrus orchards, to assess the effectiveness of multispectral imaging in detecting water stress, nutrient deficiencies, and pest infestations. The integration of multispectral sensors mounted on drones enabled the early identification of anomalies and targeted interventions through vegetation indices such as the Green Chlorophyll Index (GCI), thereby reducing yield losses and optimizing the use of agricultural inputs.

The results confirm the numerous advantages of this technology: rapid and precise crop monitoring, more efficient use of water resources and fertilizers, and a reduction in the environmental impact of phytosanitary treatments. Compared to conventional approaches, multispectral imaging enhances agronomic decision-making and promotes more sustainable and efficient agriculture. However, certain technical constraints remain and may limit its large-scale deployment.

Despite these challenges, the integration of drones into agronomic monitoring represents a significant step forward in precision agriculture, offering better risk anticipation and more effective crop management.

ABSTRACT

The alcohol C15H26O was synthesized by hydroboration-oxidation of α-transhimachalene (R) with 9-BBN and H2O2/OH- in tetrahydrofuran. The chemoselectivity of the reaction was studied theoretically using molecular density theory (MEDT). Experimental chemoselectivity with optimal interaction was determined appropriately, as predicted by Parr's functions, analysis of the electron localization function (ELF) of the reactants, and energy studies. Furthermore, the hydroboration-oxidation reaction of α-trans-himachalene (R) by 9-BBN and H2O2/OH- exhibits lower activation energy in water and ethanol, demonstrating that this reaction can be carried out in environmentally friendly solvents. The mechanistic study indicates that this hydroboration-oxidation reaction follows a concerted mechanism with asynchronous bond formation. In addition, a docking study was performed by docking α-trans-himachalen (R), alcohol P"1, and alcohol P"2 with the main protease Topoisomerase II (1ZXM) relative to etoposide, and in the main protease of Tubulin (1SA0) relative to taxol. This study showed that alcohols could be candidates for cancer drugs.

Keywords: hydroboration-oxidation, MEDT, ELF, α-trans-himachalene, activation energy.

GIS-BASED MULTICRITERIA ANALYSIS FOR OPTIMAL GREEN HYDROGEN (GH2) PRODUCTION SITE SELECTION

1Amina Yahia

1Amina Yahia : Institute of Urban Management Techniques, Oum el Bouaghi University, Algeria.

Email: yahia.amina@univ-oeb.dz.

ORCID: 0000-0002-3782-1713

ABSTRACT:

The viability of a green hydrogen economy in Algeria depends on successfully exploiting its green energy production, water availability, and its potential to convert to hydrogen. Identifying optimal production sites should encompass the entire hydrogen value chain, while considering all elements influencing the levelized cost of hydrogen (LCOH). This comprehensive approach can ensure the sustainable development of a hydrogen economy in Algeria, while providing insight into potential synergies between the actors involved. This would improve the efficiency of the value chain and potentially reduce the LCOH.

Stable production of green hydrogen requires a constant supply of sustainable energy. Fortunately, Algeria has abundant solar and wind resources suitable for large-scale green hydrogen production. The strategic approach of harnessing both solar and wind sources offers significant benefits. This synergy enhances the stability of sustainable energy supply by mitigating the production fluctuations inherent in variable renewable resources. [1]

This article has been developed to document and deepen knowledge on green hydrogen (GH2) from existing research and policy documents. The demonstrated knowledge is expected to contribute to a better understanding of the factors relevant to the optimal location of GH2 production facilities.

The second objective is to use the knowledge developed under the first objective to identify optimal locations and regions for GH2 production using wind and solar energy. This includes the process and methodology used to leverage geographic information systems (GIS) to identify optimal locations for Algeria's GH2 production facilities. The document details the factors incorporated into the evaluation process, fully explaining the logic behind the importance or weighting assigned to each factor. The analysis results are discussed, and relevant questions to improve the process in future evaluations are presented.

As part of this study, three green hydrogen production scenarios are established:

Scenario 1: Large-scale pilot sites with an electrolyser capacity of 20 to 50 MW,

Scenario 2: Industrial sites with an electrolyzer capacity of 200 to 400 MW,

Scenario 3: Giga-sites with an electrolyzer capacity of 2 GW.

For each of the three GH2 production scenarios, typical configurations including electrolyzers, wind, and solar energy were established. The analysis starts with a 1 MW electrolyzer as a reference. Using current technological data, the potential production of hydrogen is calculated based on different capacity factors (CFs).

Keywords: Green Hydrogen (GH2), Hydrogen Economy in Algeria, Optimal Production Sites, Solar Energy in Algeria, Wind Energy in Algeria, Geographic Information Systems (GIS), Site Selection Methodology.

HEALTH AND NUTRITIONAL BENEFITS OF THE MEDITERRANEAN DIET AND OLIVE OIL CONSUMPTION

Gresa Ahma

ABSTRACT

The Mediterranean Diet (MedDiet) is widely acknowledged for its significant role in enhancing health and preventing chronic diseases. Characterized by a high intake of plant-based foods such as fruits, vegetables, legumes, whole grains, and nuts, it also emphasizes olive oil as the primary source of dietary fat. While extra virgin olive oil (EVOO) is particularly noted for its rich polyphenol content and antioxidant properties, all forms of olive oil virgin or refined remain essential components of the MedDiet, contributing substantially to its overall health benefits. Although extensive research has demonstrated the MedDiet's positive effects on cardiovascular, metabolic, and cognitive health, current investigations continue to explore the specific mechanisms underlying olive oil's contribution to these outcomes. This paper explores the association between adherence to the MedDiet especially olive oil consumption and improvements in nutritional status as well as the prevention of non-communicable diseases (NCDs). A comprehensive review of recent clinical trials and systematic reviews was conducted, synthesizing data from various populations and study designs. The evidence consistently indicates that regular olive oil consumption within the MedDiet framework is linked to reduced systemic inflammation, improved lipid profiles, lower obesity rates, and enhanced cognitive performance. The high concentration of monounsaturated fatty acids (MUFA) and bioactive compounds in olive oil plays a crucial role in these beneficial effects. Overall, these findings reinforce the value of incorporating olive oil into daily dietary practices and underscore the MedDiet as a sustainable and effective approach to long-term health promotion.

Keywords: Mediterranean Diet, Olive Oil, Nutritional Health, Chronic Disease Prevention, Longevity

AGRICULTURE AND AMINAL SCIENCE DEVELOPMENT

Mustapha Muhammad Imam

Ahlul-Baıty Internatıonal Unıversıty (Abu Tehran)

Department: Archıtecture

ABSTRACT

This article explores the transformative convergence of modern agriculture and animal science, outlining a path toward a more sustainable and efficient global food system. It argues that the integration of digital technologies, genetic advancements, and circular economic models is revolutionizing traditional practices. Key developments discussed include the application of precision agriculture and precision livestock farming (PLF) for data-driven management, the use of genetic tools like CRISPR for developing resilient crops and livestock, and the implementation of integrated crop-livestock systems that minimize waste. The article concludes that this synergistic approach, grounded in the "One Health" principle, is essential for enhancing productivity, improving animal welfare, and ensuring environmental sustainability to meet the challenges of the future.

IMPLEMENTATION OF A NEW PROTOCOL FOR CLEANING/DISINFECTING OF FRUITS AND VEGETABLES AGAINST PESTICIDES

Amel ZITOUNI1, Afaf Oualhaci1, Faiza Ilyas1, Amel BELGACEM1, Azzeddine SENOUCI1.

1Department Of Agri-Food, Faculty Of Science And Technology, University Of Ain Temouchent , ALGERIA;

ABSTRACT

Food safety and human health are closely linked. Unsafe or contaminated food creates a vicious cycle of diseases and poisonings, which can be caused by the presence of pathogens on the surface of agricultural products, as well as their chemical contamination by pesticides and fertilizers. In light of this situation, it is necessary to implement good hygiene protocols aimed at disinfecting fruits and vegetables before consumption.

Our study aligns with this dynamic and aims to achieve two main objectives:

The first is to contribute to improving knowledge of the incidence of food poisoning from pesticide residues and microorganisms. We conducted a survey of 200 university students from various universities in Western Algeria and 50 public health employees in the Aïn Temouchent province (west of Algeria). Of those consulted, 65.2% believe that raw fruits and vegetables contain contaminants, 71.6% have experienced food poisoning from consuming these agricultural products, and 91.2% wish for an appropriate industrial disinfectant/cleaner for fruits and vegetables to be available in the Algerian market. Therefore, we conducted another small survey of 50 people living abroad, where 98% recommended using this product for its effectiveness.

In the second part, our study is dedicated to experimenting with and establishing a good protocol for disinfecting and cleaning fruits and vegetables. The objective is to provide a new depollutant composed of two different products: a disinfectant based on sodium hypochlorite and a cleaner made from citrus lemon essential oil and some natural components, marking the originality of our study.

Key words: Fruits- Vegetables- Contaminants- Pesticides- Microorganisms- Food poisoning.

FROM REFILLABLE TO DISPOSABLE WATER GALLONS: A DILEMMA IN ECO-FRIENDLY WATER CONSUMPTION

Emalisa Emalisa

Faculty of Business, President University – Indonesia

Jhanghiz Syahrivar

Faculty of Business, President University – Indonesia

Corresponding Author: jhanghiz@president.ac.id

ABSTRACT

The transition from refillable to disposable water gallons presents a critical sustainability dilemma. While disposables are promoted as practical, they generate substantially more plastic waste and pose greater environmental and health risks than refillable options, which remain the eco-friendly option. This study investigates the psychological and perceptual factors that may encourage consumer adoption of disposable gallons, with the aim of informing strategies to reinforce refillable systems. Drawing primarily on the Theory of Reasoned Action (TRA), the research examines how perceptions of price fairness, environmental awareness, and health consciousness influence consumer attitudes, and how these attitudes shape purchase intention toward disposable gallons. Data were collected from 300 refillable water gallon users familiar with disposable gallons through an online survey and analyzed using Structural Equation Modeling (SEM). The results show that price fairness, environmental awareness, and health consciousness have a significant impact on attitudes, which in turn predict purchase intention for disposable products. Notably, the positive effect of environmental awareness on attitudes reveals a misalignment between perceived and actual sustainability, suggesting that some consumers mistakenly view disposables as environmentally friendly. This counterintuitive finding underscores the importance of education, communication, and policy interventions to correct misconceptions, discourage reliance on disposables, and promote refillable systems as the more sustainable choice in water consumption.

WATER-BASED PROBIOTIC SUPPLEMENTATION IMPROVES GROWTH AND INTESTINAL MORPHOLOGY IN JUVENILE GULSHA TENGRA (*mystus cavasius)*

Mithila Sen

Laboratory of Fish Disease, Department of Aquaculture, Bangladesh Agricultural University, Bangladesh

Email: mithila.1906025@student.bau.edu.bd

ABSTRACT

Probiotics, particularly Bacillus-based formulations, are increasingly used in aquaculture to enhance fish growth. However, their water application methods and optimal dosing for indigenous species like Gulsha Tengra (Mystus cavasius) remain poorly understood. This study evaluated the effects of water-based probiotics on the growth performance and intestinal morphology of M. cavasius. Four treatments were administered: T1 (Control; 0 mg/L B. subtilis), T2 (1 mg/L B. subtilis), T3 (5 mg/L B. subtilis), and T4 (10 mg/L B. subtilis) for 60 days. Results demonstrated that T3 showed significantly better performance compared to others by exhibiting the highest weight gain (WG), specific growth rate (SGR), and the lowest feed conversion ratio (FCR). Moreover, the intestinal morphology was also improved significantly in T3. These findings demonstrate that water-applied B. subtilis probiotic at 5 mg/L significantly enhances growth performance and intestinal health in M. cavasius, providing a practical protocol for small-scale farmers.

Keywords– Probiotics, intestinal morphology, aquaculture, Mystus cavasius

INFLUENCE OF PLASTIC MULCHING ON PHYTOPHTHORA INOCULUM DENSITY IN THE CITRUS ROOT ZONE

MAJJI M'hamed [1,2], TALHA Abdelhak[1], AOUZIOU Brahim[1], BOUNSIR Abdelwahed[1,2], BENKIRANE Rachid[2], BENYAHIA Hamid[1,*]

[1] Research Unit in Plant Breeding and Germplasm Conservation, National Institute for Agricultural Research (INRA), Kenitra, Morocco

[2] Laboratory of Botany, Biotechnology, and Plant Protection, Ibn Tofail University, Kenitra, Morocco

ABSTRACT

Phytophthora root rot is among the most damaging diseases affecting citrus production in Morocco, causing root decay, trunk gummosis, and fruit brown rot. This study evaluated the effect of plastic mulching on the density of Phytophthora inoculum in the rhizosphere of citrus rootstocks. The trial was conducted for one year on new citrus varieties at the El-Menzeh experimental field (INRA, Kenitra). Composite soil samples were collected around the base of trees (15–20 cm depth, four directions) and processed using the dilution plating technique on BARPHY72 selective medium. Results revealed significant variation in inoculum density depending on both rootstock and mulching treatment. Plastic mulching consistently reduced Phytophthora propagule density, with a stronger effect observed in Citrange carrizo compared to Citrus volkameriana. These findings highlight mulching as an effective strategy to limit Phytophthora infection in citrus orchards.

Keywords: Soilborne pathogens, Propagule density, Disease management, Cultural practices, Sustainable agriculture.

AGRO-PHYSIOLOGICAL AND BIOCHEMICAL RESPONSES OF THE 'ANGELINO' CULTIVAR (*prunus salicina l*) UNDER CONDITIONS OF DROUGHT AND HEAT STRESS

ABSTRACT

This study examines the impact of deficient irrigation and high temperatures on the levels of growth, production and physico-chemical quality of the plum cultivar 'Angelino' (Prunus salicina L). The study was conducted in the field of the National Agricultural Research Institute (INRA) experimental estate at 'Ain Taoujdate'. Two stress treatments were applied, namely a drought stress (DS) level of 50% of crop evapotranspiration (ETc), and exposure to a heat stress (HS) of 2.5°C, were compared with on-demand irrigation (100% of ETc) not under thermal stress, during the fruit development period from the fruit set stage until harvest time. Observations were made on various traits that could be stress descriptors, including fruit yield, certain vegetative growth characteristics including shoot length, number of leaves and leaf area, as well as physiological characteristics such as stomatal characteristics, leaf proline, cuticular wax and chlorophyll a and b pigment content, with some chemical and biochemical components of plum quality. The results obtained showed that the effect of drought and heat stress reduced plum productivity by a general average of 61%, vegetative growth also declined by 49% and physiological characteristics decreased by 48% except proline and cuticular wax, although the taste quality of plums has been improved thanks to increases in the content of sugars, amino acids and polyphenols. This illustrates the need for agriculture in the study area to adapt to the conditions imposed and predicted by climate change in terms of water resources and high temperatures.

Keywords: Prunus salicina L, Drought stress, Temperature, Production, Growth, Quality.

BIOFUEL PRODUCTION FROM CHLORELLA SPECIES

ABSTRACT

Biofuels are considered a more sustainable alternative to fossil fuels because they are produced from biomass sources, making them renewable and biodegradabl. This study was carried out to investigate the potential of Chlorella species for biodiesel production. Here is a concise summary of the provided study. This study investigated the potential of Chlorella species for biodiesel production using samples collected from ponds, stagnant water, and drainage sources. Microalgae were identified through microscopic and molecular methods, with Chlorella sorokiniana confirmed via molecular analysis. Cultivation was optimized by adjusting pH, temperature, and light, using three different growth media: BG11, NPK, and Biomark Algal Broth. Among the identified species were Chlorella spp., Spirogyra spp., Chlamydomonas spp., Oedogonium spp., and Microspora spp. BG11 medium supported the highest growth rate (0.140 mg/day), biomass productivity (0.842 mg/ml/day), and oil yield (0.028 ml, 24%). In contrast, NPK medium had the lowest values in all categories. Biodiesel was extracted via mechanical pressing and transesterified using ethanol and sodium hydroxide. BG11-grown microalgae produced the highest biodiesel yield (0.021 ml), while NPK-grown yielded the least (0.00723 ml). The study recommends the use of microalgae, especially Chlorella, as a sustainable and eco-friendly biofuel source.

ABSTRACT

Piperazine-based Mannich bases have attracted significant attention in recent years due to their broad range of biological and agricultural applications. These compounds display notable antifungal, antibacterial, antiviral, antioxidant, anti-inflammatory, and anticancer properties, making them valuable candidates for developing new agents against crop and animal pathogens. Their ease of synthesis, structural diversity, and tunable physicochemical properties further enhance their potential as sustainable bioactive molecules.This review summarizes the recent (2020–2025) progress in multicomponent Mannich-type methodologies for constructing functionalized piperazine scaffolds. Key advances in reaction design, catalyst systems, and substrate scope are discussed alongside correlations between structure and biological activity. The relevance of these synthetic strategies to agricultural, environmental, and veterinary research is emphasized, highlighting their contribution to sustainable rural development. Overall, this review provides an updated perspective on piperazine-based Mannich bases, underscoring their growing significance across chemical and life sciences.

VETERİNER TIBBİ ÜRÜNLERİN KALİTE KONTROL TESTLERİ

Dr. Tülay AVCI
Selçuk Üniversitesi Veteriner Fakültesi
Email: tulay.avci@selcuk.edu.tr
ORCID 0009-0005-0817-8182

ÖZET

Veteriner tıbbî ürün, hayvan hastalıklarının teşhisi, önlenmesi, tedavisi veya fizyolojik fonksiyonların düzenlenmesi amacıyla hedef türe uygulanan ya da hedef tür için kullanılmak üzere tüm üretim aşamalarından geçerek kullanıma hazır hâle getirilmiş etkin madde içeren ürünlerdir. Resmi otoriteler tarafından yayımlanan kılavuzlarda, farmasötik ürün, bitmiş ürün, müstahzar ve ilaç gibi farklı şekillerde de ifade edilmektedir. Veteriner ilaç endüstrisi, hayvan sağlığının korunması, antimikrobiyal dirençle mücadele ve gıda güvenliğinin sağlanması açısından veteriner tıbbi ürünün yaşamsal döngüsünün kritik öneme sahip olduğu, sürekli olarak istenilen kalitede ürün üretebilme becerisinin olduğu bir endüstridir. Veteriner tıbbi ürünlerin hedeflenen kalitede üretildiklerinin güvence altına alınmasında resmi otoriteler tarafından gerçekleştirilen denetimler ve konuya ilişkin yapılan düzenlemeler de oldukça önemlidir. Ülkemizde veteriner tıbbi ürünlerin üretimi, ithalatı, ihracatı, kullanımı, reçeteli ya da reçetesiz satışı, izin, kontrol ve teminine ilişkin uygulamaların belirlenmesine yönelik otorite Tarım ve Orman Bakanlığı'dır. İlaç endüstrisinde özellikle son on yılda, farmasötik ürün kalitesinin güvence altına alınmasında yenilikçi yaklaşımların kullanılmaya başlandığı görülmektedir. İyi Üretim Uygulamaları (GMP) çerçevesinde, ulusal ve uluslararası düzenleyici otoritelerin belirlediği kalite, güvenlik ve etkin standartlarına uygun olarak üretilen veteriner tıbbi ürünlerin kalite bütünlüğü, lojistik ve dağıtım süreçlerinin herhangi bir aşamasında bozulma riski taşımaktadır. Veteriner tıbbi ürünlerde yaşanacak bozulmaların ortaya konmasında piyasaya arzı sonrası mevzuat kapsamında yapılan denetlemelerde alınan numunelerin üretici firma tarafından beyan edilen spesifikasyonlara uygunluğunun araştırılması ile mümkündür. Spesifikasyonlar etkin madde miktarı tayini, fiziksel-kimyasal analizler (pH, yoğunluk, çözünürlük vb.), mikrobiyolojik kontroller (sterilite testleri, bakteriyel endotoksinler vb.) ve ambalaj uygunluğu gibi parametreler içermektedir. Bu kapsamda bu derlemede; Veteriner tıbbi ürünlerin piyasaya arz edilirken sunulan raf ömrü spesifikasyon parametreleri kapsamında kalite kontrol testleri hakkında bilgi verilmiştir.

QUALITY CONTROL TESTS FOR VETERINARY MEDICAL PRODUCTS

ABSTRACT

Veterinary medicinal products are products containing active substances that have undergone all stages of production to be ready for use, applied to the target species or intended for use on the target species for the diagnosis, prevention, treatment or regulation of physiological functions of animal diseases. In guidelines published by official authorities, they are also referred to in different ways, such as pharmaceutical products, finished products, preparations, and medicines. The veterinary drug industry is one in which the life cycle of veterinary medicinal products is of critical importance in terms of protecting animal health, combating antimicrobial resistance and ensuring food safety, and which has the ability to continuously produce products of the desired quality. Inspections carried out by official authorities and regulations on the subject are also very important in ensuring that veterinary medicinal products are produced to the targeted quality. In our country, the Ministry of Agriculture and Forestry is the authority responsible for determining the practices related to the production, import, export, use, prescription or non-prescription sale, licensing, control and supply of veterinary medicinal products. In the pharmaceutical industry, particularly in the last decade, innovative approaches have been adopted to ensure the quality of pharmaceutical products. Within the framework of Good Manufacturing Practices (GMP), the quality integrity of veterinary medicinal products manufactured in accordance with the quality, safety and efficacy standards set by national and international regulatory authorities is at risk of deterioration at any stage of the logistics and distribution processes. The occurrence of deterioration in veterinary medicinal products can be identified by examining the compliance of samples taken during post-market inspections with the specifications declared by the manufacturing company. Specifications include parameters such as active ingredient quantity determination, physical-chemical analyses (pH, density, solubility, etc.), microbiological controls (sterility tests, bacterial endotoxins, etc.), and packaging suitability. In this context, this review provides information on quality control tests within the scope of shelf life specification parameters presented when veterinary medicinal products are placed on the market.

ORCID: 0000-0002-2789-0635

ÖZET

Isı stresi, hayvanların termal konfor bölgesinin üzerinde kalan sıcaklık ve neme maruz kalması sonucunda fizyolojik, metabolik ve davranışsal adaptasyon mekanizmalarının yetersiz kaldığı bir durum olarak tanımlanmaktadır. Isı stresi, hayvan yetiştiriciliğinde verimi etkileyen en önemli çevresel faktörlerden biri olup hayvanların verim performanslarını, sağlıklarını ve refahlarını olumsuz etkileyerek doğrudan veya dolaylı olarak hayvan yetiştiriciliğinde zorluklar yaşanmasına yol açmasından dolayı hayvancılık sektörün de kritik bir sorundur. Küresel iklim değişikliğiyle birlikte artan sıcaklıklar, Türkiye'nin de yer aldığı Akdeniz iklim kuşağındaki bölgelerde hayvancılık için daha da kritik bir sorun haline gelmiştir. Son raporlar da küresel sıcaklığın son 10 yılda 0,25 °C artacağı bildirilmiş ve bu artışın 2100 yılına kadar 1,9 ila 8,5 °C'ye ulaşabileceğini öngörülmüştür. Bu durum göz önünde bulundurulduğunda ısı stresinin önemli ölçüde artacağı ve sürdürülebilir hayvancılığın sağlanmasında daha ciddi zorluklar yaşanmasına neden olacağı söylenebilir.

Sığırlar, yüksek vücut kütlesine sahip olmaları ve sınırlı terleme kapasitelerinden dolayı ısı stresine karşı oldukça hassastır. Sığırlarda ısı stresi; özellikle sıcak ve nemli iklimlerde yaygın olarak görülür ve sığırların vücut ısısını düzenleme yeteneklerini sınırlamaktadır. Hayvanların fizyolojisinde ve genel performansında baskı oluşturarak üreme verimini olumsuz etkilemektedir. Sıcaklık-nem indeksi (SNİ) sığırlarda ısı stresinin şiddetini belirlemede kritik bir rol oynamaktadır ve SNİ'nin 72'nin üzerine çıkması, üreme performansında belirgin düşüşlerle ilişkilendirilmiştir.

Sığır yetiştiriciliğinde üreme verimi, sürünün sürdürülebilirliğinin sağlanması ve dolayısıyla ekonomik kazanç elde edilmesi açısından önemlidir. Ancak ısı stresi, hem dişi hemde erkek sığırlarda üreme fonksiyonlarını doğrudan etkileyerek gebelik oranlarında düşüşe yol açmaktadır. Dişi sığırlarda ısı stresi; hormonel dengesizliklere, zayıf östrus davranışına, ovulasyonun gecikmesine ve oosit kalitesinin düşmesi gibi olumsuzluklar oluşturmaktadır. Ayrıca, ısı stresi sonucunda ineklerde uterus içi sıcaklığındaki artış, embriyonun gelişimini olumsuz etkileyerek, implantasyonda başarısızlıklara dolayısıyla erken gebelik kayıplarına neden olmaktadır. Erkek sığırlarda ise testis dokusundaki oluşan hipertermi, spermatogenez sürecinde aksamalara, sperm kalitesinde bozulmalara neden olarak anormal sperm sayısını artırmaktadır.

Bu çalışmanın amacı, ısı stresinin sığır üreme verimi üzerindeki etkilerini detaylı bir şekilde ele almaktır. Hem dişi hem de erkek sığırlarda ısı stresine maruz kalma sonucu ortaya çıkan fizyolojik ve hücresel değişiklikler, hormonel bozulmalar ve bunun sonucunda ortaya çıkan

embriyo gelişimi ile gebelik oranlarında yaşanan düşüşler değerlendirilecektir. Bunların yanı sıra bu olumsuz etkileri azaltmaya yönelik geliştirilen stratejiler kapsamlı bir şekilde ele alınacaktır.

Anahtar Kelimeler: Sığır, Isı Stresi, Üreme Verimi

EFFECTS OF HEAT STRESS ON CATTLE REPRODUCTIVE EFFICIENCY

ABSTRACT

Heat stress is defined as a condition in which animals' physiological, metabolic, and behavioral adaptation mechanisms fail due to exposure to temperatures and humidity above their thermal comfort zone. Heat stress is one of the most significant environmental factors affecting productivity in animal husbandry and poses a critical problem in the livestock sector because it negatively impacts animals' performance, health, and welfare, directly or indirectly leading to difficulties in animal husbandry. Rising temperatures due to global climate change have become an even more critical problem for husbandry in regions within the Mediterranean climate zone, which includes Turkey. Recent reports have predicted that global temperatures will increase by 0.25°C in the last 10 years, and this increase could reach 1.9 to 8.5°C by 2100. Considering this situation, it can be predicted that heat stress will increase significantly, causing more serious challenges to sustainable animal husbandry.

Cattle are highly susceptible to heat stress due to their high body mass and limited sweating capacity. Heat stress in cattle: It is particularly common in hot and humid climates and limits cattle's ability to regulate body temperature. It negatively impacts reproductive efficiency by putting pressure on animals' physiology and overall performance. The Heat-Humidity Index (THI) plays a critical role in determining the severity of heat stress in cattle, and THI exceeding 72 has been associated with significant decreases in reproductive performance.

In cattle farming, reproductive efficiency is crucial for ensuring herd sustainability and, consequently, economic profit. However, heat stress directly affects reproductive functions in both cow and bull, leading to decreased pregnancy rates. In cow, heat stress causes adverse effects such as hormonal imbalances, poor estrus behavior, delayed ovulation, and decreased oocyte quality. Furthermore, increased intrauterine temperature in cows resulting from heat stress negatively impacts embryo development, leading to implantation failure and, consequently, early pregnancy loss. In bulls, hyperthermia in the testicular tissue disrupts spermatogenesis, impairs sperm quality, and increases abnormal sperm counts.

The aim of this study is to examine in detail the effects of heat stress on cattle reproductive performance. The physiological and cellular changes, hormonal disruptions, and resulting decreases in embryo development and pregnancy rates resulting from exposure to heat stress in both female and male cattle will be evaluated. Furthermore, strategies developed to mitigate these adverse effects will be comprehensively discussed.

Keywords: Cattle, Heat Stress, Reproductive Efficiency

ÖZET

Yağlı tohum küspeleri, yem sanayinde yaygın olarak kullanılan önemli bir protein kaynağıdır. Yağlı tohum küspelerinin maliyetini düşürmek için protein olmayan nitrojen (NPN) kaynaklarından birisi olan üre eklenebilmektedir. Ancak, yem katkı maddesi olarak eklenen üre miktarının kontrolü hem hayvan sağlığı hem de yasal düzenlemelere uyum açısından büyük önem taşımaktadır. Üre, günümüzde ruminant yemlerinde NPN kaynağı olarak kullanımı Avrupa Komisyonu Uygulama Yönetmeliği (AB) No 839/2012 (EU, 2012) ile yetkilendirilmiş, bitkisel ve hayvansal protein kaynaklarının yerine ikame edilebilen ucuz bir yem katkı maddesi olarak yaygınlaşmıştır.Laboratuvarlarda yemlerde üre olup olmadığı, var yok testleri ile kalitatif olarak belirlendiği gibi, kantitatif olarak da üre miktarı belirlenmektedir. Kantitatif üre tayini çalışmalarında ulusal ve uluslararası kuruluşlar tarafından yayınlanan standartlara uyulmaktadır. Ülkemizde ve AB ülkelerinde üre miktarı, spektrofotometrik yöntemle belirlenmekte, ancak yem içerisinde serbest amino asitlerin olması durumunda yanlış/pozitif sonuçlar alınabilmektedir. Bu araştırmada, sığır süt yemlerinde ürenin kantitatif olarak belirlenmesi için geliştirilen Refraktif İndeks Dedektörlü (RID) Yüksek Performanlı Likit Kromatagrafisi (HPLC) yönteminin, yağlı tohum küspelerindeki etkilerinnin belirlenmesi amaçlanmıştır. Araştırmada piyasada satışa sunulan 3'er adet ayçiçeği tohumu küspesi, kolza tohumu küspesi, pamuk tohumu küspesi ve soya fasulyesi küspelerinin her birine %0.2 ve %2.0 düzeylerinde yemlik granül üre deneysel olarak katılarak spektrofotometrik yöntem ile sonuçları karşılaştırılmıştır. Araştırma sonucunda; HPLC- (RID) yöntemi ile ayçiçeği tohumu

küspesi, kolza tohumu küspesi ve pamuk tohumu küspesine katılan yemlik granül ürenin rutin analiz laboratuvarları tarafından belirlenebileceği kanıtlanmıştır. Bu yöntem ile analiz sonuçlarının güvenirliğini sağlamak için validasyonun yapılması gerektiği sonucuna varılmıştır. Ayrıca bu yöntemin yağlı tohum küspelerinde ürenin belirlenmesi için uygun bir yöntem olma potansiyeline sahiptir.

DETERMINATION OF UREA IN OILSEED MEALS USİNG HİGH-PERFORMANCE LİQUİD CHROMATOGRAPHY WİTH REFRACTİVE INDEX DETECTİON (HPLC-RID

ABSTRACT

Oilseed meals are an important protein source widely used in the feed industry. To reduce the cost of oilseed meals, non-protein nitrogen (NPN) sources such as urea can be added. However, the control of the amount of urea added as a feed additive is of great importance both for animal health and compliance with legal regulations. Urea is currently authorized for use in ruminant feeds as an NPN source under Commission Implementing Regulation (EU) No 839/2012, and it has become a common feed additive due to its affordability and ability to substitute plant- and animal-based protein sources. In laboratories, the presence of urea in feed can be determined both qualitatively (presence/absence tests) and quantitatively. Quantitative determination of urea is performed according to standards published by national and international organizations. In Türkiye and EU countries, urea levels in feed are generally determined using spectrophotometric methods. However, the presence of free amino acids in feed can lead to false-positive results with these methods. This study aimed to evaluate the applicability of a High-Performance Liquid Chromatography method with Refractive Index Detection (HPLC-RID), developed for the quantitative determination of urea in dairy cattle feeds, to various oilseed meals. For this purpose, three commercial samples each of sunflower seed meal, rapeseed meal, cottonseed meal, and soybean meal were experimentally spiked with feed-grade granular urea at concentrations of 0.2% and 2.0%. The results obtained were compared with those from the spectrophotometric method. The findings of the study demonstrated that the HPLC-RID method can be used by routine analytical laboratories to accurately determine the amount of feed-grade urea added to sunflower seed meal, rapeseed meal, and cottonseed meal. It was concluded that validation of the method is essential to ensure the reliability of the analytical results. Furthermore, this method has significant potential as a suitable tool for the determination of urea in oilseed meals.

ÖZET

Tele-Tıp, veteriner hizmetlerinin sunumunda her geçen gün daha belirgin bir dönüşüm sağlamaktadır. Uzaktan ön muayene, danışmanlık ve eğitim gibi alanlarda dijital teknolojiler aracılığıyla yeni olanaklar sunmaktadır. Bu dönüşüm devam ederken; geleceğin veteriner hekimlerinin Tele-Tıp'a nasıl yaklaştığını ve bu teknolojiyi nasıl benimsediğini anlamak, klinik ve akademik uygulamalara başarılı bir şekilde entegre edilmesi açısından büyük önem taşımaktadır. Bu çalışma, mesleğin geleceğini şekillendirecek kilit bir grup olan veteriner fakültesi intörn öğrencilerinin tele-tıp konusundaki bilgi düzeylerini, tutumlarını ve eğitim beklentilerini araştırmaktadır.

2024-2025 eğitim-öğretim yılında Ankara Üniversitesi Veteriner Fakültesi'nde öğrenim görmekte olan 60 intörn öğrenciyle bir anket çalışması yürütülmüştür. Öğrencilerin Tele-Tıp konusundaki başlangıç düzeydeki farkındalıkları düşük olarak belirlenmiş yalnızca %25'i bu kavramı önceden duymuştur. Ancak anket sürecine entegre edilen bilgilendirmeler sonrasında %97'si farkındalıklarının arttığını belirtmiş, %87'si ise çalışma sonrasında daha fazla bilgi edinmek istediğini ifade etmiştir.

Katılımcıların %85'i Tele-Tıp'ın veteriner hekimliği müfredatına entegre edilmesini desteklemektedir. Aynı zamanda %87'si bu teknolojinin klinik vaka çeşitliliğini artıracağına inanmaktadır. Öğrencilerin %91'i Tele-Tıp'ın özellikle uzaktan vaka tartışmalarında, %77'si ise uzman eğitimlerine erişimde kullanılması gerektiğini belirtmiştir. Ayrıca öğrencilerin %78'i, Tele-Tıp'ı gelecekteki mesleki uygulamalarında çeşitli alanlarda kullanmayı düşündüklerini ifade etmiş; bu bağlamda, uzman danışmanlıklarını %65, laboratuvar sonuçlarının uzaktan değerlendirilmesini %70 ve genel klinik rehberlik gibi alanları %70 oranında faydalı

bulmuşlardır. Ayrıca, kırsal bölgelerdeki hayvan sahiplerine erişim sağlama ve yoğun klinik ortamlarında zaman yönetimini kolaylaştırma potansiyeli de vurgulanmıştır.

Bu olumlu yaklaşıma rağmen, bazı engeller de belirlenmiştir. Öğrencilerin %100'ü güvenli ve etik kullanım için yasal düzenlemelere ihtiyaç duyulduğunu vurgulamıştır. Katılımcıların %85'i yanlış tanı riskini, %75'i fiziksel muayene eksikliği ve yetersiz uygulamalı eğitim gibi konularda endişelerini dile getirmiştir. Tele-Tıp'ın klinik yoğunluğu azaltma ve operasyon sonrası izlem süreçlerindeki rolü konusunda ise görüşler farklılık göstermiştir. Bu da yüz yüze bakımın ve fiziki klinik ziyaretlerinin bazı yönlerinin vazgeçilmez olduğunu göstermektedir.

Sonuç olarak, veteriner fakültesi intörn öğrencileri Tele-Tıp'a karşı güçlü bir ilgi ve potansiyel benimseme eğilimi göstermektedir. Bu teknolojinin uygun ve etkili bir şekilde benimsenebilmesi için yapılandırılmış müfredatlara, uygulamaya dayalı eğitimlere ve destekleyici yasal çerçevelere ihtiyaç duyulmaktadır.

KNOWLEDGE AND AWARENESS OF TELEMEDICINE APPLICATIONS IN VETERINARY MEDICINE: THE PERSPECTIVE OF INTERN STUDENTS

ABSTRACT

Telemedicine is increasingly driving a more profound transformation in the delivery of veterinary services. Through digital technologies, it offers new opportunities in areas such as remote pre-examination, consultation, and education. As this transformation continues, understanding how future veterinarians perceive and adopt telemedicine is of great importance for its successful integration into both clinical and academic practices. This study investigates the knowledge levels, attitudes, and educational expectations of veterinary faculty intern students who represent a key group shaping the future of the profession regarding telemedicine.

A survey was conducted with 60 intern students enrolled at the Faculty of Veterinary Medicine, Ankara University, during the 2024–2025 academic year. The initial awareness of students on telemedicine was found to be low, with only 25% having previously heard of the concept. However, after the information provided during the survey, 97% reported an increase in their awareness, and 87% expressed a desire to further improve their knowledge on the subject.

A majority of participants (85%) supported the integration of telemedicine into veterinary curriculum, while 87% believed that this technology would enrich the diversity of clinical cases. Moreover, 91% stated that telemedicine should particularly be used in remote case discussions, and 77% emphasized its role in access to expert training. Additionally, 78% indicated that they plan to apply telemedicine in various aspects of their future professional practice; among these, 65% highlighted expert consultations, 70% the remote evaluation of laboratory results, and 70% general clinical guidance as particularly beneficial. The potential of telemedicine to improve access for animal owners in rural areas and to facilitate time management in busy clinical environments was also underlined.

Despite these positive perspectives, some barriers were identified. All students (100%) emphasized the need for legal regulations to ensure safe and ethical use. Concerns were raised by 85% of participants regarding the risk of misdiagnosis, and by 75% regarding the lack of physical examination and insufficient hands-on training. Opinions diverged on the role of telemedicine in reducing clinical workload and in post-operative follow-up processes, indicating that certain aspects of face-to-face care and physical clinical visits remain indispensable.

In conclusion, veterinary intern students demonstrated strong interest and potential willingness to adopt telemedicine. For proper and effective adoption, there is a clear need for structured curriculum, practice-based training, and supportive legal frameworks.

Keywords: Curriculum Integration, Digital Technologies, Telemedicine, Veterinary Education

Gynura aurantiaca (MOR YAPRAK) BİTKİSİNDE FeEDDHA DEMİR KAYNAĞININ FARKLI DOZLARININ KALLUS İNDÜKSİYONU VE BİTKİ REJENERASYONU ÜZERİNDEKİ ETKİLERİ

Dr. Mansur Hakan EROL

Çukurova Üniversitesi, Biyoteknoloji Araştırma ve Uygulama Merkezi, Adana, Türkiye

Email: hknmnsr@gmail.com

ORCID: 0000-0003-2424-5670

ÖZET

Gynura aurantiaca, yaygın adıyla mor yaprak veya mor kadife bitkisi, Asteraceae familyasına ait, dikkat çekici morumsu yapraklarıyla tanınan bir süs bitkisidir. Yaprak yüzeyindeki kadifemsi tüyler, bitkiye hem estetik hem de ayırt edici bir görünüm kazandırır. Genellikle iç mekân süs bitkisi olarak değerlendirilmekle birlikte, içerdiği antosiyanin bileşikleri sayesinde yüksek antioksidan potansiyeli ile biyoteknolojik uygulamalarda da dikkat çekmektedir.

Bu çalışmada, mor yaprak bitkisinin *in vitro* koşullarda yaprak eksplantlarından kallus oluşumu ve bitkiye dönüşüm süreçlerinde alternatif demir kaynağı olan FeEDDHA'nın farklı dozlarının etkisi araştırılmıştır. Standart demir kaynağı olarak kullanılan FeEDTA (100 µM) kontrol grubu olarak değerlendirilmiştir. Kültür ortamı olarak Murashige ve Skoog (MS) besin ortamı kullanılmış ve FeEDDHA demir kaynağı 100, 200, 400 ve 800 µM dozlarında uygulanmıştır. Kallus oluşumu yüzdesi, kallus ağırlığı, kallus alanı, elde edilen bitki sayısı ve bitkiye dönüşüm yüzdesi parametreleri değerlendirilmiştir.

FeEDDHA'nın 200 µM dozunda kallus ağırlığı ve kallus alanı en yüksek düzeyde gözlenmiştir. Bitkiye dönüşüm yüzdesi açısından 100 µM FeEDDHA uygulaması, FeEDTA kontrol grubuna göre anlamlı şekilde daha yüksek bulunmuştur. 800 µM dozda ise kallus oluşumu ve bitkiye dönüşüm belirgin şekilde azalmış, bazı tekrarlar tamamen inhibe olmuştur. LSD analizine göre dozlar arasında istatistiksel olarak anlamlı farklılıklar saptanmıştır ($p < 0.01$).

FeEDDHA demir kaynağı, uygun dozlarda kullanıldığında mor yaprak bitkisinin in vitro rejenerasyonunu FeEDTA kontrolüne kıyasla daha etkin şekilde desteklemektedir. Özellikle 100–200 µM aralığı, kallus verimliliği ve bitkiye dönüşüm açısından optimal doz aralığı olarak öne çıkmaktadır. Bu sonuçlar, mikropropagasyon protokollerinde demir kaynağı seçiminin kritik rolünü vurgulamaktadır.

Anahtar Kelimeler: Mor kadife bitkisi, FeEDDHA, in vitro, Kallus indüksiyonu, Bitki rejenerasyonu

EFFECTS OF DIFFERENT DOSES OF FEEDDHA IRON SOURCE ON CALLUS INDUCTION AND PLANT REGENERATION IN *Gynura aurantiaca* (PURPLE LEAF)

ABSTRACT

Gynura aurantiaca, commonly known as purple leaf or purple velvet plant, is an ornamental species belonging to the Asteraceae family, recognized for its striking purplish foliage. The velvety trichomes on the leaf surface not only enhance its aesthetic appeal but also contribute to its distinct identity. While primarily cultivated as an indoor ornamental plant, its high antioxidant potential, attributed to anthocyanin compounds, has drawn attention in biotechnological applications.

In this study, the effects of different doses of the alternative iron source FeEDDHA on callus induction and plant regeneration from leaf explants of Gynura aurantiaca under *in vitro* conditions were investigated. The standard iron source FeEDTA (100 µM) was used as the control group. Murashige and Skoog (MS) medium was supplemented with FeEDDHA at concentrations of 100, 200, 400, and 800 µM. Parameters including callus formation percentage, callus weight, callus area, number of regenerated plants, and plant conversion percentage were evaluated.

The highest callus weight and area were observed at 200 µM FeEDDHA. In terms of plant conversion percentage, the 100 µM FeEDDHA treatment showed significantly higher values compared to the FeEDTA control. At 800 µM, both callus formation and plant regeneration were markedly reduced, with some replicates showing complete inhibition. LSD analysis revealed statistically significant differences among the tested doses ($p < 0.01$).

FeEDDHA, when applied at appropriate concentrations, enhanced the in vitro regeneration of Gynura aurantiaca more effectively than the FeEDTA control. Particularly, the 100–200 µM range emerged as the optimal dose window for promoting callus productivity and plant regeneration. These findings underscore the critical role of iron source selection in micropropagation protocols.

Keywords: Purple velvet plant, FeEDDHA, in vitro, Callus induction, Plant regeneration

AVERMEKTİN VE DİAMİD GRUBU İNSEKTİSİTLERİN YUMURTA PARAZİTOİDLERİ TRICHOGRAMMA EVANESCENS VE T. PINTOI'YE AKUT TOKSİSİTELERİNİN DEĞERLENDİRİLMESİ

Dr. Adil Tonğa

ORCID: 0000-0001-7485-8411

ÖZET

Yumurta parazitoitleri, özellikle Trichogramma türleri, Lepidopter zararlılar da dahil olmak üzere ekonomik olarak önemli, geniş bir herbivor böcek kitlesinin kontrolündeki etkinlikleri sayesinde tarımsal ekosistemlerde büyük öneme sahiptir. Ancak, hedef dışı akut insektisit maruziyeti dahil olmak üzere birçok faktör, parazitoitlerin ekolojik fonksiyonunu parazitleme potansiyelini azaltarak ve davranışsal tepkilerini değiştirerek olumsuz etkileyebilir. Bu çalışma, generalist yumurta parazitoitleri Trichogramma evanescens ve T. pintoi üzerinde iki avermektin (abamectin ve emamectin benzoate), iki diamid (chlorantraniliprole ve flubendiamide) ve hazır kullanıma yönelik bir karışım (chlorantraniliprole + abamektin) insektisidinin akut toksisitesini değerlendirmektedir. İlk deneyler, her insektisidin her iki türde %10-90 ölüm oranına yol açan konsantrasyon aralıklarını belirlemek amacıyla yapılmıştır. Buna göre, her insektisid için LC30 ve LC50 konsantrasyonlarını hesaplamak üzere probit analizi uygulanmıştır. Avermektinler her iki parazitoit için benzer toksisite göstermiş, flubendiamid değişken toksisite göstermiş ve chlorantraniliprole her iki parazitoit türü için toksik bulunmamıştır. Risk katsayısı analizleri, her iki diamidin güvenli olduğunu, abamektin ve karışımının tehlikeli olduğunu ve emamektin benzoatın parazitoitler için hafiften orta derecede güvenli olduğunu göstermiştir. Bundan sonraki denemelerde, insektisitlerin LC30 ve LC50 konsantrasyonlarının her iki türün beslenme performansı ve çeşitli davranışsal parametreleri üzerindeki etkileri incelenecektir. Son olarak, bu bulgular, avermektin ve diamid insektisitlerinin Trichogramma parazitoitleri üzerindeki akut etkilerine ilişkin önemli bilgiler sağlayarak toksikolojik ve davranışsal değerlendirmeleri birleştirecek ve doğal zararlı kontrol etkinlikleri üzerindeki potansiyel sonuçların daha iyi değerlendirilmesine olanak tanıyacaktır.

Anahtar kelimeler: probit analizi, davranışsal değerlendirmeler, parazitlenme performansı, risk katsayısı

ASSESSING THE ACUTE TOXICITY OF AVERMECTIN AND DIAMIDE INSECTICIDES TO THE EGG PARASITOIDS TRICHOGRAMMA EVANESCENS AND T. PINTOI

ABSTRACT

Egg parasitoids, particularly those from the genus Trichogramma, are of great importance in agricultural ecosystems thanks to their efficiency in controlling a wide range of herbivorous insects including economically significant Lepidopteran pests. However, numerous factors including non-target acute insecticide exposure, can compromise their ecological function by reducing parasitism potential and altering behavioral responses. This study evaluates the acute toxicity of two avermectins (abamectin and emamectin benzoate), two diamides (chlorantraniliprole and flubendiamide), and one ready-to-use mixture of chlorantraniliprole + abamectin on the generalist egg parasitoids Trichogramma evanescens and T. pintoi. Initial experiments were conducted to determine the concentration ranges of each insecticide that caused 10-90% mortality in both species. Probit analysis was accordingly employed to calculate LC30 and LC50 concentrations for each insecticide. Avermectins were similarly toxic to both parasitoids, flubendiamide showed variable toxicity, and chlorantraniliprole was not toxic to both parasitoid species. Risk quotient indicated that both diamides are safe, abamectin and its mixture are dangerous and emamectin benzoate is slightly to moderate safe to the parasitoids. Future experiments will investigate the effects of LC30 and LC50 concentrations on feeding performance and several behavioral parameters of both species. Finally, these findings will provide significant insights into the acute effects of avermectin and diamide insecticides on Trichogramma parasitoids, integrating toxicological and behavioral assessments to better evaluate potential consequences for their natural pest control efficiency.

KENEVİR (*Cannabis sativa l.)* CPDNA'SINDA POTANSİYEL MUTASYON BÖLGELERİNİN TANIMLANMASI

Dr. Öğr. Üyesi Saber DELPASAND KHABBAZI

Yozgat Bozok Üniversitesi, Kenevir Araştırmaları Enstitüsü

Email: saber.d.khabbazi@yobu.edu.tr

ORCID: 0000-0002-1697-9327

ÖZET

Kenevir (Cannabis sativa L.), Cannabaceae familyasına ait, kökeni Orta Asya'ya dayanan ekonomik ve biyoteknolojik açıdan büyük öneme sahip bir bitkidir. Lif, tohum ve kannabinoid içeriği sayesinde hem endüstriyel hem de tıbbi alanlarda geniş kullanım potansiyeline sahiptir. Lifleri tekstil, kağıt ve kompozit malzeme üretiminde değerlendirilirken; tohumları gıda, besin takviyesi ve yağ üretimi için kullanılmaktadır. Kannabinoid bileşikleri ise farmasötik ve terapötik uygulamalarda giderek artan bir şekilde değerlendirilmektedir. Ancak bitkinin yüksek tetrahidrokannabinol (THC) içeriği ve psikoaktif etkileri, birçok ülkede yetiştiriciliğini sıkı yasal düzenlemelere tabi kılmaktadır. Cannabis cinsinin tür düzeyindeki sınıflandırması bilimsel olarak tartışmalıdır. Bazı araştırmacılar cinsi yüksek polimorfizme sahip tek bir tür olarak değerlendirirken, bazıları morfolojik ve kimyasal farklılıklara dayanarak birden fazla türden oluşan bir cins olarak sınıflandırmaktadır. Geleneksel sınıflandırma yöntemleri çoğu zaman çevresel koşullardan etkilenmekte ve kesin sonuçlar vermemektedir. Bu bağlamda, DNA temelli genetik belirteçlerin kullanımı, bitki türleri ve çeşitlerinin doğru, hızlı ve maliyet etkin biçimde tanımlanmasını sağlayan güvenilir bir yöntem olarak öne çıkmaktadır. Bu belirteçler ayrıca endüstriyel kenevir ile yasa dışı esrar türlerinin ayırt edilmesinde ve uyuşturucu ticaretinin izlenmesinde de etkili araçlardır. Bu çalışmada, kenevir kloroplast DNA'sında (cpDNA) mutasyon yoğunluğunun yüksek olduğu bölgeler detaylı olarak incelenmiştir. Farklı genotipler arasında tespit edilen dizi varyasyonları ve kısa ardışık tekrarların (SSR) birikimi, CLPP genik ve ndhF–rpl32 intergenik bölgelerinin potansiyel moleküler belirteçler olarak kullanılabileceğini göstermektedir. Bu bölgeler, genotipe özgü markörlerin geliştirilmesi için uygun hedeflerdir. Elde edilen sonuçlar, kenevirde çeşit ayrımı, popülasyon genetiği ve markör destekli ıslah programları için sağlam bir bilimsel temel oluşturmakta ve genetik kaynakların korunmasına yönelik stratejilerin geliştirilmesine katkı sağlamaktadır.

Anahtar Kelimeler: cpDNA, Genetik varyasyon, Kenevir, SSR

IDENTIFICATION OF POTENTIAL MUTATION HOTSPOTS IN THE CHLOROPLAST DNA OF HEMP (CANNABIS SATIVA L.)

ABSTRACT

Hemp (Cannabis sativa L.) is an economically and biotechnologically significant plant of the Cannabaceae family, with origins traceable to Central Asia. Owing to its fibre, seed and cannabinoid content, it holds substantial potential for both industrial and medicinal applications. Its fibres are employed in textile production and composite materials, its seeds serve as a source of food and oil, and its cannabinoid compounds are increasingly utilised in pharmaceutical and therapeutic contexts. Nevertheless, the elevated concentrations of tetrahydrocannabinol (THC) and the associated psychoactive properties of the species have resulted in legal restrictions on its cultivation in numerous jurisdictions. The species-level taxonomy of the Cannabis genus has been a subject of longstanding debate. Some researchers treat the genus as a single, highly polymorphic species, whereas others recognise multiple distinct species based on morphological and chemical differences. Conventional classification methods are often influenced by environmental conditions and consequently may produce ambiguous or non-definitive results. In this context, DNA-based genetic markers have emerged as a reliable, rapid and cost-effective alternative for the accurate identification of plant species and cultivars. In the present study, regions of the hemp chloroplast genome (cpDNA) exhibiting elevated mutation density were investigated. Sequence variation detected among diverse C. sativa genotypes particularly the accumulation of simple sequence repeats (SSRs) indicates that the CLPP genic region and the ndhF–rpl32 intergenic region represent promising candidates as molecular markers. These loci appear suitable targets for the development of genotype-specific markers in hemp. The findings contribute a solid scientific basis for cultivar discrimination, population genetic analyses and marker-assisted breeding programmes. Moreover, the data generated herein are pertinent to the conservation of hemp genetic resources and the formulation of sustainable breeding strategies.

ÖZET

Köpeklerde görülen paraziter enfeksiyonlardan askaridiozis, hem hayvan sağlığını hem de halk sağlığını tehdit eden önemli zoonotik bir hastalıktır. Bu hastalık özellikle genç köpeklerde sık rastlanan, gastrointestinal sisteme yerleşir. Hastalığın etkeni genellikle Toxocara canis olup, nadiren Toxascaris leonina türü de köpeklerde görülmektedir. Askaridlerin yaşam döngüsü karmaşık olup, transplasental, laktasyonel ve oral yollarla bulaşma görülebilir. Bu durum, özellikle yavru köpeklerin erken dönemde enfekte olmasına neden olmaktadır. Askarid larvaları, konağın ince bağırsağında gelişim gösterirken mekanik irritasyon, mukozal hasar ve besin emiliminde bozulmaya yol açar. Yoğun enfeksiyonlarda kusma, karın şişkinliği, kilo kaybı, iştahsızlık ve kanlı ishal gibi belirgin klinik semptomlar ortaya çıkabilir. Parazitin neden olduğu mukozal zedelenme ve sekonder bakteriyel enfeksiyonlar, hastalığın seyrini daha da ağırlaştırabilir. Özellikle yavru köpeklerde yüksek parazit yükü, gelişme geriliği ve hatta ölüme kadar ilerleyebilen ciddi komplikasyonlara yol açabilmektedir. Bu çalışma, kanlı ishal belirtileri gösteren köpeklerde askaridiozis enfeksiyonunun varlığını belirlemek ve bu paraziter enfeksiyonun klinik bulgularla ilişkisini ortaya koymak amacıyla yürütülmüştür. Araştırma, farklı yaş, cinsiyet ve ırka sahip toplam 50 adet köpek üzerinde gerçekleştirilmiştir. Hayvanlardan alınan taze dışkı örnekleri, laboratuvar ortamında makroskobik ve mikroskobik olarak değerlendirilmiştir. Makroskobik incelemede dışkının kıvamı, rengi, kan ve mukus varlığı kaydedilmiştir. Mikroskobik incelemelerde ise özellikle Toxocara canis ve Toxascaris leonina yumurtalarının tanımlanması amacıyla flotasyon (şeker çözeltisi yöntemi) ve sedimantasyon teknikleri kullanılmıştır. Sonuçlar, incelenen köpeklerin %30'unda askarid yumurtalarının tespit edildiğini göstermiştir. Enfeksiyon oranının özellikle 6 aydan küçük yavru köpeklerde ve dış ortamda yaşayan hayvanlarda daha yüksek olduğu belirlenmiştir. Pozitif olguların büyük bir kısmında dışkıda taze veya pıhtılaşmış kan, mukus, karın şişkinliği ve kilo kaybı gibi belirtiler gözlemlenmiştir. Ayrıca bazı köpeklerde anemi, iştahsızlık ve halsizlik gibi sistemik bulgular da rapor edilmiştir. Elde edilen veriler, kanlı ishal olgularında askaridiozisin

göz ardı edilmemesi gereken önemli bir etken olduğunu göstermektedir. Sonuç olarak, köpeklerde görülen kanlı ishal vakalarının değerlendirilmesinde paraziter nedenlerin, özellikle askarid enfeksiyonlarının mutlaka dikkate alınması gerektiği sonucuna varılmıştır. Düzenli antiparaziter tedavi programlarının uygulanması, dışkı muayenelerinin periyodik olarak yapılması ve çevresel hijyenin sağlanması, hem bireysel hayvan sağlığı hem de zoonotik riskin azaltılması açısından büyük önem taşımaktadır.

Anahtar Kelimeler: Köpek, Askaridiozis, Kanlı ishal, Toxocara canis

INVESTIGATION OF THE PRESENCE OF ASCARIASIS IN DOGS WITH SYMPTOMS OF BLOODY DIARRHEA

ABSTRACT

Askaridiosis, a parasitic infection seen in dogs, is an important zoonotic disease that threatens both animal and public health. This disease is particularly common in young dogs and affects the gastrointestinal system. The causative agent is usually Toxocara canis, although the species Toxascaris leonina is also rarely seen in dogs. The life cycle of ascarids is complex, and transmission can occur through transplacental, lactational, and oral routes. This situation causes puppies to become infected early on. Ascarid larvae develop in the host's small intestine, causing mechanical irritation, mucosal damage, and impaired nutrient absorption. In heavy infections, pronounced clinical symptoms such as vomiting, abdominal distension, weight loss, loss of appetite, and bloody diarrhea may occur. Mucosal damage caused by the parasite and secondary bacterial infections can further aggravate the course of the disease. High parasite load, especially in puppies, can lead to serious complications, including growth retardation and even death. This study was conducted to determine the presence of ascariasis infection in dogs showing symptoms of bloody diarrhea and to reveal the relationship between this parasitic infection and clinical findings. The study was conducted on a total of 50 dogs of different ages, genders, and breeds. Fresh fecal samples collected from the animals were evaluated macroscopically and microscopically in a laboratory setting. Macroscopic examination recorded the consistency, color, and presence of blood and mucus in the feces. Microscopic examination used flotation (sugar solution method) and sedimentation techniques, particularly for the identification of Toxocara canis and Toxascaris leonina eggs. The results showed that ascarid eggs were detected in 30% of the dogs examined. The infection rate was found to be higher, especially in puppies younger than 6 months and in animals living outdoors. In most of the positive cases, symptoms such as fresh or clotted blood in the stool, mucus, abdominal distension, and weight loss were observed. In addition, systemic findings such as anemia, loss of appetite, and lethargy were also reported in some dogs. The data obtained indicate that ascariasis is an important factor that should not be overlooked in cases of bloody diarrhea. Consequently, it has been concluded that parasitic causes, particularly ascariasis infections, must be considered in the evaluation of bloody diarrhea cases in dogs. The implementation of regular antiparasitic treatment programs, periodic fecal examinations, and ensuring environmental hygiene are crucial for both individual animal health and reducing zoonotic risk.

ABSTRACT

Ammonia microbial transformation is essential for wastewater treatment and environmental sustainability. Despite their effectiveness, conventional nitrification–denitrification systems utilize a lot of energy and release the powerful greenhouse gas nitrous oxide.

A revolutionary development in biological nitrogen removal is the direct ammonia oxidation (DIRAMMOX) technique. By using hydroxylamine as a crucial intermediary, DIRAMMOX permits the direct aerobic conversion of ammonia (NH_3) to dinitrogen gas (N_2), in contrast to traditional nitrification–denitrification and anammox procedures that call for sequential redox reactions. The DnfABC enzyme complex, which was found in Alcaligenes species, is responsible for this action. DnfA catalyzes the oxidation of hydroxylamine to nitrogen gas, while DnfB and DnfC facilitate electron transfer and substrate regeneration. By removing nitrite and nitrate intermediates, the process functions effectively in aerobic environments, lowering nitrous oxide emissions, carbon source dependence, and aeration energy.

Its potential integration with microbial electrochemical systems to improve reactor performance and redox balance has been emphasized by recent investigations. In addition to making nitrogen transformation easier, DIRAMMOX provides a low-carbon, scalable wastewater treatment method. Optimizing reactor design and process management requires an understanding of its environmental adaptability, enzyme kinetics, and genetic modulation.

DIRAMMOX, which connects applied environmental biotechnology and microbial physiology, has the potential to become a key tool in sustainable nitrogen management as research advances.

ABSTRACT:

This study examines the effects of ownership structure on performance of quoted industrial goods firms in Nigeria. The study relies on secondary data derived from various companies' financial statements and the Nigerian Exchange fact book to determine and measure the level of ownership holdings of various firms in corporate financial statements, applying an all-inclusive multivariate analysis. Samples of 10 industrial goods firms quoted in Nigeria Exchange Group were used for the period of ten years spanning 2015 to 2024. The study employed ex-post facto and longitudinal research design. The secondary sources of data were collected from annual reports of the selected industrial goods companies and five (5) specific objectives and hypotheses were subjected to some preliminary data tests using descriptive statistics, Pearson correlation analysis and variance Inflation Factor and were tested and analyzed using panel regression analysis. The empirical analysis using a total of 100 company-year observations, shows that foreign ownership has negative but significant effect on performance of quoted industrial goods companies in Nigeria which was statistically significant at 5% level of significance while a positive and significant effect were documented for family ownership at 95% confidence level. Institutional ownership and block ownership were found to have positive but insignificant effect on performance of quoted industrial goods companies in Nigeria. In line with the above findings, this study therefore recommends among others that, family members should be encouraged to have shareholding in their respective businesses as this helps in maintaining high performance of firms in Nigeria industrial goods sector while emphasis on foreign shareholding in the firms should be minimized since it was found to have negative and insignificant effect on performance of industrial goods firms in Nigeria.

BIO FERTILIZER-BASED APPROACHES TO ALLEVIATE SALINITY STRESS AND IMPROVE SOIL FERTILITY IN LEGUMINOUS CROPS

Mahesha MADUMALI

Department of Agricultural Biology, Faculty of Agriculture, University of Ruhuna, Mapalana, Kamburupitiya

maheshamadumali5@gmail.com

ABSTRACT

Salinity stress poses a significant threat to crop productivity, affecting physiological, biochemical, and yield parameters. This review highlights the potential of bio fertilizers particularly Azolla concentrates, and algal bio fertilizers in mitigating salinity induced damage and improving nutrient uptake in leguminous crops such as mung bean and cowpea. The continuous demand for food crops, coupled with declining productivity from the excessive use of chemical fertilizers, has caused reduced yields, soil fertility loss, and land degradation, thereby hindering progress toward sustainable agriculture. Azolla effectively reduce ethylene levels and alleviate salinity stress, enhancing photosynthetic traits and grain quality. Similarly, the use of Azolla pinnata concentrates as a bio stimulant has shown to increase soil fertility, nutrient uptake, and economic returns, though its effect on seed yield remained insignificant. Furthermore, the application of green and brown algae, especially cyanobacteria (blue-green algae), demonstrates promising improvements in plant growth, antioxidant activity, soil aggregation, nitrogen fixation, and stress tolerance. The review concludes that these bio-based inputs offer sustainable alternatives to synthetic fertilizers, promoting eco-friendly agriculture and resilience to salinity stress.

ABSTRACT

According to the World Health Organization, nearly 80% of the global population depends primarily on traditional medicine, which often involves plant-based remedies or their bioactive constituents. India, with its vast biodiversity and long-standing heritage of traditional healing systems such as Ayurveda, Siddha, Unani, Amchi, and various local practices, provides a strong basis for the use of numerous medicinal plants in both preventive healthcare and the management of common ailments. One such important plant is Tinospora cordifolia, a deciduous climbing shrub distributed across India, China, and Africa, belonging to the Menispermaceae family. Its medicinal value lies mainly in the roots, stems, and leaves, which are rich in bioactive compounds like alkaloids, steroids, glycosides, lactones, and polysaccharides. Almost all parts of the plant are known for their immunomodulatory properties, making it a vital herb in Ayurvedic medicine for the treatment of conditions such as fever, common cold, diabetes, and rheumatoid arthritis.

INFLUENCE OF DIETARY SUPPLEMENTATION OF *celosia argentea* (SOKO) STEM OXYTETRACYCLINE AND BUTYLATED HYDROXYANISOLE ON PRODUCTION INDICES, BLOOD CHEMISTRY, CARCASS AND MEAT QUALITY OF BROILER CHICKENS

ZAİNAB O. BELLO

ABSTRACT

This study investigated the influence of dietary supplementation of Celosia argentea (soko) stem, oxytetracycline and butylated hydroxyanisole (BHA) on production indices, blood chemistry, carcass and meat quality of broiler chickens. A total of 240 day-old Ross 308 broilers were randomly assigned to four dietary treatments with six replicates and ten birds per replicate for a period of six weeks: Basal diet (T1), Basal diet with BHA and Oxytetracycline (T2), and two experimental groups with 0.25g/kg (T1) and 0.5g/kg (T2) of Celosia argentea stem powder, respectively.

The phytochemical analysis indicated the presence of flavonoids, coumarins, glycosides, terpenoids, and phytic acid. Production indices were not significantly different ($p > 0.05$) with weight gain, feed intake and best FCR recorded in supplemented birds. Blood chemistry results showed hypocholesterolemic effect of celosia argentea due to reduced values of cholesterol and LDL. ALT, AST were reduced reflecting hepatoprotective effect of the feed additive. Haematological indices were not significantly affected by the supplemented diet. Carcass and meat quality showed no significant differences ($p > 0.05$) across treatments, with dressing percentage ranging from 69.81% (T2) to 74.89% (T1), suggesting that supplementation of Celosia argentea (soko) stem powder at up to 0.5g/kg diet may be a potential alternative to synthetic feed additive such as Butylated hydroxyanisole and oxytetracycline in broiler diets.

Keywords: Ross 308, treatment, alternative, replicate, significant

ABSTRACT

The agricultural sector is undergoing a critical transformation as it confronts the intertwined challenges of climate change, environmental degradation, and food insecurity. Climate-Smart Agriculture (CSA) has emerged as a comprehensive approach that enhances productivity, strengthens resilience and reduces emissions simultaneously. By integrating innovative technologies such as precision agriculture, remote sensing, renewable energy systems and water-efficient irrigation, CSA enables the sustainable use of natural resources and supports climate adaptation. It not only improves farm-level productivity but also contributes to soil health, biodiversity conservation and sustainable livelihoods. Furthermore, adopting climate-smart practices promotes rural prosperity by enhancing market access, reducing input costs and fostering income stability among smallholder farmers. Successful implementation of CSA requires strong institutional support, effective extension services and policies that encourage innovation, capacity building and financial inclusion. Equally important is the participation of farmers, researchers and policymakers in co-developing context-specific solutions that balance environmental and economic objectives. As global food systems transition towards sustainability, CSA provides a viable framework to align agricultural growth with environmental stewardship. By fostering technological innovation and resource efficiency, climate-smart technologies offer a clear pathway toward achieving food security, ecological balance and inclusive rural development in an era of climate uncertainty.

INFLUENCE OF TANK COLORATION IN MODULATING PHYSIOLOGICAL GROWTH, SURVIVAL AND SKIN PIGMENTATION EXPRESSION IN NURSERY-REARED CHANNA STRIATA

Md. Rabiul Awal[1], Md. Moniruzzaman[1], Md. Saiful Islam[1], Al-amin[1], Md. Harunor Rashid[2], Anuradha Bhadra[3]

[1] Scientific Officer, Bangladesh Fisheries Research Institute, Freshwater Station, Mymensingh -2201

[2] Chief Scientific Officer, Bangladesh Fisheries Research Institute, Freshwater Station Mymensingh -2201

[3]Director General, Bangladesh Fisheries Research Institute, Mymensingh-2201

ABSTRACT:

Tank background coloration was tested for its influence on growth, survival, cannibalism, and pigmentation of striped snakehead (Channa striata) larvae under nursery conditions. A 35-day rearing trial was conducted using five treatments: control (T0), white (T1), black (T2), blue (T3), and red (T4), each in triplicate. Water quality remained within optimal ranges. Growth and survival differed significantly ($p < 0.05$) among treatments. Larvae reared in blue (T3) and white (T1) tanks achieved the greatest final length (7.57 ± 0.88 cm and 7.32 ± 0.52 cm) and weight gain (3.40 ± 0.19 g and 3.18 ± 0.21 g), with efficient feed conversion ratios (1.19 ± 0.07 and 1.17 ± 0.07). Survival was also highest in T1 (95.11 ± 5.09%) and T3 (94.89 ± 5.11%), while the lowest occurred in T0 (70.77 ± 4.49%). Cannibalism was markedly reduced in blue (2.21%) and white (2.12%) tanks but elevated in black (9.24%) and control (10.77%). Pigmentation analysis showed tank color altered CIELAB parameters, with T3 yielding the highest hue angle (140.57°) and T4 the greatest chroma (23.26 ± 0.11). Correlation analysis confirmed positive relationships of tank color with growth and survival and negative with cannibalism. These results demonstrate that blue and white backgrounds markedly enhance larval performance, offering a low-cost, scalable strategy to improve seed quality and productivity in snakehead aquaculture.

ABSTRACT

The study examined the use of communication channels for accessing agricultural information among poultry farmers in Oyo State, Nigeria. A multi-stage sampling technique was used in the selection of 156 respondents for the study. Data were collected with the use of structured face-to-face interview schedule and analyzed with the use of descriptive statistics such as; frequency counts, means, percentages, while Chi-square test was employed as inferential statistical tool at 5 percent level of probability. The results revealed that the major available and most utilized communication channels for accessing agricultural information were: Mobile phone (98.7%, WMS=4.65), Radio (91.7%, WMS=4.19) and fellow farmers (91.0%, WMS=4.17) respectively. Agricultural information accessed through the available channels include information on handling of chicks (100%), brooding and lighting management of day old chicks (98.1%) and breeds of birds (97.4%). The result of Chi-Square revealed that significant relationship existed between Sex (X2 =28.88; p=0.000), Marital Status (X2 =74.40: p=0.000), Education (X2 =40.24; p=0.000), Religion (X2=3.92; p=0.048); Household size (X2=14.44; p=0.071), Primary occupation (X2=64.80: p=0.000); Secondary occupation (X2 =39.20; p=0.000) and the extent of communication channels usage. The study concluded that both modern digital and interpersonal channel were mostly explored for accessing information especially during early production stage. It was therefore recommended that agricultural information could be disseminated through the identified channels for easy and timely access for improved productivity among poultry farmers in the state..

Key words: Agricultural information, Communication channels, poultry (Chicken) farmers, information usage

ROLE OF BIOTECHNOLOGY IN ANIMAL BREEDING

S. Shakthi Sree

Bharath Institute of Higher Education and Research, Selaiyur, Chennai -73.

ABSTRACT

Biotechnology has revolutionized animal breeding by providing advanced tools to enhance genetic improvement, reproductive efficiency, and disease resistance. Traditional breeding methods are now complemented by modern biotechnological techniques such as artificial insemination, embryo transfer, in vitro fertilization, and cloning, which enable faster propagation of superior traits. Molecular technologies like marker-assisted selection and genomic selection allow precise identification and selection of animals with desirable genetic characteristics. Furthermore, gene editing tools such as CRISPR-Cas9 facilitate targeted genetic modifications to improve productivity and health traits. The use of transgenic and cloned animals also contributes to the development of high-yielding and disease-resistant breeds. Additionally, cryopreservation techniques help conserve valuable and endangered genetic resources for future use. Overall, biotechnology plays a crucial role in accelerating genetic progress, improving livestock performance, and ensuring sustainable animal production systems.

Keywords : Biotechnology, animal breeding, reproductive efficiency, genetic characteristics, genetic modifications.

INNOVATİVE SOLUTİONS FOR SUPPORTİNG AFFECTED WOMEN

Amina Bigzad

Masters Student of Department of Womens Studies, Ahlul Bayt İnternational University İran.

ABSTRACT

This article examines innovative and effective strategies for supporting women affected by violence and discrimination, particularly in vulnerable societies. In complex and crisis-ridden conditions like Afghanistan, women, especially, face various forms of social, economic, and .physical violence, situations that require serious and practical attention

In this study, we analyze traditional methods of support for women and explore their limitations. Instead, this article introduces new and innovative approaches, particularly those developed through the use of information technology and social media. The use of online platforms as effective tools for providing psychological counseling, organizing educational .programs, and fundraising is one such strategy

Additionally, the article investigates the critical role of non-governmental organizations, social activists, and governments in creating support networks

facilitating access to health and legal services. It emphasizes how collaboration among these .entities can significantly contribute to positive changes in the lives of affected women

Finally, the importance of active community participation and synergy between various organizations in successfully implementing these strategies is highlighted, along with .recommendations for improving and expanding these initiatives.

Keywords : Inovative solution , supporting effeted womens.

RURAL DEVELOPMENT AND THE SOCIAL ROLE OF WOMEN IN THE DEVELOPMENT PROCESS

Amina Bigzad

Masters student of department of womens studies, Ahlul bayt international university iran.

Email: aminabigzad@gmail.com

ABSTRACT

This article investigates the social role of women in the rural development process and aims to demonstrate how active participation of women at the village level can lead to improvements .in economic-social development indicators, social cohesion, and the sustainability of projects The theoretical framework combines culture-economy theories and gender-focused approaches to development to explain the relationship between values, local institutions, and women's participation opportunities. The main research question is: how can women's social power and —resources—including education, health, entrepreneurship, and social-political participation alter the path of rural development? Key hypotheses are: (1) the active presence of women in ,the management of development projects and village councils improves transparency accountability, and project efficiency; (2) equal access to education, health, and employment ;opportunities for women strengthens local value creation and rural labor force development balancing traditional roles with modern opportunities for women leads to cultural (3) ,sustainability and acceptance of innovation in rural areas. The methodology is mixed combining a systematic literature review, comparative case studies in villages with diverse cultural contexts, and qualitative-quantitative analysis through in-depth interviews, focus groups, and indicators of women's participation in decision-making and rural development indicators. Preliminary findings indicate that: (1) women's participation in local decision-making, with better access to resources, increases entrepreneurship and the delivery of public services; (2) practical training and skill-building opportunities for women facilitate home-based entrepreneurship and enhance rural production capabilities; (3) institutional and structural barriers such as gender gaps in leadership in villages are obstacles requiring policy interventions and institutional change. Ultimately, the article recommends that rural development policymaking adopt a gender mainstreaming approach at all levels, with emphasis on equal participation, transparency in resource distribution, and support for women's supportive networks

INTERNET OF THINGS (IOT) IN SMART AGRICULTURE: CONSIDERATION AND CHALLENGES

Mrs.A.Rajeswari

G.Venkataswamy Naidu College, Kovilpatti, Tamilnadu, India.

Email: rajeswari@gvncollege.edu.in

ORCID: 0005-7906-5089

ABSTRACT

The modern society is constantly evolving in terms of technology and there are numerous tools and approaches to use in the agricultural industry. Also, the IoT preference in the agricultural division is knowledge processing. Newly installed sensors will be useful in collecting all the information. The Internet-of-things (IoT)-based technology of risk mitigation, industry mechanization, production improvement, livestock inspection, environmental condition monitoring, greenhouse roboticization, and crop monitoring has transformed virtually every business including smart agriculture and has led into a shift in methods of operation being quantitative, rather than factual. The concepts help the Internet of Things (IoT) to link real things that contain sensors, actuators, and processing capabilities such that they can collaborate on a project and yet remain connected online. Internet of Things (IoT) is a collection of computers, software, and sensors, among other devices, which are connected to the Internet according to the Worldwide Guidelines Operation by the World Telecommunication Union. The resource is highly susceptible to the consequences of its smart agriculture.

Keywords: Smart Farming, Smart Agriculture, Application of IOT, Implications of implementation.

ARABLE FARMERS' PERCEPTION OF USAGE OF AGRICULTURAL TECHNOLOGIES IN KWARA STATE , NIGERIA

ABSTRACT

This study examines the perceived effects of agricultural technology usage on the level of production among arable crop farmers in, Kwara State, Nigeria. The study adopted a survey-based approach and collects data through use of well structured questionnaire. The study used multistage sampling procedure to select a sample size of 120 respondents, The result were analyzed with percentages, frequency , mean and correlation analysis. The findings of the study revealed that farmers, male arable crop farmers dominated the sample, making up 62.5% of the respondents, Regarding agricultural technologies, fertilizers were the most commonly used technology with a usage rate of 95.8%, followed by irrigation materials at 91.7%. In terms of the perceived effects of using agricultural technologies, increased income received the highest mean score of 2.61, indicating its significant impact. Increase in food production and improvement in food consumption level both had mean scores of 2.476 The study also identified constraints to the usage of agricultural technologies, with inadequate capital and high implementation costs perceived as the most significant challenges (mean scores of 3.13 out of 5). The findings further shows that sex, marital status, year of schooling, household size, occupation, crop yield, income from the last season, and credit access were statistically significant with the extent of technology usage.. Therefore, it is recommended that the usage of fertilizer, irrigation, pesticide and extension information technologies should be encouraged among farmers in Sub-Sharan Africa.

DEVELOPMENT OF A SMART IOT-BASED MODEL TO GET WEATHER INFORMATION FROM RICE FIELD

Nawrin Tamanna Rasha

Laboratory of Agricultural Machinery, Department of Farm Power and Machinery, Sylhet Agricultural University, Sylhet 3100, Bangladesh

Email: nawrinrasha@gmail.com

ABSTRACT

Half of the agricultural GDP and one-sixth of the total income in Bangladesh is derived from the rice industry. In the country, rice is grown by almost 13 million agricultural families. Human error, delays, and inconsistent data collection are common when gathering weather data manually (rainfall, humidity, soil moisture, and wind speed). Automated systems and sensors typically capture real-time meteorological data more accurately and efficiently. The foundation of this study's Internet of Things (IoT) idea is a real-time environmental monitoring system. The Internet of Things (IoT) is a key component of today's world through an extensive and enduring network of sensors that monitor the surroundings and their parameters. By using sensors, this system keeps track of and stores critical environmental information like temperature, humidity, soil moisture, and wind speed. Data is subsequently transferred to the cloud. Through the internet, this data is accessible from any location, and the sensor data is then displayed graphically. The setup and outcomes of an environmental monitoring system that uses sensors to gauge the local temperature, humidity, and other environmental parameters are covered in this study.

ABSTRACT

Actinomycetes are prolific producers of secondary metabolites with therapeutic potential, particularly in antimicrobial and anticancer domains. Mangrove ecosystems represent underexplored reservoirs for novel bioactive strains. This study reports the cultural characteristics, and bioactivity assessment of *Streptomyces viridiostaticus* recovered from mangrove soil sample of the Mangalore coastal region, India. Morphological and biochemical characterization was performed on SCNA and additional selective media. Antibacterial activity of crude proteins was tested against Gram-positive and Gram-negative pathogens. Protein purification was carried out using Sephadex G-10 column chromatography, Cytotoxic activity was determined via MTT assay using the PC3 prostate cancer cell line. Metabolite profiling through mass spectrometry, identifies Tryprostatin B. S24 was confirmed as *Streptomyces viridiostaticus* by 16S rRNA sequencing (Accession: MZ021336.1). The isolate displayed robust growth across different media, with distinct brown aerial and substrate pigmentation. Crude protein extracts exhibited antibacterial activity against *Bacillus cereus*, *Proteus vulgaris*, *Salmonella typhimurium*, *Staphylococcus aureus*, and *Pseudomonas aeruginosa*, with inhibition zones up to 24 mm. Protein purification yielded a 10.75-fold increase in specific activity, though with reduced recovery (9.25%). Cytotoxic assays revealed dose-dependent inhibition of PC3 cells, achieving 51.85% growth inhibition at 200 µg/mL. Mass spectrometry confirmed the presence of Tryprostatin B, a known indole alkaloid with anticancer potential. The study demonstrates that *Streptomyces viridiostaticus* is a promising source of bioactive proteins and metabolites with antibacterial and anticancer properties. Its discovery from mangrove soil highlights the ecological and pharmaceutical significance of marine-derived *Actinomycetes* as reservoirs of novel therapeutic compounds.

Keywords: *Actinomycetes*; anticancer activity; antimicrobial peptides; mangrove soil; protein purification; *Streptomyces viridiostaticus*; Tryprostatin

ABSTRACT

Sustainable soil fertility management is vital for crop productivity in Bangladesh, particularly for smallholder farmers dependent on organic inputs. This study assessed the potential of composted water hyacinth (*Eichhornia crassipes*), an invasive aquatic weed, as an alternative to cowdung in cauliflower (*Brassica oleracea* var. botrytis subvar. cauliflora L.) cultivation under AEZ-14 (Gopalganj-Khulna Beels). A field trial was conducted using a randomized complete block design (RCBD) with four treatments: cowdung (5 t/ha), water hyacinth compost at 5, 8, and 11 t/ha. Agronomic parameters, yield, and soil nutrient dynamics were evaluated. Results revealed that water hyacinth compost at 11 t/ha significantly improved curd length (23.50 cm), diameter (50.13 cm), weight (534 g), and yield (22.25 t/ha) compared to cowdung (15.25 t/ha). Soil nutrient status post-harvest showed increased potassium and micronutrient availability, demonstrating water hyacinth's high nutrient content and its role in soil enrichment. The findings suggest water hyacinth compost is a cost-effective, eco-friendly alternative to conventional organic fertilizers, supporting sustainable crop production in nutrient-depleted soils.

FROM WASTE TO CLIMATE ACTION: EXPLORING THE ROLE OF SOLID WASTE MANAGEMENT IN MITIGATING GREENHOUSE GAS EMISSIONS – REVIEW

ABSTRACT

Human activities generate large amounts of solid waste, which represent a significant source of greenhouse gases (GHGs) and contribute directly to climate change. Globally, the waste sector is estimated to account for about 3.2% of total GHG emissions, including nearly 11% of global methane (CH_4) emissions, a gas with a much higher warming potential than carbon dioxide. This presentation provides a literature review on the impacts of solid and organic waste on the global carbon balance, highlighting their main sources, environmental consequences, and the mechanisms through which they exacerbate global warming.
The study also explores sustainable waste valorization strategies, such as energy recovery, composting, industrial reuse, and integrated approaches within a circular economy framework. These practices not only reduce GHG emissions but also promote more efficient resource use and support sustainable development.

Finally, the presentation discusses future perspectives for optimizing waste management, emphasizing the importance of innovative technologies and policies tailored to local contexts. It demonstrates that well-designed waste valorization can play a key role in mitigating climate change while fostering sustainable practices at the global level.

ABSTRACT

The poultry industry faces increasing demand for natural feed additives that enhance nutrient utilization while reducing reliance on synthetic growth promoters. Phytogenic plants such as garlic (*Allium sativum*), ginger (*Zingiber officinale*), and onion (*Allium cepa*) possess bioactive compounds with antioxidant, and digestive-stimulant properties that may improve feed utilisation efficiency in broiler production. This study was conducted to evaluate the effect of aqueous extracts of garlic, ginger, and onion on the nutrient digestibility of broiler chickens. A total of 120-day-old broilers were allocated into four treatment groups with three replicates each. Treatments consisted of aqueous blend prepared at 20 g, 30 g, and 40 g of each spice per litre of water, administered at 1 ml/litre (T1, T2, and T3), while the control group (T4) received plain water with antibiotics. Faecal samples were collected for proximate composition to determine nutrient excretion and digestibility in the laboratory. The results were subjected to one way analysis of variance. The results revealed significant differences ($p < 0.05$) among treatments in crude-protein, fat, ash, and nitrogen-free extract. Broilers in T1 exhibited the lowest faecal NFE (65.94%) and moderate crude protein excretion (10.46%), indicating superior carbohydrate and protein digestibility. T2 and T3 had higher crude protein excretion, suggesting reduced nitrogen retention, while the control group recorded the highest NFE

(73.39%) and lowest protein utilization. Although T1 showed higher fat excretion, its overall balance in nutrient utilization was superior. It was concluded that moderate inclusion of aqueous extracts of garlic, ginger, and onion at 40g/L is optimal for improving nutrient digestibility in broilers. The study recommends the adoption of phytogenic extracts in poultry production to enhance feed efficiency, reduce nutrient losses, and support sustainable, residue-free poultry farming.

ABSTRACT

In the current paper the authors had presented a way that the Tribes of Chhattisgarh may use to safeguard their lives from dangerous wild animals. A big region of the state chhattisgarh a state of India is under forest region. In the current paper the author had proposed the usage of AI based technology that is ML for the identification of dangerous wild animals arriving in the residential area and to take preventive measures to safeguard their lives. The prototype proposed is going to be handed over to the Government officials that is the Forest Service people generally Forest Ranger to keep track of the arrival of dangerous animals and safeguard the Tribes of Chhattisgarh. The developed prototype using Computer Vision technology equipped with CCTV coverage will go for Government approval and after the approval the Forest rangers can take preventive measures for the Tribes of Chhattisgarh.

ÖZET

Araştırmanın amacı, Konya ili Karapınar ilçesi şartlarında Orta Anadolu Merinosu kuzuların yapay mera ve yoğun besleme altında besi performanslarının karşılaştırılmasıdır. Araştırma Konya ili Karapınar ilçesinde bir koyun işletmesinde yürütülmüştür. İşletmede 60 baş Orta Anadolu Merinosu kuzu kullanılmıştır. Çalışmada 3 farklı besi grubu oluşturulmuş ve deneme 60 gün sürdürülmüştür. Deneme grupları 1.grup Mera+ süt (20 baş), 2.grup Mera+ süt+ ilave yem (20 baş), 3.grup entansif besleme (20 baş) şeklinde dizayn edilmiştir. Mera çalışması için 24 da mera alanı kurulmuştur. Mera 3 buğdaygil + 3 baklagil karışımından oluşmuştur. Mera karışımları % 30 çok yıllık çim, % 20 kamışsı yumak, % 20 domuz ayrığı, % 10 korunga, % 5 yonca ve % 15 ak üçgülden oluşmuştur. Deneme parselleri eşit olarak 4 alt parsele bölünmüş ve parsellerde rotasyonlu otlatma yapılmıştır. Araştırma sonucunda yapay meradan farklı tarihlerde biçilen meranın yeşil ot verimi 6.640, 4.075, 3.400 ve 1.620 kg/da, kuru ot verimi, 2.603, 1.970, 1.505 ve 625 kg/da ($p<0.001$) bulunmuştur. Denemeden elde edilen otların kuru madde içerikleri sırasıyla % 93.38, 93.58, 93.65, 94.28; ADF değerleri % 32.36, 35.66, 36.28, 34.87; NDF değerleri % 53.75, 56.94, 55.25, 57.13; Ham Selüloz değerleri % 35.05, 32.87,

31.83, 27.92; Ham protein değerleri ise % 17.25, 16.91, 15.73 ve 15.51 olarak bulunmuştur ($p<0.001$). Deneme gruplarındaki kuzularının değişik dönemlerdeki canlı ağırlıkları incelendiğinde entansif, mera + süt ve mera + süt + ilave yem grubunun besi başı ağırlıkları sırasıyla 22.84, 20.69, 21.79 kg; besi sonu ağırlıkları sırasıyla; 41.64, 36.59, 39.23 kg ($p<0.001$) tespit edilmiştir. Besi sonu ortalama canlı ağırlık artışları; 313.3, 264.9 ve 290.8 g/gün olarak ($p<0.001$) hesaplanmıştır. Entansif ve mera + süt +yem grubundaki kuzuların besi sonu yem tüketimleri ve yemden yararlanma değerleri sırasıyla; 1.18, 1.07 kg; 5.94, 4.02 olarak ($p<0.001$) tespit edilmiştir.

Sonuç olarak, yüksek üretim ve ot tüketimi için tahıl ekimi yapılamayan arazilerin yapay mera alanına dönüştürülmesi akılcı bir çözüm olduğu ve Merinos kuzularında sadece entansif yemleme dayalı bir besleme sisteminin ekonomik olmadığı belirlenmiştir.

Anahtar kelimeler: Orta Anadolu Merinosu, kuzu, yapay mera, besi performansı

COMPARISON OF FATTENING PERFORMANCES OF CENTRAL ANATOLIAN MERINO LAMBS FED IN ARTIFICIAL PASTURE AND INTENSIVE IN KARAPINAR CONDITIONS

ABSTRACT

The primary objective of this study was to compare the fattening performance of Central Anatolian Merino lambs under conditions of artificial pasture and intensive feeding in the Karapınar district of Konya Province. The research was conducted in a commercial sheep farm located in Karapınar, utilizing a total of 60 Central Anatolian Merino lambs. The study was designed with three experimental groups and lasted for 60 days. The treatment groups were organized as follows: Group 1 – Pasture + milk (20 lambs), Group 2 – Pasture + milk + supplementary feed (20 lambs), and Group 3 – Intensive feeding (20 lambs). For the pasture component, a 24-decare artificial pasture area was established. The pasture mixture was composed of three grasses and three legumes, specifically 30% perennial ryegrass, 20% tall fescue, 20% cocksfoot, 10% sainfoin, 5% alfalfa, and 15% white clover. "The experimental plots were equally divided into four sub-plots, and rotational grazing was implemented within these plots. The green forage yields from different cutting periods of the artificial pasture were determined as 6,640, 4,075, 3,400, and 1,620 kg/da, while dry matter yields were recorded as 2,603, 1,970, 1,505, and 625 kg/da, respectively ($p<0.001$). The chemical composition of the harvested forages revealed dry matter contents of 93.38%, 93.58%, 93.65%, and 94.28%; ADF values of 32.36%, 35.66%, 36.28%, and 34.87%; NDF values of 53.75%, 56.94%, 55.25%, and 57.13%; crude fiber contents of 35.05%, 32.87%, 31.83%, and 27.92%; and crude protein values of 17.25%, 16.91%, 15.73%, and 15.51%, respectively ($p<0.001$). When the body weights of lambs in the different feeding groups were examined, the initial live weights were determined as 22.84 kg, 20.69 kg, and 21.79 kg in the intensive, pasture + milk, and pasture + milk + supplementary feed groups, respectively. At the end of the fattening period, the final live weights were 41.64 kg, 36.59 kg, and 39.23 kg, respectively ($p<0.001$). The average daily live weight gains were calculated as 313.3 g/day, 264.9 g/day, and 290.8 g/day, respectively ($p<0.001$). Feed intake and feed conversion ratios of lambs in the intensive, pasture + milk and pasture + milk + supplementary feed groups were recorded as 1.18 kg and 1.07 kg, and 5.94 and 4.02, respectively ($p<0.001$).

In conclusion, the findings indicate that transforming non-arable lands—where grain cultivation is not feasible—into artificial pastures provides a rational solution for enhancing forage production and utilization. Furthermore, it was determined that a feeding system based solely on intensive concentrate feeding in Merino lambs is not economically viable.

ÖZET

Bu çalışmada, 18054 nolu Yüreğir/Çukurova Tarımsal Araştırma Otomatik Meteoroloji Gözlem İstasyonunu 2016–2025 yılları arasındaki meteorolojik verileri kullanılarak 5 cm derinlikteki günlük toprak sıcaklığı derin öğrenme modeli olan Uzun Kısa Süreli Bellek (LSTM) kullanılarak tahmin edilmesi amaçlanmıştır. Model giriş değişkenleri olarak ortalama rüzgâr hızı, toplam yağış, ortalama sıcaklık, maksimum sıcaklık, minimum sıcaklık, bağıl nem ve günlük evapotranspirasyon değerleri kullanılmıştır. Veri setlerindeki eksik veriler doğrusal interpolasyon yöntemi ile tamamlanmıştır. Modelin girdi değişkenleri min-max normalizasyonu ile ölçeklendirilmiştir. Model geliştirme sürecinde, farklı kayan pencere (sliding window) boyutları (3, 5, 7, 10, 14, 21 ve 30 gün) test edilerek her bir boyutun tahmin doğruluğuna etkisi araştırılmıştır. Model performansı, Ortalama Mutlak Hata (MAE), Kök Ortalamaları Kare Hatası (RMSE) ve Belirleme Katsayısı (R^2) ölçütleri ile değerlendirilmiştir. Değerlendirme sonucunda en yüksek doğruluk 7 günlük kayan pencere kullanılarak elde edilmiş ve MAE, RMSE ve R^2 değerleri sırasıyla 1.565 °C, 1.890 °C ve 0.943 olarak belirlenmiştir. Kısa günlük kayan pencerelere (3 ve 5 gün) sahip modeller, yetersiz geçmiş bilgi nedeniyle daha düşük doğruluk sağlamıştır ($R^2 \approx 0.885$). Daha uzun günlük kayan pencerelerde (21 ve 30 günlük) ise bilgi güncelliği kaybı nedeniyle model performansının düştüğü gözlemlenmiştir ($R^2 \approx 0.916$–0.921). Elde edilen bulgular, toprak sıcaklığının kısa vadeli iklim dinamiklerine gecikmeli tepkiler verdiğini ve zaman serisi tahminlerinde kayan pencere boyutunun model başarımında belirleyici bir faktör olduğunu göstermektedir.

Anahtar Kelimeler: LSTM, RMSE, Sliding window, Toprak Sıcaklığı Tahmini

EVALUATION OF THE EFFECT OF DIFFERENT SLIDING WINDOW SIZES ON SOIL TEMPERATURE PREDICTION WITH DEEP LEARNING MODEL

ABSTRACT

In this study, the aim was to predict daily soil temperature at a depth of 5 cm using a deep learning model, Long Short-Term Memory (LSTM), based on meteorological data from the Yüreğir/Çukurova Agricultural Research Automatic Meteorological Observation Station (station no. 18054) for the period between 2016 and 2025. The input variables of the model included average wind speed, total precipitation, average temperature, maximum temperature, minimum temperature, relative humidity, and daily evapotranspiration values. Missing data in the dataset were completed using the linear interpolation method. The input variables of the model were scaled using min-max normalization. During model development, various sliding window sizes (3, 5, 7, 10, 14, 21, and 30 days) were tested to examine their effect on prediction accuracy. The model performance was evaluated using Mean Absolute Error (MAE), Root Mean Square Error (RMSE), and the Coefficient of Determination (R^2) metrics. As a result of the evaluation, the highest accuracy was achieved using a 7-day sliding window, with MAE, RMSE, and R^2 values determined as 1.565 °C, 1.890 °C and 0.943 respectively. Models with shorter sliding windows (3 and 5 days) yielded lower accuracy due to insufficient historical information ($R^2 \approx 0.885$). On the other hand, in models with longer sliding windows (21 and 30 days), a decrease in performance was observed due to the loss of information timeliness ($R^2 \approx$ 0.916–0.921). The findings indicate that soil temperature responds with a delay to short-term climate dynamics, and the sliding window size is a determining factor in the performance of time series predicting models.

ÖZET

Türkiye'de bitkisel ürün deseni içerisinde tarla bitkileri kapsamında yetiştirilen ürünler gerek insan beslenmesinde gerekse hayvan yemi olarak önemli yer tutmaktadır. Bu çalışmanın amacı, Türkiye'de üretilen bazı tarla ürünlerinin mevcut durumlarının incelenmesi ve istatistiksel verilerden yararlanarak geleceğe yönelik tahminlerde bulunulmasıdır. Bu kapsamda tarla bitkilerinden sıcak iklim tahılı olarak mısır, yağlı tohumlu bitkilerden de soya, ayçiçeği ve yer fıstığına ait veriler kullanılmıştır. Mısır, günümüzde ekonomik değeri büyük ve enerji değeri yüksek olan dünyada ve ülkemizde insan beslenmesinde büyük öneme sahip bir bitkidir. Mısır, son yıllarda silaj tekniklerinin gelişmesiyle geviş getiren hayvanlar için dünyada en önemli silaj bitkilerinden birisi olmuştur. Yüksek besin değerine sahip olan mısır, insan gıdası olarak ön plana çıkarken, mısır silajı hayvan yemi ve sanayi ham maddesi olarak da kullanılarak önemini bir kez daha arttırmaktadır. Yağlı tohumlu bitkiler de insan ve hayvan beslenmesinin yanı sıra enerji sektöründe kullanılması ve yoğunlukla dış ticarete konu olması bakımından stratejik ürünlerdir. Türkiye'de yağlı tohumlu bitkilerin üretimi yurt içi kullanıma yetmemekte ve ihtiyaç duyulan ürünler ithalat yoluyla karşılanmaktadır. Çalışmanın ana materyalini, Türkiye İstatistik Kurumundan (TÜİK) alınan istatiksel veriler oluşturmaktadır. Çalışmada 2006 ile 2024 yılları

arasını kapsayan dönem verileri analiz edilmiştir. Ayrıca değerlendirme ve yorumlama aşamasında konu ile ilgili daha önceden yapılan çalışmalardan faydalanılmıştır. Yöntem olarak zaman serileri analiz yöntemlerinden Trend Analizi kullanılmıştır. Yapılan analiz sonucu 2006 yılında 5.360.000 da olan mısır ekim alanı 2030 yılında 9.215.680 da, 2006 yılında 119.186 da olan soya ekim alanı 2030 yılında 550.576 da, 2006 yılında 226.900 da olan yerfıstığı ekim alanı 2030 yılında 663.464 da ve 2006 yılında 5.100.000 da olan ayçiçeği ekim alanı 2030 yılında 9.580.006 da olacağı tahmin edilmektedir. İncelenen dönemde özellikle soya ekim alanındaki artış dikkat çekmektedir. Elde edilen bulgular üretim deseninde yer alan ürünlerin ileriki dönemlerde nasıl bir eğilim içerisinde olacağı ve bu ürünlerin iç talebi karşılayabilme durumunu göstermesi açısından önemlidir. Bu bulgulara dayalı sonuçlar karar vericilere politika üretme konusunda yararlı bilgiler sunmaktadır. Ayrıca çalışmada ele alınan ürünlerin ekonomideki yeri ve önemi göz önüne alındığında bu ve benzeri çalışmaların, yeni yayınların yapılmasına zemin oluşturacağı değerlendirilebilir.

Anahtar kelimeler: Tarla ürünleri, Tahmin, Beklenti, Trend Analizi

PRESENT POSITION AND FUTURE PREDICTIONS FOR SOME FIELD CROPS IN TURKEY

ABSTRACT

In Turkey, crops cultivated within the field crop category of plant cropping systems have important roles both in human nutrition and as animal feed. The aim of this study is to examine the current status of some field crops produced in Turkey and to make projections for the future using statistical data. In this context, data on corn as a warm climate grain crop and on soybeans, sunflowers, and peanuts as oilseed crops were used. Corn is a plant of great economic value and high energy value today, and it is of great importance in human nutrition both globally and in our country. With the development of silage techniques in recent years, maize has become one of the most important silage crops in the world for ruminants. Maize, which has high nutritional value, is prominent as human food, while maize silage is also used as animal feed and industrial raw material, further increasing its importance. Oilseed crops are strategic products in terms of their use in human and animal nutrition, their use in the energy sector, and their heavy involvement in foreign trade. In Turkey, the production of oilseed crops is insufficient for domestic consumption, and the required products are met through imports. The main material of the study consists of statistical data obtained from the Turkish Statistical Institute (TÜİK). Data covering the period between 2006 and 2024 were analyzed in the study. In addition, previous studies on the subject were utilized during the evaluation and interpretation phase. The Trend Analysis method from time series analysis methods was used. The analysis results show that the corn cultivation area, which was 5,360,000 da in 2006, will be 9,215,680 da in 2030, the soybean cultivation area, which was 119,186 da in 2006, will be 550,576 da in 2030, the peanut cultivation area, which was 226,900 da in 2006, is estimated to be 663,464 da in 2030, and the sunflower cultivation area, which was 5,100,000 da in 2006, is estimated to be 9,580,006 da in 2030. The increase in soybean cultivation areas during the period under review is particularly noteworthy. The findings obtained are important in terms of showing the future trends of the products included in the production pattern and their ability to meet domestic demand. The findings provide decision-makers with useful information for policy-making. Furthermore, considering the place and importance of the products examined in this study in the economy, it can be argued that this and similar studies will pave the way for new publications.

ÖZET

Bu çalışma, Et ve Balık Kurumu'nun (EBK) 1952'deki kuruluş amaç ve görevlerini, kurumun sadece ekonomik bir Kamu İktisadi Teşebbüsü (KİT) olmanın ötesinde, Osmanlı'dan süre gelen iaşe misyonunu üstlendiğini ve kurumsal devamı olarak analiz etmektedir. Tarihsel olarak Osmanlı İmparatorluğu'nun başkenti İstanbul'da Celebkeşan, Celeb, Koyun Emini ve Kasapbaşı gibi isimler aracılığıyla yürütülen et iaşesi, orduya sürekli bir tedarik ve narh uygulaması ve beraberindeki kurallar ile halkın temel gıdaya erişimini sağlama olmak üzere çeşitli görevler üstlenmiştir. Zaman İçerisinde Osmanlı'nın son dönemlerine doğru bu geleneksel yapılar zayıflasa da, iaşe görevi bir devlet politikası olarak varlığını korumuştur.

Cumhuriyet döneminde, özellikle II. Dünya Savaşı sonrasında ortaya çıkan İstanbul'da hayat pahalılığı krizi, et tedariki sorununu ulusal güvenlik meselesine dönüştürmüştür. Bu konunun önemi 1936 yılında Sanayi Kongresi'nde konuşulmuştur. Ama kurumsal olarak bu kararların faaliyete geçmesi 1949 yılını bulmuştur. Hükümet, bu görevi Marshall yardımları aracılığıyla 1949 yılında görevi ilk olarak Toprak Mahsulleri Ofisi'ne (TMO) devretmiş, ancak bu girişim TMO'nun görev çeşitliliği dolayısıyla yetersiz kalmıştır. Bu durum tamamen özel bir konu olarak, EBK'nın 1952'de Milli Korunma Kanunu'na dayanarak kurulmasını zorunlu kılmıştır.

EBK, kuruluş amaçları ile bağlantılı olarak Osmanlı dönemindeki piyasanın düzenlenmesi ve orduya ve halka et tedariği ve süreklilik gibi benzer görevleri sürdürmüştür. Çalışma, EBK'nın maliyetlerinin ve oluşan zararın yönetimsel verimsizlikten ziyade, kurumun üstlendiği kamu yükümlülüğünün sonucu olduğunu savunmaktadır. Sonuç olarak, 1992 yılında özelleştirilen kurumun, 2005 yılında özelleştirme kapsamından çıkarılması ve yeniden kamu kurumu haline gelmesi, iaşe görevinin özele bırakılmayacak şekilde devlet için vazgeçilemez bir stratejik görev olduğunu göstermektedir. Bu analiz, EBK'yı sadece bir KİT olmaktan çıkarıp, iaşe görevinin devlet için bir zorunluluk olduğunu tanımlayarak literatüre katkı sağlamaktadır.

AN OTTOMAN LEGACY: THE MEAT AND FISH INSTITUTION (EBK) AND THE FOOD PROVISION CHAIN

ABSTRACT

This study analyzes the foundation objectives and duties of the Meat and Fish Institution (Et ve Balık Kurumu - EBK) in 1952, arguing that the institution was not merely an economic State Economic Enterprise (SEE), but undertook the provision mission (iaşe) sustained from the Ottoman period, serving as its institutional continuation. Historically, the meat provisioning (iaşe) system in the Ottoman capital of Istanbul, managed through officials such as Celebkeşan, Celeb, Koyun Emini, and Kasapbaşı, assumed diverse responsibilities. These included ensuring a constant supply for the military and securing public access to essential foodstuffs through narh (price control) and associated regulations. Although these traditional structures weakened towards the final periods of the Ottoman Empire, the provision mission persisted as a paramount state policy.

During the Republican era, the cost of living crisis that emerged in Istanbul, particularly following World War II, transformed the meat supply problem into a matter of national security. The significance of this issue was first discussed at the Industry Congress in 1936. However, the institutional activation of these decisions only occurred in 1949. Utilizing Marshall Plan aid, the government initially assigned this duty to the Turkish Grain Board (TMO) in 1949. However, this endeavor proved inadequate due to TMO's diverse range of functions. This inadequacy, relating to a highly specialized matter, necessitated the establishment of the EBK in 1952, founded upon the National Protection Law (Milli Korunma Kanunu).

In connection with its founding objectives, the EBK sustained analogous duties from the Ottoman period, such as market regulation and ensuring the provision and continuity of meat supply to the military and the public. The study posits that the EBK's costs and resulting financial losses originated not from managerial inefficiency, but rather from the public obligation assumed by the institution. Consequently, the removal of the institution from the scope of privatization in 2005—having been privatized in 1992—and its subsequent return to a public entity status, demonstrates that the iaşe mission is an indispensable strategic function for the state, one that cannot be entrusted to the private sector. This analysis contributes to the literature by reframing the EBK, moving it beyond the definition of a mere SEE and defining the iaşe duty as a fundamental state imperative.

ORCID: 0000-0002-5703-5752

ÖZET

Bu çalışma, Et ve Balık Kurumu'nun (EBK) 1952'deki kuruluşu, gelişme sürecini ve günümüz arasındaki süreci, Türkiye'nin et üretim ve tüketim merkezleri arasında gıda tedarik ve bölgesel kalkınma misyonu ve sürekliliği üzerinden incelemektedir. Ülkemizde hayvancılığın merkezi olan Doğu Anadolu'dan, nüfusun ve tüketimin yoğun olduğu batı merkezlerine yapılan canlı hayvan naklinden kaynaklanan yüksek fire ve maliyetler, ulusal et tedarik zincirinin kronik bir sorunu olmuştur. Bu konu, 1936 Sanayi Kongresi'nde gündeme gelmiş ve hayvanların yoğun olarak yetiştirildiği yerde kesilip, ürün haline getirildikten sonra batıda yer alan tüketim merkezlerine daha düşük maliyet ve fire ile nakledilmesi temel strateji olarak benimsenmiştir.

EBK, Milli Korunma Kanunu temelinde, bu kamusal zorunluluğu hayata geçirmek üzere kurulmuştur. Kurumun kurulmasından önce bu görevi üstlenen Toprak Mahsulleri Ofisi Marshall yardımları ile Amerika'dan gelen uzmanların katkıları ile ilk girişimi Erzurum Kombinası ile gerçekleştirmiştir. EBK, bu girişim ve sonrasında gelişen süreç ile doğu ve batı bölgesi arasındaki gelişmişlik ve kalkınma farkını ve iç göçü en aza indirmek amacıyla bölgesel kalkınmada ve Doğu Anadolu Bölgesi'nin hayvancılığını desteklemede hayati bir rol üstlenmiştir.

Özelleştirme sürecinde ve özelleştirme kapsamından çıktığı tarihte de çalışmaya devam eden kombinaların çoğu doğu ve güneydoğu illerinde bulunmaktaydı ve bölge hayvancılığının devam etmesine fayda sağlamaktaydı. Ancak 1992 yılında özelleştirme kapsamına alınan kurumun bu süreçte hükümetin teşviklerine karşın Doğu ve Güneydoğu Anadolu Bölgesi'ne yeterince yatırım yapmadığı görülmüştür. Bu durum, stratejik gıda transferi ve bölgenin kalkındırılması misyonunun özel sektör tarafından sürdürülemeyecek bir kamu yükümlülüğü olduğunu kanıtlamıştır. Sonuç olarak, EBK'nın 2005 yılında özelleştirme kapsamından çıkarılması ve TAR-ET Projesi gibi programlarla yeniden bölge hayvancılığını destekleme görevini üstlenmesi, devletin Doğu'dan Batı'ya güvenli ve düzenli gıda tedarik misyonunu geri aldığını göstermektedir. Mevcut durumda misyonuna Et ve Süt Kurumu olarak devam eden kurumun mevcutta yer alan kombinalarının da doğu, güney doğu ve iç Anadolu bölgelerinde bulunması da bu görevin önemini vurgulamakta ve günümüzde devam ettiğini göstermektedir. Bu analiz, EBK'nın kuruluş misyonu ve günümüzdeki durumu ile bölgesel kalkınma ile et ve et ürünlerinin üretim merkezinden tüketim merkezine bir düzen içerisinde ulaştırılması ile stratejik bir kurum olarak tanımlayarak literatüre katkı sağlamaktadır.

Anahtar Kelimeler: Et Balık Kurumu (EBK), Et ve Süt Kurumu, Bölgesel Kalkınma, Gıda Transferi.

MEAT LOGISTICS IN TÜRKIYE: THE STRATEGIC ROLE OF THE MEAT AND FISH INSTITUTION (EBK) IN LINKING PRODUCTION CENTERS TO CONSUMPTION HUBS

ABSTRACT

This study examines the foundation, development process, and current status of the Meat and Fish Institution (Et ve Balık Kurumu - EBK) since 1952, focusing on its mission continuity related to food provision and regional development between Turkey's meat production and consumption centers. High wastage and costs arising from the transport of live animals from Eastern Anatolia (the center of animal husbandry) to the densely populated consumption centers in the West have been a chronic problem for the national meat supply chain. This issue was brought to the agenda at the 1936 Industry Congress, where the core strategy was adopted: animals should be slaughtered and processed where they are intensively raised and then transported as finished products to Western consumption centers at lower cost and with minimal wastage.

The EBK was founded on the basis of the National Protection Law (Milli Korunma Kanunu) to execute this public imperative. The first institutional attempt was realized with the Erzurum Meat Processing Plant (Erzurum Kombinası), an initiative supported by Marshall Plan aid and American experts, prior to the official establishment of EBK by the Turkish Grain Board (TMO). Through this initiative and subsequent development, EBK assumed a vital role in regional development and supporting animal husbandry in Eastern Anatolia, aiming to minimize the disparity in development and internal migration between the East and West.

During the privatization process and at the time of its removal from the scope of privatization, most operating Meat Processing Plants were located in the Eastern and Southeastern provinces, contributing significantly to the continuation of regional livestock farming. However, the private sector, despite government incentives, was observed to have not invested adequately in the Eastern and Southeastern Anatolia Regions. This proved that the strategic mission of food transfer and regional development was a public obligation that could not be sustained by the private sector. Consequently, the removal of the EBK from the privatization scope in 2005 and its re-assuming the duty of supporting regional animal husbandry through programs like the TAR-ET Project, signified the state’s reclaim of the mission for a secure and regulated food supply from East to West. The fact that the Meat Processing Plants of the successor institution, the Meat and Milk Board (Et ve Süt Kurumu, ESK), are currently located in the Eastern, Southeastern, and Central Anatolia regions further emphasizes the continued importance of this mission. This analysis contributes to the literature by defining the EBK—from its founding mission and present status—as a strategic institution responsible for regional development and the regulated conveyance of meat and meat products from production to consumption centers.

Keywords: Meat and Fish Institution (EBK), Meat and Milk Board (ESK), Regional Development, Food Transfer, Public Obligation.

FLEXIBLE SOIL SENSORS FOR SMART AND SUSTAINABLE AGRICULTURE

ABSTRACT

In conventional agriculture, soil condition is evaluated based on experience and subjective observations of farmers. For instance, soil moisture is generally checked manually to determine irrigation timing, while planting seasons are determined based on seasonal temperature changes. However, these methods lead to inefficient use of resources such as water, fertilizer, pesticides, and labor, which in turn increases costs and causes greater environmental damage.

Soil sensor technologies, developed as a solution to these problems, provide measurable and real-time data, ensuring that agricultural production processes are more efficient, sustainable, and controlled. These sensors detect moisture, temperature, pH, etc., converting physical and chemical signals into electrical outputs and making them measurable. Rigid soil sensors, manufactured from ceramic or metal bodies, are inserted into the soil and can only measure data at their specific location. When the soil dries out, swells, or compacts, gaps form between the sensor and the soil, leading to measurement errors. Furthermore, it is costly to use multiple rigid sensors to detect the conditions of a field.

This study investigates flexible soil sensors developed to overcome the limitations of rigid sensors. Fabricated from flexible substrate materials, these sensors can be placed without damaging the root zone of plants; and their thin, lightweight, and low-cost nature enhances applicability. By adapting to the physical properties of the soil, flexible sensors can monitor critical parameters such as moisture, temperature, pH, and nutrient levels, offering an innovative solution that both optimizes resource use and increases crop productivity. This approach enables the transition from conventional to smart and sustainable agriculture.

ÖZET

Silisyum ve aljinik asit bitkide büyüme ve gelişme üzerinde olumlu etkileri olan maddelerdir. Bu çalışmada, silisyum ve aljinik asit içerikli toprak düzenleyicinin buğday bitkisinin verim ve verim parametreleri üzerine etkisi araştırılmıştır. Bu amaçla kurulan deneme, Doğu Akdeniz Tarımsal Araştırma Enstitüsü arazilerinden Doğankent lokasyonunda tarla koşullarında yürütülmüştür. Söz konusu deneme 450 adet m^2 ekim normunda, tesadüf blokları deneme desenine göre üç tekerrürlü olarak kurulmuştur. Deneme parselinin büyüklüğü 1.4 m eninde 5 m boyunda olacak şekilde 7 m^2 olarak ayarlanmıştır. Denemede bitkisel materyal olarak Adana-99 ekmeklik buğday çeşidi kullanılmıştır. Ekim zamanında taban gübresi olarak DAP (18-46-0) ile birlikte toprak düzenleyicinin 0, 10, 20, 30, 40, 50 kg da^{-1} dozları, uygulanmıştır. Kardeşlenme döneminde üst gübre olarak üre (%46 N) gübresi kullanılmıştır.

Araştırma sonucunda, kullanılan toprak düzenleyici materyalin buğday verim ve verim parametreleri üzerine etkisi olumlu bulunmuştur. Uygulamaların buğdayın bitki boyu (cm), başak sayısı (adet m^{-2}), 1000 tane ağırlığı (g), biyolojik verim (kg da^{-1}) üzerine etkisi istatistiki olarak önemli bulunmuştur. En yüksek değer, kontrol uygulaması konusuna göre dekara 40 ve 50 kg toprak düzenleyici uygulamalarından elde edilmiştir. Yapılan araştırmada verim ve toprak düzenleyici arasında quadratik bir ilişki ($y= 438.838+24.409x-0.334x^2$) bulunmuştur. Bu eşitliğe göre, buğday bitkisinde uygulanabilecek toprak düzenleyicinin optimum dozu 36.54 kg da^{-1} olarak tespit edilmiştir. Tek yıllık bir araştırma sonucunda, denemeye konu olan jeotermal biyomineral kompozisyonun buğdayın verim ve verim kriterleri üzerine etkileri incelendiğinde, buğday tarımında kullanılmasının olumlu etkisinin olabileceği gözlemlenmiştir.

Anahtar kelimeler: Silisyum, aljinik asit, buğday, toprak düzenleyici, jeotermal biyomineral rezerv

USE OF GEOTHERMAL RESERVES CONTAİNİNG SİLİCON AND ALGİNİC ACİD İN WHEAT

ABSTRACT

As a result of a one-year research, when the effects of the geothermal biomineral composition, which was the subject of the experiment, on the yield and yield criteria of wheat were examined, it was observed that its use in wheat agriculture could have a positive effect. As a result of a one-year research, when the effects of the geothermal biomineral composition, which was the subject of the experiment, on the yield and yield criteria of wheat were examined, it was observed that its use in wheat agriculture could have a positive effect. Silicon and alginic acid are substances that have positive effects on plant growth and development. This is possible, an investigation was made on the yield and yield of wheat plants compatible with soil containing silicon and alginic acid. For this purpose, the experiment was carried out under field conditions in Doğankent location, one of the lands of the Eastern Mediterranean Agricultural Research Institute. The experiment was conducted with three replications, according to the randomized block trial design, with a planting norm of 450 m^2. The size of the trial plot was adjusted to 7 m^2, with a width of 1.4 m and a length of 5 m. Adana-99 bread wheat variety was used as plant material in the experiment. DAP (18-46-0) as base fertilizer and 0, 10, 20, 30, 40, 50 kg da^{-1} doses of soil conditioner were applied together at the time of planting. Urea (46% N) fertilizer was used as top fertilizer during the tillering period.

As a result of the research, the effect of the soil amendment material used on wheat yield and yield parameters was found to be positive. The effects of the treatments on plant height (cm), number of ears (number m^{-2}), 1000 grain weight (g), biological yield (kg da^{-1}) of wheat were found to be statistically significant. The highest value was obtained from 40 and 50 kg soil conditioner applications per decare, depending on the control application subject. In the research, a quadratic relationship ($y= 438.838+24.409x-0.334x^2$) was found between yield and soil conditioner. According to this equation, the optimum dose of soil conditioner that can be applied to wheat plants was determined as 36.54 kg da^{-1}. As a result of a one-year research, when the effects of the geothermal biomineral composition, which was the subject of the experiment, on the yield and yield criteria of wheat were examined, it was observed that its use in wheat agriculture could have a positive effect

Keywords: Silicon, alginic acid, wheat, soil conditioner, geothermal biomineral reserve.

KAYISIDA KÜLTÜR ÖNCESI BOR VE KALSIYUM UYGULAMALARININ MIKROÇOĞALTIM, CAMLAŞMA VE APİKAL NEKROZA ETKISI

ÖZET

Bu çalışmada materyal olarak, Konya'da yapılan önceki çalışmalar sonucunda anaçlık özellikleri bakımından üstün bulunan 42-25 zerdali kayısı genotipine ait, Selçuk Üniversitesi Bahçe Bitkileri Bölümü'nde mikroçoğaltma ile elde edilmiş 3 yaşındaki fidanlar kullanılmıştır. Kayısı genotipinde eksplant alınacak bitkilere kültür öncesi uygulanan bor (150 ve 300 ppm), kalsiyum (%1 ve %2 $CaCl_2$) ve bunların kombinasyonlarının *in vitro* mikroçoğaltma ve köklendirme başarısına etkilerini belirlemek amacıyla yürütülmüştür.

Kültür öncesinde belirlenen dozlarda Ca ve B püskürtülen bitkiden alınan çelikler, sterilizasyon işlemlerinden geçirilmiş ve MS besi ortamına aktarılmıştır. Çoğaltma aşamasında eksplantlar, yeterli sayıya ulaşıncaya kadar düzenli olarak alt kültüre alınmış ve bu süreç toplam yedi alt kültür boyunca devam etmiştir. Her alt kültürde sağlıklı gelişim gösteren sürgünler bir sonraki ortama aktarılmıştır. Bu aşamada bitki canlılığı, sürgün sayısı, sürgün uzunluğu ve camlaşma oranı değerlendirilmiştir. Köklendirme aşamasında ise köklenme oranı, kök sayısı, kök uzunluğu ve apikal nekroz oranları incelenmiştir. Sonuç olarak, toplam dokuz uygulamanın beşinde başarılı veriler elde edilmiş (Kontrol, %1 $CaCl_2$, %1 $CaCl_2$ + 150 ppm B ve %1 $CaCl_2$ + 300 ppm B ve 300 ppm B); apikal nekrozdaki artış ve yüksek dozlara bağlı fitotoksisite nedeniyle diğer uygulamalarda bitkilerin yaşamını yitirdiği tespit edilmiştir.

Elde edilen bulgulara göre sürgün sayısı en fazla kontrol grubunda (9,40 adet/eksplant) belirlenmiştir. Sürgün uzunluğu ise en yüksek 300 ppm B uygulamasında kaydedilmiştir. Camlaşma oranı en yüksek yine 300 ppm B'de gözlenmiş ancak %1 $CaCl_2$ ve bazı kombinasyonlarda tamamen engellenmiştir. Köklenme oranı kontrol dahil tüm uygulamalarda %100 gerçekleşirken, kök sayısı özellikle %1 $CaCl_2$ ve kontrol'de öne çıkmıştır. Kök uzunluğu %1 $CaCl_2$ ve kombinasyonlarında en yüksek seviyelere ulaşmıştır. Ayrıca apikal nekroz oranı en düşük %1 $CaCl_2$ uygulamasında kaydedilmiş ve bu uygulamanın önemli bir baskılama etkisi yaptığı belirlenmiştir.

Anahtar Kelimeler: Kayısı, bor, kalsiyum, mikroçoğaltım başarısı

EFFECTS OF PRE-CULTURE BORON AND CALCIUM APPLICATIONS ON MICROPROPAGATION, VITRIFICATION, AND APICAL NECROSIS IN APRICOT

ABSTRACT

In this study, three-year-old seedlings of the 42-25 apricot (Prunus armeniaca L.) genotype, previously identified in field studies conducted in Konya as superior in terms of rootstock characteristics and obtained through micropropagation at the Department of Horticulture, Selçuk University, were used as plant material. The study aimed to determine the effects of pre-culture applications of boron (150 and 300 ppm), calcium (1% and 2% $CaCl_2$), and their combinations on *in vitro* micropropagation and rooting success in this apricot genotype.

Cuttings taken from plants sprayed with predetermined doses of Ca and B before culture were sterilized and transferred to MS nutrient medium. During the propagation phase, explants were subcultured regularly until a sufficient number was reached, continuing for a total of seven subcultures. Shoots showing healthy growth in each subculture were transferred to fresh medium. At this stage, plant viability, shoot number, shoot length, and vitrification rate were evaluated. In the rooting phase, rooting rate, root number, root length, and apical necrosis rate were examined. As a result, successful outcomes were obtained in five of the nine treatments (Control, 1% $CaCl_2$, 1% $CaCl_2$ + 150 ppm B, 1% $CaCl_2$ + 300 ppm B, and 300 ppm B), while increased apical necrosis and phytotoxicity caused by higher doses led to plant death in the remaining treatments.

According to the findings, the highest shoot number was recorded in the control group (9.40 shoots/explant), whereas the longest shoots were obtained from the 300 ppm B treatment. The highest vitrification rate was also observed in the 300 ppm B treatment; however, vitrification was completely prevented in 1% $CaCl_2$ and some combination treatments. Rooting rate reached 100% in all treatments, including the control, while root number was particularly higher in 1% $CaCl_2$ and control treatments. Root length reached its maximum levels in 1% $CaCl_2$ and its combinations. Additionally, the lowest apical necrosis rate was recorded in the 1% $CaCl_2$ treatment, indicating a strong suppressive effect.

Keywords: Apricot, boron, calcium, micropropagation success.

FAYDALI BAKTERİLERİN FASULYEDE *Macrophomına phaseolına* [(tassı) goıd.]'NIN NEDEN OLDUĞU KÖMÜR ÇÜRÜKLÜĞÜ HASTALIĞI VE BİTKİ GELİŞİMİ ÜZERİNE ETKİLERİ

ÖZET

Bu çalışma bazı faydalı bakterilerin fasulyede kömür çürüklüğü hastalık etmeni *Macrophomina phaseolina* [(Tassi) Goid.]'ya karşı biyokontrol potansiyellerini belirlemek ve bu bakterilerin fide gelişimi üzerindeki etkilerini araştırmak amacıyla yapılmıştır. Çalışmada çeşitli kaynaklardan izole edilen bakteri izolatları, fasulyeden izole edilen *M. phaseolina* izolatı ve Gina çeşidi fasulye tohumları kullanılmıştır. Çalışma, *in vitro* ve iklim odası koşullarında yürütülmüştür. *In vitro* koşullarda Triptik Soy Agar besi yerinde ikili kültür testi ile yapılmış ve uygulama yapılan petrilerde fungus miselyum çapları ölçülerek bakteri izolatlarının fungus üzerindeki etkisi belirlenmiştir. İkili kültür testinde fungus üzerinde etkili olan altı adet izolat ile saksı denemesi kurulmuştur. Saksı denemesinde, fasulye tohumları her bir izolattan hazırlanan bakteri süspansiyonu ile muamele edilmiştir. Tohum ekimi esnasında *M. phaseolina*'dan hazırlanan mikrosklerot süspansiyonu tohum çevresine uygulanmış ve bu uygulamadan yedi gün sonra ikinci bir bakteri uygulaması topraktan sulama şeklinde tohumlara verilmiştir. Negatif kontrol olarak saf su uygulanan tohumlar, pozitif kontrol olarak sadece patojen fungus uygulanan tohumlar kullanılmıştır. Yaklaşık 30 gün sonra bitkilerdeki çökme sayısına göre değerlendirme yapılmıştır. Çalışmada ayrıca bakterilerin fasulyede fide gelişimine olan etkisi de araştırılmıştır. Patojen uygulaması dışında bakteri uygulanan tohumlardan oluşan fidelerde farklı parametrelerle değerlendirme yapılmıştır. İkili kültür testlerinde bakterilerin %37,6-86,5 arasında değişen oranlarda *M. phaseolina* miselyum gelişimini baskıladığı belirlenmiştir. Saksı denemesinde ise kontrol (2,4) ile kıyaslandığında MBB1 (0,2) en yüksek biyokontrol potansiyeline sahip izolat olarak belirlenmiştir. Kullanılan bakterilerin çeşitli parametrelerde fide gelişimini de olumlu yönde etkilediği görülmüştür. Çalışmada bazı faydalı bakterilerin kömür çürüklüğü hastalığı üzerine etkisi belirlenmiş olup, sera ve tarla koşullarında yürütülecek çalışmalar ile baskılama özelliklerinin ortaya konulması mücadelesi zor olan bu hastalık için oldukça önem arz etmektedir. Kullanılan bakterilerin etki mekanizmalarının ve biyogübre potansiyellerinin detaylı bir şekilde belirlenmesi çalışmayı daha anlamlı kılacaktır.

Anahtar Kelime: *Macrophomina phaseolina,* Faydalı bakteriler, Biyolojik mücadele

EFFECTS OF BENEFICIAL BACTERIA ON CHARCOAL ROT DISEASE CAUSED BY *Macrophomına phaseolına* [(tassı) goıd.] AND ON THE GROWTH OF COMMON BEAN

ABSTRACT

This study was conducted to determine the biocontrol potential of certain beneficial bacteria against the charcoal rot pathogen *Macrophomina phaseolina* [(Tassi) Goid.] in bean (*Phaseolus vulgaris* L.) and to investigate their effects on seedling growth. Bacterial isolates obtained from various sources, an *M. phaseolina* isolate collected from bean, and seeds of the Gina bean variety were used in the study. The experiments were carried out under both *in vitro* and climate chamber conditions. Under *in vitro* conditions, a dual culture test was performed on Tryptic Soy Agar medium. The mycelial diameter of the fungus was measured to determine the inhibitory effect of the bacterial isolates. Based on the *in vitro* results, six isolates that showed high antifungal activity were selected for pot experiments. In the pot experiment, bean seeds were treated with bacterial suspensions prepared from each isolate. During sowing, a microsclerotial suspension of *M. phaseolina* was applied around the seeds, and seven days later, a second bacterial treatment was administered to the soil as irrigation. Sterile distilled water-treated seeds served as the negative control, while seeds inoculated only with the pathogen constituted the positive control. Approximately 30 days after sowing, disease incidence was evaluated based on the number of collapsed seedlings. In addition, the effects of the bacterial treatments on seedling growth were evaluated. In treatments without pathogen inoculation, seedlings derived from bacterium-treated seeds were assessed using various growth parameters. The dual culture tests revealed that bacterial isolates inhibited *M. phaseolina* mycelial growth by 37.6–86.5%. In the pot experiment, when compared with the control (2.4), isolate MBB1 (0.2) exhibited the highest biocontrol potential. The tested bacterial isolates also positively affected seedling growth parameters. Overall, the study demonstrated that some beneficial bacteria can suppress charcoal rot disease in beans. Future greenhouse and field experiments will be crucial to confirm their disease-suppressive potential against this difficult-to-control pathogen. Moreover, detailed investigation of the mechanisms of action and biofertilizer potential of these bacteria will further enhance the significance of this research.

ÖZET

Bu çalışma, sığırlarda yemleme öncesi ve sonrası biyoelektrik aktivitede meydana gelen değişiklikleri tespit etmek ve bu durumun fizyolojik sebeplerini ortaya koymak amacıyla yapılmıştır. Doğru tasarlanmış in vitro simülasyon teknolojileri biyolojik araştırmalarda tamamlayıcı bir araçtır. Bu nedenle canlının vücudunda üretilen ve sürekli var olan biyoelektrik aktivitenin de üretim mekanizmasında etkili bir faktör olarak değerlendirilmesi gerektiğini düşünmekteyiz.

Çalışmada, Van ilinden 16 dişi ve Kars ilinden 14 erkek Simmental Melezi sığır kullanılmıştır. Hayvanların biyoelektrik aktivitesi, 35 gün boyunca her gün akşam yemleme öncesi ve sonrasında Avometre cihazı ile yalıtkan bir platform üzerinde ölçülmüştür. Elde edilen veriler, hayvanların cinsiyet, yaş, ağırlık ve şehir gibi faktörlere göre istatistiksel analizleri yapılmıştır.

Ölçümler sonucu; yemleme öncesi 0.517±0.011v ve yemleme sonrası 0.507±0.010v biyoelektrik aktivite bulundurdukları tespit edilmiştir. Yemleme öncesi ve sonrası ölçülen biyoelektrik aktivite değerlerinin cinsiyet, yaş, durum, ağırlık ve şehir bakımından önemli bir fark oluşturdukları tespit edilmiştir.

Vücuttaki elektriksel iletkenlik, iyonların (sodyum, potasyum, kalsiyum) dengesi ve su miktarı ile doğrudan ilişkilidir. Özellikle kan damarlarındaki sıvı dengesi ve hormonal etkiler, biyoelektrik aktivite ölçümlerinde geçici dalgalanmalara neden olmaktadır. Bu durum, sindirimle birlikte metabolik süreçlerin hızlanması ve vücudun yeni bir denge durumuna geçmesiyle açıklanabilir.

Sonuç olarak, sığırlardaki biyoelektrik aktivitenin yemlemeden önce yüksek, yemlemeden sonra ise önemli oranda düştüğü tespit edilmiştir. Bu bulgular, yapılacak çalışmalarda biyoelektrik aktivite ölçümlerinin dinamik bir süreç olarak ele alınması gerektiğini ortaya koymaktadır. Bu çalışma, hayvanlardaki biyoelektrik aktivitenin günlük yaşam döngüsü içindeki değişimlerini anlamak için önemli bir ilk adımdır ve gelecekte bu konuda yapılacak araştırmalar için bir temel oluşturabilir.

INVESTIGATION OF BEFORE- AND AFTER-FEEDING BODY BIOELECTRICAL ACTIVITIES IN SIMMENTAL CROSSBRED CATTLE

ABSTRACT

This study was conducted to determine the changes in bioelectric activity that occur in cattle before and after feeding and to reveal the physiological reasons for these changes. We believe that bioelectric activity, which is produced continuously in a living organism's body, should be considered an effective factor in its production mechanism. In vitro simulation technologies, when designed correctly, are a complementary tool in biological research.

For the study, 16 female and 14 male Simmental Crossbred cattle from Van and Kars provinces, respectively, were used. The animals' body electricity was measured

for 35 days, both before and after their evening feeding, using an Avometer on an insulating platform. The data obtained from the measurements were statistically analyzed based on factors such as the animals' sex, age, weight, and city.

The measurements revealed that the animals' bioelectric activity was 0.517±0.011v before feeding and 0.507±0.010v after feeding. It was also determined that the bioelectric activity values measured before and after feeding showed a significant difference based on gender, age, physiological status, weight, and city.

Electrical conductivity within the body is directly related to the balance of ions (sodium, potassium, calcium, etc.) and water content. The fluid balance in blood vessels and hormonal effects, in particular, cause temporary fluctuations in bioelectric activity measurements. This can be explained by the acceleration of metabolic processes and the body's transition to a new state of equilibrium during digestion.

In conclusion, it was determined that the bioelectric activity in cattle is high before feeding and decreases significantly after feeding. These findings suggest that bioelectric activity measurements in future studies should be treated as a dynamic process. This study is an important first step toward understanding the daily variations in bioelectric activity in animals and can provide a basis for future research in this area.

ABSTRACT

Chhattisgarh a state of India is suffering from naxal problem. The identification whether a person is belonging to Naxal domain or not is a very difficult problem. Government of India and Chhattisgarh has made commendable progress in maintaining the catastrophic situation in some parts of chhattisgarh. In the current paper the authors knowing that the naxal people are generally located in dense forest area will take help of the proposed prototype of the current article. In the current article with the advancement of CNN based drone technology and CCTV based CNN technologies could be used for the detection of people having weapon and send an alert to the respective officer in-charge that government has appointed to take care of the problem. In the current work we will be performing a Training Operation where all the individuals from the Government who carry weapons will be detected and afterwards whenever a new person carrying weapon is detected in the suspected region will send an alert in terms of Email or Message. The prototype is what is conveyed in the paper using the CNN based technology and the conservation of Tribes which is the majority population near the dense forest area are going to have the help.

ABSTRACT

Designer eggs are one of the significant improvements in poultry egg production, driven by the increasing need for nutritionally dense foods. They are enriched eggs that are produced by modifying the diet of laying hens to improve the nutritional profile of eggs with superior makeup/composition to their original. As designer eggs are laid by hens whose diets have been infused with certain feed additives which includes antioxidants, vitamins, minerals, omega-3-rich sources, and the likes, they can also be considered as nutritionally enhanced eggs. By means of genetic selection and beneficial modifications, designer eggs can also be produced to provide advantageous health benefits. This review explores the different techniques of producing designer eggs, with an emphasis on feed-based approaches including adding flaxseed, fish oil, microalgae, selenium, and carotenoids to hens' diet. These dietary changes produce eggs that are highly metabolized. The paper further examines the use of designer eggs to prevent chronic diseases, such as cardiovascular ailments, cognitive decline, and vitamin deficiencies, in addition to detailing compositional enhancements. Within the larger framework of nutrition-sensitive agriculture, the function of designer eggs to promote public health is assessed with a focus on alleviating undetected malnutrition and non-communicable diseases in both industrialized and developing nations. Even though, there are still issues with production costs, safety standards, and nutritional stability, designer or enhance eggs present a viable pathway for the development of functional foods. They offer a practical, long-term approach to enhancing population health by combining focused dietary modifications with farming methods.

ABSTRACT

Street food plays a vital role in urban food culture, offering affordable and accessible meals to millions worldwide. However, despite its cultural and economic significance, street food often poses major public health challenges due to inadequate hygiene practices, lack of proper storage facilities, and limited regulatory oversight. This study aims to explore the relationship between street food consumption, food safety standards, and public health outcomes. Emphasis is placed on understanding the social importance of street food vendors, consumer behavior, and awareness regarding food hygiene. Findings suggest that while street food supports local economies and preserves traditional culinary practices, it also contributes to foodborne diseases when safety measures are neglected. Strengthening food safety education, implementing hygiene regulations, and promoting awareness among vendors and consumers are essential for ensuring safe street food practices. The study highlights the need for integrated policy approaches that balance cultural preservation with public health protection

ABSTRACT:

Agriculture serves as a vital pillar in pharmaceutical sciences, especially in the sourcing and development of plant-based medicines. Many essential drugs originate from medicinal plants cultivated through agricultural practices, making knowledge of cultivation, harvesting, and post-harvest handling critical to ensuring drug quality and consistency. Agricultural studies in pharmacy focus on medicinal plant identification, soil and climate requirements, pest management, and sustainable farming techniques to optimize the yield of pharmacologically active compounds. .Understanding agriculture is not only important for herbal drug production but also for ensuring the authenticity, safety, and efficacy of natural products. With the growing global demand for phytopharmaceuticals and traditional medicines, pharmacists must be equipped with agricultural insights to ensure ethical sourcing and promote conservation of medicinal plant biodiversity Integrating agricultural knowledge into pharmacy strengthens the link between nature and medicine, supporting innovation, sustainability, and global health.

ABSTRACT

The experiment was carried out in an experimental greenhouse at the Department of Agronomic Sciences, University of Biskra. Two 1 m³ tanks, each housing 30 fish, were utilized with a mechanical filtration system and weekly water replenishment. In the evaluated diet, soybean meal was substituted with peanut meal in equivalent quantities The control feed comprised 41% soybean meal, 14% fish meal, 35% corn, 8% oil, and 2% multivitamin supplement (MVS). The fish were nourished bi-daily, and the assessed parameters included weight, length, width, and growth coefficient. The primary aim of this study is to compare the weight and growth of hybrid

tilapia (Oreochromis sp.) fed a diet consisting of readily available vegetable materials (peanuts) with those nourished on commercial feed. The proposed methodology involves weekly measurements of the weights and sizes of hybrid tilapia over a two-month duration. The mean weight at the conclusion of the experiment was 33.54 grams. The average dimensions measured were 12.22 cm in length and 4.5 cm in width. The results gathered in this study indicates that food derived from plant products warrants our utmost attention and should be broadly valued.

CONSTRUCTION FEATURE AND REGULATORY ASPECTS OF ORGAN CHIP FOR DRUG DELIVERY APPLICATION

Babita Gupta

Assistant Professor, Institute of Technology and Management

Email: guptababita2001@gmail.com

ABSTRACT

Organ-on-chip is an innovative technique, that emerged from tissue engineering and microfluidic technologies. Organ-on-chip devices (OoCs) are anticipated to provide efficient resolutions to dealing with challenges in pharmaceutical advancement and individualized illness therapies. Organ-on-chip is an advanced technology that simulates the physiological processes of human organs on a silicon chip. The main objective of the organ-on-chip technique is to replicate three essential aspects of human physiology: the complex cellular interfaces found in organs such as blood vessels, lungs, and the gut, which act as barriers in tissues. The article aims to explore the detailed design factors that contribute to the biomimetic character of Organ-on-Chip devices, focusing on their construction aspects primarily for drug delivery applications. Three-dimensional organ-on-a-chip models can contract and secrete albumin like genuine tissues. Several scientific fields employ microfluidic devices to construct basic humanoid model systems. Effective integration of this advanced technical platform with common pharmaceutical and medical contexts is still a challenge. subsequently, it summarizes tumor-on-a-chip technologies and indicates their application in anti-cancer drug assessment. Microfluidic technology, a micro-level technique, has become a potent tool for biomedical engineering research. As a result, it has revolutionized disciplines including physiological material interpreting, compound detection, cell-based assay, tissue engineering, biological diagnostics, and pharmaceutical identification. The review provides a comprehensive analysis of the regulatory dimensions related to the application of OOC technology in the field of drug delivery. The article explores how Organ-on-Chip medication delivery technology must improve the connection between experimental models and clinical applications.

ABSTRACT

The need for friendly and sustainable solution from consumers is causing a major shift in the food packaging sector. Innovation in food packaging are focused on reducing waste, increasing recyclability, and promoting environmentally responsible practices. Recent development in the edible packaging, biodegradable material, and smart packaging technologies are highlighted in this abstract as example of sustainable of food packaging. Redesigning food packaging options to be more sustainable is necessary, but evaluating which option is more optimal while taking into account the full value chain of food products is a highly challenging issue. Although earlier research cleared the path for a definition of sustainable food packaging, it is still far from widely used or widely accepted in the felid of food system, which leads to all parties involved in the value chain producer, distribution, practitioners, and consumer making ignorant decisions about sustainable food packaging.

Biodegradable material, such as plant-based bioplastics and compostable packaging, offer a promising alternative to traditional plastics. Packaging waste is completely eliminated with edible packaging, which is produced from natural substances like cornstarch or seaweed. Smart packaging technologies, including intelligent labels and sensor, enable real-time monitoring of food freshness and quality. In general, it is expected that more countries and regions would implement laws to reduce waste and promote a circular economy, continuing the trend toward sustainable food packaging regulation. This is likely to encourage the creation of new eco-friendly packaging materials and encourage businesses to adopt more sustainable practices. As consumer become more aware of the environmental impact of their purchasing decisions, the demand for sustainable food packaging will continuous to grow, driving further innovation and adoption of eco-friendly practices.

Keywords: Eco-friendly materials, **Biodegradable packaging, Circular economy,** Green technolog

ABSTRACT

Introduction:

Rosehip by-products represent a sustainable source of fibers, polyphenols, and carotenoids (Borşa et al., 2025) with strong antioxidant and coloring potential. Their inclusion in meat products may reduce synthetic additives while enhancing quality and stability. This study explores their valorization as natural functional additives for pork sausage reformulation. Exploring their incorporation into meat systems offers an opportunity to improve both product quality and circular economy outcomes in the food sector.

The objective of this study was to investigate the feasibility of incorporating rosehip by-product powder into pork sausages and to evaluate its influence on their technological, physicochemical, and sensory characteristics within a sustainability-oriented framework.

Three pork sausage formulations were prepared: a control sample without rosehip powder and two experimental variants containing 2.7% and 5.5% rosehip by-product powder. The sausages were analyzed to determine the influence of the ingredient on color, texture, and general quality attributes throughout storage. Physicochemical parameters, including pH, moisture, and lipid oxidation, were measured, alongside colorimetric and textural profile analyses. Furthermore, total polyphenol and carotenoid contents were quantified to assess the functional contribution of the powder. Sensory evaluation was carried out with consumer panels to determine acceptance and perceived quality differences among the samples.

The inclusion of rosehip by-product powder in pork sausage formulations resulted in measurable changes to their composition and quality parameters. Moisture and protein contents showed a significant decrease, while total carbohydrates, polyphenol, and carotenoid levels increased proportionally to the amount of powder added. The powder also contributed to a lower pH and reduced easily hydrolysable nitrogen, indicating potential preservative effects. In terms of appearance, reformulated sausages exhibited enhanced red and yellow tones, reflecting improved visual quality. Texture profile analysis revealed reductions in gumminess and chewiness, while sensory evaluation showed only minor differences in taste and mouthfeel compared to the control. Overall consumer acceptance remained high across all treatments, indicating good market potential.

Rosehip by-products represent a promising functional ingredient for pork sausage reformulation, offering both technological and nutritional benefits while supporting sustainable waste valorization and clean-label product development.

Keywords: carotenoids, polyphenols, physicochemical properties, functional meat products

FOOD SAFETY REGULATIONS AND CONSUMER AWARENESS

ABSTRACT

Food safety is a critical component of public health that ensures the protection of consumers from foodborne diseases, contamination, and adulteration. With globalization and the expansion of food supply chains, the role of food safety regulations has become increasingly important in maintaining quality standards from production to consumption. Effective regulations, such as the Hazard Analysis and Critical Control Points (HACCP), Food Safety and Standards Authority of India (FSSAI) guidelines, and Codex Alimentarius standards, provide a framework for controlling hazards and ensuring safe practices. However, the effectiveness of these regulations depends largely on consumer awareness and participation. Educated consumers are more likely to read food labels, demand compliance, and report unsafe practices, thereby encouraging industries to adhere to regulatory norms. In many developing countries, limited awareness leads to weak enforcement and higher risks of foodborne illnesses. Public health campaigns, digital platforms, and community-based interventions play a crucial role in bridging this gap. The integration of regulatory frameworks with consumer education creates a sustainable system where both industry and consumers contribute to food safety. Therefore, enhancing consumer awareness alongside strengthening regulations is essential to safeguard health, promote trust, and ensure sustainable development in the food sector.

ABSTRACT

The dairy industry produces large volumes of whey, a by-product with a high organic and nutrient load that poses serious environmental challenges when discarded untreated. Transforming this effluent into a useful agricultural input aligns with the principles of circular economy and sustainable production. This study investigates the potential of whey-derived digestate as a natural biostimulant to improve seed germination and early growth of two major crops, tomato (*Solanum lycopersicum*) and wheat (*Triticum aestivum*).

Synthetic whey was prepared by heating to 80 °C and adding 2% citric acid for coagulation and filtration. Anaerobic digestion was then carried out under mesophilic conditions (35–40 °C), producing a nutrient-rich digestate containing nitrogen, phosphorus, potassium, and calcium. The digestate was diluted to four concentrations (0%, 25%, 50%, and 75%) and applied to plants under controlled conditions. Germination rate, root and shoot length, and total biomass were measured and statistically analyzed to determine dose–response effects.

Results showed that moderate digestate concentrations (25–50%) significantly enhanced germination rate, root elongation, and shoot biomass, particularly in tomato, while excessive concentrations (≥ 75%) inhibited growth due to high organic and mineral loads.

These findings demonstrate that whey-derived digestate can serve as an effective and sustainable biostimulant, improving crop establishment while contributing to the valorization of dairy waste. Optimizing dilution and application protocols could further enhance its agronomic benefits and reduce the environmental footprint of the dairy sector.

ABSTRACT

Old train carriages are often left to rust and decay, even though they're built to last and could be repurposed in creative ways. This project repurposes these forgotten carriages into immersive escape rooms, creating interactive environments that engage visitors both intellectually and physically. By building on the existing structure, the design reduces environmental impact and revives forgotten infrastructure with a fresh purpose. The "Threads of Escape" concept links several carriages into one seamless journey, creating a stronger sense of exploration and keeping the experience engaging throughout. Preserving the original form of the trains, the project blends history with innovation, offering a unique recreational attraction that local tourism and public engagement. It demonstrates how adaptive reuse can turn outdated spaces into vibrant, experience-focused destinations, reimagining abandonment as a chance for creativity and innovation.

ABSTRACT

The use of Antibiotic for reproductive performance and disease prevention does not only impair livestock's natural physiological processes, it also encourages the development of resistant infections pathogens that people can contract through food chains. In this study feed forms (mash and pellets) and two inclusion levels of oyster mushroom were tested on three hundred and twenty (320), fourteen (14) weeks old pullets that were divided into four treatments containing 80 birds in a treatment with 10 replicates of 8 birds each. The study was arranged in a 2 × 2 factorial laid out in a completely randomized design consisting of two feed forms (mash and pellets) and two inclusion levels of oyster mushroom (0 or 1 g/kg). After six weeks of administering the treatments, two birds per replicate were randomly selected and eviscerated to determine the reproductive organ development at 20^{th} week of age. The length of the oviduct, number of follicles, follicle weight, number of ovary and weight of the ovary were evaluated. Data collected were subjected to two ways analysis of variance. The result of the study showed that the effect of feed form and the interaction between the feed forms and oyster mushroom inclusion did not significantly ($p>0.05$) affect the reproductive organs parts of the pullets. However, the inclusion of 1 g/kg (1.00g) of oyster mushroom in the diet of the birds significantly ($p>0.05$) decreased the follicle weight relative to the control (1.75g). The study concluded that the inclusion of 1 g/kg significantly reduced the follicle weight of the birds.

ABSTRACT

The growing accumulation of polyethylene terephthalate (PET) waste, primarily from discarded beverage bottles, has become a major environmental and resource management concern. Mechanical recycling of PET into sheets is a promising strategy for waste valorization; however, the resulting recycled PET (rPET) often suffers from poor mechanical, thermal, and barrier properties compared with its virgin counterpart. In recent years, the integration of nanomaterials has emerged as a powerful approach to overcome these limitations. This review critically examines recent advances in the application of nanomaterials—including nano clays, carbon nanotubes, graphene derivatives, metal oxide nanoparticles, and bio-based nanofillers—to enhance the structural and functional performance of rPET sheets. The discussion emphasizes the influence of nanoparticle type, surface modification, dispersion techniques, and processing routes on the final properties of PET-based nanocomposites. Particular attention is given to the interfacial interactions between the PET matrix and nanofillers, which govern crystallinity, rheology, and barrier behavior. Moreover, this review highlights the potential of hybrid nanofiller systems and green synthesis methods to achieve both performance improvement and environmental sustainability. Finally, key challenges and future perspectives—such as nanoparticle dispersion control, recyclability, and industrial-scale processing—are outlined to guide further research toward circular and high-performance PET nanocomposite materials.

RECENT ADVANCES TOWARDS THE PET ENVIRONMENTALLY FRIENDLY BOTTLES TECHNIQUES : A REVIEW

Afshin Tavasoli Farsheh

Department of Agriculture, Mashhad Branch, Islamic Azad University, Mashhad, Iran

Email: tavasoliaf@gmail.com

Arezoo Sadat Khafi

Department of Biology, Mashhad Branch, Islamic Azad University, Mashhad, Iran

ABSTRACT

Polyethylene terephthalate (PET) has long dominated the beverage packaging industry due to its transparency, strength, and low cost; however, the environmental burden associated with its fossil-based origin and poor degradability has prompted extensive research into more sustainable alternatives. This review highlights recent progress in developing environmentally friendly PET bottles through innovations in material design, recycling technologies, and bio-based feedstocks. Advances in chemical and enzymatic recycling have enabled the recovery of high-purity monomers such as terephthalic acid and ethylene glycol, facilitating the production of high-quality recycled PET (rPET) suitable for food-grade applications. Parallel efforts in bio-based PET synthesis—using renewable precursors such as bio-ethylene glycol and 2,5-furandicarboxylic acid (FDCA)—have demonstrated comparable performance to conventional PET while reducing carbon footprint. Additionally, the incorporation of biodegradable copolymers, nanofillers, and green additives has improved the degradability, mechanical integrity, and barrier properties of PET bottles. Emerging technologies such as reactive extrusion, advanced catalysis, and life-cycle optimization further support a closed-loop circular economy for PET packaging. This review concludes that integrating bio-based chemistry, nanotechnology, and smart recycling systems offers a realistic pathway toward fully sustainable PET bottles that balance performance, recyclability, and environmental impact

Key words: Polyethylene terephthalate, environmentally friendly, enzymatic recycling, green additives

AI FOR AGRARIAN TRANSFORMATION: UNLOCKING THE POTENTIAL OF MACHINE LEARNING FOR CROP YIELD PREDICTION, DISEASE DETECTION, AND SMART FARMING

Wasiu Olatunde OLADAPO

Lagos State University of Education

Email: wasiuoladapo19@gmail.com

ABSTRACT

The food security and economic development of the countries rely on agriculture which is becoming more and more challenged by the climate change, resource availability, and population growth. The recent development in the Artificial Intelligence (AI) and the Machine Learning (ML) is reshaping the agrarian environment, making it possible to use data-driven decision-making, predictive analytics, and automation. The paper will discuss how AI is changing the agrarian systems and emphasize three relevant areas of crop yield prediction, disease detection, and smart farming. Internet of things (IoT) sensors, remote sensing data, the combination of ML algorithms allow farmers make more accurate predictions about yields, real-time disease detection in crop, optimization of the input, such as water, fertilizers, and pesticides. It presents cases of practical applications of deep learning and predictive modeling, which are enhancing productivity and sustainability in developed and developing regions. It also covers the barriers to adoption including the absence of data, infrastructural barriers and the need to have digital literacy training that targets farmers. The results highlight that AI use in agriculture could have huge potentials in attaining agrarian transformation in a sustainable approach, enhancing food chains and facilitating the global food security ambitions.

ABSTRACT

Climate change intensifies these stresses, emphasizing the need for resilient agricultural systems. Intercropping has emerged as a sustainable strategy to mitigate these impacts by enhancing soil moisture retention, regulating root-zone temperatures, and optimizing nutrient acquisition under salinity stress. Salinity is considered as one of the most serious factors limiting plant growth and crop productivity by affecting various physiological and biochemical parameters of plants. Salt stress can negatively influence plant development and efficiency of numerous crops, particularly in arid and semi-arid zones. Different strategies and techniques can be applied to moderate the negative effects of high NaCl concentrations within the soil. In the present study, we have evaluated the salinity tolerance of two tomato varieties grown in an intercropping system with maize by analysing fruit production, lycopene content, pH, total soluble solids (TSS), Na^+ and K^+ in fruits. Our results show that chlorophyll a was higher in the intercropping tomato than in the monoculture plants in both control (T0 = 0 mM NaCl) and NaCl-treated varieties (T1 = 125 mM NaCl). Moreover, in intercropping systems, the variety of Karima was less affected by NaCl treatment. Regarding fruit quality, pH value of Karima was higher in intercropped plants under NaCl treatment, while the Brix value was less affected by NaCl and intercropping conditions. Finally, intercropping practices significantly influenced Na^+ and K^+ accumulation and Karima variety showed the capacity to accumulate more K^+ and less Na^+

Keywords: Intercropping, salinity tolerance, tomato, fruit quality, yield

ABSTRACT

In the past decade, there have been significant advancements in agricultural technologies, which have revolutionized the agricultural industry. The use of modern technology has led to the development of more efficient, precise, and versatile machinery that can optimize crop yield while reducing labor costs, workload and environmental impact. The success of the planting phase in agriculture can affect the success of all plant production at the very beginning. The aim of this paper is to review the advancements in seeders over the past decade. In recent years, there has been a focus on developing seed flow and in-row seed distribution of seeders. To achieve this there have been conducted several research to produce prediction models that provide improvement on arrangements of present seeders. Development of no-till seeders reduce soil erosion and improve soil health, as well as reducing the time and energy required for tillage. Thus, farmers save money by reducing the need for fuel and labor costs. Additionally, planting multiple crops simultaneously have been achieved and that provide time and resource saving where farmers need to maximize their yield on a limited space while maximizing crop diversity. Precision agriculture, which includes GPS-guided seeders that can provide accurate and consistent seed placement, has significantly reduced seed waste and increased crop yield by ensuring planting at right depth and spacing. Precision technology has paved the way for development of robotic seeders as well. In conclusion, the advancements in seeders over the last decade have had a significant impact on the agricultural industry. Theoretical an practical imprevements have contributed to the development of more efficient and sustainable seeders. These advancements have helped farmers increase crop yield, reduce labor costs, and minimize environmental impact. As technology continues to advance, it is likely to see further improvements to ensure food security for future generations.

ROLE OF PHARMACY IN RURAL DEVELOPMENT AND PUBLIC HEALTHCARE

K. Dinesh Rajan

Faculty of pharmacy, Bharath institute of higher education and research, Chennai, India

D.Aravindhan

Faculty of pharmacy, Bharath institute of higher education and research, Chennai, India

N.Arshad Ahamed

Faculty of pharmacy, Bharath institute of higher education and research, Chennai, India

ABSTRACT

Rural development and pharmacy are deeply interconnected in improving the overall health and well-being of rural communities. Access to quality healthcare and essential medicines remains a major challenge in many rural areas due to limited healthcare infrastructure, shortage of qualified professionals, and lack of health awareness. Pharmacists play a vital role in bridging this gap by providing primary healthcare services, ensuring rational drug use, and promoting health education. Community pharmacies act as accessible centers for dispensing medicines, offering counseling, and spreading awareness about disease prevention, hygiene, and nutrition. Moreover, pharmacists contribute to national health programs such as immunization, maternal and child health, and the control of communicable diseases. Through mobile pharmacy services and telepharmacy, pharmaceutical care can reach even the most remote villages, improving treatment adherence and reducing medication errors. Encouraging local production and distribution of essential drugs also supports rural economic development. Integrating pharmacy practice with rural health initiatives not only strengthens healthcare delivery but also empowers communities toward a healthier and more sustainable future.

ABSTRACT

In food and agricultural commodities, toxic mold contamination impacts 25% of global crops, resulting in significant financial losses and associated health hazards. Here, we introduce a nanostructured microarray that uses silver-coated porous silicon (Ag-pSi) as a transducer for surface-enhanced Raman scattering (SERS). The internal porous void and pore morphology were optimized to amplify the SERS effect, achieving an enhancement factor of 1.75×10^7. A portable Raman equipment was utilized to assess three target mycotoxins using the microarray features. When the anti-target mycotoxin aptamer-modified scaffold demonstrated selective biorecognition, the optical output was inversely proportional to the analyte concentration. In the 0.001–1000 ppb range, the Ag-pSi SERS substrate showed low limits of detection (0.922, 0.547, and 0.008 ppb for ochratoxin A, fumonisin B1, and aflatoxin B1, respectively). Additionally, three weeks of stability, four regeneration cycles, and no interference with competing mycotoxins were among the good performance values that were shown by the careful evaluation of selectivity, reusability, and overall shelf life. Finally, the SERS microarray that was built was tested on rice, maize, and wheat. The results showed recovery rates of 95–104% and an RSD of less than 6.6%. To monitor food and feed safety, the integrated approach provides a reliable, field-deployable solution for a real-time multi-analyte screening platform.

Keywords: Microarray, SERS, Aptamer, Mycotoxin.

A LEXICAL-SEMANTIC READING OF AGRICULTURAL TERMS IN TWO OF NIYI OSUNDARE'S POEMS

Ajayi, Mercy Adenike

General Studies Department, Federal Polytechnic, Ilaro, Nigeria

Adesanmi, Moses Ademola

General Studies Department, Federal Polytechnic, Ilaro, Nigeria

Email: moses.adesanmi@federalpolyilaro.edu.ng

ABSTRACT

This study focuses on the interrogation of the lexical-semantic deployment of agricultural terms in two of Niyi Osundare's poems, with an intent to expatiate how agrarian lexicon functions beyond its denotative meanings to convey deeper socio-political and ecological messages. Using a qualitative textual analysis, and from the lenses of lexical semantics and systemic functional linguistics as its theoretical framework, the paper investigates how Osundare's choice of agricultural vocabulary contributes to thematic development and socio-political commentary. The analysis reveals that Osundare deploys agricultural terms not merely to depict rural life but as metaphors to encapsulate broader societal issues, such as exploitation, resistance, and environmental degradation. It is oblivious that in "The Hoe," the hoe is a symbol both the tool of labour and at the same time the burden of the oppressed. In the same vein, in "Harvestcall," the harvest represents both agricultural yield and the fruits of collective struggle. These findings underscore the poet's strategic use of agrarian language to engage readers in critical reflection on societal structures and ecological concerns. The study concludes that tactical integration of agricultural lexicon by Osundare serves as a powerful tool for socio-political critique and ecological consciousness, thereby enriching the interpretive possibilities of his poetry.

ABSTRACT

Since ancient times, synthetic pesticides formulated with chemical compounds and carriers such as polymers have been used to target specific pests and improve crop yields.The pesticides can be clasified based on the active ingredients and function. Despite synthetic pesticides have positive effects on crop yield and productivity, they do have negative impacts on soil biodiversity, animals, aquatic life, and human life .Therafter biopesticides and microbial inoculants have been very useful in the control of pests with lot of merits such as its being cheap, ecosafe and specific mode of action by the inhibition and destruction of the plasma membrane and protein translation of pathogens/pests. Repeated application of these biopesticides may alter resident soil microbial communities, affect beneficial arthropods (pollinators, natural enemies), and change ecosystem functions in ways that are poorly characterized under realistic agricultural conditions. Few setbacks of biopesticides are short shelf life, wherein it can completely eliminate the existing pests and prevent the growth of the pests that will come after the application of the biopesticides. The critical assessment of these merits and demerits, and the possible measures to improve on these seeming drawbacks has become very important. The research will systematically evaluate the non-target ecological effects of representative biopesticides (e.g., azadirachtin / neem formulations) and microbial inoculants (e.g., *Trichoderma spp.*, *Pseudomonas* / biofertilizer consortia) across controlled greenhouse experiments and multi-season field trials using a combination of (i) soil physicochemical assays, (ii) amplicon and shotgun metagenomics, (iii) soil and plant metabolomics (LC-HRMS), (iv) enzyme and nutrient-cycling assays, and (v) insect bioassays (pollinators & beneficial predators). By integration of results from product application , soil microbiome shifts , changes in ecosystem functions and impacts on non-target organisms including isolation, tracking of introduced strains (barcoded/marker strains where allowed), gnotobiotic reconstitution experiments which involve germ-free host plants colonized with a

defined, known community of microbes to study how these specific microorganisms influence the host's health, development, and metabolism. These experiments will investigate the specific roles of individual microbes or entire microbial communities by controlling the entire microbial composition of the system. The study identifies safe application doses and formulations. This integrated approach will fill a major knowledge gap and support policies for scaling up biobased agricultural inputs safely.

Keywords: Biopesticides, microbial inoculants, soil microbiome shifts, gnotobiotic

SIGHTINGS OF BIRDS IN OIL PRODUCTION AREAS (MONGOLIA)

Tsegmid N. And Zayatogtokh B.

Mongolian University of Life Sciences.

Email: Tsegmid@muls.edu.mn

ABSTRACT

The surveyed area is located in the East Mongolian Plain Steppe subregion [1, 3]. The landscape of this subregion approximates ideal plains. Their absolute elevation is 600-800 m, with only the highest points in the west barely reaching 1000 m. Steppe vegetation predominates throughout the chestnut soils [2].The field study area is located in the steppes of the Matad soums of Dornod Province, where oil is produced.

The primary research method was foot-based route surveys, covering a total of over 80 km. The total area covered was 213.92 km2. Birds were collected on June 8 and September 8, 2024, and June 8 and August 24, 2025. Bird counts were conducted using a ZESS CONQUEST HD 8*32 binoculars and a SONY DSC-HX400 digital camera with 20.4 megapixels. Bird names in the list are based on the summary by S. Gombobaatar, 2019, and the faunal genetic structure by Stegmann, 1938.

In Eastern Mongolia, including the oil production area, 47 bird species belonging to 12 orders, 24 families, and 38 genera have been recorded. They inhabit various ecological environments (steppes, structures, and wetlands) in the adjacent steppes of the Matad soum of Dornod aimag. Of these, 14 species are sedentary, and 33 species pass through during spring and autumn migration. Of the total number of recorded bird species, 25 (53.2%) belong to the order Passeriformes. During the observation, 10 species of birds (*Buteo hemilasius, Columba livia, Pyrrhocorax pyrrhocorax, Hirundo rustica, Alauda arvensis, Eremophila alpestris, Melanocorpha mongolica, Oenanthe isabelline, Passer montanus, Anthus godlewskii*) were frequently encountered.

During spring migration, 7 species of birds (*Tadorna tadorna, Grus virgo, Charadrius dubius, Charadrius veredus, Sterna hirundo, Apus apus, Apus pacificus, Oenanthe oenanthe*) were noted.

During autumn migration, 18 species of birds were encountered (*Coturnix japonica, Anas zonorhyncha, Otis tarda, Vanellus vanellus, Gallinago gallinago, Upupa epops, Phylloscopus borealis, Phylloscopus proregulus, Saxicola maurus, Ficedula narcissina, Ficedula albicilla, Muscicapa striata, Muscicapa sibirica, Muscicapa dauurica, Motacilla cinerea, Motacilla alba, Carpodacus erythrinus, Emberiza yessoensis*). Of these, seven bird species (*Phylloscopus borealis, Phylloscopus proregulus, Ficedula albicilla, Muscicapa striata, Muscicapa sibirica, and Muscicapa dauurica*) were actively migrating in the dry steppe where oil is extracted on August 24. After 14 days (September 8), nine bird species (*Coturnix japonica, Anas zonorhyncha, Vanellus vanellus, Gallinago gallinago, Saxicola maurus, Motacilla cinerea, Motacilla alba, Carpodacus erythrinus, and Emberiza yessoensis*) were observed migrating, but their migration was not intense, with 1-16 individuals observed.

Oil production is underway in this steppe region, but this also indicates that many bird species are still feeding and resting during migration. The summer of 2025 was dry and arid. Therefore, the waterbirds recorded in 2024 were not observed. However, migration of arboreal birds, which feed primarily on insects, was observed.

The avifauna of Matad soum, Dornod province, where the oil extraction region is located, is widely represented by mid-latitude species. According to the ornithogeographic division of B.K. Stegman (1938), they belong to the following fauna types: Mongolian 34% (n=16), Transpalearctic 25.5% (n=12), Siberian 12.8% (n=6), Chinese 10.7% (n=5), European 8.5% (n=4), Mediterranean 6.4% (n=3), and Arctic 2.1% (n=1).

FOOD IRRADIATION FOR MITIGATING POST-HARVEST LOSSES IN NIGERIA

Dr. Halid Sheriff Adegbusi

Department of Biological Sciences, Nigeria Police Academy Wudil, Kano Nigeria

Email: Khalidadegbusi@yahoo.com

ORCID: 0000-0003-0038-9776

ABSTRACT

This paper is a contributory advocacy on the commercial usage of food irradiation for food preservation for reducing postharvest losses of agricultural produce in Nigeria. Postharvest losses were found to cause a loss of about 13 million metric tons of agricultural crops in Nigeria, especially for perishable crops, grains, and fish. About 0.7 million metric tons of tomatoes were found lost annually. Resulting in the annual economy loss of about 3.7 trillion and 72 billion Nigeria Naira, in respect of agricultural produce and especially of tomato. Comparatively food irradiation offers a better method for food preservation, but does not serve for the replacement of others. Food irradiation was used to preserved yam, water yam, onions, tomatoes, potatoes, cowpea seeds and other crops without reported toxic effect and deteriorated nutritional qualities. Cobalt-60, electron beam and X-rays are commonly used for food irradiation. Over 70 countries have legislated its usage, and has been endorsed by reputable world regulatory bodies for the propensity of food and nutritional, health, economic and export securities. The only one irradiation facility available in Nigeria is Gamma Irradiation Facility operated on Cobalt-60 source, and currently under laboratory use. Putting the facility under commercial usage can help reducing postharvest losses of agricultural crops, thus strengthening food security for achieving sustainable development goal 2 in Nigeria. Commercial usage of the technology may also stimulate agricultural productivity for gross domestic product (GDP), safe exportation for Nigeria currency growth, global market is increasing for irradiated foods. Factors hindering its commercial adsorption can be surmounted by government craftiness. It is therefore recommended, for quick commercial operation of food irradiation, that positively adequate education about the technique is disseminated among relevant stakeholders, and that government should establish more accessible irradiation facilities at strategic areas in Nigeria for both farmers and marketers of perishable food crops, and interested individuals.

ABSTRACT

A 150-day study was conducted at the Bangladesh Fisheries Research Institute, Mymensingh, to evaluate the growth, survival, and economic performance of Butter Catfish (*Ompok pabda*) and Walking Catfish (*Clarias batrachus*) cultured in an 8,000 L bottom-clean indoor tank system. Three stocking densities (1200, 1500, and 1800 ind./m³) were tested, with fish fed a commercial diet containing 37% crude protein twice daily. Water quality parameters remained within optimal ranges throughout the culture period. For *O. pabda*, the lowest density (1200 ind./m³) yielded the highest final weight (22.35 ± 4.06 g), weight gain (18.85 ± 0.26 g), survival rate (90.23 ± 1.81%), feed conversion ratio (1.13 ± 0.09), and specific growth rate (2.67 ± 0.04% day⁻¹), respectively. *Walking Catfish* exhibited a similar trend, attaining maximum growth (final weight 40.33 ± 5.03 g; weight gain 34.76 ± 0.03 g), survival (82.55 ± 2.32%), and feed efficiency (FCR 1.21 ± 0.04) at the same density. Increasing density reduced individual growth and survival; nevertheless, biomass yield per unit volume remained comparable across culture period. Furthermore, economic analysis confirmed that the moderate density (1200 ind./m³) achieved the greatest net profit and benefit–cost ratio for both species. Albeit higher densities provided equivalent biomass output, they compromised survival and feed efficiency. Overall, the findings demonstrate that bottom-clean aquaculture is an effective and economically viable system for intensive indoor production of high-value catfish, offering a sustainable strategy for small- and medium-scale aquaculture enterprises in Bangladesh.

ABSTRACT

Green Pharmacy is an emerging concept that emphasizes the design, manufacture, use, and disposal of pharmaceutical products in an environmentally responsible manner. Traditional drug production often generates significant chemical waste, consumes large amounts of energy, and leads to pharmaceutical pollutants entering the environment. Green Pharmacy seeks to minimize these impacts by integrating eco-friendly principles into every stage of the drug life cycle—from discovery and synthesis to packaging and disposal. Sustainable drug development involves the use of biodegradable excipients, renewable resources, green chemistry techniques, and energy-efficient manufacturing processes. It also encourages proper waste management, recycling of pharmaceutical materials, and public education on safe drug disposal. By adopting sustainable practices, the pharmaceutical industry can protect both human health and the environment, contributing to global goals such as pollution reduction, biodiversity preservation, and sustainable healthcare systems. The integrated GREENER approach can be used to accelerate discussions about future innovations in drug discovery and development.

ABSTRACT

Mustard has long been an important crop in Bangladesh, valued both for its role in crop rotation and the steady demand for mustard oil. Yet, the full economic promise of mustard farming often remains out of reach for many farmers. This study explores how profitability, input management, and institutional support shape the realities of mustard cultivation across the country. The analysis showed that simply expanding the cultivated area brings only modest income gains ($r = 0.236$, $p = 0.024$). Surprisingly, higher spending on inputs does not always lead to better yields ($r = –0.273$, $p = 0.009$), pointing to mismanagement in fertilizer use and other practices. At the same time, investment still plays a strong role in overall earnings ($R^2 = 0.714$, $p < 0.001$), suggesting that mustard can be a profitable venture when resources are used wisely. Training programs do not seem to improve yields in any meaningful way, and more than 90% of farmers report receiving no institutional help. Even so, 72% believe mustard is more profitable than rice, wheat, or maize, thanks to lower input needs and strong market demand. For the remaining 26%, risks like climate shocks, pests, and input shortages keep profitability uncertain. Together, these findings reveal a crop with strong potential, but one that needs smarter training, better input management, and stronger institutional backing to truly deliver for farmers.

URBAN RENEWAL APPROACHES FOR THE REVITALIZATION OF TUDUN NUPAWA NEIGHBORHOOD, KADUNA, NIGERIA

Aliyu Hassan

Department of Civil and Environmental Engineering, Air Force Institute of Technology,

Nigerian Air Force, Kaduna-Nigeria

Email: aliyuhassan13@yahoo.com

ABSTRACT

Urban renewal has emerged as a vital strategy for addressing the challenges of physical decay, environmental degradation, and socioeconomic decline in many inner-city neighborhoods. This study examines the strategies for urban renewal aimed at revitalizing the Tudun Nupawa neighborhood in Kaduna, Nigeria. The research assesses the existing physical, social, and economic conditions of the area and identifies the key factors contributing to urban deterioration, such as inadequate infrastructure, poor housing quality, and ineffective land-use management. Using a mixed-method approach that integrates field surveys, spatial analysis, and stakeholder interviews, the study evaluates current renewal initiatives and explores sustainable models applicable to the local context. Findings reveal that effective urban renewal in Tudun Nupawa requires an integrated framework involving community participation, public–private partnership, improved infrastructure provision, and inclusive planning policies. The study concludes that revitalizing Tudun Nupawa through context-specific and participatory renewal strategies will enhance the neighborhood's livability, economic productivity, and environmental resilience. Recommendations are made for urban policymakers and planning authorities to adopt inclusive, sustainable, and adaptive renewal approaches to transform Tudun Nupawa into a functional and vibrant urban community.

ABSTRACT

The greater numbers of the youth, who have the potential to change the Agricultural landscape of the country, are enrolled in the tertiary institutional system. Therefore, there is need to leverage on TVET to increase agricultural productivity as a means of ensuring food security in the country. This study attempts to investigate the role of TVET in ensuring food sufficiency in the country. *The study* adopted descriptive statistics to analyze data obtained using Multi-stage sampling techniques. Responses were drawn from questionnaires administered to 250 students of Agricultural technology from Federal Polytechnic, Ilaro and Moshood Abiola Polytechnic situated in Ogun State. The findings from the study shows that majority of the respondents are young and energetic for farm work. The study also revealed that most of the students are ready to engage in agriculture after graduation if adequate facilities are available. The findings from the regression analysis revealed that agricultural technology education and training have positive significant impact on agricultural productivity in Nigeria. on this note, the study the paper suggests, inter-alia, increase in government expenditure on technical institution, and encourage the participation of youth into agriculture after graduation through free interest agricultural loan facilities.

ABSTRACT

Animal–Computer Interaction (ACI) is an emerging interdisciplinary field that explores how animals engage with digital technologies designed specifically for their needs, welfare, and communication. Moving beyond traditional human-centric design, ACI seeks to create interfaces and systems that enable animals to express choices, control aspects of their environment, and even communicate across species barriers. From touchscreens for parrots and video-call devices for dogs to AI-based systems that interpret animal emotions and behavior, ACI integrates principles from computer science, animal behavior, cognitive science, and ethics. It promotes animal welfare through enrichment, mental stimulation, and improved monitoring of health and stress levels. With advancements in artificial intelligence, wearable sensors, and interactive robotics, the future of ACI lies in developing adaptive, non-invasive, and ethical interfaces that empower animals to become active participants rather than passive subjects. This innovative field not only enhances animal well-being but also reshapes our understanding of interspecies communication and co-existence in the digital era.

ABSTRACT

The study aims to treat polluted water using adsorption technology, a proven and efficient method for removing contaminants from wastewater. Methylamine, a common organic pollutant found in industrial effluents, was selected as the model contaminant to assess the efficacy of the treatment method. The adsorbent material chosen for the study was a wood- derived activated carbon nanocomposite, known for its high surface area and porosity, which enhances its adsorption capabilities. The impact of various operational parameters—including contaminant concentration, pH levels, temperature, contact time, and the amount of adsorbent used—was systematically studied to optimize the process and understand the dynamics influencing adsorption. The study also included an analysis of adsorption kinetics and isotherm models to characterize the interaction between the adsorbent and the adsorbate. Results indicated that the adsorption process followed the Langmuir isotherm model, suggesting monolayer adsorption on a homogeneous surface with a maximum methylamine adsorption capacity of 46.37 mg/g. Kinetic studies demonstrated that the process adhered to a pseudo-second-order model, indicating chemisorption as the rate-limiting step. The adsorption efficiency was found to be significantly influenced by the pH of the solution, with optimal uptake observed at a specific pH range. The findings of this study underscore the potential of biomass-derived activated carbon nanocomposites as an effective, sustainable solution for the treatment of organic pollutants in wastewater. This approach offers significant advantages over traditional treatment methods due to its simplicity, cost-effectiveness, and potential for scalability, making it an attractive option for large-scale industrial applications aimed at improving water quality and ensuring environmental safety.

ABSTRACT

Microplastics (MPs) and the heavy metal mercury (Hg) have drawn increasing global scrutiny as major aquatic contaminants due to their significant toxic effects on aquatic organisms. Individually, their effects on aquatic organisms are well documented; however, their combined effects remain poorly elucidated. In today's environmental context, aquatic organisms experience concurrent exposure to multiple pollutants, underscoring the need to investigate their integrative effects. Here, we investigated the effects of polyamide microplastic (PA-MP), mercury (Hg) and their combination on Nile tilapia (*Oreochromis niloticus*) fingerlings in relation to survival, growth metrics, hematology, tissue morphology, antioxidant defense, immune function and the GH/IGF axis. Fingerlings were subjected to sub-lethal concentrations of PA-MP (10 mg/L), Hg (0.03 mg/L), a combination of both stressors or maintained under control conditions for six weeks, with 20 individuals per tank in triplicate. The co-exposure group showed increased MP accumulation and mortality, suppressed growth performance (e.g., weigh gain, specific growth rate and feed efficiency); substantial shifts in blood physiology including elevated glucose (126.83 ± 2.40 mg/dL) and lowered hemoglobin level (9.45 ± 0.85 g/dL) as well as pronounced cellular and nuclear irregularities. The histo-architectural assessment identified significant tissue damage in gills, intestine, liver and kidney of fish under co-exposure. At transcriptional level, co-exposure exerted oxidative damage in fish liver by influencing the activities of antioxidant genes (*sod* and *cat*) and significantly upregulated immune-related genes *ifn-γ* and *tnf-α* as well as suppressed the expression of *il-1β*, indicating an inflammatory response. Besides, the expression level of growth hormone-secreting gene (*gh*) in the pituitary gland, along with the expression levels of insulin-like growth factors (*igf-1* and *igf-2*) in liver showed a significant downregulation ($p < 0.05$) under co-exposure. Collectively, these findings underscore that co-exposure to MP and Hg aggravates systemic and molecular impairments in Nile tilapia, reducing physiological performance and survivability.

ÖZET

Dünya nüfusu ve bunun paralelinde sosyo-ekonomik gerekçelerle kent nüfusu hızlı bir şekilde artmaktadır. Bu durum geniş kitlelerin sınırsız ihtiyaçlarının belirli merkezlerde odaklanması yol açmıştır. Bu ağırlık merkezleri, yarattıkları taleple tedarik zincirlerini zorlamakta; politika yapıcılarını ve endüstriyi yeni çözümler araştırmaya itmektedir.

Üretim, depolama, dağıtım ve nihai tüketiciye sunumu içeren bu tedarik zinciri yapısının doğru planlanması bulunabilirlik, ulaşabilirlik, maliyet, kalite gibi parametreleri doğrudan etkileyecektir. Gıda üretiminin de hem artan talebi karşılayacak şekilde genişlemesi hem de üretim noktalarından tüketim bölgelerine verimli bir şekilde aktarılması gerekmektedir. Bu bağlamda, kent ve kent çevresel tarım, gıda arz güvenliği ile başa çıkmada kaldıraç noktalarından biri olarak karşımıza çıkmaktadır. Kent ve kent çevresel tarım, kentlerin tarım ürünü ihtiyaçlarını karşılamak üzere, bu ürünlerin üretildiği nispeten uzak bölgelerden şehirlere taşınmasının yerine kent çevresinde yetiştirilmesi olarak ifade edilebilir.

Bu bağlamda; önerilen konsept yapı ile kaynakların daha etkin kullanılacağı, yüksek taşıma maliyetlerinin ortadan kaldırılacağı bir sistem öngörülmektedir. Mevcut tedarik zincirinin kısaltılıp taşıma maliyetlerin düşürülmesi, gıda arz güvenliğine katkı sunması, yeşil enerji kaynaklarının kullanılarak ekonomiye kazandırılması olmak üzere doğrudan ve ayrıca bölgesel üretim havzaları ile yatırım, istihdam ve sair ekonomik faaliyetlere imkan verecek olması, toplumsal refah artışına katkı sunması gibi de dolaylı pozitif etkilerinin olması beklenmektedir.

Anahtar Kelimeler: Kent Çevresel Tarım, Jeotermal Seracılık, Gıda Arz Güvenliği.

INVESTIGATION OF GEOTHERMAL GREENHOUSE USAGE IN PERI-URBAN AGRICULTURE

ABSTRACT

The world's population, and in parallel, the urban population driven by socio-economic factors, is rapidly increasing. This situation has led to the concentration of the unlimited needs of large masses in specific centers. These centers of gravity, through the demand they generate, strain supply chains and push policymakers and industries to seek new solutions.

The proper planning of this supply chain structure encompassing production, storage, distribution, and delivery to the final consumer, will directly affect parameters such as availability, accessibility, cost, and quality. Food production must also increase to meet the growing demand, and the goods should be efficiently transferred from production sites to consumption areas. In this context, urban and peri-urban agriculture emerges as one of the leverage points in addressing food security. Urban and peri-urban agriculture can be defined as the cultivation of agricultural products in and around cities rather than transporting them from relatively distant rural areas to urban centers.

In this context, the proposed conceptual structure envisions a system that utilizes resources more efficiently and eliminates high transportation costs. It is expected to have direct positive effects, such as shortening the current supply chain, reducing transportation costs, contributing to food supply security, and integrating green energy resources into the economy. It also has indirect positive effects, such as facilitating investment, employment, and other economic activities within regional production basins, and contributing to increased social welfare.

Keywords: Peri-Urban Agriculture, Geothermal Greenhouse Cultivation, Food Security.

TARIM ALANLARININ HUKUKİ KIRILGANLIĞI: TÜRKİYE ÖRNEĞİ

ÖZET

Türkiye'de tarım alanlarının korunması, temel olarak 5403 sayılı Toprak Koruma ve Arazi Kullanımı Kanunu ile düzenlenmiştir. Ancak yerel yönetim ölçeğindeki dönüşümlerde ve özellikle ülkedeki afetler sonrası yeniden yapılanma süreçlerinde ve bu koruma mekanizmalarının etkinliği önemli ölçüde azalmaktadır.

Bu çalışma, Türkiye'de tarım alanlarının hukuki kırılganlık dinamiklerini mevzuat perspektifinden incelemektedir. Analiz, 5403 (Toprak Koruma ve Arazi Kullanımı Yasası), 3194 (İmar Kanunu), 6306 (Afet Riski Altındaki Alanların Dönüştürülmesi Kanunu) ve 6360 sayılı (On Dört İlde Büyükşehir Belediyesi ve Yirmi Yedi İlçe Kurulmasi İle Bazı Kanun ve Kanun Hükmünde Kararnamelerde Değişiklik Yapılmasına Dair Kanun-Bütünşehir Yasası) yasalar arasındaki etkileşimleri karşılaştırmalı biçimde değerlendirmektedir. Bulgular, özellikle afet sonrası yeniden yapılanma sürecinde kamu yararı ve imar kolaylıkları gerekçesiyle tarım dışı kullanım baskısının arttığını; ayrıca 6360 Sayılı Yasa ile Türkiye'de kırsal alan statüsünün ortadan kalkmasının, tarım topraklarının belediye imar yetkileri altında daha korunmasız hale gelmesine yol açtığını göstermektedir. Yasa sonrasında köylerin mahalleye dönüştürülmesi, tarım alanlarının planlama süreçlerinde kentleşme baskısına açılmasına ve tarımsal üretim haklarının zayıflamasına neden olmuştur. Bu durum, özellikle afet sonrası dönemde arazi kullanımında çok katmanlı bir hukuki kırılganlık üretmektedir.

Sonuç olarak, tarım alanlarının korunabilmesi için afet yönetimi, imar ve yerel yönetim mevzuatının tarımsal arazi koruma ilkeleriyle bütünleştirilmesi, yetki çatışmalarının giderilmesi ve iklim dayanıklılığı odaklı yasal reformların hayata geçirilmesi gerekmektedir.

Anahtar Kelimeler: Tarım Alanları, Hukuki Kırılganlık, Afet Yönetimi, Arazi Kullanımı

THE LEGAL VULNERABILITY OF AGRICULTURAL AREAS: TURKIYE EXAMPLE

ABSTRACT

The protection of agricultural lands in Turkey is primarily regulated under Law No. 5403 on Soil Conservation and Land Use. However, its effectiveness is significantly reduced during post-disaster reconstruction and local governance transformations. In particular, Law No. 6306 on the Transformation of Areas under Disaster Risk and Law No. 6360 (Metropolitan Municipality Law) indirectly weaken the legal status of agricultural lands.

This study examines the legal vulnerability dynamics of agricultural lands in Turkey from a legislative perspective. It analyzes interactions between Law No. 5403, Law No. 3194, Law No. 6306, and Law No. 6360. Findings indicate that post-disaster reconstruction often prioritizes "public interest" and facilitates zoning changes, increasing pressure for non-agricultural land use. The Metropolitan Municipality Law, which converted villages into urban neighborhoods, exposes agricultural lands to urban planning pressures and weakens their protection.

As a result, agricultural lands face multi-layered legal vulnerability, compounded by overlapping authorities, inconsistent regulations, and rapid policy decisions during post-disaster recovery. Safeguarding agricultural lands requires harmonizing legislation on disaster management, zoning, and local governance with agricultural land protection principles, resolving jurisdictional conflicts, and developing climate-resilient, food-security-oriented legal reforms.

ORCID: 0000-0002-3934-5319

ÖZET

2025 yılında yürürlüğe giren 7552 sayılı Türkiye İklim Kanunu, net sıfır emisyon hedefleri, yeşil büyüme vizyonu ve iklim değişikliğine uyum ilkeleri çerçevesinde tarımsal üretim, arazi kullanımı ve kırsal alan yönetimini doğrudan ve dolaylı olarak etkileyen kritik bir düzenlemedir. Bu çalışma, Kanunun tarımsal peyzajlar üzerindeki fırsat, risk ve tehditlerini değerlendirmeyi amaçlamaktadır.

Kanun, karbon yutaklarının korunması, ekosistem temelli yaklaşımlar ve sürdürülebilirlik ilkeleri aracılığıyla tarımsal peyzajların direncini ve uyum kapasitesini güçlendirme potansiyeline sahiptir. Kanun kapsamında tarımsal peyzajlar için öne çıkan fırsatlar; karbon depolama ve sera gazı azaltımı, iklim dirençli ürün desenleri, agroekoloji ve agroforestry uygulamaları, örtü bitkileri ve sulak alan yönetimi ile toprak sağlığının iyileştirilmesi, arazi kullanım planlaması, yeşil alan ve su havzalarının korunması, erozyon ve çölleşmeyle mücadele ile ekosistem hizmetlerinin sürdürülmesidir. Yeşil finansman ve karbon piyasalarına erişim, biyolojik çeşitlilik ile uyumlu tarımsal uygulamaları güçlendirmektedir. Öte yandan, küçük üreticilerin finansman ve teknolojiye erişim güçlükleri, üretim maliyetleri, bölgesel farklılıkların yönetimi, karbon fiyatlandırması, arazi kullanım kısıtlamaları, geleneksel su-yoğun ve monokültür tarım uygulamaları ve tarım arazilerinin kentsel genişleme ile kaybı risk ve tehditler arasında yer almaktadır. Ayrıca Kanunun mevcut ulusal mevzuatla entegrasyonu ve tarım teşvikleriyle uyumu konusundaki belirsizlikler, uygulamadaki etkinliği sınırlayabilecek yapısal riskler olarak öne çıkmaktadır.

Sonuç olarak, Türkiye İklim Kanunu, tarımsal peyzajları hem iklim değişikliğinin yükünü taşıyan hem de çözümün merkezinde yer alan alanlar hâline getirme potansiyeline sahiptir ve bu potansiyelin gerçekleşmesi uygulamadaki bütüncüllük, yerel uyarlama ve küçük üreticiyi gözeten politikalarla mümkün olacaktır. Ayrıca Kanunun tarımsal peyzaj ölçeğinde etkin uygulanması; toprak karbonu yönetimi, biyolojik çeşitlilik entegrasyonu, su bütçesi gözetimi, kırsal kalkınma, bölgesel adaptasyon planları, çiftçi eğitim ve destek programları, adil geçiş mekanizmaları ve ekosistem temelli planlama ile mümkündür.

Anahtar Kelimeler: Türkiye İklim Kanunu, Tarımsal Peyzaj, İklim Değişikliğine Uyum, Sürdürülebilir Tarım.

AN ASSESSMENT OF THE POTENTIAL IMPACTS OF THE TURKISH CLIMATE LAW ON AGRICULTURAL LANDSCAPES

ABSTRACT

Enacted in 2025, Türkiye's Climate Law (Law No. 7552) represents a pivotal framework shaping agricultural production, land use, and rural landscape management within the pursuit of net-zero emissions, green growth, and climate adaptation. This study assesses the opportunities and challenges the Law introduces for agricultural landscapes.

The Law offers significant potential to strengthen resilience and adaptive capacity by protecting carbon sinks, promoting ecosystem-based approaches, and embedding sustainability principles. Key opportunities include advancing carbon sequestration and greenhouse gas mitigation, encouraging climate-resilient cropping systems, and supporting agroecology and agroforestry practices. Measures such as cover cropping, wetland restoration, improved soil management, and integrated land-use planning further enhance ecosystem services. Protection of water basins, erosion control, and desertification prevention are also central to achieving long-term sustainability. Access to green financing and participation in carbon markets create additional incentives for biodiversity-friendly practices.

Nevertheless, the Law entails notable risks and challenges. Smallholders may face barriers in accessing finance and technology, while rising production costs and regional disparities could exacerbate inequalities. Carbon pricing, land-use restrictions, reliance on water-intensive monocultures, and the ongoing conversion of farmland to urban uses present further constraints. Moreover, uncertainties in aligning the law with existing national legislation and agricultural subsidy schemes pose structural obstacles to effective implementation.

In conclusion, the Climate Law positions agricultural landscapes both as vulnerable domains affected by climate change and as critical levers for mitigation and adaptation. Unlocking this dual potential requires holistic and locally adapted implementation, policies supportive of small-scale farmers, and integration with broader rural development agendas. Effective landscape-level action depends on soil carbon management, biodiversity mainstreaming, water budget monitoring, regional adaptation planning, farmer capacity-building, just transition mechanisms, and ecosystem-based land-use strategies.

ÖZET

Ceviz yetiştiriciliğinde yaşanılan en büyük sorunlardan birisi hasat sonu işlemlerden olan kurutma işlemidir. Cevizlerin sarsmayla yere düşürüldükten sonra uzun süre bekletilmesi; meyvede kararma, ısıdan zarar görme, kurtlanma ve küflenme gibi kalite kayıplarını oluşturabilmektedir. Bu sebeple, yere düşürülen meyvelerin zaman kaybetmeden toplanması, yeşil kabuklarının soyulması ve kurutulması gerekmektedir. Bu projede cevizler, 32 ºC ve 37 ºC'de güneş enerjisi-biyokütle hibrit kurutucusunda, 35 ºC ve 40 ºC'de laboratuvar tipi elektrikli fırında ve açık alanda gölgede kurutulmuştur. Kurutma denemeleri 19 Ekim tarihinde başlamış ve 28 Ekim tarihinde sona ermiştir. Denemede elde edilen verilere göre; açık alanda gölgede kurutulan örneklerin ortalama nem değeri, 193.5 saatin sonunda %31.21'den %11.8'e düşmüştür. Güneş-biyokütle hibrit kurutucuda 32 ºC derecede kurutulan örneklerin %26.9 olan nem oranı, 23.5 saat sonunda ortalama %9.07'ye düşmüştür. Güneş-biyokütle hibrit kurutucuda 37 ºC derecede kurutulan örneklerin %31.9 olan nem oranı, 26 saat sonunda ortalama %7.8'e düşmüştür. 35 ºC derecede elektrikli fırında kurutulan örneklerin %25.36 olan nem oranı ise 39 saat sonunda %3.62'ye düşmüştür. 40 °C derecede elektrikli fırında kurutulan örneklerin %30.76 olan nem oranı ise 16 saat sonunda %7.22'ye düşmüştür. Tekirdağ ilinde Ekim ayı iklim verilerine göre yağışlı bulutlu günlerin olması ve yüksek nem içeriğinden dolayı, cevizlerin açık alanda gölgede kurutulması mikrobiyolojik risk taşımaktadır. Bundan dolayı, Tekirdağ ilinde açık alanda gölgede kurutma yöntemi önerilmemektedir. Güneş-biyokütle yöntemleri, kurutma kinetikleri ve kalite kriterlerine göre karşılaştırıldığında kurutma havası sıcaklığının 37°C'de olmasının 32 °C'ye göre tercih edilmesi önerilmektedir. Elektrikli fırında kurutma yönteminde ise değerlendirme kriterlerine göre kurutma havası sıcaklığının 40 °C olması 35 °C'ye göre önerilmektedir.

INVESTIGATION OF DRYING KINETICS OF WALNUT DRIED WITH DIFFERENT METHODS IN TEKIRDAĞ CONDITIONS

ABSTRACT

One of the biggest problems experienced in walnut cultivation is the drying process of the walnut, which is one of the post-harvest processes. Keeping the walnuts waiting for a long time after being dropped to the ground by shaking; It can cause quality losses such as darkening of the fruit, damage from heat, worming and molding. For this reason, it is necessary to collect the fallen fruits without losing time, peel the green skins and dry them. In this project, walnuts were dried in a solar-biomass hybrid dryer at 32 °C and 37 °C, in a laboratory electric oven at 35 °C and 40 °C, and in the open area in the shade. Drying trials started on October 19, 2021 and ended on October 28, 2021. The average moisture value of samples dried in the open area decreased from 31.21% to 11.8% after 193.5 hours. The moisture content of the samples, which was 26.9% in a solar-biomass hybrid dryer at 32 °C, decreased to an average of 9.07% at the end of 23.5 hours. The humidity of 31.9% of the samples dried in a solar-biomass dryer at 37 °C decreased to an average of 7.8% at the end of 26 hours. The moisture content of the samples dried at 35 °C in an electric oven, which was 25.36%, decreased to 3.62% at the end of 39 hours. The moisture content of the samples dried in an electric oven at 40 °C, which was 30.76%, decreased to 7.22% at the end of 16 hours. According to climate data for October, drying walnuts in the open area carries a microbiological risk due to the rainy, cloudy days and high moisture content. Therefore, open area drying method is not recommended in Tekirdağ province. When the methods in solar-biomass are compared in terms of quality criteria and drying kinetics, solar-biomass (37°C) drying method is more preferable than solar-biomass (32°C) drying method. In electric oven drying, when compared in terms of quality criteria and drying kinetics, the electric oven drying method at 40°C is more preferable than the 35°C drying method.

ÖZET

Amaç:

Silajlık mısır ülkemiz için önemli bir kaba yem kaynağıdır. İzmir, Türkiye'de silajlık mısır üretiminde yaklaşık %12'lik payı ile ilk sırada yer almaktadır. Bölgede yaygın olan süt ve besi

sığırcılığı faaliyetleri kaliteli kaba yeme olan talebi artırmış bu da silajlık mısır ekim alanlarının genişlemesinde etkili olmuştur. Bu çalışma Ege Bölgesi Silajlık Mısır Islah projesi sonucunda geliştirilen hibritler ile bölgemiz koşullarında üretimi yapılan ticari çeşitlerin verim ve kalite özelliklerini belirlemek amacıyla yürütülmüştür.

Materyal ve Yöntem:

Deneme İzmir koşullarında, Ege Tarımsal Araştırma Enstitüsü deneme alanlarında 2023 ve 2024 yılı ana ürün yetiştirme sezonunda iki yıl süre ile tesadüf blokları deneme desenine göre 3 tekerrürlü olarak yürütülmüştür. Denemede materyal olarak Enstitümüzde yürütülen mısır ıslah çalışmaları sonucunda geliştirilen Ege F1 95, Ege F1 98 ve Ege F1 100 genotipleri ve 8 adet ticari çeşit (Aga, Samada 07, Pehlivan 07, Kilowatt, PR31Y43, DKC 6777, LG.30685, LG.30709) kullanılmıştır.

Bulgular:

Çalışmanın 2 yıllık sonuçları değerlendirildiğinde; genotipler arasında bitki boyu, yeşil bitki ve kuru madde verimleri, ham protein, ADF ve NDF oranları açısından farklılıklar istatistiksel olarak önemli bulunmuştur. Genotiplerin ortalama bitki boyları 246,7-296,2 cm arasında ölçülmüştür. Genotiplerin ortalama yeşil bitki verimleri 6300-8581 kg/da olarak belirlenmiş, ıslah çalışmaları sonucunda geliştirilen Ege F1 100 ilk verim grubunda yer almıştır. Genotipler kuru madde verimi açısından değerlendirildiğinde Kilowatt (2765 kg/da), Ege F1 100 (2761 kg/da) ve LG 30.685 (2749 kg/da) ilk verim grubunda yer almışlardır. Yine Ege F1 100 genotipi ortalama % 10,4 ham protein oranı ile ilk grubu oluşturmuştur. Genotiplerin ortalama ADF oranları %22,13-31,05 arasında değişiklik göstermiştir. NDF oranları ise %38,88-50,39 olarak saptanmıştır.

Sonuç:

Verim ve bazı kalite değerleri kontrol çeşitlerin üzerinde olan Ege F1 100 genotipinin bölgemiz için ümit var olduğu ve tescil olması halinde bölge çiftçisine tavsiye edilebileceği düşünülmektedir.

Anahtar Kelimeler: Silajlık mısır, yeşil bitki verimi, kuru madde verimi, kalite, ham protein, ADF, NDF

DETERMINATION OF YIELD AND QUALITY TRAITS OF SOME SILAGE MAIZE (Zea mays L.) GENOTYPES IN İZMİR CONDITIONS

ABSTRACT

Objective:

Silage corn is an important source of forage for our country. İzmir ranks first in Türkiye's silage corn production, accounting for approximately 12%. The widespread dairy and beef cattle farming activities in the region have increased the demand for high-quality forage, which has contributed to the expansion of silage corn acreage. This study was conducted to determine the yield and quality characteristics of hybrids developed as a result of the Aegean Region Silage Corn Breeding Project and commercial varieties cultivated in our region.

Materials and Methods:

The experiment was conducted in Izmir conditions at the trial areas of the Aegean Agricultural Research Institute using a randomized complete block design with three replications for two years during the 2023 and 2024 main crop growing seasons. Ege F1 95, Ege F1 98 and Ege F1 100 genotypes developed as a result of corn breeding studies carried out in our Institute and 8 commercial cultivars (Aga, Samada 07, Pehlivan 07, Kilowatt, PR31Y43, DKC 6777, LG.30685, LG.30709) were used as the experimental material.

Conclusion:

When the two-year results of the study were evaluated, the differences among genotypes in terms of plant height, green plant and dry matter yields, crude protein, ADF and NDF ratios were found to be statistically significant. The average plant heights of the genotypes ranged between 246.7 and 296.2 cm. The average green plant yields of the genotypes were determined to range from 6300 to 8581 kg/da, with the Ege F1 100 genotype developed through breeding studies being placed in the highest yield group. When evaluated in terms of dry matter yield, Kilowatt (2765 kg/da), Ege F1 100 (2761 kg/da), and LG 30.685 (2749 kg/da) were included in the highest yield group. Additionally, the Ege F1 100 genotype formed the first group with an average crude protein ratio of 10.4%. The average ADF ratios of the genotypes ranged from 22.13% to 31.05%, while the NDF ratios were determined to range from 38.88% to 50.39%.

Results:

It is thought that the Ege F1 100 genotype, which has yield and some quality values above the control varieties, is hopeful for our region and can be recommended to farmers in the region if it is registered.

ORCID: 0000-0002-0613-3600

ÖZET

Geviş getiren hayvanların sindirim sistemi karmaşık, zengin bir mikrobiyal topluluğa sahiptir. Burada yaşayan mikrobiyota; bakteriler, arkealar, protozoalar ve mantarlardan oluşmaktadır. Söz konusu mikroorganizmalar, ruminantlar tarafından tüketilen lignoselülolitik yapısal karbonhidratları parçalayarak bu hayvanların sindirebileceği asetik, propiyonik ve bütirik asit gibi uçucu yağ asitlerinin üretilmesini sağlamaktadırlar. Bazı mikroorganizma türleri, rumende fermantasyon sırasında doğal olarak oluşan hidrojen ve karbondioksitten metan üretmektedirler. Metanogenez adı verilen bu süreçte, anaerobik ortamda açığa çıkan metan, metanojenik arkealar ve kimi diğer mikroorganizmalar tarafından üretilmektedir. Metan, ruminant hayvanlarda enerji kaybına neden olarak hem verim kayıplarına hem de çevre kirliliğine neden olabilmektedir. Son yıllarda kamuoyunun odağı haline gelen metan üretiminin azaltılması konusu dikkat çekmekte olup çeşitli metan azaltma stratejileri geliştirilmektedir. Bu çalışmada rumende fermantasyon sırasında oluşan metan ve rumen mikrobiotası arasındaki ilişki tartışılacaktır.

Anahtar Kelimeler: Ruminant, Metan, Mikrobiyom

METHANE PRODUCTION AND RUMEN MICROBIOTAS IN RUMINANTS

ABSTRACT

The digestive system of ruminants possesses a complex and rich microbial community. The microbiota living there consists of bacteria, archaea, protozoa, and fungi. These microorganisms break down lignocellulolytic structural carbohydrates consumed by ruminants, enabling the production of volatile fatty acids such as acetic, propionic, and butyric acids that these animals can digest. Some microorganisms produce methane from the naturally occurring hydrogen and carbon dioxide during fermentation in the rumen. In this process, called methanogenesis, methane released in an anaerobic environment is produced by methanogenic archaea and some other microorganisms. Methane causes energy loss in ruminants, which can lead to both productivity losses and environmental pollution. The reduction of methane production, a topic that has become a public focus in recent years, has attracted attention, and various methane reduction strategies are being developed. This study will discuss the relationship between methane produced during rumen fermentation and the rumen microbiota.

Keywords: Ruminant, Methane, Microbiome

ÖZET

Menemen Ovası tarımsal üretim potansiyeli açısından stratejik öneme sahip bölgeler içerisinde yer almaktadır. Ovada karşılaşılan sorunların tespitine yönelik yapılan çalışmalardan elde edilen verilere göre Menemen Ovası'nın toplamda yaklaşık üçte birinde tuzluluk probleminin farklı seviyelerde gözlendiği ortaya çıkmıştır. Tuzluluk kaynaklı ihtiyaç duyulan su miktarının bitki tarafından alınamaması ve beraberinde verim kaybı ile elde edilen gelirin olumsuz etkilenmesi üreticiler açısından önemli bir problem olarak değerlendirilmektedir. Tuzluluğun bölgesel olarak karşılaşılan alanlarda denize yakın olmasının ve delta etkisinin etkili olduğu ancak çiftçi kaynaklı bilinçsiz uygulamalar sonucunda da bu etkinin arttığı düşünülmektedir. Bu çalışma ile üreticinin tuzluluk ile karşı karşıya kaldığı bu alanlarda hangi tarımsal uygulamaların olumlu etkisi olabileceği, alınabilecek önlemler ya da bu problemin çözümü noktasında üreticilerin davranışsal yaklaşımı ve istekliliği değerlendirilmiştir. Ayrıca, Menemen Ovası'nda tuzluluğun oluşmasında etkili olabilecek sebeplerin çeşitli yönlerden değerlendirmesi üretici yaklaşımı ile ortaya koyularak üreticilerin ne şekilde etkilendiği ele alınmıştır. Anket yolu ile Menemen Ovası'nda görüşülen 30 üreticinin %57'si tuzluluk problemi ile çeşitli düzeylerde karşılaştığını belirtmiş ve tuzluluğa sebep olan en önemli etkenin kuraklık olduğu ve bunun beraberinde sulama suyu kalitesinin de önemli derecede etkili olduğu belirtilmiştir. Bölgedeki tuzluluğu önlemek için alınabilecek önlemler açısından üreticilerin yaklaşımı değerlendirildiğinde karar verici ilgili birimler tarafından altyapısal rehabilitasyonun yapılmasının etkili olabileceği ve tarımsal sulamada kullanılan sulama suyu kalitesinin iyileştirilmesi yönünde alınabilecek önlemlerin çözüm getirebileceği ortaya çıkmıştır. Tuzluluk sebebi ile tarımsal üretim dışına çıkarılan tarım arazilerinin olduğunu belirten üreticilerin sürdürülebilir üretim kapsamında kalabilmeleri için hem altyapısal önlemlerin alınması hem de üretici uygulamalarından kaynaklı olumsuz etkilerin en aza indirgenmesi önem taşımaktadır. Çiftçilerin yanlış uygulamalarından kaynaklı etkilerin azaltımı yönünde ise bilinç düzeyinin arttırılarak doğa temelli çözümlerin benimsetilmesi gerekmektedir.

Anahtar Kelimeler: Tuzluluk, Üretici davranışı, Menemen Ovası

FARMER APPROACH ON SALINITY AS A CHALLENGE; MENEMEN PLAIN CASE

ABSTRACT

Menemen Plain is located in a region of strategic importance in terms of its agricultural production potential. According to data obtained from studies investigating problems in the plain, it has been revealed that salinity is present at various levels in around a third of Menemen Plain. The inability of plants to absorb the required amount of water due to salinity, coupled with the subsequent loss of yield and its negative impact on income, is considered a significant problem for producers. It is thought that salinity is encountered regionally in areas close to the sea, and that the delta effect is influential. However, this effect is also increased as a result of unconscious farming practices. This study evaluated the potential positive impact of agricultural practices in areas where producers face salinity, the measures that could be taken and the behavioural approach and willingness of producers to solve this problem. Furthermore, a producer approach was considered to evaluate the various factors that could contribute to salinity formation in the Menemen Plain, examining how producers are affected. A survey of 30 producers in the Menemen Plain revealed that 57% had encountered salinity problems to varying degrees. The survey indicated that drought was the most significant cause of salinity and that the quality of irrigation water also had a significant impact. When evaluating the approaches of producers to measures that could prevent salinization in the region, it was determined that rehabilitation of infrastructure by the relevant decision-making bodies could be effective, as could improving the quality of irrigation water used in agriculture. It is important that both infrastructure measures are taken and negative effects arising from producer practices are minimized so that producers who indicate that agricultural land has been excluded from agricultural production due to salinity can remain within the scope of sustainable production. In order to reduce the effects caused by farmers' incorrect practices, it is necessary to raise awareness and promote nature-based solutions.

ABSTRACT

A total of 3 different bread wheat varieties were used as rootstocks, including a variety developed by Tekirdağ Namık Kemal University Tekirdağ Faculty of Agriculture Department of Field Crops (NKÜ Lider) and 2 old bread wheat varieties (Sagittario and Flamura 85) cultivated in the Thrace Region in different periods. 12 mutant advanced lines and their rootstocks, selected among the mutant advanced lines developed from M4 populations of these varieties, which were developed by gamma irradiation from a 60Co source, were used as standard materials in this study.

In this study, germination and early seedlings of mutant advanced lines developed from different commercial varieties by gamma irradiation. It was aimed to contribute to the literature knowledge on this subject by examining their responses to salinity stress during development periods and identifying promising lines.

ÖZET

Uzun yıllar boyunca gerçekleşen arazi kullanım değişimleri, özellikle tarım alanlarının genişlemesi, kentleşme ve sanayileşme süreçlerinin hızlanmasıyla birlikte doğal ekosistemler üzerinde önemli baskılar oluşturmuştur. Bu süreçler, orman ve mera alanlarının giderek daralmasına, karbon depolama kapasitesinin azalmasına ve ekosistem hizmetlerinde ciddi kayıplara yol açmıştır. Özellikle tarımsal üretim amacıyla doğal alanların dönüştürülmesi, toprak organik karbon stoklarının azalmasına, toprak yapısının bozulmasına ve arazi bozulumunun hızlanmasına neden olmaktadır. Bu durum, bölgesel ölçekte karbon döngüsünün dengesini bozarak iklim değişikliğinin etkilerini daha belirgin hale getirmektedir. Bu çalışmada, Sentinel-2A ve Sentinel-2B uydularına ait 10 m spektral çözünürlüklü veriler kullanılarak 2017–2024 yılları arasında Adana ili Yumurtalık ilçesindeki arazi kullanım ve arazi örtüsü değişimleri (LULC) analiz edilmiştir. Coğrafi bilgi sistemleri ile değişimler incelenerek uydu görüntülerinin sınıflandırılmasıyla tarım, mera, orman ve diğer (yerleşim ve su yüzeyleri) arazi kullanımları olmak üzere arazi kullanım sınıfı belirlenmiş, bu sınıflar üzerinden zamansal değişim oranları hesaplanmıştır. Bu sonuçlara göre, incelenen dönemde tarım alanlarında yaklaşık 437,7 hektarlık artış, mera alanlarında ise 563,8 hektarlık azalma meydana gelmiştir. Ayrıca, alanın genelinde tarım arazilerinin toplam arazi kullanımının yaklaşık %80–90'ını, ormanlık alanların ise yalnızca %0,1–0,3'ünü oluşturduğu belirlenmiştir. Elde edilen sonuçlar, Yumurtalık bölgesinde mera alanlarının giderek tarım alanına dönüştüğünü ve bu dönüşümün toprak bozunumu riskini artırdığını göstermektedir. Bu durum, uzun vadede hem toprak verimliliği hem de karbon stoklama kapasitesi üzerinde olumsuz etkiler yaratabilir. Dolayısıyla, gelecekteki araştırmaların daha geniş alanları kapsayacak şekilde arazi kullanım değişimlerinin toprak karbon dinamikleri üzerindeki etkilerine odaklanması ve sadece uydu görüntüleri ile değil aynı zamanda açılan toprak profilleri ile derinlikteki değişimin incelenmesi hem sürdürülebilir arazi yönetimi hem de iklim değişikliğiyle mücadele açısından büyük önem taşımaktadır.

LONG-TERM ANALYSIS OF LAND USE CHANGES AND ESTABLISHMENT OF A SOIL DATABASE: THE CASE OF YUMURTALIK

ABSTRACT

Land use changes that have occurred over many years, particularly the expansion of agricultural areas, have created significant pressures on natural ecosystems, especially with the acceleration of urbanization and industrialization processes. These processes have led to the gradual reduction of forest and pasture areas, a decrease in carbon storage capacity, and serious losses in ecosystem services. The conversion of natural areas for agricultural production, in particular, has caused a decrease in soil organic carbon stocks, soil structure degradation, and accelerated land degradation. This situation disrupts the balance of the carbon cycle at the regional scale, making the effects of climate change more pronounced. In this study, land use and land cover (LULC) changes in the Yumurtalık district of Adana province between 2017 and 2024 were analyzed using 10 m spectral resolution data from the Sentinel-2A and Sentinel-2B satellites. Changes were examined using geographic information systems, and land use classes were determined by classifying satellite images into agricultural, pasture, forest, and other (settlements and water surfaces) land uses. Temporal change rates were calculated for these classes. According to these results, there was an increase of approximately 437.7 hectares in agricultural areas and a decrease of 563.8 hectares in pasture areas during the period under consideration. Furthermore, it was determined that agricultural lands constituted approximately 80–90% of the total land use in the area, while forested areas constituted only 0.1–0.3%. The results obtained show that pasture areas in the Yumurtalık region are gradually being converted into agricultural areas and that this conversion increases the risk of soil degradation. This situation may have negative effects on both soil fertility and carbon storage capacity in the long term. Therefore, it is crucial for future research to focus on the effects of land use changes on soil carbon dynamics, covering larger areas, and to examine changes at depth not only with satellite images but also with soil profiles. This is of great importance for both sustainable land management and combating climate change.

BÜYÜKBAŞ HAYVANLARDA DAVRANIŞIN VERİM ÜZERİNE ETKİLERİ

Arş. Gör. Dr. Murat TURAN
Van Yüzüncü Yıl Üniversitesi, Ziraat Fakültesi, Zootekni
Email: muratturan@yyu.edu.tr
ORCID: 0000-0001-9286-3046

ÖZET

Büyükbaş hayvanlarda davranış özellikleri, hayvan refahını ve üretim verimliliğini doğrudan etkileyen temel bir unsurlardan biridir. Büyükbaş hayvanların sergiledikleri davranışsal tepkiler; çevresel faktörler, sürü içi sosyal etkileşimler, yönetim uygulamaları ve genetik yapı gibi birçok unsur tarafından etkilenmektedir. Hayvan davranışların sistematik biçimde gözlemlenmesi, refah düzeyinin belirlenmesinde ve uygun sürü yönetim stratejilerinin geliştirilmesinde önemli bir araç olarak değerlendirilmektedir. Son yıllarda büyükbaş hayvancılık işletmelerinde uygulanan davranış testleri ile sürü içerisindeki bireysel davranış farklılıklarının erken dönemde tespiti mümkün hale gelmiştir. Büyükbaş işletmelerinde uygulanan davranış testleri aracılığıyla hayvanların çevresel uyum yetenekleri, stres düzeyleri, sosyal etkileşim biçimleri ve insanla iletişim dereceleri objektif olarak değerlendirilebilmektedir. Bu uygulamalar, sürü içerisinde hayvan refahı düzeyinin yükselmesine, stres faktörlerinin azaltılmasına ve ekonomik kayıpların önlenmesine katkı sağlamış; aynı zamanda davranış özelliklerinin damızlık hayvan seçiminde bir kriter olarak kullanılmasına olanak tanımıştır. Son yıllarda büyükbaş hayvanlarda davranış özellikleri üzerine yapılan araştırmalar, büyükbaş hayvanlarda davranış özelliklerinin süt verimi, büyüme hızı, döl verimi ve et kalitesi üzerinde belirgin etkiler oluşturduğunu göstermektedir. Uygulanan davranış testleri, bireysel farklılıkların, stres tepkilerinin ve çevresel uyum yeteneklerinin değerlendirilmesinde önemli bir araç olarak kullanılmaktadır. Bu testlerde genellikle fizyolojik parametreler (kalp atım hızı, nabız, vücut sıcaklığı ve kortizol düzeyi) ile davranışsal veriler birlikte değerlendirilmekte ve hayvanın genel refah durumu hakkında kapsamlı değerlendirmeler yapılabilmektedir.

Son dönemlerde geliştirilen yapay zekâ tabanlı görüntüleme sistemleri, sensör teknolojileri ve otomatik hayvan davranış izleme araçları sayesinde büyükbaş hayvan davranışlarının tespiti daha kolay, hızlı ve objektif hale gelmiştir. Bu teknolojilerin yaygınlaşması ve davranış testlerinin uygulanması hem bireysel hem de sürü düzeyinde refah ve verim düzeylerinin artırılmasına katkı sağlayarak modern büyükbaş hayvancılıkta sürdürülebilir üretim hedeflerinin gerçekleştirilmesini desteklemektedir.

Anahtar Kelimeler: Büyükbaş hayvan, Davranış testleri, Refah, Verim, Stres, Kortizol

THE EFFECTS OF BEHAVIOR IN CATTLE ON PRODUCTIVITY

ABSTRACT

Behavioral characteristics in cattle are one of the fundamental elements that directly affect animal welfare and production efficiency. Animal behavioral responses are influenced by numerous factors, including environmental factors, social interactions within the herd, management practices, and genetic makeup. Systematic observation of animal behavior is considered an important tool in determining welfare levels and developing appropriate herd management strategies. In recent years, behavioral tests implemented in cattle farms have made it possible to identify individual behavioral differences within the herd at an early stage. Through behavioral tests implemented in cattle farms, animals' environmental adaptation abilities, stress levels, social interaction patterns, and levels of human interaction can be objectively assessed. These practices have contributed to improving animal welfare within the herd, reducing stress factors, and preventing economic losses; they have also enabled the use of behavioral traits as a criterion for breeding animal selection. Recent research on behavioral traits in cattle has shown that behavioral traits have significant effects on milk yield, growth rate, fertility, and meat quality. Applied behavioral tests are used as an important tool in assessing individual differences, stress responses, and environmental adaptation abilities. These tests generally evaluate physiological parameters (heart rate, pulse, body temperature, and cortisol levels) along with behavioral data, allowing for comprehensive assessments of the animal's overall well-being.

Recently developed artificial intelligence-based imaging systems, sensor technologies, and automated animal behavior monitoring tools have made identifying cattle behavior easier, faster, and more objective. The widespread adoption of these technologies contributes to improving welfare and productivity at both the individual and herd levels, supporting the achievement of sustainable production goals in modern cattle farming.

ÖZET

Bu çalışma, amatör balıkçılıkta kullanılan farklı iğne tipleri, iğne boyutları ve yem türlerinin birim çaba başına av miktarı (CPUE) ile yakalanan türlerin boy seçiciliği üzerindeki etkilerini belirlemeyi amaçlamıştır. Veriler, 2025 yılında İzmir'de (Ege Denizi) kıyıdan ve tekneden yapılan gözlemlerle toplanmıştır. Çalışmada üç farklı yem türü (sülünez, mamun ve sardalya), üç farklı iğne boyutu ve iki iğne tipi (Circle ve J tipi) kullanılmıştır. Ortalama birim çaba başına av miktarı (CPUE), en yüksek sülünez kullanılan iğnelerde, ardından mamun ve sardalya ile kullanılanlarda elde edilmiştir. Ortalama CPUE, Circle iğnelere kıyasla J tipi iğnelerde daha yüksek bulunmuştur. Genel olarak iğne boyu ile balık boyu arasında istatistiksel olarak anlamlı bir fark bulunmamış, ancak bazı türlerde anlamlı farklılıklar tespit edilmiştir. Yem tipi yakalanan balıkların boyunu anlamlı düzeyde etkilemiştir; mamun ile yakalanan bireylerin ortalama boyu en yüksek, sülünez ile yakalananlarınki orta, sardalya ile yakalananlarınki ise en düşük bulunmuştur. Gözlenen oranlara göre, iğne hasarı Circle iğnelerde J iğnelere kıyasla daha düşük görünmekle birlikte, bu fark istatistiksel olarak anlamlı değildir. İğne ve yemlerin boy seçiciliği ile hasar düzeylerine ilişkin elde edilen sonuçlar doğrultusunda balıkçılık yönetimi için bazı öneriler tartışılmıştır.

EFFECTS OF HOOK SIZE, HOOK TYPE, AND BAIT ON CATCH PER UNIT EFFORT AND FISH SIZE IN RECREATIONAL FISHERIES OF THE AEGEAN SEA: IMPLICATIONS FOR FISHERIES MANAGEMENT

ABSTRACT

This study aimed to determine the effects of different hook types, hook sizes, and bait types used in recreational fishing on catch per unit effort (CPUE) and the size selectivity of the caught species. The data were collected in 2025 in İzmir (Aegean Sea) through observations conducted both from shore and by boat, using three bait types (razor shell, mud shrimp, and sardine), three hook sizes, and two hook types (Circle and J type). The mean catch per unit effort (CPUE) was highest on hooks used for razor shell, followed by those used for mud shrimp and sardine. The mean CPUE was found to be higher on J-type hooks compared to Circle hooks. Overall, there was no statistically significant difference between hook size and fish size; however, for certain species, a significant difference was detected. Bait type significantly affected the size of the caught fish; individuals caught with mud shrimp had the largest average size, those caught with razor shell were intermediate, and those caught with sardine had the smallest average size. Based on the observed proportions, the incidence of hooking damage appears lower with Circle hooks compared to J hooks; however, this difference is not statistically significant. Based on the results regarding hook and bait size selectivity and levels of damage, we discussed some recommendations for fisheries management.

ABSTRACT

Leptocorisa oratorius, rice ear bug is a dominant pest that has the potential to suck ripe rice grains, so that the rice grains will not be fully filled or even empty. The compilation of the use of carcasses with organic attractant enrichment is one alternative for controlling rice ear bug (*L. oratorius*) pests. The aim of this study was to determine the preference of the brown planthopper for the compilation of carcasses and organic attractants and to determine the most effective organic attractants for controlling the brown planthopper. This study was conducted from July 2025 to September 2025, in organic rice fields in Lubuk Bayak Village, Perbaungan District, Serdang Bedagai Regency, Sumatera Utara. This study used an experimental method with attractant treatments of salted fish, crab, and shrimp. Data were analysed using the Kruskal-Wallis test. Quantitative and qualitative descriptive data will be displayed in the form of scores and images. The number and mortality index of the brown planthopper on the salted fish attractant showed the highest, but not significant, difference with the shrimp attractant. The number of brown planthoppers collected from each treatment using salted fish, crab, and shrimp was twenty-four, six, and twelve individuals.

ABSTRACT

Fertilizers are essential for increasing crop yield, maintaining soil fertility, and ensuring nutrient supply. However, excessive use can lead to environmental issues such as nutrient loss and pollution. Eco-friendly organomineral fertilizers with slow and controlled release offer a sustainable alternative, enhancing nutrient use efficiency while reducing environmental impact.

This study examines the formulation effects of organomineral fertilizers and sustainable biological coating material: pectin extracted from orange peels for its gelling, thickening, and stabilizing properties, as a barrier for controlled-release fertilizers (CRFs). By valorizing agro-industrial waste through aerobic and anaerobic biotransformation, nutrient-rich materials are converted into biofertilizers and combined with phosphogypsum (PG) to produce organomineral fertilizers with slow and controlled nutrient release. FTIR, SEM, pH analysis, NPK release, germination, and fertilization tests were conducted to assess the effectiveness of coated and uncoated fertilizers compared to conventional fertilizers.

The best performing mixtures demonstrated optimal nutrient release profiles: M2-coated (compost) released only 22.05 (±1.43) % of nitrogen over 28 days, M5- coated (50% compost–50% PG) displayed a sustained phosphorus release profile with 33.17(±2.16) % over 28 days, and M5-coated exhibited a controlled potassium release, reaching just 25 (±1.45) % within 28 days, meeting CRF standards for nutrient release over time.

Results highlight the potential of these CRFs to enhance nutrient release efficiency, reduce leaching, and improve soil health, supporting climate-smart agriculture. This approach aligns with Conservation Agriculture principles and contributes to Sustainable Development Goals 2, 12, and 13 by promoting sustainable agriculture and minimizing environmental impact.

THE ROLE OF AGRICULTURE IN THE ECONOMIES OF DEVELOPING COUNTRIES: A FRAMEWORK OF PARTICIPATION, CHALLENGES, AND PATHWAYS TO SUSTAINABILITY.

Amina Bigzad

Masters student of department of womens studies, Ahlul bayt international university iran.

Email: aminabigzad@gmail.com

ABSTRACT

Agriculture, as a key sector in the economies of developing countries, has historically played a dual ;role: on the one hand, it is the main driver of rural economic growth, job creation, and food security on the other hand, it constitutes a source of development challenges such as income inequality, pressure on natural resources, and dependence on climatic factors. This article deeply examines the ,multidimensional role of agriculture in these countries and, drawing on international and case evidence analyzes the direct and indirect impacts of agriculture on gross domestic product (GDP) growth, per :capita income, employment, food security, and sustainable poverty. The key axes are

Growth of production and value-adding processes: How agriculture can contribute to GDP growth and - ,the development of related industries by improving input efficiency (water, fertilizer, energy) :addressing market distortions, and developing value chains.- Employment and rural poverty reduction ,Agriculture's role in creating sustainable job opportunities, moving from informal to formal economies and reducing poverty through farm incomes and ancillary services such as local trade, processing .industries, and rural tourism

Food security and market autonomy: How farm-level flexibility and crop diversity, access to domestic - and export markets, and supportive policies can strengthen food security and elevate a country's role in global markets- Climate resilience and resource management: Designing and implementing strategies to reduce climate-related risks, managing water and land resources, preserving biodiversity, and -transferring sustainable technologies to minimize damages from hydro meteorological events ,Innovation and efficient technologies: Adoption of smart agriculture, data-driven approaches, drones production forecasting models, and access to financial services and product insurance to reduce agricultural risks and increase investment.- Supportive and institutional policies: The role of market-oriented policies, value-chain contracts, access to credit, product insurance, and advisory services in improving efficiency and sustainability of agriculture, considering institutional and input constraints of ,countries.- Gender equality and social participation: Increasing women's participation in agriculture improving access to resources and technologies, and reducing poverty by strengthening the capacities .of rural households

,Applied Framework for Countries- Optimizing investment in rural infrastructure: Water, electricity :market-access roads, and product storage systes- Strengthening human and institutional capacities Technical training for farmers, promoting crop diversification, and improving farm management capabilities.- Developing value chains with emphasis on value addition: Processing units, modern packaging, access to domestic and global markets- Climate-risk financial instruments: Product insurance, forward-looking market tools, and credit schemes, especially for smallholders.- Sustainable ,and balanced policy support: Balancing short-term supports with long-term investments in research .innovation, and supportive services

For developing countries, agriculture is not only a source of food security but also a hub of rur economic growth and a driver of overall national economic development. By adopting a comprehensive approach …that

IMPACT OF PHYTOCHEMICALS ON THE HATCHING ABILITY OF *MELOIDOGYNE INCOGNITA*

MEZERKET Amina

Laboratoire d'ethnobotanique et de substances naturelles. Ecole Normale Supérieure (ENS) Kouba Algiers, Algeria

Email: amina.mezerket@g.ens-kouba.dz

ABSTRACT

In Algeria, the *Meloidogyne* genus of root- knot nematodes represents the most destructive pests affecting vegetable crops. These sedentary endoparasites are prevalent in nearly all market garden plots, inflicting significant harm, especially to tomato crops. To mitigate the use of chemical nematicides and their adverse effects on the environment and plant health, various methods have been developed, including the application of phytochemicals such as essential oils. In their natural state, essential oils are biodegradable, non-toxic to the environment, and considerate of consumer health. Our research focused on assessing the nematicidal efficacy of the essential oil derived from white mugwort *Artemisia herba alba* Asso (Asteraceae) on the potential hatching of *Meloidogyne incognita* eggs. One egg mass of *M. incognita* was placed in each hatcher, which contained the essential oil of mugwort at concentrations of 50, 100, 200, 400, and 800 µl/l, along with a control and a fenamiphos chemical solution. The percentage of inhibition of *M. incognita* larvae hatching was evaluated after 12 days. The findings indicated that the essential oil of *Artemisia herba alba* possesses considerable nematicidal activity. The rates of hatching inhibition increased with the concentrations tested. At the highest concentration (800 µl/l) of essential oil, the inhibition rate of *M. incognita* hatching reached 62.79%. In comparison, the chemical treatment yielded an inhibition rate of 63.54%. Additionally, a chemical screening was conducted to identify the secondary metabolites present in this plant, concluding that this oil is primarily composed of tannins, saponosides, and flavonoids. Therefore, it would be beneficial to conduct tests using various plants from different families as potential nematicides.

Key words: *Artemisia herba alba* , essential oil , hatching inhibition, *Meloidogyne incognita*, eggs.

FOOD-BASED STRATEGIES FOR NEURODEGENERATIVE DISEASE PREVENTION: AN IN SILICO STUDY USING PARKINSON'S DISEASE AS A MODEL

ABSTRACT

Food-based preventive strategies are increasingly recognized as a promising approach to reduce the risk of neurodegenerative disorders such as Parkinson's disease (PD), a progressive condition with limited curative options. Bioactive compounds derived from dietary sources can modulate gene expression through epigenetic mechanisms, offering a pathway for nutrition-oriented disease prevention. In this study, we performed an *in silico* analysis to identify nutritional epigenetic modulators targeting genes implicated in PD. Using the Genome-Wide Association Studies (GWAS) catalog, we selected the most significant PD-associated single nucleotide polymorphisms (SNPs) (rs356182-A/G, rs356203-T, rs34637584-A, rs76763715-G, rs1372518-A, rs35682329-A, rs34311866-T) and identified their corresponding genes: *SNCA*, *LRRK2*, *GBA1*, *HMGN2P18*, and *TMEM175*. Gene interaction networks were constructed and enriched via the STRING database to elucidate functional relationships. Subsequently, bioactive compounds with nutritional origins were identified from the PubChem database, including dopamine precursors (bananas, avocados, chocolate), gallic acid (green tea, berries), lactic acid (fermented foods), resveratrol (grapes, peanuts), alpha-lipoic acid (spinach, broccoli, tomatoes), and phloretin (apples, pears). These compounds demonstrated potential epigenetic influence on PD-related genes, linking dietary diversity directly to molecular pathways involved in neuroprotection. Our findings suggest that food-based epigenetic interventions, explored through *in silico* tools, can contribute to the development of preventive nutritional strategies against neurodegenerative diseases, bridging agriculture, food sciences, and molecular biology.

OPTIMIZING VITAMIN D3 BIOAVAILABILITY: DEVELOPMENT OF HIGH-DOSE ORAL SHOT FORMULATION (VOL-D)

Bismillah Iftikhar

Essentials Healthcare Lahore , Pakistan

Email: Bismillahiftikhar12@gmail.com

ABSTRACT

Background: Vitamin D3 (cholecalciferol) deficiency is a prevalent global health concern associated with skeletal, cardiovascular, and immune dysfunctions. Despite widespread supplementation, poor bioavailability and low patient adherence to conventional oral tablets or capsules remain major limitations. This study focuses on the formulation and evaluation of VOL-D, a high-dose (200,000 IU) oral shot designed to enhance Vitamin D3 absorption and improve compliance.

Objective: To develop and assess a high-strength, single-dose oral shot formulation of Vitamin D3 (VOL-D) for optimized bioavailability, ease of administration, and improved patient adherence.

Methods: A lipid-based emulsion system was optimized to enhance the solubility and intestinal absorption of cholecalciferol. The formulation was evaluated for physicochemical stability, uniformity, and palatability. Comparative in vitro dissolution and simulated intestinal absorption studies were conducted against conventional tablet forms. Additionally, sensory acceptability and compliance potential were assessed through pilot consumer feedback.

Results: VOL-D demonstrated superior dispersion and dissolution characteristics compared to standard Vitamin D3 tablets, indicating improved bioavailability potential. The formulation remained physically and chemically stable over accelerated storage conditions. Participant feedback reflected enhanced convenience, taste acceptability, and willingness for continued use, supporting improved adherence potential.

Conclusion: The VOL-D oral shot offers an innovative, patient-friendly, and effective nutraceutical approach to address Vitamin D3 deficiency. By combining high-dose efficacy with superior absorption and convenience, this formulation can contribute to global preventive healthcare strategies against hypovitaminosis D.

ABSTRACT

Schiff base derived from acetophenone and o-aminophenol was synthesized as well as its Mn(II) and Co(II) complexes. The compounds were characterized based on melting/decomposition temperature, solubility, magnetic susceptibility, infrared analysis, Atomic Absorption Spectroscopy and Elemental Analysis. The azomethine bond was formed at 1685cm^{-1} and that of metal(II) complexes are 1596 cm^{-1} and 1626 cm^{-1}. The melting point of the Schiff base was found to be 186^{o}C and the decomposition temperature of the metal(II) complexes was found to range from 240^{o}C - 286^{o}C. The magnetic moment value (5.93 and 4.85B.M) shows that all metal ions in the complexes are paramagnetic in nature. The two complexes have low conductance value (19.6 and 18.3 ohm^{-1}cm-1mol^{-1}), indicating that they were non-electrolyte. Atomic Absorption Spectroscopy and Elemental Analysis reveal that all metal complexes are in 1:2 metal-ligand ratio, analytical data suggest that the Schiff base act as bidentate ligand towards metal ions. The synthesized ligand and the metal complexes were screened for their antibacterial against *Staphylococcus aureau, Eschericia coli* and *Salmonella typhi* bacterial strains and antifungal activity against *Aspergillus niger, Aspergillus flavus* and *Candida albicans* . The results of these studies revealed that all the compounds and their metal complexes showed significant antibacterial and antifungal strength at highest concentration. Cytotoxicity analysis results reveals that both ligand and metal (II) complexes were toxic with LC_{50} values range from 91.861 to 171.226µg/ml.

FOOD IRRADIATION FOR MITIGATING POST-HARVEST LOSSES IN NIGERIA

Dr. Halid Sheriff Adegbusi

Department of Biological Sciences, Nigeria Police Academy Wudil, Kano Nigeria

Email: Khalidadegbusi@yahoo.com

ORCID: 0000-0003-0038-9776

ABSTRACT

This paper is a contributory advocacy on the commercial usage of food irradiation for food preservation for reducing postharvest losses of agricultural produce in Nigeria. Postharvest losses were found to cause a loss of about 13 million metric tons of agricultural crops in Nigeria, especially for perishable crops, grains, and fish. About 0.7 million metric tons of tomatoes were found lost annually. Resulting in the annual economy loss of about 3.7 trillion and 72 billion Nigeria Naira, in respect of agricultural produce and especially of tomato. Comparatively food irradiation offers a better method for food preservation, but does not serve for the replacement of others. Food irradiation was used to preserved yam, water yam, onions, tomatoes, potatoes, cowpea seeds and other crops without reported toxic effect and deteriorated nutritional qualities. Cobalt-60, electron beam and X-rays are commonly used for food irradiation. Over 70 countries have legislated its usage, and has been endorsed by reputable world regulatory bodies for the propensity of food and nutritional, health, economic and export securities. The only one irradiation facility available in Nigeria is Gamma Irradiation Facility operated on Cobalt-60 source, and currently under laboratory use. Putting the facility under commercial usage can help reducing postharvest losses of agricultural crops, thus strengthening food security for achieving sustainable development goal 2 in Nigeria. Commercial usage of the technology may also stimulate agricultural productivity for gross domestic product (GDP), safe exportation for Nigeria currency growth, global market is increasing for irradiated foods. Factors hindering its commercial adsorption can be surmounted by government craftiness. It is therefore recommended, for quick commercial operation of food irradiation, that positively adequate education about the technique is disseminated among relevant stakeholders, and that government should establish more accessible irradiation facilities at strategic areas in Nigeria for both farmers and marketers of perishable food crops, and interested individuals.

ABSTRACT

Plant-based complementary foods (CFs) generally supply insufficient amount of nutrients to meet recommended nutrient intakes for 6–23 months old children. This study determined the nutritional quality of CFs formulated from Nigerian yellow maize (*Zea mays*), soybean (*Glycine max*) and crayfish (*Procambarus clarkii*). Three CFs were formulated, namely; maize-only flour (MF, 100 g), blends of maize and soybean flour (MSF, 72:28 g) and maize, soybean and crayfish flour (MSCF, 80:10:10 g). Nutritional quality was evaluated using analyses of chemical composition of CFs, and biology quality of complementary food diets (CFDs) fed to weaned Sprague Dawley rats fed. Data were compared by Multivariate Analysis of Variance and significantly differentiated at $P \leq 0.05$. Nine selected nutritional criteria were used to determine CF that possessed optimal nutritional characteristic on comparison with MF and fortified wheat flour (FWMF). Total scores obtained from selected fifteen (15) nutritional criteria ranked MSCF, having total score of 30, the lowest and thus considered to possess the most desirable nutritional characteristics compared to MF, MSF and commercial CF (FWMF) that had the respective total score of 55, 39 and 24. Conclusively, MSCF may serve as a better alternative CF for MF and MSC, which compared favourably with FWMF. This study has produced a potential alternative cost-effective and adequate CF, formulated from crayfish (*Procambarus clarkii*) supplementation of locally available blend of yellow maize (*Zea mays*) and soybean (*Glycine max*), for the poor human population, in order to encourage the consumption of animal-sourced CF for alleviating the prevalence of childhood undernutrition.

ABSTRACT

Hexavalent chromium is widely used in industries such as leather tanning, electroplating, mining, paint production, and wood preservation, with wastewater discharges posing serious risks to the environment and human health. This study investigated the use of sulphuric acid modified *Cucumeropsis mannii* peel as a cost-effective biosorbent for the removal of hexavalent chromium from aqueous solution. Batch adsorption experiments were carried out to examine the effects of pH, contact time, adsorbent dosage, and initial chromium concentration. The biosorbent exhibited optimum performance at pH 2, with maximum chromium removal achieved using 1.0 g of adsorbent at an initial concentration of 50 ppm without agitation (0 rpm). Equilibrium was attained within 60 minutes of contact time. The point of zero charge (pHpzc) was determined to evaluate the influence of surface charge on adsorption behavior. Fourier Transform Infrared Spectroscopy (FTIR) analysis confirmed the involvement of hydroxyl, carboxyl, and carbonyl functional groups in chromium binding. The results demonstrate that sulphuric acid modified *Cucumeropsis mannii* peel is an efficient, eco-friendly biosorbent with strong potential for treating chromium-contaminated water.

KEYWORDS: Biosorption, chromium, *Cucumeropsis mannii*, sulphuric acid modification, point of zero charge.

NEXUS OF GREEN INNOVATION AND ORGANIZATIONAL PERFORMANCE: THE MEDIATING ROLE OF TECHNOLOGY TRANSFER

ABSTRACT

This study investigates the role of green innovation in enhancing organizational performance in Pakistan's textile manufacturing sector and examines how technology transfer mediates this relationship. Drawing on Signaling Theory and the Resource-Based View (RBV), green innovation is conceptualized as a higher-order construct comprising product and process innovation. Product innovation focuses on eco-friendly design, recyclable materials, and reduced environmental impact, while process innovation emphasizes sustainable production, energy efficiency, and waste minimization. Technology transfer enables firms to acquire and integrate advanced environmental technologies from external sources, bridging capability gaps and accelerating sustainability adoption.

A quantitative, cross-sectional research design was employed, surveying 230 senior managers from medium-to-large textile firms. Partial Least Squares Structural Equation Modelling (PLS-SEM) was used to assess the measurement and structural models. Results confirm that both product and process innovations significantly contribute to green innovation, which, in turn, positively influences organizational performance. Technology transfer further enhances this relationship, underscoring its strategic value in accelerating environmental technology adoption.

The findings extend Signaling Theory by demonstrating how technology transfer strengthens the credibility of sustainability commitments, and they reinforce RBV by framing green innovation and external technologies as valuable, rare, and inimitable resources. Practically, the study offers actionable insights for managers to integrate internal innovation efforts with

strategic technology partnerships, while policymakers can design incentives to promote technology-sharing collaborations. This integrated approach positions firms for sustainable competitiveness in increasingly environmentally conscious markets.

ORCID: 0000-0002-6783-3248

ABSTRACT

Zebrafish (Danio rerio) are widely acknowledged as an important model organism for the investigation of environmental and biomedical processes, owing to their genetic resemblance to humans, transparent embryonic development, and sensitivity to water quality. This study examines the potential impacts of UV-sterilized drinking water and natural groundwater on the health of zebrafish, with a specific focus on the generation of Reactive Oxygen Species (ROS) and responses to oxidative stress. Parameters of water quality, including pH, temperature, dissolved oxygen, and mineral content, can significantly affect physiological and cellular functions in aquatic organisms. UV-sterilized water, which is commonly utilized for human consumption, undergoes ultraviolet disinfection that removes microbial contaminants but may also modify essential trace minerals and organic compounds. Conversely, groundwater, while naturally filtered, may contain varying concentrations of dissolved minerals and possible pollutants. The comparative analysis aims to understand whether variations in the chemical composition of these water sources influence ROS production, antioxidant enzyme activity, and tissue integrity in zebrafish. Increased levels of ROS can disturb cellular homeostasis, resulting in oxidative damage and compromised metabolic processes. The outcomes of this research are anticipated to underscore the impact of water treatment methods on aquatic model organisms and offer insights into the connection between water quality and oxidative stress. Future investigations will broaden these findings to include long-term exposure effects, gene expression profiling, and behavioral evaluations. The results could guide the advancement of enhanced water management and bioassay systems for assessing the safety of treated and natural water sources, ultimately benefiting both aquatic ecosystems and human health.

ABSTRACT

This research investigates the efficacy of an acetonic extract obtained from OM leaves as a natural corrosion inhibitor for carbon steel (CS) in a 1M HCl medium. With a growing emphasis on environmentally friendly corrosion mitigation strategies, natural inhibitors have gained prominence. OM leaves, were selected as a potential source of corrosion inhibition. Results indicate a substantial influence of the OM leaf acetonic extract on corrosion inhibition. The extract's inhibition efficiency (IE%) was evaluated using various experimental techniques, including Potentiodynamic Polarization (PDP) and Electrochemical Impedance Spectroscopy (EIS), across five concentrations ranging from 0.125 to 1 g/L. The results indicated that the inhibitory effect escalated as the concentration of OM extract increased up to 1 g/L (94%). Fourier-transform infrared spectroscopy identified the characteristic functional groups present in the extract, while scanning electron microscopy of the mild-steel surface evidenced the formation of a coherent protective layer. Adsorption of the inhibitory species followed the Langmuir isotherm, and the thermodynamic parameters confirmed that the process was spontaneous and predominantly governed by physisorption. Density functional theory (DFT) calculations revealed strong interactions between the inhibitor molecules and the steel surface, reflected by a lowered frontier-orbital energy gap (ΔE), which corroborates the observed molecular-level inhibition efficiency.

ABSTRACT

Phytoremediation is the use of plants to remove and degrade environmental pollutants and has gained international attention as an inexpensive and eco-friendly approach to soil, water, and air contamination. Heavy metal-contaminated soil, water, and air pollution and increased soil salinity are a serious risk to the industrializing and agricultural economies of Ethiopia. The phytoremediation of toxins is economical and environmentally sound relative to conventional remediation technology, and native grasses are excellent themes because they naturally adapt to native climatic and soil conditions. This review attempts to gather the articles of indigenous grass and plants used for Phytoremediation in Ethiopia (2000-2024). Following PRISMA guidance, relevant keywords were used to search PubMed, Scopus, Web of Science, and Google Scholar. A total of 17 indigenous grass and plant species have been recognized for their phytoremediation potential use. The results that record native grass species are *Chrysopogon zizanioides* (Vetiver grass), *Rumex nepalensis, Chloris gayana,* and *Cyperus* spp. with high potential towards phytoremediation. This review confirms that indigenous grass vegetation of Ethiopia is a precious and still relatively under-exploited resource for developing effective and cost-effective environmental improvement practices. Thus, it is highly recommended that future efforts need to be aimed at large-scale, in-situ field trials using ingenious grass species and explore methods for maximizing remediation effectiveness.

ABSTRACT

Corrosion remains a persistent industrial and environmental challenge, leading to significant economic losses and safety concerns worldwide. It is one of the primary causes of degradation and premature failure of metallic structures and equipment exposed to aggressive conditions. Factors such as material composition, temperature, flow dynamics, microbial activity, and mechanical stress collectively influence the corrosion process and its kinetics.

In this study, a bioactive molecule extracted from a natural plant source is investigated as an eco-friendly corrosion inhibitor for C38 carbon steel immersed in a 1 M hydrochloric acid solution. The inhibition performance of the compound was evaluated using electrochemical techniques, including electrochemical impedance spectroscopy (EIS), chronoamperometry, and potentiodynamic polarization (PDP). The impact of inhibitor concentration and temperature on the protection efficiency was also examined to establish optimal operating conditions.

Complementary theoretical investigations based on **Density Functional Theory (DFT)** and **Molecular Dynamics Simulations (MDS)** were carried out to gain deeper insight into the adsorption mechanism and electronic interactions governing the inhibition process. The strong agreement between experimental and theoretical results confirms the high efficiency and environmentally sustainable potential of the selected natural compound.

ABSTRACT

Aphaisia is the language disorder which mostly occurs in the left hemisphere of posterior and inferior frontal gyrus of Brodmann Area. It is basically the language impairment in which there is a loss of communication. Patient with this disorder are unable to communicate properly and they faces a lots of problems while speaking. It can be worse while it can cure through various assesments and methods and mainly this disorder can be cured by communicating continuously. This mostly occurs after stroke which damages the part of language namely (Broca's And Wernicke's Area) which are responsible for language producing. Apopharygis is an important field of study, which it's studies included in many basic and clinical sciences such as speech-language pathology; psycology ; neurology and linguistics. In this review we discuss about the neuroanatomy,and there clinical assesments methods through which aphaisia can be controlled and also the speech therapy which remains unchanged. The method used to do transcranial is innovative repetitive transcranial magnetic stimulation and direct current stimulation, which are used to regulate cortical excitability by delivering cortical brain stimulation and are only now being investigated.

ASSESSMENT OF PROTECTED AND RECREATIONAL AREAS IN THE SOUTHWESTERN PART OF LITHUANIA

Vilma Salkauskiene

Lietuvos Inzinerijos Kolegija Higher Education Institution

vilma.salkauskiene@lik.tech

ORCID NO: 0000-0002-1042-8591

ABSTRACT

In recent decades, increasing attention has been devoted to environmental protection and sustainable land development, aiming to balance human activities with the preservation of natural resources. Protected and recreational areas form an essential part of environmental and regional development systems – they not only maintain ecological and biological diversity but also play a significant social and economic role. These territories contribute to the well-being of local communities, promote sustainable tourism, and strengthen regional identity.

The southwestern part of Lithuania is characterized by highly valuable natural and recreational resources, distinguished by landscape diversity and cultural heritage. However, the management and utilization of their potential remain insufficiently analyzed. Limited attention has been given to territorial planning, protection regimes, and sustainable recreational use, which constrains opportunities to ensure their long-term sustainability.

The relevance of this research is further emphasized by the growing public interest in ecological sustainability and nature-based recreation. As visitor numbers increase, challenges related to inadequate infrastructure, territory adaptation, and the protection of natural assets become more evident. These trends highlight the need for balanced solutions that would harmonize nature conservation with recreational activities and economic potential.

In Lithuania, the ecological, social, and economic value of protected and recreational areas, as well as their management efficiency, have not been sufficiently studied. There is a lack of consistent research and methodologies to determine the optimal use of these territories while maintaining ecological balance. To ensure sustainable development, a comprehensive approach to territorial planning is required—integrating environmental, social, and economic interests and implementing sustainable management principles.

After analyzing the protected and recreational areas of the selected territory in Lithuania, it was determined that the region is characterized by high recreational and ecological diversity. A comprehensive evaluation of these areas allows proposing solutions to optimize the management of protected and recreational territories, promote sustainable development, and ensure the long-term preservation of natural and recreational resources. This research is significant both scientifically and practically, providing a foundation for further studies.

Keywords: protected areas, recreational areas, evaluation.

ANIMAL GENETICS AND BREEDING

Devadharshini.R

Dr.R.Srinivasan

Faculty of pharmacy, Bharath institute of higher education and research, Chennai-600073,India

ABSTRACT

Animal genetics and breeding play a fundamental role in improving livestock productivity, disease resistance, and adaptability to diverse environmental conditions. This scientific field focuses on understanding the genetic basis of traits such as growth rate, milk yield, fertility, and disease resistance, enabling the selection and propagation of superior animals. Traditional breeding techniques, including selective breeding and crossbreeding, have long been used to enhance desirable traits. However, recent advances in molecular biology and biotechnology, such as genomic selection, DNA sequencing, and CRISPR gene editing, have revolutionised the field by allowing precise identification and manipulation of genes. These innovations accelerate genetic improvement programs, leading to enhanced production efficiency and improved animal health. Additionally, genetic research supports the conservation of indigenous and endangered breeds, ensuring biodiversity and long-term sustainability in livestock systems. Ethical considerations, including animal welfare and responsible genetic modification, remain essential in modern breeding practices. Overall, animal genetics and breeding contribute significantly to global food security, sustainable agriculture, and the development of resilient livestock suited to future challenges such as climate change and population growth.

ÖZET

Türkiye coğrafi konumu ve iklim özellikleri nedeniyle birçok tarım ürününün yetiştirilebildiği bir ülkedir. Bu ürünlerin birçoğu her kıtaya ihraç edilmekte ayrıca tarım ürünlerinin işlenmesiyle de ülke gıda sanayi gelişim göstermektedir. Türkiye'nin coğrafik koşulları hemen hemen tüm bölgelerde kiraz üretimine olanak sağlamaktadır. Bununla birlikte ticari ölçekte ele alındığında Ege bölgesi özellikle İzmir ve Manisa listenin başını çekmektir. Bu çalışmada ülkemiz için büyük bir üretim ve ihracat değerine sahip kiraz meyvesi taze meyve olarak ele alınmıştır. Türkiye dünya kiraz üretiminin yaklaşık % 27'sini tek başına gerçekleştirmektedir.

Diğer kültür bitkilerinde olduğu gibi kirazda da verim ve kalite son derece önemlidir. Hatta ihracaat sözkonusu olduğunda kalite çoğu zaman verimden de daha önemli bir konuma yükselebilmektedir. Bu nedenle, yüksek verim ve kalite için, üretim koşullarının düzenlenmesi ve verim-kaliteyi etkileyen koşulların optimize edilmesi gerekir. Bu bağlamda çeşit, anaç, budama, gübreleme, sulama ve bitki koruma gibi verim ve kaliteyi etkileyen etmenlerin kontrolü son derece önem taşımaktadır.Kültür bitkileri için gübreleme programlarının hazırlanması için 3 önemli veri grubuna gereksinim duyulmaktadır. Bunlar; 1-Toprakta bitkilerin yararlanabileceği durumda bulunuan besin elementi miktarları; 2-Farklı bitki kısımları (meyve+dal+sürgün+kök) ile bir vejetasyon döneminde topraktan kaldırılan besin maddesi miktarları; 3- Farklı bitki kısımları ile topraktan uzaklaştırılan besin maddelerinin, vejetasyon periyoduna göre gösterdiği değişimdir.

Bu çalışmada, İzmir'in Kemalpaşa ilçesinde kiraz yetiştiriciliğinin yoğun yapıldığı 11 farklı bahçeden, 3 farklı kiraz çeşidi olan Early Burlat, Napolyon ve Salihli çeşitlerine ait meyve örnekleri alınmıştır.Meyvelerin et,çekirdek ve meyve sapı kısımlarında toplam, N,P,K,Ca ve Mg analizleri yapılmıştır.Araştırma sonuçlarına göre incelenen çeşitlerde 100 kg meyve ile topraktan 164.3-416.8 g N;42.2-116.7 g P_2O_5; 148.3-476.9 g K_2O; 37.4-80.9 g CaO; 7.4-53.7 g MgO arasında değişen miktarlarda besin elementi kaldırıldığı saptanmıştır.

Anahtar Kelimeler: Kiraz, Çeşit, Meyve, Besin Elementi, Alınım, Miktar

ABSTRACT

Turkey, due to its geographical location and climate, is a country capable of growing a wide variety of agricultural products. Many of these products are exported to every continent, and the country's food industry is developing through the processing of agricultural products. Turkey's geographical conditions allow for cherry production in almost all regions. However, on a commercial scale, the Aegean region, particularly Izmir and Manisa, leads the list. This study examines cherries, which hold significant production and export value for our country, as fresh fruit. Türkiye alone accounts for approximately 27% of global cherry production.

As with other cultivated plants, yield and quality are crucial for cherries. In fact, when it comes to export, quality can often outweigh yield. Therefore, to achieve high yield and quality, production conditions must be adjusted and the conditions affecting yield and quality optimized. In this context, controlling factors affecting yield and quality, such as variety, rootstock, pruning, fertilization, irrigation, and plant protection, is crucial. Three important data sets are needed to develop fertilization programs for cultivated plants. These are: 1. The amount of nutrients available to plants in the soil; 2. The amount of nutrients removed from the soil by different plant parts (fruit, branch, shoot, and root) during a single vegetation period; and 3. The variation in nutrients removed from the soil by different plant parts over the vegetation period.

In this study, fruit samples of 3 different cherry varieties, Early Burlat, Napoleon and Salihli, were taken from 11 different orchards where cherry cultivation is intensive in the Kemalpaşa district of İzmir. Total, N, P, K, Ca and Mg analyses were carried out in the flesh, seed and fruit stalk parts of the fruits. According to the results of the research, it was determined that nutrient elements were removed from the soil with 100 kg of fruit in the examined varieties, ranging from 164.3-416.8 g N; 42.2-116.7 g P2O5; 148.3-476.9 g K2O; 37.4-80.9 g CaO; 7.4-53.7 g MgO.

Abstract

Infertility remains a major global reproductive health concern, prompting the search for effective and affordable therapeutic alternatives. This review evaluates the reliability of seventeen medicinal plants traditionally used for fertility enhancement. Literature analysis revealed varied outcomes: six plants (*Ajuga iva, Anacyclus pyrethrum, Prunus amygdalus, Grewia tenax, Punica granatum,* and *Salvia officinalis*) showed consistent pro-fertility and androgenic effects, while two (*Cuminum cyminum* and *Marrubium vulgare*) demonstrated mechanisms supporting fertility improvement. Three species (*Artemisia absinthium, A. herba-alba,* and *Peganum harmala*) exhibited dose-dependent or contradictory actions. Conversely, six plants (*Mentha pulegium, Ricinus communis, Carlina gummifera, Trigonella foenum-graecum, Salvadora persica,* and *Ruta chalepensis*) displayed anti-fertility or toxic properties. These findings highlight both the therapeutic promise and safety concerns surrounding fertility-enhancing plants and emphasize the need for rigorous pharmacological validation to ensure their informed and safe incorporation into modern fertility care.

ABSTRACT

Endophytic bacteria, which are linked or associated with medicinal plants, employ unique strategies that enhance the growth and survival of their host plants, often through the mediation of distinctive secondary metabolites. These bacteria and their secondary metabolites constitute crucial subjects for fundamental and applied research focused on sustainable agriculture. In this study, an endogenous bacterial strain originating from a medicinal plant (*Adenosma bracteosum* Bonati) stored at the Institute of Biotechnology and Food, Can Tho University, was assessed for its *in vitro* antibacterial activities against common pathogenic bacteria, including *Escherichia coli* and *Staphylococcus aureus.*

The SB4R5 strain exhibited high resistance to two pathogenic bacterial strains. It demonstrated simultaneous production of siderophores and four types of lytic enzymes (such as protease, cellulase, amylase, and chitinase), which are potentially important mediators of antagonistic activity against pathogens. Based on 16S rDNA sequences, the SB4R5 strain showed the closest genetic relationship to *Bacillus velezensis* (Named *Bacillus velezensis* SB4R5). Gas chromatography/mass-spectrometry (GC-MS) analysis of cell-free extracts of the SB4R5 strain showed that at least 4 compounds were produced, including putative compounds known to have antimicrobial activity. Our discoveries offer fresh insights into the antibacterial capabilities of natural endophytes. These findings suggest that this particular species could be a promising candidate as an antibacterial agent, potentially providing resistance against other pathogens.

Keywords: Antibacterial activities, *Bacillus velezensis*, endophytic bacteria, GC-MS.

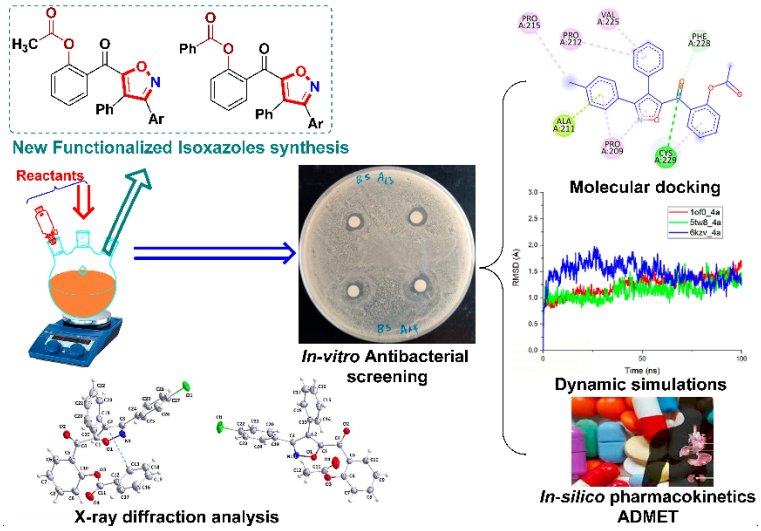
ABSTRACT:

A field experiment was carried out at Horticulture Farm of the Department of Crop Science and Technology, University of Rajshahi, during the period from November 2018 to February 2019. The experiment consisted of two factors: Factor A: Planting time (three levels) as T1= 10 November; T2= 25 November and T3= 10 December and Factor B: Nitrogen (four levels) as No= 0 kg per ha (control); N1=180 kg per ha; N2= 240 kg per ha and N3= 300 kg per ha nitrogen, respectively. The two factors experiment were laid out in Randomized Complete Block Design with three replications. The variety of cabbage was Atlas-70. Due to different planting time, the maximum thickness of head (14.5 cm) and the highest marketable yield (46.5 ton per ha) was obtained from T2 and the minimum thickness of head (13.2 cm) and the lowest marketable yield (40.01 ton per ha) was obtained from T3. For nitrogen, the maximum thickness of head (15.4 cm) and the highest marketable yield (50.06 ton per ha) was found from N2 and the minimum thickness of head (12.4 cm) and the lowest marketable yield (37.5 ton per ha) were found from No. For combined effect, the maximum thickness of head(16.4 cm) and the highest marketable yield (51.7 ton per ha) were found from T2N2 and the minimum thickness of head (11.5 cm) and the lowest marketable yield (34.04 ton per ha) were found from T3No.Economic analysis revealed that T2N2 gave the maximum benefit cost ratio (2.33). So, 25 November planting along with 240 kg per ha nitrogen was the best for growth and yield of cabbage.

EFFICIENT SYNTHESIS, STRUCTURAL ELUCIDATION, ANTIBACTERIAL SCREENING, AND IN SILICO EVALUATION OF NOVEL ESTER-FUNCTIONALIZED ISOXAZOLES

Khalid Boujdi



Faculty of Sciences and Technologies Mohammedia, University Hassan II, B.P. 146, Mohammedia 28800, Morocco

ABSTRACT

In response to the growing threat of antimicrobial resistance, we synthesized and evaluated a new series of ester-functionalized isoxazole derivatives as potential antibacterial agents. These compounds were obtained through a 1,3-dipolar cycloaddition of (Z)-2-benzylidenebenzofuran-3(2H)-one with in situ-generated arylnitrile oxide dipoles, followed by esterification. The final products were fully characterized using IR, ^{1}H and ^{13}C NMR, high-resolution mass spectrometry, and, for compounds 4c and 4f, single-crystal X-ray diffraction.

Their antibacterial activities were assessed in vitro against Escherichia coli, Bacillus subtilis, and Staphylococcus aureus. Compound 4a showed strong inhibition against E. coli (17.5 ± 1.2 mm), while compound 4f exhibited significant activity against S. aureus (15.5 ± 1.6 mm), comparable to reference antibiotics. Molecular docking studies revealed favorable binding affinities and interaction profiles with key bacterial proteins. Molecular dynamics simulations further confirmed the stability of the ligand–protein complexes, especially for compound 4a.

In silico ADME-Tox predictions indicated excellent intestinal absorption, no Ames toxicity, and favorable pharmacokinetic profiles for all compounds. These findings suggest that this family of isoxazole derivatives holds promise as a scaffold for the development of new multi-target antibacterial agents.

Keywords: Isoxazoles, antibacterial agents, molecular docking, ADME-Tox, molecular dynamics, heterocycles.

RURAL DEVELOPMENT

E. Praveena, S.rubinthara, R.swathi .

Bharath Institute of higher education and research. Chennai India.

ABSTRACT

The rapid development of China's economy, greatly improved the living standards of rural residents, and also caused the destruction of the rural ecological environment. government to formulate rural development planning and can also be used as a reference for the evaluation of rural ecological environment in developed and underdeveloped areas. Diets are not static and indeed are changing due to globalization, urbanization and demographic and rural development are central to the diversity of global food systems and diets, Challenges include natural resource declines, climate change .this article constructs an evaluation index system for URI from five dimensions: economic integration, social integration, ecological integration, element integration, and spatial integration. the dynamic urban-rural integration level (URIL) of 373 counties from 2000 to 2019.Urban-rural integration development (URID) is the solution to the excessive urban-rural gap, unequal and insufficient development in urban-rural areas, along with the process of dynamic and balanced urban-rural growth. The URI indicator system is built using the new development philosophy, and 94 cities in the YRB are used as samples .the construction of URIs should be promoted at a more microscopic city and county level; and strong support is provided to achieve high-quality sustainable development of the YRB .Rural development is , including economic, , environmental, and cultural aspects of rural life .many areas and particularly in mountainous countries, forest depletion, largely from uncontrolled agricultural expansion, is leading to a loss of environmental protection of the forest, resulting in floods, droughts, erosion, desertification and loss of agricultural body of knowledge by examining the asymmetric link between rural development and pro-environmental in rural China. Rural development is assessed via rural income and digital financial . The article has applied the Augmented Dickey-Fuller (ADF) test to examine and quantile autoregressive distributed lag (QARDL) model to investigate the association among variables. The results revealed that the construction industry revenue, growth, construction policy GDP, and industrialization positively link sustainable rural development in China. the policy development authorities to develop effective policies related to improvement in the construction industry that will enhance sustainable rural development.

ÖZET

Eimeria türlerinin neden olduğu koksidiyoz, küçük ruminantlarda önemli ekonomik kayıplara ve refah sorunlarına yol açan en ciddi bağırsak paraziter hastalıklardan biridir. Klasik genom çapında ilişki analizleri (GWAS), parazit direncine ilişkin bazı genomik bölgeleri belirlemiş olsa da, bu yöntemler karmaşık özelliklerin doğrusal olmayan ve çok genli doğasını modellemede sınırlıdır. Bu çalışmada, Orta Anadolu Merinosu (CAM) koyunlarında koksidiyoz direncinin genetik yapısını incelemek için iki aşamalı makine öğrenmesi (ML) tabanlı bir GWAS yaklaşımı uygulanmıştır. Toplam 228 kuzuda gram başına ookist (OPG) sayıları kaydedilmiş ve log(OPG + 1) dönüşümüne tabi tutulmuştur. Genotipleme, Illumina OvineSNP50 BeadChip kullanılarak gerçekleştirilmiştir. Birinci aşamada, bilgi içeriği yüksek SNP'leri belirlemek için *LASSO*, *Ridge Regression* ve *Elastic Net* modelleriyle öznitelik seçimi yapılmıştır. İkinci aşamada, *Destek Vektör Regresyonu (SVR)*, *Rastgele Orman (RF)* ve *XGBoost* modelleri tekrarlı çapraz doğrulama altında ilişki modellemesi için kullanılmıştır. SVR modeli en yüksek tahmin performansını (R^2 = 0.440; RMSE = 0.865) göstermiş, RF modeli ise bunu (R^2 = 0.407; RMSE = 0.890) ile takip etmiştir. Anlamlı SNP'lere yakın konumlanan aday genlerin anotasyonu, epitel bariyer bütünlüğü (*SCN7A*, *SCN9A*, *AQP4*), mukozal koruma (*CHST9*, *GALNT5*) ve immün-sinirsel düzenleme (*PDE10A*, *DRD3*) ile ilişkili lokusları ortaya koymuştur. Ayrıca *PCOLCE2*, *WASHC3* ve *ATP6V1A* gibi genlerin, mukozal savunmada kilit rol oynayan hücre dışı matriks yeniden yapılanması, endozomal taşınma ve asitlenme süreçlerinde görev aldığı belirlenmiştir. Makine öğrenmesinin GWAS ile bütünleştirilmesi, *Eimeria* enfeksiyonuna karşı dirençteki varyasyonun altında yatan biyolojik olarak anlamlı aday bölgelerin belirlenmesini sağlamıştır. Bu bulgular, yerli koyunlarda parazit direncinin genomik seleksiyon programlarına dahil edilmesinin uygulanabilirliğini desteklemektedir.

Anahtar Kelimeler: *Eimeria spp*., ookist sayısı, makine öğrenmesi, GWAS, SVR, intestinal bağışıklığı, genomik seleksiyon, Orta Anadolu Merinosu.

ABSTRACT

Coccidiosis, caused by *Eimeria* species, remains one of the most important enteric parasitic diseases in small ruminants, resulting in significant economic and welfare losses. Conventional genome-wide association studies (GWAS) have identified relevant genomic regions for parasite resistance, yet they are limited in modeling the non-linear and polygenic nature of complex traits. This study employed a two-stage machine-learning (ML) GWAS approach to dissect the genetic architecture of resistance to coccidiosis in Central Anatolian Merino (CAM) sheep. Oocyst per gram (OPG) counts were recorded for 228 lambs and log-transformed as log(OPG + 1). Genotyping was performed using the Illumina OvineSNP50 BeadChip. In Stage 1, LASSO, Ridge Regression, and Elastic Net models were applied for feature selection to derive a consensus set of informative SNPs. In Stage 2, Support Vector Regression (SVR), Random Forest (RF), and XGBoost were used for association modeling under repeated cross-validation. SVR achieved the highest predictive performance (R^2 = 0.440; RMSE = 0.865), followed by RF (R^2 = 0.407; RMSE = 0.890). Candidate genes proximal to significant SNPs were annotated, revealing loci related to epithelial barrier integrity (SCN7A, SCN9A, AQP4), mucosal protection (CHST9, GALNT5), and immune-neural regulation (PDE10A, DRD3). Additional genes such as PCOLCE2, WASHC3, and ATP6V1A were involved in extracellular matrix remodeling, endosomal trafficking, and acidification—key processes in mucosal defense. The integration of ML with GWAS enabled the identification of biologically meaningful candidate regions potentially underlying variation in resistance to *Eimeria* infection. These findings support the feasibility of incorporating parasite resistance into genomic selection programs for indigenous sheep.

Keywords: *Eimeria spp.*, oocyst count, machine learning, GWAS, SVR, intestinal immunity, genomic selection, Central Anatolian Merino.

INTRODUCTION

Coccidiosis, caused by protozoan parasites of the genus *Eimeria*, represents a major enteric disease in sheep flocks worldwide (Chartier & Paraud, 2012). Clinical and subclinical infections result in reduced growth rates, feed conversion efficiency, and overall productivity, leading to substantial economic losses in the sheep industry (Taylor et al., 2016). The disease is particularly relevant in intensive and semi-intensive production systems, where environmental conditions facilitate oocyst accumulation and reinfection. In Türkiye, *Eimeria ovinoidalis*, *E. parva*, and *E. crandallis* are the most common species affecting lambs, especially during the weaning transition period (Arslan et al., 1999).

The host's response to *Eimeria* infection is complex, involving mucosal immune mechanisms, epithelial integrity, and metabolic adjustments that mitigate intestinal damage (Yun et al., 2000; Rose et al., 2012). Genetic variation in resistance has been demonstrated in several sheep populations, suggesting the potential for selection-based control strategies (Bishop & Stear, 2003). However, coccidiosis resistance is a polygenic trait, governed by multiple loci each exerting small effects, often involving non-linear interactions among genetic, physiological, and environmental factors (). Consequently, conventional linear GWAS approaches may fail to capture these non-additive genomic signals (Hu et al., 2016).

Machine learning (ML) has emerged as a promising complement to classical GWAS for dissecting complex traits (Pérez-Enciso & Zingaretti, 2019). Unlike linear models, ML algorithms can accommodate non-linearity, multicollinearity, and high-dimensional data structures (Cortes & Vapnik, 1995; Kuhn & Johnson, 2013). Recent advances in livestock genomics have demonstrated the value of ML-based GWAS in uncovering subtle genotype–phenotype associations for growth, wool, and disease resistance traits in sheep and cattle ().

The Central Anatolian Merino (CAM) is a native Turkish composite breed derived from Karacabey Merino × Akkaraman crosses, selected for dual-purpose production under semi-arid conditions (Keskin et al., 2021). Understanding the genetic mechanisms of disease resistance in this population is pivotal for sustainable breeding strategies that reduce reliance on chemoprophylaxis and contribute to the One Health agenda on antimicrobial stewardship (FAO, 2022).

This study therefore aimed to (i) apply a two-stage ML-GWAS to identify genomic regions associated with resistance to *Eimeria* spp. infection in CAM lambs; (ii) evaluate and compare model predictive performances; and (iii) annotate and biologically interpret the most informative SNPs and genes linked to intestinal defense and immune regulation.

MATERIALS AND METHODS

Animals and Phenotypic Data

A total of 228 Central Anatolian Merino (CAM) lambs were sampled from the Aksaray region of Türkiye. All animals were reared under semi-intensive management conditions with standardized feeding and vaccination programs. Fresh fecal samples were collected directly from the rectum at 90–120 days of age, coinciding with the post-weaning period when *Eimeria* infection pressure is typically high (Taylor et al., 2016). Oocyst counts were determined using the McMaster technique and expressed as oocysts per gram (OPG) of feces (Foreyt, 2013). To normalize data distribution and reduce skewness, values were log-transformed as log(OPG + 1) prior to analysis (Sallé et al., 2012).

Genotyping and Quality Control

Genomic DNA was extracted from whole blood and genotyping was performed with the Illumina OvineSNP50 BeadChip (approximately 54,000 SNPs) (Kijas et al., 2014). SNPs with

a minor allele frequency (MAF) < 0.05, call rate < 0.95, or deviation from Hardy–Weinberg equilibrium ($p < 1\times10^{-6}$) were removed (Purcell et al., 2007). After quality control, approximately 48,000 high-quality SNPs and all 228 individuals were retained for analysis.

Two-Stage Machine Learning GWAS Framework

A two-stage ML framework was implemented to integrate feature selection and predictive association modeling (Pérez-Enciso & Zingaretti, 2019). Stage 1 involved regularization-based methods—LASSO, Ridge Regression, and Elastic Net—applied independently using tenfold cross-validation (Tibshirani, 1996; Zou & Hastie, 2005). A consensus SNP panel was constructed by intersecting the top 5 % of SNPs from each model, retaining markers that consistently contributed to variance across methods. Stage 2 employed Random Forest (Breiman, 2001), Support Vector Regression (Cortes & Vapnik, 1995), and eXtreme Gradient Boosting (Chen & Guestrin, 2016). Hyperparameters were tuned via grid search, and each model was evaluated under repeated fivefold cross-validation (Varma & Simon, 2006).

Candidate Gene Annotation and Functional Enrichment

Significant SNPs were mapped to the *Oar_v4.0* sheep reference genome (Jiang et al., 2014). Genes located within ±100 kb of significant loci were retrieved using Ensembl BioMart (Kinsella et al., 2011). Functional annotation was based on Gene Ontology and KEGG pathway databases (Kanehisa et al., 2023).

Statistical and Visualization Tools

All analyses were conducted in R (version 4.3). Feature selection used the **glmnet** package , ensemble learning used **randomForest**, **e1071**, and **xgboost**, and visualization employed **ggplot2** and **VennDiagram**.

RESULTS

3.1. Model Performance and Comparative Evaluation

In the first stage of analysis, feature selection using LASSO, Ridge, and Elastic Net regularization models revealed a highly polygenic architecture underlying resistance to coccidiosis. Each algorithm identified distinct but partially overlapping sets of influential SNPs (Figure 1). Specifically, LASSO selected 58 unique markers, Ridge 55, and Elastic Net 48, with 16 SNPs consistently retained across all three methods. These shared loci were prioritized for subsequent modeling as they represented the most stable predictors under different regularization penalties.

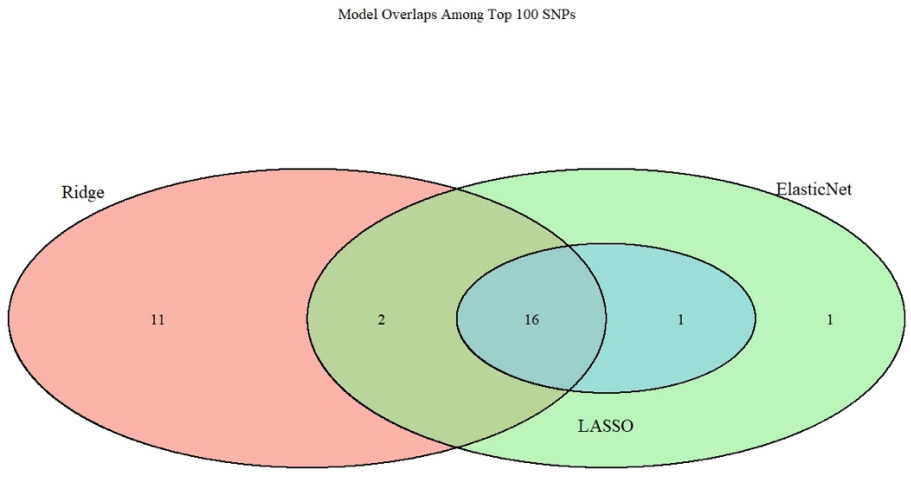

Figure 1. Venn diagram showing overlap of selected SNPs across feature selection models (LASSO, Ridge, Elastic Net).

The overlap among the top 100 SNPs from each model (Figure 1) highlights a consensus set of variants that likely capture true genetic signals rather than algorithm-specific artifacts. The recurrence of these markers across penalization schemes further supports the presence of genomic regions consistently contributing to variation in Eimeria oocyst load. The resulting consensus SNP panel was therefore used as input for the second-stage association modeling, ensuring both biological relevance and computational efficiency.

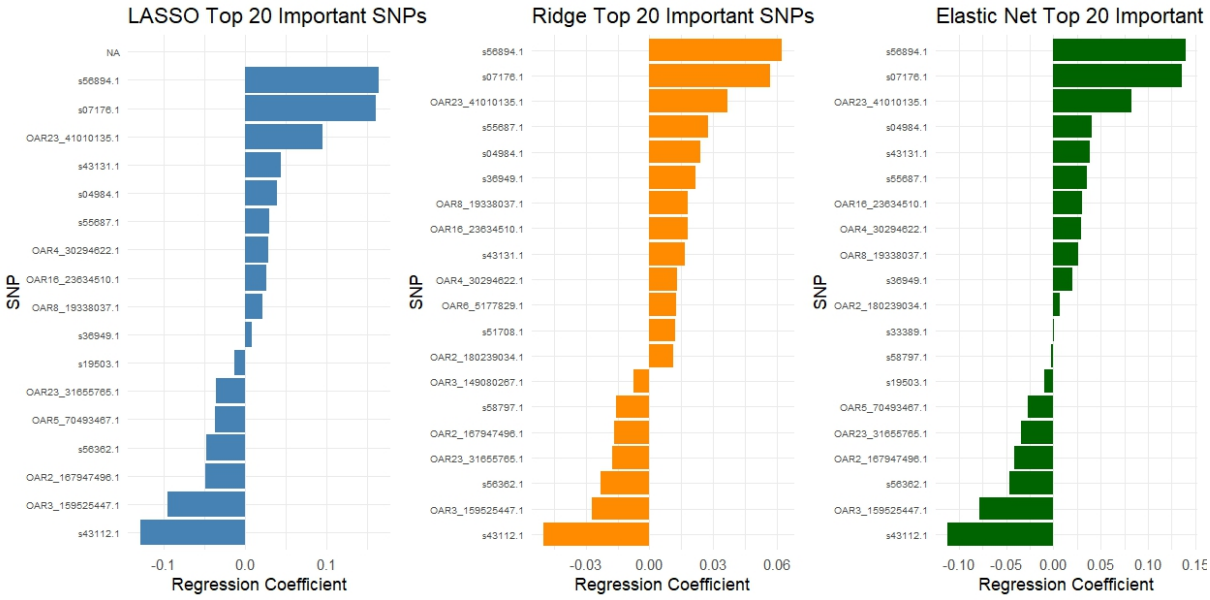

Figure 2. Comparison of regression coefficient of top 20 SNPs among ML algorithms at future selection stage.

In the second stage, three machine learning algorithms—Support Vector Regression (SVR), Random Forest (RF), and XGBoost—were compared for their ability to predict oocyst load using the consensus SNP set. All models demonstrated satisfactory predictive power, although SVR clearly outperformed the others (Table 1). SVR achieved the highest prediction accuracy ($R^2 = 0.440$, RMSE = 0.865), followed by RF ($R^2 = 0.407$, RMSE = 0.890) and XGBoost ($R^2 = 0.319$, RMSE = 0.954).

Table 1. Performance comparison of ML models for prediction of coccidia oocyst load.

Model	R^2	RMSE	Ranking
Support Vector Regression (SVR)	**0.440**	**0.865**	1
Random Forest (RF)	0.407	0.890	2
XGBoost	0.319	0.954	3

Repeated cross-validation confirmed the robustness of the SVR model, with consistently higher correlations between observed and predicted phenotypes. This superior performance reflects the model's ability to capture complex, non-linear genotype–phenotype relationships characteristic of polygenic resistance traits.

Figure 2 illustrates the comparative predictive performance of the models, while Figure 3 presents the relationship between observed and predicted values. The SVR model exhibited the narrowest error distribution, further confirming its reliability and generalization capacity.

3.2. Identification of Informative SNPs

The two-stage approach successfully reduced the SNP space from approximately 48,000 markers to a refined consensus panel of 240 highly informative SNPs. Among these, 20 markers were recurrent across at least two feature selection models (LASSO, Ridge, Elastic Net), indicating strong stability across algorithms (Figure 1).

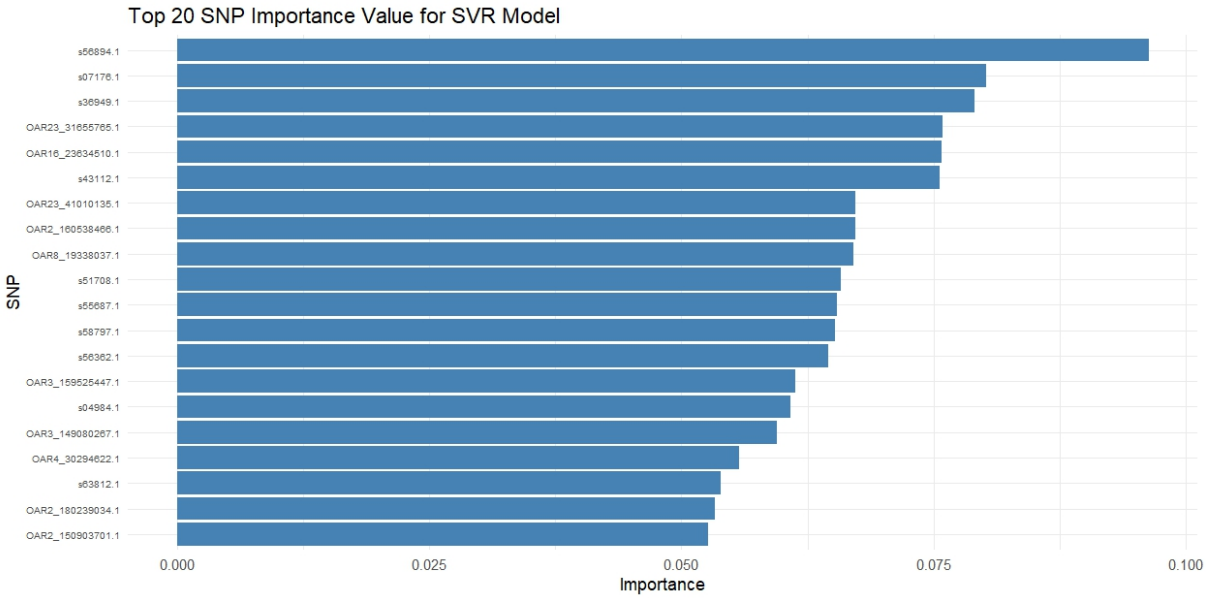

Figure 3. Top 20 SNP importance value from SVR Model.

Top-ranking SNPs were distributed across multiple chromosomes (OAR1, OAR2, OAR3, OAR4, OAR8, OAR12, OAR16, OAR23, OAR25), with particularly dense clusters on OAR2 and OAR3, suggesting the involvement of multiple small-effect loci in the trait's architecture (Table 2).

Table 2. Representative SNPs identified by the ML-based GWAS and their associated candidate genes.

SNP ID	Chr	Position (bp)	Nearest Gene	Functional Category
OAR2_150903701.1	2	141953798	**SCN7A**	Voltage-gated sodium channel; epithelial barrier electrophysiology
OAR2_180239034.1	2	170225946	**AQP4**	Water channel; osmotic balance and mucosal hydration
OAR23_31655765.1	23	30222859	**CHST9**	Sulfotransferase; mucus layer sulfation

SNP ID	Chr	Position (bp)	Nearest Gene	Functional Category
OAR23_41010135.1	23	38700316	**GALNT5**	Glycosyltransferase; mucin-type O-glycosylation
OAR3_149080267.1	3	139117389	**DRD3**	Dopamine receptor; immune–neural regulation
OAR3_159525447.1	3	149407337	**PDE10A**	Phosphodiesterase; cAMP/cGMP pathway modulation

s43112.1	1	244063117	**PCOLCE2**	Extracellular matrix remodeling and tissue repair
s56894.1	8	84419597	**WASHC3**	Actin cytoskeleton and endosomal trafficking
OAR16_23634510.1	16	21605012	**GRAMD1C**	Lipid transport and membrane signaling
s58797.1	25	41360346	**SEL1L**	ER protein quality control during infection
s63812.1	12	37948669	**CNOT2**	Transcriptional regulation and immune signaling

3.3. Functional Annotation and Biological Interpretation

Annotation and pathway enrichment analyses indicated that the significant loci were enriched in biological processes related to **epithelial integrity, ion transport, metabolic regulation, and immune–neural communication.**

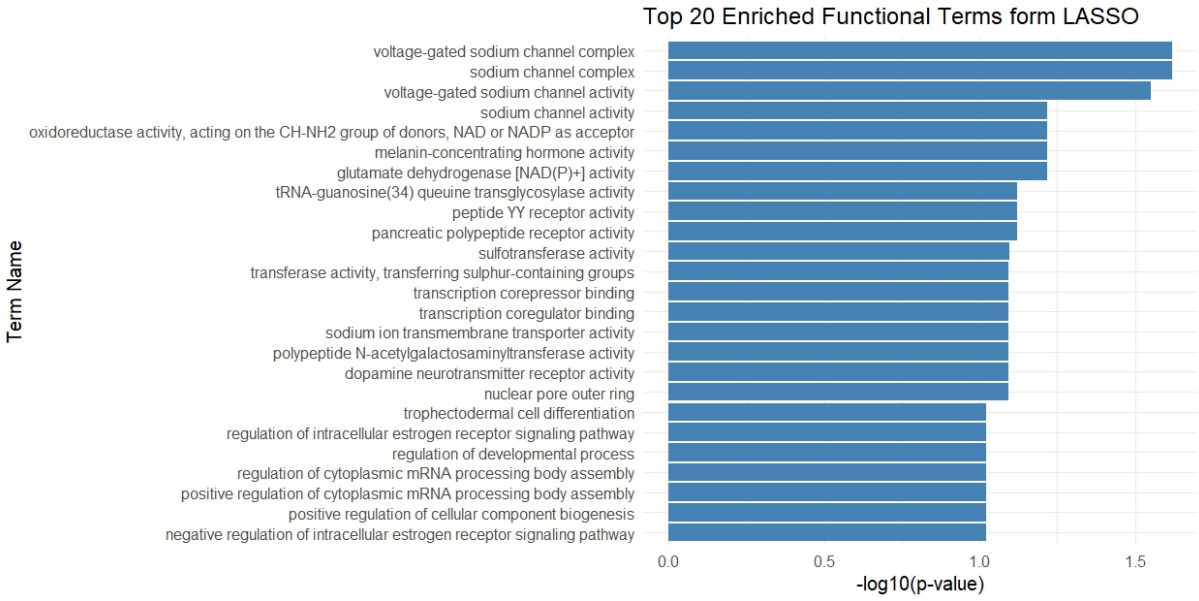

Figure 4. Schematic representation of enriched biological processes and gene networks associated with coccidiosis resistance.

- **Epithelial Defense and Barrier Function:**

The sodium channel genes *SCN7A* and *SCN9A*, along with *AQP4*, are critical for maintaining intestinal epithelial potential and fluid transport. Their modulation under infection stress suggests a host strategy to preserve ion–water balance during *Eimeria*-induced damage.

- **Mucosal Protection:**

CHST9 and *GALNT5* encode enzymes responsible for sulfation and glycosylation of mucins, which enhance the protective mucus layer, limiting oocyst adhesion and invasion.

- **Immune and Neural Regulation:**

PDE10A and *DRD3* influence cAMP/cGMP-mediated signaling and dopaminergic regulation, supporting cross-talk between the enteric nervous system and mucosal immunity.

- **Tissue Repair and Endosomal Function:**

PCOLCE2, *WASHC3*, and *ATP6V1A* participate in extracellular matrix remodeling, actin polymerization, and acidification, respectively, which are essential during epithelial regeneration and pathogen clearance.

- **Metabolic and Transcriptional Control:**

GRAMD1C, *CNOT2*, and *SEL1L* contribute to lipid transport, transcriptional fine-tuning, and ER-associated degradation, all vital for maintaining cellular homeostasis during infection.

A schematic summary of gene interactions and functional categories is presented in *Figure 4*.

DISCUSSION

This study is among the first to apply a comprehensive machine-learning GWAS framework to unravel the genomic architecture of coccidiosis resistance in sheep. The integration of regularization-based feature selection and non-linear regressors effectively captured hidden patterns in SNP data that conventional linear GWAS approaches might overlook (Pérez-Enciso & Zingaretti, 2019; Abdollahi-Arpanahi et al., 2020).

4.1. Model Comparison and Methodological Strengths

The superior performance of SVR highlights the relevance of kernel-based learning for modeling polygenic, non-linear traits such as parasite resistance (Cortes & Vapnik, 1995; González-Recio et al., 2020). Similar approaches have demonstrated strong predictive capacity for growth and wool traits in livestock where complex genotype–phenotype interactions are present (Liaw et al., 2022). Ensemble models such as RF and XGBoost also showed high but slightly lower predictive ability, consistent with their ability to capture primarily additive effects (Breiman, 2001; Chen & Guestrin, 2016).

4.2. Biological Relevance of Identified Genes

The top candidate genes collectively reflect the multifactorial host-defense mechanisms against *Eimeria* infection. Genes regulating epithelial structure and function (e.g., *SCN7A*, *AQP4*, *CHST9*) underscore the importance of maintaining mucosal barrier integrity (Kim et al., 2021). Immune–neural interaction genes (*DRD3*, *PDE10A*) suggest the involvement of neuroimmune signaling in modulating intestinal inflammation and repair (Rose et al., 2012). Similar findings have been reported in studies of nematode and coccidia resistance, where genes involved in epithelial renewal, ion transport, and mucosal defense were identified as critical determinants of resilience (Bishop & Stear, 2003; Sallé et al., 2012). The identification of *ATP6V1A* and *WASHC3* further supports the participation of acidification and cytoskeletal

remodeling processes in intestinal parasite defense—mechanisms previously associated with epithelial activation in mammalian infection models (Yun et al., 2000).

4.3. Implications for Genomic Selection

The candidate loci identified in this study may serve as useful genomic markers for selective breeding programs targeting enhanced resistance to coccidiosis (Bishop & Stear, 2003). Incorporating such loci into genomic prediction pipelines could help reduce disease prevalence without compromising growth performance. The ML-GWAS framework described here can also be adapted to other parasitic or infectious diseases of small ruminants, supporting precision breeding initiatives aligned with the One Health approach (FAO, 2022).

CONCLUSIONS

The two-stage machine-learning GWAS effectively uncovered genomic regions associated with resistance to *Eimeria* spp. in Central Anatolian Merino sheep. The SVR model provided the highest prediction accuracy, validating the use of kernel-based non-linear modeling for complex parasitic traits. Candidate genes implicated in epithelial integrity, mucosal protection, and immune regulation provide strong biological evidence for host resilience mechanisms. These findings can contribute to developing genomic selection indices that incorporate parasite resistance, promoting sustainable sheep production systems in endemic regions.

ÖZET

Myostatin (MSTN) geni, iskelet kası gelişimini negatif yönde düzenleyen ve çiftlik hayvanlarında et verimini doğrudan etkileyen önemli bir genetik faktördür. Bu derleme çalışmasında, sığır, koyun, domuz, keçi ve tavuk gibi başlıca çiftlik hayvanlarında MSTN genine ait varyasyonların kas gelişimi, karkas özellikleri ve büyüme performansı üzerindeki etkileri değerlendirilmiştir. Ayrıca follistatin, IGF-1 ve aktivin reseptörleri gibi moleküllerle olan etkileşimler ile MSTN'in biyolojik aktivitesi üzerindeki düzenleyici mekanizmalar tartışılmıştır. CRISPR/Cas9 ve RNA interferans gibi modern gen düzenleme teknolojilerinin MSTN ekspresyonunu hedefleyerek kas kütlesini artırmada nasıl kullanılabileceği örnek çalışmalarla sunulmuştur. MSTN varyantları, et verimi yüksek hayvanların ıslahında genetik biyobelirteç olarak değerlendirilebilir. Bununla birlikte, gen düzenlemeye dayalı yaklaşımların etik, yasal ve sürdürülebilirlik boyutları da göz önünde bulundurulmalıdır. Bu kapsamlı değerlendirme, MSTN geninin tarımsal biyoteknoloji ve genetik ıslah uygulamalarında taşıdığı potansiyeli ortaya koymaktadır.

Anahtar Kelimeler Myostatin, GDF-8, kas gelişimi, genetik varyasyon, biyoteknoloji.

ABSTRACT

The Myostatin (MSTN) gene is a critical genetic factor that negatively regulates skeletal muscle development and directly influences meat yield in livestock. This review evaluates the impact of MSTN gene variants on muscle growth, carcass traits, and growth performance in major farm animals, including cattle, sheep, pigs, goats, and chickens. It also discusses molecular regulatory mechanisms involving follistatin, IGF-1, and activin receptors that modulate MSTN activity. The use of modern gene-editing tools such as CRISPR/Cas9 and RNA interference to suppress MSTN expression and enhance muscle mass is highlighted through recent studies. MSTN polymorphisms can serve as valuable genetic biomarkers in the selection of high-yield meat-producing animals. However, ethical, legal, and sustainability concerns regarding gene-editing approaches must also be considered. This comprehensive evaluation underscores the significant potential of the MSTN gene in agricultural biotechnology and genetic improvement strategies.

Keywords: Myostatin, GDF-8, muscle development, genetic variation, biotechnology.

INTRODUCTION

Muscle development is of great importance in animal production, particularly in terms of meat yield. Skeletal muscle constitutes a significant portion of total body weight and is a direct determinant of carcass productivity in livestock. Myostatin (GDF-8) is a protein that negatively regulates skeletal muscle growth and was discovered in 1997 by McPherron and colleagues (McPherron et al., 1997). This protein belongs to the Transforming Growth Factor-beta (TGF-β) superfamily, and mutations occurring in its coding regions can lead to increased muscle mass (Kambadur et al., 1997). Inactivation of the myostatin gene in mouse models has been shown to cause both hyperplasia and hypertrophy, resulting in increased number and size of muscle fibers (McPherron et al., 1997; Grobet et al., 1997). Studies in cattle, sheep, pigs, goats, and poultry have demonstrated that this gene plays a universally conserved regulatory role in muscle development (Clop et al., 2006; Stinckens et al., 2008; Bellinge et al., 2005).

Naturally occurring mutations identified in the MSTN gene of livestock species have led to marked improvements in carcass yield and muscle quality (Grobet et al., 1997; Oldham et al., 2001). For example, the “double-muscling” phenotype observed in Belgian Blue cattle vividly demonstrates the gene’s functional impact. Likewise, variants located in the UTR region of Texel sheep affect muscle development through microRNA-mediated regulation, contributing to superior meat yield (Clop et al., 2006).

In this context, identification of genetic variations and their integration into animal breeding programs enhance economic efficiency and influence crucial traits such as animal welfare and calving ease. Furthermore, recent advances in genome-editing technologies such as CRISPR/Cas9 have made it possible to manipulate these variations in a controlled manner (Crispo et al., 2015). This review discusses the molecular characteristics, genetic variants, species-specific effects, and biotechnological applications of the myostatin gene.

MOLECULAR STRUCTURE AND FUNCTION OF THE MYOSTATIN GENE

The myostatin (MSTN) gene, which negatively regulates muscle development, is located on chromosome 2. In humans, it consists of three exons and two introns, and its coding region is highly conserved across species. Transcription of the gene yields a 376-amino-acid precursor protein, which becomes biologically active after proteolytic cleavage and functions in its homodimeric form by binding to TGF-β receptors (Lee & McPherron, 2001).

Active myostatin can be antagonized by binding proteins such as follistatin, representing a key regulatory mechanism that limits its biological effects (Sharma et al., 1999). Myostatin suppresses muscle cell growth through the Akt/mTOR and Smad signaling pathways, inhibiting both proliferation and differentiation of myocytes. In muscle tissue, its principal role is to restrict muscle cell growth and replication. When MSTN expression is downregulated or its function disrupted, muscle hypertrophy (enlargement of existing fibers) and hyperplasia (increase in fiber number) occur. McPherron et al. (1997) demonstrated that myostatin-deficient mice exhibited nearly double the muscle mass of wild-type animals.

Similar effects have been observed in pigs, sheep, and cattle, making MSTN a major target in selective breeding programs. Mutations in the myostatin gene in Belgian Blue and Piemontese breeds are associated with the double-muscling phenotype (Grobet et al., 1997). Moreover, a SNP in the 3′ UTR region of Texel sheep was found to interact with miR-1 and miR-206, leading to translational repression and increased muscle development (Clop et al., 2006).

Overall, myostatin functions as a key biological regulator limiting muscle growth and serves as a critical target for both basic biological research and applied livestock breeding.

MYOSTATIN VARIANTS AND THEIR EFFECTS IN LIVESTOCK

Cattle

Mutations in the MSTN gene identified in Belgian Blue and Piedmontese cattle cause the well-known "double-muscling" phenotype (Grobet et al., 1997). These mutations often occur within the coding region—particularly in exon 3—as frame-shift deletions that yield nonfunctional proteins, eliminating myostatin's inhibitory effect. Other breeds such as Marchigiana, Limousin, Charolais, Aubrac, and Parthenais also carry MSTN variants influencing muscle mass, carcass yield, and marbling (Dunner et al., 2003).

Missense mutations detected in Charolais and Limousin cattle reduce protein activity, thereby increasing muscle fiber diameter and overall meat proportion. However, these same variants may also lead to adverse production outcomes such as dystocia, low birth weight, reduced fertility, and calf mortality (Kambadur et al., 1997; Bellinge et al., 2005). Most of these changes cause functional losses in regions responsible for dimerization, proteolytic cleavage, or receptor binding, effectively abolishing the gene's regulatory capacity.

In local breeds such as Parthenais and Aubrac, MSTN polymorphisms have been significantly associated with traits like loin eye area, thigh width, and carcass weight, indicating that while selection for these variants can enhance muscularity, it must be balanced with welfare-related and reproductive considerations (Rodgers et al., 2007).

Sheep

In Texel sheep, a SNP located in the 3′ UTR of the myostatin gene affects post-transcriptional regulation, leading to increased muscle growth (Clop et al., 2006). This mutation disrupts microRNA (miR-1 and miR-206) binding sites, reducing translation of the MSTN protein and promoting hypertrophy, particularly in the loin and hindquarter muscles. Consequently, Texel sheep are recognized as a high-meat-yield breed.

The effect of this variant is not limited to Texel sheep. Studies in Suffolk, Awassi, Merino, Barki, and Romney breeds have shown that MSTN genotypes significantly influence growth performance, birth and weaning weights, and carcass characteristics (Zhou et al., 2006; Bellinge et al., 2005). For instance, in Merino sheep, MSTN polymorphisms correlate positively with muscle fiber density and carcass quality, while in Romney sheep, certain variants are linked to increased hind-leg muscle mass.

In sheep, MSTN variants are mainly concentrated in the 3′ UTR, exon 1, and promoter regions. Polymorphisms within the promoter have been shown to directly alter gene expression levels, leading to increased fiber numbers (Sato et al., 2006). Likewise, mutations within microRNA interaction sites regulate translation efficiency and contribute to breed-specific phenotypic variation in musculature.

In summary, although MSTN variant effects differ among breeds, suppression of this gene in high-meat-yield sheep breeds produces substantial phenotypic divergence, highlighting its importance as a target for both genetic selection and biotechnological interventions.

Pigs

In pig breeds such as Large White, Landrace, Duroc, Meishan, and Hampshire, variants have been identified in both the promoter and coding regions of the MSTN gene, influencing muscle fiber composition, fat content, and meat quality (Stinckens et al., 2008). Reduced MSTN expression leads to greater muscle mass and alters the ratio of type I to type II fibers. Some lines with low MSTN levels exhibit faster growth and improved carcass yield.

These variants are primarily located in exons 1–2 and the promoter region. Promoter mutations affect transcription-factor binding sites, directly regulating gene expression and thereby suppressing protein production, which results in myofiber hyperplasia (Li et al., 2011). Comparative analyses between Duroc and Meishan pigs revealed lower MSTN expression in Duroc, correlating with greater muscle mass.

Functional knockdown studies using RNA interference and CRISPR/Cas9 technologies confirmed that suppression of MSTN significantly enhances muscle growth (Cai et al., 2017). Amino acid substitutions caused by natural variants reduce biological activity of the protein, promoting more efficient muscular development.

Tissue-specific expression analyses also show that pigs with lower MSTN expression exhibit higher lean meat percentage and optimal meat quality (Wang et al., 2012). Thus, MSTN variants represent promising markers for selection programs aimed at improving pig growth and carcass traits.

Goats

In goats—particularly Boer, Saanen, Black Bengal, Damascus, Alpine, and Honamlı breeds—MSTN polymorphisms have been identified mainly in introns 1–2 and the promoter region. These variants are significantly associated with carcass weight, loin eye area, body length, muscle thickness, and meat yield. For example, intron 1 variants in Boer goats are positively correlated with loin eye area and meat production (Li et al., 2004). In high-milk-yield breeds such as Saanen and Alpine, MSTN polymorphisms affect growth rate and may be used to optimize dual-purpose breeding strategies for milk and meat (Han et al., 2013). In Damascus goats, MSTN variants influence carcass composition and fat distribution (Zhou et al., 2017).

Studies on Black Bengal goats have demonstrated that certain SNPs in the promoter region of MSTN interact with IGF-1, enhancing muscle protein synthesis and thus meat yield (Sutarno et al., 2005). Positive correlations have also been reported between MSTN expression levels and live weight gain (He et al., 2011). Recent studies in Honamlı goats indicate a strong relationship between the breed's high muscular potential and MSTN gene polymorphisms, emphasizing the need for further population-level investigations (Yıldız et al., 2021).

With the advent of gene-editing technologies in livestock, CRISPR/Cas9-mediated knockout of the MSTN gene in goats has produced significant increases in muscle mass (Zhou et al., 2017). These experimental findings suggest that suppression of MSTN not only enlarges muscle volume but also improves feed efficiency and fattening performance (Jin et al., 2016).

Overall, MSTN variation and its phenotypic effects in goats represent a valuable resource for optimizing within-species genetic potential. These polymorphisms are promising biomarkers for improving meat yield through integration of conventional selection and molecular breeding approaches (Li et al., 2004; Han et al., 2013; Zhou et al., 2017).

Poultry

Studies conducted in poultry, particularly in broiler lines such as Ross 308, Cobb 500, Hubbard, Arbor Acres, and Lohmann, have demonstrated that SNPs in the promoter and coding regions of the MSTN gene are associated with live weight, breast muscle width, feed conversion ratio, and overall growth performance (Sato et al., 2006). Polymorphisms within the promoter region can affect transcription factor binding sites, leading to reduced gene expression. This reduction has been linked to faster muscle growth and higher carcass yield, especially in commercial broilers (Zhou et al., 2006).

Additionally, suppression of MSTN expression can be achieved using molecular techniques such as RNA interference (RNAi) and antisense oligonucleotide technology. Experimental

studies utilizing these approaches have reported increased hypertrophy in breast muscles and accelerated growth rates (Kang et al., 2017). Furthermore, CRISPR/Cas9-mediated gene-editing studies have enabled targeted mutagenesis of the myostatin gene, resulting in significant increases in muscle volume even in newly hatched chicks (Yu et al., 2018).

Interactions between MSTN expression and other growth-related factors such as IGF-1 and follistatin also play key roles in regulating growth parameters. The inverse relationship between IGF-1 and MSTN, particularly during early embryonic development, directly influences the proliferation and differentiation of muscle progenitor cells (Sharma et al., 1999). These molecular interactions are therefore critical when evaluating chicken genotypes for fattening and growth performance.

Identifying genetic variants that serve as potential biomarkers for breeding purposes offers valuable opportunities for developing more efficient poultry lines and reducing economic losses. Genome-wide association studies (GWAS) have identified significant SNPs within the MSTN genomic region, providing essential information for use in genetic selection strategies (Sato et al., 2006; Yu et al., 2018).

MOLECULAR INTERACTIONS IN MYOSTATIN REGULATION

The biological activity of myostatin is tightly regulated through interactions with various regulatory proteins and receptors. Follistatin, in particular, binds myostatin with high affinity, preventing its interaction with target cells and thereby promoting muscle growth (Lee & McPherron, 2001; Amthor et al., 2004). This binding blocks the interaction between myostatin and the activin type IIB receptor (ActRIIB), suppressing the Smad2/3 signaling pathway. Inhibition of this pathway allows activation of genes required for muscle cell proliferation and differentiation (Sharma et al., 1999).

Insulin-like Growth Factor 1 (IGF-1) acts as an anabolic factor that functions in the opposite direction of myostatin. IGF-1 positively regulates myoblast proliferation and differentiation, thus enhancing muscle development (Durieux et al., 2007). The equilibrium between IGF-1 and myostatin plays a crucial role in maintaining muscle mass and functional capacity.

In addition to follistatin, proteins such as FLRG (follistatin-related gene) also inhibit myostatin activity. Although the effects of FLRG on muscle development are not fully elucidated, several studies have reported that overexpression of such inhibitory proteins can induce hypertrophy in skeletal muscles (Zimmers et al., 2002).

Overall, myostatin regulation operates through a complex molecular network. Understanding these interactions is of great significance for developing strategies to treat muscle growth disorders, for designing genetic selection programs, and for applying biotechnological interventions aimed at improving meat yield (Rodgers & Garikipati, 2008).

BIOTECHNOLOGICAL APPLICATIONS AND GENE-EDITING TECHNOLOGIES

Advances in biotechnology have made it possible to manipulate the myostatin gene with high precision. Targeted gene-editing tools such as CRISPR/Cas9 enable the introduction of stable mutations within the MSTN gene, accelerating the genetic selection process in meat production (Crispo et al., 2015). CRISPR-based applications in models such as mice, pigs, sheep, and goats have resulted in substantial increases in muscle mass and improved carcass traits (Li et al., 2018).

Moreover, temporary silencing of MSTN expression can be achieved through RNA interference (RNAi) techniques. Studies using this approach in chickens and mice have reported muscle fiber hypertrophy, demonstrating the potential of RNAi in muscle-enhancement strategies (Sato et al., 2006; Reardon et al., 2001).

Transgenic and MSTN-knockout animal models serve as valuable resources for elucidating the physiological roles of this gene. Myostatin-deficient mice exhibit pronounced hyperplasia (increased fiber number) and hypertrophy (enlarged fiber size) (McPherron et al., 1997; Sharma et al., 1999). Similar outcomes have been reported in pigs and goats following targeted suppression of MSTN expression through genetic engineering (Zhou et al., 2016).

Such biotechnological applications are not only utilized to enhance productivity in breeding programs but also to improve economic efficiency. However, these technologies must be assessed within ethical, legal, and sustainability frameworks. When carefully managed, they hold promise as fundamental tools in future animal genetics research and livestock improvement.

DISCUSSION AND FUTURE PROSPECTS

Due to its central role in muscle development, the myostatin gene has become a pivotal research subject in both basic science and agricultural biotechnology. Experimental inhibition of GDF-8 and analyses of its genetic variants have yielded promising results for developing livestock with higher meat production potential (McPherron et al., 1997; Sharma et al., 1999). For example, in Belgian Blue cattle, inactivating mutations in the MSTN gene cause the double-muscling phenotype, which markedly enhances meat yield (Grobet et al., 1997). Similarly, in Texel sheep, mutations in the 3′UTR of the MSTN gene lead to hypertrophy of muscle fibers and improved growth performance (Clop et al., 2006).

Comparable findings have been reported in goats and chickens, where MSTN polymorphisms are significantly associated with muscle thickness, body size, and live weight (Li et al., 2004; Sato et al., 2006). Modern gene-editing technologies such as CRISPR/Cas9, RNA interference, and transgenic animal models have clearly demonstrated that suppression of myostatin stimulates muscle growth (Crispo et al., 2015; Kang et al., 2017). These tools allow for more precise and rapid selection of high-yield genotypes.

However, the application of these technologies in livestock production must be evaluated within ethical and regulatory contexts, considering food safety and sustainability principles. Factors such as consumer perception, animal welfare, and environmental impact should also be taken into account when designing production models based on myostatin manipulation (Rodgers & Garikipati, 2008).

CONCLUSION

The myostatin (MSTN) gene, a key negative regulator of muscle development, holds strategic importance for improving meat yield in animal production systems. This review has provided a comprehensive evaluation of genetic variations in the MSTN gene across different livestock species and their phenotypic impacts. From the double-muscling phenotype in Belgian Blue and Piedmontese cattle to miRNA-dependent translational regulation in Texel sheep, and from polymorphisms in pigs, goats, and chickens to biotechnological interventions such as gene editing and RNA interference, a wide range of findings highlight the universal yet species-specific regulatory role of myostatin.

While many MSTN variants confer economic advantages such as increased muscle mass and carcass quality, potential risks—including dystocia, reduced fertility, and physiological imbalances—should not be overlooked. Therefore, the development of MSTN-based breeding strategies must involve multifaceted evaluation tailored to species, breed, and production system.

Today, advanced biotechnological tools such as CRISPR/Cas9, RNA interference, and transgenic model systems enable targeted manipulation of MSTN, greatly accelerating genetic

improvement processes. Nevertheless, widespread adoption of these technologies must align with ethical, legal, and sustainability standards and incorporate holistic assessments of public health, animal welfare, and environmental consequences.

In conclusion, the myostatin gene will continue to serve both as a critical target for improving livestock productivity and as a model system that exemplifies the transformative potential of genetic engineering in modern animal science.

ÖZET

Küresel iklim değişikliği, azalan doğal kaynaklar ve artan gıda talebi, tarımda yeni ve sürdürülebilir yöntemlere olan ihtiyacı artırmaktadır. Bu doğrultuda, nanoteknolojiye dayalı tohum nano-priming uygulamaları gelecek vadeden bir yaklaşım olarak öne çıkmaktadır. Nanoparçacıkların kullanımıyla gerçekleştirilen priming işlemi, tohum metabolizmasını ve sinyal mekanizmalarını düzenleyerek çimlenme hızını ve homojenliğini artırmakta, fide gelişimini desteklemekte ve bitkilerin abiyotik ile biyotik streslere karşı dayanıklılığını güçlendirmektedir. Ayrıca nano-priming, besin elementlerinin alımını kolaylaştırarak gübre kullanımını azaltmakta, pestisit ihtiyacını düşürmekte ve gıda kalitesinin yükselmesine katkı sağlamaktadır. Bu bildiride, tohum nano-primingin temel prensipleri, kullanılan farklı nanoparçacık tipleri ve bitki gelişimi üzerindeki etkileri tartışılacak; tarımsal üretimde sürdürülebilirlik açısından sunduğu fırsatlar ile olası çevresel riskler değerlendirilecektir.

Anahtar Kelimeler: Tohum Nano-Priming, Nanoteknoloji, Sürdürülebilir Tarım, Çimlenme

ABSTRACT

Global climate change, depletion of natural resources, and the increasing demand for food highlight the urgent need for sustainable and innovative strategies in agriculture. In this context, seed nano-priming has recently emerged as a promising approach. This technique, based on the use of nanoparticles, modulates seed metabolism and signaling mechanisms, resulting in faster and more uniform germination, enhanced seedling establishment, and improved tolerance to both abiotic and biotic stresses. Furthermore, nano-priming facilitates nutrient uptake, thereby reducing the need for fertilizers, decreases pesticide application, and contributes to improved food quality. This paper will discuss the basic principles of seed nano-priming, the different types of nanoparticles employed, and their impacts on plant growth and development. In addition, the potential opportunities it provides for sustainable crop production, along with possible environmental risks, will be critically evaluated.

Keywords: Seed Nano-Priming, Nanotechnology, Sustainable Agriculture, Germination

1.GİRİŞ

Günümüzde dünya nüfusunun yaklaşık 8 milyar olduğu tahmin edilmekte ve 2050 yılına kadar 10 milyara ulaşması beklenmektedir (Cardarelli vd., 2022). Birleşmiş Milletler'in öngörülerine göre, 2100 yılı itibarıyla bu rakam 11,2 milyara ulaşacaktır (Omran ve Baek 2022). Nüfusun hızla artması, küresel ölçekte gıda talebini ve beslenme ihtiyaçlarını önemli ölçüde artırmıştır (War vd., 2020). Buna karşın, artan üretim baskısı altında yürütülen yoğun tarım uygulamaları hem çevresel hem de insani boyutlarda ciddi sürdürülebilirlik sorunlarını beraberinde getirmiştir. Kimyasal gübreler ve pestisitlerin aşırı kullanımı sonucu, tarımsal kimyasal kalıntılarının insan vücudunda birikmesi, besin elementlerinin yıkanması, ötrofikasyon, toprak kirliliği ve sera gazı salınımı gibi problemler yaygın hale gelmiştir (Rahman ve Zhang 2018; Kumar vd., 2019a, b).

Bu durum, hem mevcut üretim sistemlerinin ekolojik denge üzerindeki baskısını azaltacak hem de gelecek nesillerin güvenli gıdaya erişimini garanti altına alacak **sürdürülebilir tarımsal yaklaşımların** geliştirilmesini zorunlu kılmaktadır. Çevre ve Kalkınma Komisyonu'nun (WCED) raporunda da vurgulandığı üzere sürdürülebilirlik; mevcut kuşakların ihtiyaçlarını karşılarken, gelecek kuşakların kendi gereksinimlerini karşılama kapasitesini tehlikeye atmadan çevresel etkileri en aza indirme anlayışını ifade etmektedir (Pirzada vd., 2020).

Bu bağlamda, küresel tarım sektörü günümüzde zararlılardan kaynaklanan ürün kayıpları, iklim değişikliğinin olumsuz etkileri ve doğal kaynakların tükenmesi gibi çok yönlü zorluklarla karşı karşıya kalmaktadır (Kokkonen vd., 2021). Geleneksel üretim sistemleri uzun sürmekte pestisit ve gübrelerin yoğun kullanımına dayandığından, çevresel kirlilik ve ekosistem tahribatı giderek artmaktadır (Lowry vd., 2019). Sürdürülebilir tarımın sağlanması ve artan gıda talebine yanıt verebilmek için yenilikçi teknolojilerin tarıma entegre edilmesi gerekmektedir (Kah vd., 2019; Panpatte vd., 2019). Bu noktada **nanoteknoloji**, tarımsal üretimde sürdürülebilirliği destekleyebilecek yenilikçi bir çözüm alanı olarak öne çıkmaktadır (Camara vd., 2019; Shakiba vd., 2020). Toprak ve su arıtımı, nanogübreler ve nanopestisitler gibi nano tabanlı uygulamalar, kullanılan kimyasal miktarlarını azaltırken gıda üretimini ve kalitesini artırmayı hedeflemektedir (Zhao vd., 2020). Ayrıca bu uygulamalar, çevresel yükü hafifleterek ekosistem üzerindeki baskıyı azaltmakta ve çevre dostu bir alternatif sunmaktadır (De La vd., 2020). Özellikle nanopartiküllerin bitki koruma alanındaki kullanımı giderek yaygınlaşmakta; bu durum hem araştırmacıların hem de tarım sektöründeki firmaların dikkatini çekmektedir (Chau vd., 2020).

2. GELİŞME

Nanoteknolojinin tarımsal uygulamalara entegre edilmesi, tohum kaplama tekniklerinde önemli yenilikler sağlamış; bu sayede süreçler daha hassas, verimli ve çevreyle uyumlu hale gelmiştir (Kiran vd., 2021). Tohum kaplama materyallerine nanomalzemelerin eklenmesi, çimlenme başarısının artmasına, besin elementlerinin daha etkin alınmasına, çevresel stres koşullarına karşı koruma sağlanmasına ve tohumla taşınan patojenlerin kontrol altına alınmasına katkıda bulunmaktadır (Shelar vd., 2021). Nanoteknoloji, tohum çimlenmesini büyümeyi teşvik eden maddelerin kontrollü biçimde tohuma iletilmesi yoluyla geliştirebilmektedir. Nanopartiküller, oksin, giberellin ve sitokinin gibi bitki büyüme düzenleyicilerini kapsülleyerek bu hormonların zaman kontrollü salınımını sağlamaktadır (Gowtham vd., 2023; Taheri vd., 2024). Fregonezi vd. (2024), giberellik asidin nanopartiküller içinde yavaş salınımının domates tohumlarında fide gelişimini ve su stresine dayanıklılığı artırdığını bildirmişlerdir. Pathak vd. (2021), düşük dozlarda ZnO nanopartiküllerinin arpa tohumlarının çimlenmesini teşvik ettiğini, yüksek dozlarda ise toksik etki oluşturduğunu göstermiştir. Benzer şekilde, Hao vd. (2016) ile Almutairi vd. (2015) farklı nanomalzemelerin pirinç, mısır, karpuz ve kabak tohumlarında çimlenme ve kök gelişimini nanoparçacık tipi ve derişimine bağlı olarak farklı şekilde

etkilediğini belirtmişlerdir. Çevresel stres faktörleri (kuraklık, sıcaklık, tuzluluk vb.) bitki gelişimini ve verimi sınırlamaktadır. Nanoteknolojiye dayalı tohum kaplamaları, özellikle ZnO, TiO_2, SiO_2 ve karbon esaslı nanopartiküller, tohumların stres koşullarına karşı dayanıklılığını artırmaktadır. Örneğin, Cu nanopartikulleriyle muamele edilen mısır bitkilerinde büyüme, biyokütle ve kuraklık toleransı belirgin şekilde artmıştır. Benzer şekilde, Mosavikia vd. (2022), deve dikeni tohumlarında kitosan nanopartikülleri ve pridoksin ile yapılan nanoprimingin tuzluluk toleransını artırdığını; fotosentetik pigmentler, antioksidan enzim aktiviteleri ve prolin düzeylerini düzenlediğini bildirmiştir. Nanoteknoloji, tohum kaplamaları yoluyla besin maddelerinin bitkiye daha verimli ve hedefe yönelik şekilde iletilmesini sağlamaktadır. Geleneksel gübreler toprağa uygulandığında sızıntı ve yüzey akışı nedeniyle besin kayıpları ve çevre kirliliği meydana gelebilmektedir. Nanogübreler ise tohum kaplamalarına entegre edildiğinde bu kayıpları azaltarak, gerekli besinleri çimlenme ve erken büyüme dönemlerinde doğrudan tohuma ulaştırmaktadır (Yadav vd., 2020). Çinko (Zn), bakır (Cu), demir (Fe) ve magnezyum (Mg) gibi mikro besin elementlerinden yapılan nanopartiküller tohum kaplamalarında kullanılabilmektedir. Bu mikro elementler, klorofil üretimi, enzim aktivasyonu ve solunum gibi bitki metabolizmasının temel süreçlerinde görev almaktadır (Guardiola-Márquez vd., 2023). Buğday tohumlarını 500 mg Zn/L derişiminde ZnO nanoparçacıklarıyla kaplayarak aynı zamanda toprağa da uygulamış ve işlem görmüş tohumlarda çinko içeriğinin yaklaşık 96.9 ± 25.4 mg Zn kg^{-1} düzeyine yükseldiğini belirlemişlerdir. Bu sonuç, ZnO nano parçacıklarıyla yapılan tohum kaplamasının bitkide Zn birikimini artırdığını göstermektedir (Elhaj Baddar vd., 2020). Çin lahanası (Brassica rapa) tohumlarına 20, 40 ve 80 mg L^{-1} derişimlerinde gümüş (Ag) nanoparçacıklarıyla ön işlem uygulamış ve çimlenme ile besin değerini incelemişlerdir. 40 mg L^{-1} derişiminde yapılan uygulamanın verimi %44,3 oranında artırdığı, ayrıca alanin, tirozin, glutamin, histidin ve valin gibi amino asitlerin içeriğini yükselttiği belirlenmiştir. Demir içeriği de %23,8 oranında artmış; bu da Ag nanoparçacıklarının bitkinin besin değerini artırdığını göstermektedir (Zhou vd., 2021). Tohum çimlenmesi ve erken bitki gelişiminde en önemli sorunlardan biri, mantar, bakteri ve virüs gibi tohum kaynaklı patojenlerin varlığıdır. Bu patojenler düşük çimlenme oranı ve fide ölümlerine neden olarak verimi düşürmektedir. Nanoteknoloji, antimikrobiyal nanoparçacıkların tohum kaplamalarına eklenmesiyle bu soruna çözüm sunmaktadır (Shelar vd., 2021). Özellikle gümüş (Ag) nanoparçacıkları geniş spektrumlu antimikrobiyal özellikleriyle bilinmektedir; mikroorganizmaların hücre zarlarını bozarak, ROS üretimini artırarak ve DNA replikasyonunu engelleyerek etkili olmaktadır. Tohum kaplamalarına dahil edildiğinde, zararlı patojenlerin tohum yüzeyinde kolonileşmesini engellemekte ve tohum kaynaklı hastalıkları önemli ölçüde azaltmaktadır. Ag nanoparçacıklarını pirinçte Ustilaginoidea virens mantarına karşı kullanmış ve 2 nm boyutundaki nanoparçacıkların 15 nm olanlardan daha güçlü etki gösterdiğini bildirmiştir. EC_{50} değeri 2.6 mg/mL, EC_{90} değeri 6.72 mg/mL bulunmuştur. Ag nanoparçacıkları mantar gelişimini ve spor oluşumunu doz bağımlı şekilde baskılamış, hücre yapısında hasar ve vakuol birikimi oluşturmuştur (Wen vd., 2023). Bakır oksit (CuO) ve çinko oksit (ZnO) nanoparçacıkları da yaygın olarak kullanılan antimikrobiyal ajanlardır. Bu nanoparçacıklar sadece besin elementi sağlamakla kalmaz, aynı zamanda *Fusarium*, *Rhizoctonia* ve *Pythium* gibi fide hastalıklarına neden olan mantarların gelişimini de engellemektedir. Ayrıca, peroksidaz ve fenilalanin amonyak liyaz gibi savunma enzimlerinin üretimini teşvik ederek bitkinin bağışıklık yanıtını güçlendirmektedir (Daniel vd., 2021).

A. NANOMATERYAL İLE TOHUM KAPLAMA

-Nanopartiküller

Metal oksit nanoparçacıkları, tohum kaplamalarında çimlenme, fide gelişimi ve hastalıklara karşı dayanıklılığı artıran önemli bileşenlerdir (Venkateswaran vd., 2023). ZnO

nanoparçacıkları antimikrobiyal etkileriyle çimlenmeyi %15'ten fazla artırırken kök ve sürgün gelişimini desteklemektedir (Donia vd., 2023). TiO_2 nanoparçacıkları fotosentezi güçlendirmekte ve UV koruması sağlamaktadır. Fe_2O_3 ve Fe_3O_4 nanoparçacıkları demir alımını %20–25 oranında artırarak erken fide gelişimini desteklemektedir (Dola vd., 2021). CuO nanoparçacıkları antifungal özellik göstermekte; düşük dozlarda (~20 ppm) faydalı olsa da yüksek dozlarda toksik etki yaratabilmektedir (Feigl vd., 2023). SiO_2 nanoparçacıkları kaplama dayanıklılığını artırmakta, nem dengesini düzenlemekte ve kurak koşullarda çimlenmeyi %10–15 oranında iyileştirmektedir (Goswami vd., 2023). MgO nanoparçacıkları klorofil sentezi için gerekli magnezyumu sağlayarak fide büyümesini %22 artırmaktadır (Segatto vd., 2023). Ayrıca montmorillonit nanokilleri, tohum çevresinde su ve besin tutulumunu geliştirip kök büyümesini desteklemektedir (Kumari vd., 2024).

-Nanofiberler

Elektrospin yöntemiyle üretilen nanolifler, yüksek yüzey alanı, gözeneklilik ve biyolojik olarak aktif bileşikleri kapsülleme yetenekleri sayesinde tohum kaplamalarında yaygın olarak kullanılmaktadır. Elektrospinning tekniği, büyümeyi teşvik eden maddeler, besinler veya fungisitler gibi bileşenleri taşıyabilen nanoliflerin üretimine olanak sağlamaktadır (Vedakumari vd., 2023). Bu lifler, kapsüllenmiş fungisitlerin kontrollü ve uzun süreli salımını sağlayarak bitkileri hastalıklara karşı korumaktadır. Biyobozunur bir malzeme olan polilaktik asit (PLA) nanolifleri, marul gibi bitkilerin tohum kaplamalarında denenmiştir. Bu lifler, büyümeyi düzenleyici bileşiklerle yüklenerek bunları yavaşça serbest bırakırak, aşırı sızma olmadan fide gelişimini desteklemektedir. Geleneksel film kaplamalarla karşılaştırıldığında, polimerik nanolifli kaplamalar daha yüksek su geçirgenliği, daha iyi fide biyokütlesi ve gelişmiş su alışverişi sağlamaktadır. Farias vd., (2019) soya tohumlarını abamektin veya fluopyram içeren selüloz diasetat nanoliflerle kaplamış ve kaplama kalınlığının süreyle arttığını, ancak kaplamaların homojen kaldığını bildirmişlerdir. 2, 3 ve 4 saatlik kaplamalarda çimlenme oranı %90'ın üzerinde bulunmuş, bu da kaplamanın çimlenmeyi olumsuz etkilemediğini göstermiştir. Zaim vd. (2022) ise çeltik tohumlarının kaplanmasında çinko oksit nanoparçacıkları içeren selüloz asetat biyopolimer nanolifler kullanmış, %17 nanolif oranı ve 100 mg/L ZnO nano parçacığıyla kaplanan tohumlarda yaklaşık %60 çimlenme oranı elde etmişlerdir.

-Nanojeller ve Nanoemilsiyonlar

Nanojeller, suyla şişebilen çapraz bağlı polimer ağlarından oluşan üç boyutlu hidrojel yapılar olup, suda çözünmeden yüksek oranda su tutabilirler (Jessy vd., 2024). Doğal veya sentetik polimerlerden üretilebilen bu yapılar; boyut, yüzey yükü, gözeneklilik, biyobozunurluk gibi özellikleri kimyasal bileşimlerine göre ayarlanabilmektedir (Harini vd., 2024). Tarımsal uygulamalarda nanojeller, gübre veya pestisit gibi agrokimyasalların kontrollü salımı için kullanılmaktadır. Tohum kaplamalarında nanojeller, besin maddelerini veya büyüme düzenleyicilerini kapsülleyerek çevresel faktörlere (pH, nem vb.) bağlı olarak yavaş salım sağlamaktadır. Bu durum, kimyasal kullanımını azaltırken etkinliği artırmaktadır. Lv vd. (2021), alginat esaslı nanojellerle kaplanan tütün tohumlarında aktif maddenin (chloroinconazide) beş gün içinde tamamen salındığını ve bitki büyüme parametrelerinde %20 civarında artış sağlandığını bildirmişlerdir. Nanoemülsiyonlar ise genellikle 20–200 nm çapında damlacıklardan oluşan, yağ-su veya su-yağ tipinde kararlı dispers sistemlerdir (Mushtaq vd., 2023). Küçük damlacık boyutu sayesinde aktif bileşenlerin daha homojen dağılmasını ve etkili bir şekilde kaplanmasını sağlamaktadır. Bu sistemler, besin maddeleri, pestisitler ve büyüme düzenleyicilerin tohuma homojen şekilde taşınmasına olanak tanımaktadır (Preeti vd., 2023). Silva vd. (2019), neem yağı içeren nanoemülsiyonla kaplanan soya tohumlarında *Aspergillus flavus* ve *Penicillium citrinum* gibi fitopatojenlere karşı 25–28 mm'lik inhibisyon zonları elde etmişlerdir. Ayrıca, biyopolimer (kitosan, aljinat, nişasta vb.)

temelli nanoemülsiyonlar çevre dostu olup, bitkilerin bağışıklık sistemini ve büyümesini desteklemektedir (Pallavi vd., 2024; Rehman vd., 2021). Tohum toprağa dikildikten sonra bu nanoemülsiyonlar içerdikleri aktif bileşenleri yavaşça salarak besin ve koruyucu maddelerin sürekli teminini sağlamaktadır (El-Saadony vd., 2021).

B. BİYOPOLİMER NANOMALZEMELER

Doğal, yenilenebilir ve biyobozunur özellikleri nanomalzemelerin gelişmiş fonksiyonlarıyla birleştiren özel bir malzeme grubunda yer almaktadır. Selüloz, kitosan, nişasta, aljinat ve jelatin gibi kaynaklardan elde edilip 1–100 nm boyutuna indirgenerek üretilen bu malzemeler, yüksek yüzey alanı/hacim oranları sayesinde biyolojik sistemlerle etkileşimi artırmakta ve fonksiyonel kaplamalar oluşturabilmektedir (Baranwal vd., 2022). Tarımda tohum kaplamalarında kullanıldıklarında çimlenmeyi artırmakta, patojenlere karşı koruma sağlamakta ve besinlerin kontrollü salımını mümkün kılmaktadır. Bu kontrollü salım özelliği, çevresel faktörlere (örneğin nem) bağlı olarak etkinleşmekte ve gübre/pestisit israfını azaltarak çevresel etkileri düşündürmektedir (Shelar vd., 2023). Biyopolimer nanomalzemeler, gübre veya büyümeyi teşvik edici bileşikleri kapsülleyerek bitkiye bunları kademeli şekilde sağlamakta, böylece çimlenme ve erken fide gelişimini desteklemektedir (Yadav vd., 2023). Ayrıca su tutma kapasitesini artırarak tohum çevresinde nemli bir mikro ortam oluşturmakta ve yararlı mikroorganizmaların gelişimine katkıda bulunmaktadır. Antimikrobiyal ajan içeren biyopolimer kaplamalar, tohumları toprak kaynaklı patojenlere karşı koruyarak kimyasal pestisit ihtiyacını azaltmaktadır (Korbecka-Glinka vd., 2022). Bu kaplamalar, aktif maddelerin (gübre, pestisit veya biyolojik ajanlar) tohum yüzeyine daha iyi yapışmasını ve homojen dağılmasını sağlayarak tarımsal girdilerin etkinliğini artırmaktadır. Yenilenebilir kaynaklardan elde edilen biyopolimerlerin biyo bozunur olması, sentetik plastik kaplamalara göre çevresel açıdan daha sürdürülebilir bir alternatif sunmaktadır (Patta vd., 2023). Ayrıca bu kaplamalar, kuraklık, tuzluluk veya sıcaklık gibi abiyotik streslere karşı koruyucu bir bariyer oluşturarak su alımını düzenler ve stres kaynaklı zararı azaltmaktadır. Böylece biyopolimer nanomalzemeler, hem sürdürülebilir tarım uygulamalarına katkı sağlamakta hem de tohum ve fide gelişimini çok yönlü biçimde desteklemektedir.

-Polisakkarit Tabanlı Nanopartiküller

Bitki kaynaklı biyopolimerler, yenilenebilir olmaları ve çevreyle dost özellikleri nedeniyle dünyada en yaygın bulunan ve birçok uygulaması olan malzemeler arasında yer almaktadır. Bu grupta selüloz, nişasta ve pektin gibi bileşikler bulunmakta; bunlar her biri farklı yapısal roller üstlenmekte ve çeşitli sanayi dallarında kullanılmaktadır (Samir vd., 2022). Proteine dayalı nanomalzemeler ise genellikle doğal proteinlerden elde edilmekte; bu proteinler nanoparçacıklara dönüştürülerek işlevselleştirilmektedir. Bu bağlamda en sık kullanılanlar arasında soya protein nanoparçacıkları, peynir altı suyu proteini nanoparçacıkları, mısır proteini nanoparçacıkları, jelatin nanoparçacıkları, ipek fibroin nanoparçacıkları ve keratin nanoparçacıkları yer almaktadır (De Frates vd., 2018). Selüloz, bitki hücre duvarlarının temel yapısal bileşeni olup, yeryüzündeki en bol biyopolimerdir (Thirumalai vd., 2024). β-1,4 glikozidik bağlarla bağlanmış doğrusal glikoz zincirlerinden oluşan bu polisakkarit, bitkilere yüksek çekme direnci kazandırmaktadır (Arakawa vd., 2017). Nanoyapılı formu olan selüloz nanokristalleri (CNC), asit hidroliziyle elde edilmekte ve yüksek kristallilik, düşük yoğunluk ile biyobozunurluk özellikleri sayesinde çevre dostu malzeme olarak öne çıkmaktadır (Rallini vd., 2017). Tarımda CNC'ler; tohum kaplamalarında dayanıklılığı ve nem tutma kapasitesini artırmak, ayrıca pestisit ve besin taşıyıcı olarak kullanılmak amacıyla değerlendirilmektedir. Örneğin, Avicennia marina yapraklarından elde edilen sülfatlanmış polisakkaritler kullanılarak sentezlenen $Cu_2O/Cu(OH)_2$ nanoparçacıkları, buğday fidelerinde düşük dozlarda büyümeyi teşvik ederken yüksek dozlarda fitotoksik etki göstermiştir (Essa vd., 2020). Ayrıca, TEMPO-

oksitlenmiş selüloz nanoliflerinden üretilen anyonik hidrojellerin mikrogözenekli yapısı, susam fidelerinde çimlenme ve büyümeyi teşvik etmiş, antifungal etki göstermiştir (Zhang vd., 2017). Bu sonuçlar, selüloz bazlı nanomalzemelerin tohum kaplamaları, kontrollü salım sistemleri ve bitki gelişimini destekleyen hidrojel uygulamaları açısından önemli potansiyele sahip olduğunu göstermektedir. Nişasta; patates, mısır ve pirinç gibi birçok bitkide depo karbonhidratı olarak bulunan, amiloz ve amilopektinden oluşan temel bir bitkisel polisakkarittir. Nanoparçacık formuna dönüştürüldüğünde, özgün fizikokimyasal özellikler kazanarak kontrollü salımlı gübreler ve tohum kaplamalarında önemli bir rol oynamaktadır. Pathak vd. (2020), süksinat ile modifiye edilmiş nişasta bazlı biyobozunur bir hidrojelin yüksek su tutma kapasitesi (260 g su g^{-1} hidrojel) sayesinde orta düzeyde su stresi altında mısır tohumlarının çıkış oranını artırdığını bildirmişlerdir. Benzer şekilde, Kumari vd. (2024), montmorillonit ve nişasta kullanarak geliştirdikleri nanokil/nişasta hidrojelinin 20 gün boyunca çinko salınımını sürdürdüğünü ve çinko eksikliği koşullarında pirinç tohumlarının çimlenme ve verimini artırdığını göstermişlerdir. Ayrıca, Sun vd. (2019). saf sıfır değerlikli demir nanoparçacıkları (B-nZVI) ile nişasta ile stabilize edilmiş formlarını (S-nZVI) karşılaştırmış; B-nZVI'nin filiz büyümesini teşvik ederken, S-nZVI'nin yüksek dozlarda köklerde aşırı demir birikimi nedeniyle fitotoksisiteye yol açtığını raporlamıştır. Genel olarak, nişasta bazlı nanomalzemeler biyobozunur yapıları, yüksek nem tutma kapasiteleri ve besin elementlerinin kontrollü salımını sağlamaları nedeniyle sürdürülebilir tarım uygulamaları açısından büyük potansiyele sahiptir (Pathak vd., 2020; Sun vd., 2019). Pektin, kara bitkilerinin özellikle birincil hücre duvarı ve orta lamellasında bulunan, hücreleri birbirine bağlayan heteropolisakkarit bir bileşiktir. Genellikle narenciye ve elmalardan elde edilmekte ve gıda endüstrisinde jel oluşturucu, koyulaştırıcı ve dengeleyici olarak yaygın şekilde kullanılmaktadır. Ayrıca biyouyumluluğu ve sulu ortamlarda jel oluşturabilme yeteneği sayesinde biyomedikal alanda ilaç salım sistemlerinde değerlendirilmektedir (Said vd., 2023). Tarımsal uygulamalarda ise pektin bazlı hidrojeller, biyobozunur tohum kaplama materyalleri olarak; nem tutma, besin salımı ve çevresel streslere karşı koruma sağlama potansiyeli taşımaktadır. Abdukerim vd. (2024), sodyum aljinat/pektin hidrojel ile *Cucumis sativus* tohumlarını kaplayarak *Fusarium* kök çürüklüğünü %53,26 oranında kontrol altına almışlardır. Benzer şekilde, Silva vd. (2019), nem yağı nanoemülsiyonlarını pektin matrisiyle birleştirerek *Glycine max* (soya fasulyesi) tohumları için biyobozunur antifungal nanokompozit filmler geliştirmişlerdir. 59 ± 0,61 nm çapında kararlı nanoemülsiyonlar içeren bu filmler, mekanik dayanımı ve su buharı geçirgenliğini iyileştirmiş, ayrıca *Aspergillus flavus* ve *Penicillium citrinum*'a karşı antifungal etki göstermiştir. Sonuç olarak, pektin bazlı nanomalzemeler, çevre dostu yapıları ve antifungal özellikleriyle sürdürülebilir tarımda tohum koruma ve büyüme destek uygulamaları için umut vadetmektedir (Said vd., 2023; Abdukerim vd., 2024). Chitosan, kitinden deasetilasyon yoluyla elde edilen biyobozunur bir polisakkarittir (Gedda vd., 2016). Tohum kaplamalarında su tutma kapasitesini artırarak çimlenmeyi hızlandırmakta ve tuzluluk gibi abiyotik streslere karşı dayanıklılığı artırmaktadır (Bandara vd., 2020). Ayrıca nitrojen alımını ve antioksidan enzim aktivitelerini (katalaz, süperoksit dismutaz) yükselterek oksidatif stresi azaltmaktadır (Zayed vd., 2017). Antimikrobiyal özellikleri sayesinde tohumları fungal ve bakteriyel enfeksiyonlardan korumakta, böylece kimyasal pestisit ihtiyacını azaltmaktadır (Narayan vd., 2019; El Hadrami vd., 2010). Bitkilerde savunma mekanizmalarını da aktive ederek sürdürülebilir tarıma katkı sağlamaktadır (Gai vd., 2019). Alenazi vd. (2024), 0.05% kitosan ve kitosan nanoparçacıkları uygulamasının *Phaseolus vulgaris* L. bitkisinde farklı tuzluluk düzeylerinde büyüme, verim ve fizyolojik parametreleri belirgin şekilde iyileştirdiğini bildirmişlerdir. Nanoparçacıklar, 50 mM NaCl koşulunda bitki boyunu %38.89, verimi ise %40.8 artırmıştır. Ayrıca H_2O_2 ve MDA düzeylerini düşürürken antioksidan enzim aktivitelerini artırmıştır. Soni vd. (2023), *Oryza sativa* L. tohumlarında kitosan ve kitosan nanoparçacıklarıyla yapılan ön muamelenin tuzluluk stresinde çimlenme ve fide canlılığını

geliştirdiğini göstermiştir. Kitosan nanoparçacıkları, özellikle yüksek tuz konsantrasyonlarında (200 mM NaCl) daha etkili bulunmuştur. Her iki uygulama da klorofil içeriğini ve antioksidan enzim aktivitelerini artırmıştır. Allam vd. (2024), kitosan nanoparçacıklarıyla yapılan ön işlemin *Pancratium maritimum* tohumlarının çimlenmesini, fide gelişimini ve ikincil metabolit üretimini artırdığını bildirmişlerdir. Özellikle 1 mg/mL kitosan çözeltisiyle 8 saatlik uygulama, antioksidan aktiviteyi %186'ya kadar yükseltmiştir.

- Sentetik Polimer Temelli Nanomalzemeler

Biyopolimerlerle birlikte tohum kaplamalarında önemli bir yer edinmiştir. Biyopolimerler toksik olmayan, biyobozunur ve yenilenebilir kaynaklardan elde edilebilen yapıları sayesinde organik tarım için uygundur (Baranwal vd., 2022). Polivinil alkol (PVA), biyouyumluluğu, suda çözünürlüğü ve toksik olmaması nedeniyle öne çıkan sentetik bir polimerdir (Halima vd., 2016). Elektrospin veya çözeltiden üfleme gibi yöntemlerle nanolif ya da nanoparçacık formunda üretilerek gelişmiş fiziksel özellikler kazanmaktadır (Türkoğlu vd., 2024; Vimaladevi vd., 2016). Tıpta doku mühendisliği, yara örtüsü ve ilaç salınım sistemlerinde kullanıldığı gibi, tarımda da kontrollü besin salınımı ve çevresel strese karşı koruma amacıyla tohum kaplamalarında değerlendirilmektedir (Nathan vd., 2023; Lodi vd., 2024). Damasceno vd. (2013), soya fasulyesi tohumlarında PVA nanoliflerle kaplanmış rizobakterilerin canlılığını incelemiş ve bu yöntemin simbiyotik etkinliği artırarak nodül oluşumunu teşvik ettiğini bildirmişlerdir. Benzer şekilde, Raja vd. (2021), yer fıstığı ve karadane tohumlarında bitki büyüme hormonlarını (IAA ve GA_3) PVA nanolifleriyle taşımış ve çimlenme oranlarını sırasıyla %88 ve %86'ya yükseltmiştir. Polihidroksialkanoatlar (PHA) da biyobozunur ve biyouyumlu polimerlerdir. Özellikle polikaprolakton gibi polimerlerle birlikte kullanıldığında etkili tohum kaplamaları oluşturmaktadır. PHA'lar antifungal özellik göstererek *Fusarium* ve *Penicillium* türlerine karşı koruma sağlamaktadır. Usmanova vd. (2024), arpa tohumlarında PHA ve pullulan polimerlerinin *Fusarium oxysporum* enfeksiyonuna karşı koruyucu etkilerini değerlendirmiştir. Bakteri süspansiyonu ve polimer karışımıyla kaplanan tohumlar %95–97 çimlenme oranına ulaşmış, kök ve sürgün gelişimi ile antioksidan enzim aktiviteleri artmıştır. Polivinilpirolidon (PVP) bazlı nanolifler de besin takviyeli tohum kaplamalarında başarı göstermiştir. Krishnamoorthy vd. (2016), cowpea tohumlarını üre ve kobalt nanoparçacıkları içeren PVP nanoliflerle kaplayarak daha düzenli besin salınımı ve daha yüksek çimlenme oranları elde etmiştir. Lif yapısı, film kaplamalara göre daha iyi gaz değişimi ve besin dağılımı sağlamıştır. Chakkalakkal vd. (2022), mısır (*Zea mays*) tohumlarını çinko oksit nanoparçacıkları içeren polikaprolakton nanokompoziti ile kaplamış ve bu yöntemin büyüme ve besin alımını artırdığını göstermiştir. Genel olarak, PVA, PHA, PVP ve polikaprolakton temelli nanopolimerler; tohum kaplamalarında çimlenme, fide gelişimi ve stres toleransını artıran, çevre dostu çözümler olarak öne çıkmaktadır.

3. SONUÇ

Nanoteknoloji tabanlı tohum kaplama ve priming uygulamaları, sürdürülebilir tarımsal üretimde yeni bir dönemi temsil etmektedir. Çalışmalarda görüldüğü üzere; metal oksit nanoparçacıkları (ZnO, TiO_2, SiO_2, CuO vb.) ve biyopolimer temelli nanomalzemeler (kitosan, pektin, aljinat, selüloz, PVA, PHA gibi) tohumların çimlenme oranını, fide gelişimini ve stres toleransını önemli ölçüde artırmaktadır. Bu malzemeler, besin maddelerinin kontrollü salımını sağlayarak bitkinin erken gelişim evresinde besin alımını optimize etmekte, aynı zamanda toprak ve çevre kirliliğini azaltarak ekolojik sürdürülebilirliğe katkı sunmaktadır (Yadav vd., 2023; Shelar vd., 2023).

Ayrıca, biyobozunur nanokompozitler ve nanolif kaplamalar, pestisit kullanımını azaltan, nem dengesini koruyan ve tohum yüzeyinde uzun süreli koruma sağlayan yenilikçi sistemler olarak öne çıkmaktadır (Farias vd., 2019; Zaim vd., 2022). Kitosan ve pektin gibi doğal polimerlerin

antimikrobiyal özellikleri, patojen kaynaklı kayıpları azaltırken; PVA ve PHA gibi polimerlerin taşıyıcı kapasitesi, büyüme düzenleyicilerin ve faydalı mikroorganizmaların etkili biçimde iletilmesini mümkün kılmaktadır (Damasceno vd., 2013; Usmanova vd., 2024). Sonuç olarak, nanoteknolojiye dayalı tohum kaplama sistemleri, yalnızca bitki gelişimini iyileştiren biyoteknolojik bir yenilik değil, aynı zamanda sürdürülebilir tarımın ekolojik, ekonomik ve verimsel boyutlarını güçlendiren bütüncül bir yaklaşımdır. Gelecekte yapılacak araştırmaların, bu nanomalzemelerin doz optimizasyonu, uzun vadeli çevresel etkileri ve tarla koşullarındaki performansına odaklanması, teknolojinin güvenli ve etkin biçimde uygulanabilmesi açısından büyük önem taşımaktadır.

ORCID: 0000-0002-6541-0890

ÖZET

Artan dünya nüfusu, iklim değişikliği ve tarımsal üretimdeki kaynak kısıtlılıkları, hayvancılık sektöründe sürdürülebilir yem kaynaklarının geliştirilmesini zorunlu hale getirmektedir. Avrupa Birliği'nin Yeşil Mutabakat hedefleri, yalnızca gıda güvenliği ve iklim dostu üretimi değil, aynı zamanda tarımsal üretimde yenilikçi çözümleri de ön plana çıkarmaktadır. Bu bağlamda yürütülen TÜBİTAK 1507 destekli çalışmamızda amaç, mısır saha artığı, yonca kurusu, sarımsak sap ve kapsül atıkları ile Moringa oleifera yapraklarının farklı dozlarda birleştirilmesiyle elde edilen beş alternatif yem hammaddesinin hayvan beslemede sürdürülebilirlik potansiyelini değerlendirmektir.

Beş farklı yem katkısına ait laboratuvar ön analizleri gerçekleştirilmiş ve in vitro rumen fermantasyonu denemeleri için Erciyes Üniversitesi'ne gönderilmiştir. Ayrıca, Moringa oleifera bitkisi üzerinde kuraklık koşullarında yapılan denemelerden elde edilen fizyolojik veriler, bu türün stres koşullarında dahi üretim potansiyelini koruyabildiğini ortaya koymuştur. Bu ön bulgular, hem AB hem de dünya genelinde hayvan beslemede karşılaşılan iki temel eksikliğe yüksek kaliteli, sürdürülebilir protein kaynağı ihtiyacı ve iklim değişikliğine uyumlu yem formülasyonlarının yetersizliği somut çözümler üretebilecek niteliktedir. Çalışma, alternatif yem kaynaklarının yalnızca hayvansal üretimde verim artışı sağlamakla kalmayıp, aynı zamanda çevresel etkilerin azaltılması ve tarımsal dirençliliğin artırılması açısından da stratejik katkılar sunabileceğini göstermektedir. Nihai sonuçların tamamlanmasıyla birlikte, bu verilerin AB'nin sürdürülebilir tarım politikalarıyla bütünleşebilecek güçlü bilimsel çıktılara dönüştürülmesi hedeflenmektedir.

Anahtar Kelimeler: Sürdürülebilir hayvancılık, Moringa oleifera, İklim değişikliği adaptasyonu, Avrupa Yeşil Mutabakatı

SEEKING SOLUTIONS TO THE GLOBAL PROTEIN DEFICIT: PRELIMINARY FINDINGS FROM ALTERNATIVE FEED FORMULATIONS AND MORINGA STUDIES

ABSTRACT

The growing world population, climate change, and resource limitations in agricultural production make it imperative to develop sustainable feed sources for the livestock sector. The European Union's Green Deal targets not only emphasize food security and climate-friendly production but also highlight the need for innovative solutions in agricultural practices. In this context, the aim of our TÜBİTAK 1507-supported study is **to evaluate the sustainability potential of five alternative feed ingredients, obtained by combining maize field residues, alfalfa hay, garlic stalk and capsule wastes, and Moringa oleifera leaves at different doses, in animal nutrition.**

Preliminary laboratory analyses of these five feed ingredients have been completed and submitted to Erciyes University for in vitro rumen fermentation trials. In addition, physiological data obtained from Moringa oleifera grown under drought conditions revealed that this species is able to maintain its production potential even under stress. These preliminary findings can address two major gaps in animal feeding at both the EU and global levels: the need for high-quality, sustainable protein sources and the lack of climate-resilient feed formulations. The study demonstrates that alternative feed sources may not only improve livestock productivity but also contribute strategically to reducing environmental impacts and enhancing agricultural resilience. Upon completion of the final results, the data are expected to provide robust scientific outputs that can be integrated into the EU's sustainable agriculture policies.

Keywords: Sustainable livestock production, Moringa oleifera, Climate change adaptation, European Green Deal

1. INTRODUCTION

Globally, both small and large ruminants play an increasingly vital role in livestock production and rural livelihoods. Current estimates indicate that the global ruminant population including cattle, sheep, and goats exceeds 4.2 billion head, with cattle representing about 36%, sheep 30%, and goats 27% of the total. This substantial population highlights the importance of alternative feeding strategies, particularly the use of tree and shrub forages, to sustain feed quality and availability during dry or resource-limited periods.

In recent years, growing attention has been directed toward the use of Moringa oleifera forage meal as a high-protein feed component in ruminant nutrition. Owing to its rich nutrient profile, rapid biomass production, and adaptability to semi-arid conditions, Moringa offers a promising alternative protein source for cattle, sheep, and goats. Integrating Moringa and other tree-based forages into ruminant feed systems can therefore help mitigate feed shortages, enhance feed efficiency, and support both economic and ecological sustainability in livestock production.

Globally, the livestock sector is undergoing one of the most critical transformations in its history, driven by the rapidly increasing demand for meat, milk, and eggs. Over the past two decades, the surge in animal-based food consumption has reshaped the sector both economically and environmentally. Between 2000 and 2022, global meat production increased by 55%, reaching 361 million tons (FAO, 2023). One of the most striking developments during this period has been the sharp rise in poultry meat production, which by 2022 surpassed pork to become the most produced meat worldwide.

Asia, home to nearly 60% of the world's population, stands as a central force in global livestock production and consumption, supported by its ongoing demographic and economic growth (Yang et al., 2023). Within the region, China dominates as the largest livestock-producing country, exerting substantial influence over global market dynamics through its domestic production trends.

According to projections, global demand for animal products is expected to rise by 60–70% by 2050, with developing countries accounting for the majority of this growth (Makkar, 2017). Population growth, urbanization, and rising incomes are accelerating structural changes in livestock production systems and consumption patterns. In this evolving landscape, biotechnology and nanotechnology are expected to play key roles in advancing animal health, welfare, and food safety (Yitbarek, 2019).

In Sub-Saharan Africa, for example, poultry meat demand is projected to increase by 214%, and pork demand by 161% by 2050, largely due to urbanization and the growing appetite for animal-sourced foods (Erdaw, 2023). Meanwhile, shifts in China's livestock sector are anticipated to have far-reaching global implications, influencing production trends and trade flows well into the mid-21st century (Bai et al., 2018).

However, this rapid expansion raises major concerns related to food security, resource use, and climate change. The impacts of climate variability on livestock productivity and greenhouse gas emissions underline the urgent need for sustainable production technologies and more resilient food systems (Rojas-Downing et al., 2017). Consequently, the development of innovative, low-cost, and environmentally friendly feed supply strategies will be essential to ensure the sector's long-term viability and contribution to global food security.

Today, the main inputs in animal feed production are conventional crops such as maize and soybean meal, which serve primarily as sources of energy and protein, respectively. Globally, livestock accounts for over 30% of total food consumption, much of which is grain-based; soybean alone represents about 90% of this total (Su and Chen, 2020). However, only a small portion of these grains is directly utilized in industrial livestock farming.

The cultivation of these crops carries significant economic and environmental implications. In particular, soybean production has been identified as one of the main drivers of deforestation in South America, while also contributing substantially to greenhouse gas emissions (Parrini et al., 2023). Consequently, soybean trade affects both the environmental and socio-economic balance of many regions, highlighting the urgent need to develop sustainability-oriented trade policies (Boerema et al., 2016).

Moreover, the dual use of these crops for human consumption and animal feeding has intensified resource competition, further complicating global food security challenges (Khan et al., 2024; Dronne, 2018). The expansion of the so-called "maize–soybean system" has reshaped the interaction and competition between human and animal plant-protein consumption, creating new vulnerabilities in the global food chain, especially in developing economies (Dronne, 2018).

Environmental sustainability represents another pressing global concern. Currently, feed production accounts for a substantial share of the world's agricultural land use, freshwater consumption, and nitrogen pollution. Modern food systems remain heavily dependent on livestock-related greenhouse gas emissions, and addressing this dependency requires globally coordinated efforts that also ensure food security (Uwizeye et al., 2020). The cultivation of soybean and maize, which are predominantly used in livestock rations, has been linked to soil degradation, water scarcity, and broader planetary nutrient imbalances (Wang et al., 2017). These cumulative environmental impacts underscore the urgent need to identify and integrate alternative feed resources that are both sustainable and locally adaptable.

Beyond environmental pressures, economic volatility in feed prices poses a major challenge for farmers. Notably, grain prices began to rise sharply in 2005–2006, exerting significant pressure on feed costs and triggering market instability (Tejeda and Goodwin 2009). Such high and unpredictable feed expenses, coupled with fluctuating output prices, continue to create financial strain for livestock producers, limiting profitability and resilience within the agricultural sector (Minh et al., 2013).

Moringa oleifera (M. oleifera) leaves are a rich source of essential macronutrients that serve as building blocks for animal growth, development, and productivity. Macronutrients such as proteins, lipids, and carbohydrates significantly influence the overall nutritional value of M. oleifera as a feed ingredient. The leaves contain 19.3–28.7% crude protein, providing an abundant supply of essential amino acids necessary for muscle growth and tissue repair (Teixeira et al., 2014). Due to its high protein content, M. oleifera is comparable to traditional feed sources such as maize and exhibits an amino acid profile similar to that of soybean meal.

Analysis of dietary fiber is important for understanding the structural integrity of plant cell walls and their impact on nutrient digestion and absorption (Knudsen, 2001). M. oleifera leaves contain approximately 8.07% crude fiber, contributing to a balanced nutritional profile while maintaining good digestibility (Lesten and Emmanuel, 2018). Generally, low-fiber feed sources are more digestible and thus more efficient in animal diets.

Another remarkable feature of M. oleifera is its high mineral content. Studies have reported ash contents of up to 11.65% in the leaves (Ahmed et al., 2023), which is significantly higher than that of soybean meal, typically ranging between 5.6–7.2% (Kumar et al., 2010). In Botswana's Gaborone region, ash content in M. oleifera leaves varied between 5.6% and 9.1%, with an average value of 7.34% (Masitlha et al., 2024). These variations highlight the influence of soil composition, climatic conditions, and environmental factors on the mineral composition of the plant.

In some experiments, M. oleifera leaf protein concentrate was found to have an ash content of 6.00% (Laura, 2021). The distribution of minerals across plant tissues also varies; for instance, calcium concentrations in the leaves (11,153 mg/kg) and roots (12,834 mg/kg) were similar, while the calcium level in seeds was much lower (565 mg/kg) (Sodamade et al., 2023). This observation reflects the differential partitioning and accumulation of minerals within various plant parts.

M. oleifera leaves also contain substantial lipid content. On a dry matter basis, lipid concentrations range between 1.7% and 10.42%, depending on environmental conditions, analytical methods, and plant maturity (Masitlha et al., 2024). Analyses of leaves from Botswana and Gaborone revealed an average lipid content of 7.8 ± 0.13%, exceeding previously reported values of 2.3%, 5.2%, and 3.0%, suggesting possible regional variations in lipid composition (Waterman et al., 2015).

The lipid fraction of M. oleifera leaves is characterized by the predominance of unsaturated fatty acids, particularly palmitic, oleic, and linoleic acids (Sánchez- Machado et al., 2010). These fatty acids play essential physiological roles, contributing to the plant's energy value and supporting cell membrane integrity, modulation of inflammatory responses, and positive cardiovascular health effects (Masitlha et al., 2024).

Moringa is a drought-tolerant and multi-purpose tree species widely recognized for its medicinal and nutritional properties (Meel et al., 2018). The leaves are highly nutritious, providing an excellent source of protein, β-carotene, vitamins A, B, C, and E, riboflavin, nicotinic acid, folic acid, pyridoxine, essential amino acids, minerals, and various phenolic compounds. For this reason, Moringa leaves are commonly consumed as a vegetable in different culinary preparations across many countries (Khalafalla et al., 2010).

On a dry matter basis, Moringa leaves contain approximately 18.25% crude protein, 3.42% ether extract, 29.03% crude fiber, 9.18% total ash, and 0.83% acid-insoluble ash (Shankpal et al., 2019). This composition indicates that Moringa forage meal (MFM) has a nutrient profile comparable to conventional concentrate mixtures commonly used in livestock diets. However, studies assessing its potential as a partial or complete substitute for commercial concentrate feeds remain limited.

M. oleifera leaves contain a wide range of bioactive compounds, including polyphenols, alkaloids, terpenoids, flavonoids (e.g., quercetin and kaempferol), saponins, and tocopherols. These compounds exert significant immunological effects by regulating the activation of immune cells and cytokine production. Water-soluble polysaccharides, particularly arabinogalactan from Moringa, have been shown to positively shape the gut microbiota, supporting the proliferation of beneficial bacteria such as Lactobacillus and Muribaculaceae, thus enhancing gut-mediated immune responses. The immunomodulatory effects of moringa are associated with increased synthesis of anti-inflammatory cytokines (e.g., IL-10) and suppression of pro-inflammatory enzymes (e.g., COX-2). Furthermore, the antioxidant compounds found in M. oleifera reduce cellular damage caused by oxidative stress by neutralizing reactive oxygen species (ROS) and strengthening endogenous defense systems. All these findings suggest that M. oleifera can be used as a feed additive to support immune system function and enhance disease resistance. Furthermore, these properties give Moringa the potential to become a strategic component in sustainable and environmentally friendly animal production systems.

The increasing global population continues to place significant pressure on agricultural production systems, particularly on the livestock sector, where the demand for sustainable feed resources has become increasingly critical (FAO, 2021). A substantial portion of feed ingredients worldwide still relies on conventional crops such as maize and soybean. However,

these sources remain vulnerable to climate-induced production variability and contribute to the ongoing food–feed competition, raising concerns about long-term sustainability (Alexandratos & Bruinsma, 2012; Van der Linden et al., 2020).

In recent years, the European Green Deal and the Farm to Fork Strategy have established a policy framework that prioritizes climate neutrality, resource efficiency, and circularity in agricultural and food systems (European Commission, 2020). Within this framework, the livestock sector is being reshaped not only to enhance productivity but also to reduce its carbon footprint, improve waste valorization, and strengthen bio-based innovation in feed development (Makkar, 2016).

From a national perspective, Türkiye still exhibits a high dependency on imported feed materials, despite its strong agricultural potential. As of 2023, a considerable proportion of the soybean and maize used in feed production is imported, creating economic and environmental vulnerabilities (TMO, 2023). Therefore, the development of alternative feed formulations derived from local plant biomass and agro-industrial residues represents both an economic opportunity and an ecological necessity (Eren & Duru, 2020).

Among potential bioresources, Moringa oleifera has emerged as a promising multipurpose species due to its high protein, amino acid, and antioxidant content, as well as its ability to grow under semi-arid and drought-prone conditions (Leone et al., 2015; Anwar et al., 2007). Its adaptability to water-limited environments provides a unique advantage for Türkiye, where increasing water scarcity has begun to challenge agricultural sustainability (Khalafalla et al., 2010).

Combining Moringa oleifera leaves with local agricultural by-products such as maize stalk residues, garlic stalk and capsule wastes, and alfalfa hay offers new opportunities for the formulation of circular and sustainable feed systems. Such formulations can enhance microbial fermentation while aligning with the principles of resource efficiency and low-carbon livestock production (Gerber et al., 2013; Schwarm et al., 2021).

Accordingly, this research project, launched on October 1, 2024, with the support of TÜBİTAK 1507, is being systematically carried out within the framework of designated work packages. This article presents how this study is being evaluated in Turkey, based on the preliminary findings and analyses obtained during the project period, as well as technical advances, observations, and evaluations related to five different alternative feed formulations. The study represents an important step in integrating nationally developed biomass resources into sustainable feed strategies; it also contributes to the establishment of scientific and technological foundations that can integrate Turkey's local agricultural potential with the European Union's Green Deal objectives.

2. MATERIALS AND METHODS

The research was conducted in Mersin Province, located in the Mediterranean region of Türkiye, under semi-arid climatic conditions characterized by hot, dry summers and mild winters. The experimental site possesses a well-drained loamy soil profile and an existing greenhouse infrastructure suitable for controlled crop production. These conditions ensured that the cultivation process could be implemented efficiently without major technical limitations.

Figure 1: Preparation of Moringa planting land

The study was designed based on a drip irrigation system, enabling precise water and nutrient delivery to the root zone through a fertigation approach. Irrigation volumes were determined considering open water evaporation and crop coefficients, and the irrigation schedule was arranged on a weekly basis. To monitor soil moisture, samples were taken from 0–120 cm depth before each irrigation and the moisture content was evaluated by gravimetric method. After the plants were established in the soil, the deficit irrigation (100%/control, 75% and 50%) strategy was implemented. Considering the relatively dense planting arrangement (50 × 30 cm), tillage was minimized to prevent soil structure degradation. Water use efficiency (WUE) and irrigation water use efficiency (IWUE) were calculated with equations based on the relationship between plant yield and total water consumption; these indicators were used as basic parameters in the evaluation of resource efficiency and sustainable water management.

The plant material used in this study was Moringa oleifera. Sowing was performed by placing two seeds per hole at a depth of approximately 2 cm. Germination was monitored for two weeks, and non-germinated sites were re-sown. If both seeds germinated, the weaker seedling was thinned once plants reached about 30 cm in height. Fertilization applications planned according to soil analysis results were based on organic farm manure. After the first pruning, a nutrient mixture with balanced NPK content was applied to encourage plant regrowth. Pruning of Moringa plants was planned to limit vertical growth and encourage branching. When the seedlings reached 0.5–1.0 m in height, approximately 10 cm of the terminal shoots were cut. Pruning operations were repeated every 20 cm when new shoots reached 20 cm. Moringa is generally resistant to pests. Weed control is achieved through regular hoeing, and the use of chemical pesticides is avoided.

Harvesting began approximately 75 days after the plants reached the soil. Leaf collection was carried out in the early morning or late afternoon, when water loss was minimal. Harvested leaves were hung in small bundles on strings and dried by natural air circulation, without being compressed. This method was chosen to preserve leaf quality and nutritional value.

In the study, various agronomic parameters were measured to determine the yield and physiological performance of moringa under different irrigation levels. Total leaf, stem, and branch yields were evaluated on both fresh and dry weight basis. For dry weight calculations, samples were oven-dried at 70–75°C until they reached a constant weight, and the results were expressed in terms of dry matter (DM) (Figure 2). Plant height (cm) and stem diameter (cm) were measured at the final harvest. Stem diameter was determined using a calliper 10 cm above the soil surface, and the average of values from three plants was used for each replicate.

Various physiological parameters were monitored to evaluate the effects of irrigation levels on plant physiology. Stomatal resistance measurements were taken before irrigation, every three irrigation periods. One month after the start of programmed irrigation, leaf area of three randomly selected plants was measured at 15-day intervals, and the LAI value was calculated by dividing the results by the planting area. Before irrigation, leaf chlorophyll density was determined every three irrigations.

Figure 2: Moringa development under limited irrigation and processing of moringa dry leaves into moringa flour

Leaf samples from the second harvest, taken 90–95 days after planting, were used for quality parameter analyses (Figure 2). Samples from three replicates at each irrigation level were analyzed at the Kastamonu University Food Engineering Laboratory. Vitamin C (ascorbic acid), lycopene, total carotenoids, and total flavonoids were analyzed.

In this study, five different feed formulations were prepared using locally sourced raw materials. The ingredients used in the formulations were Moringa oleifera leaf meal, garlic harvest residues (stalks and capsules), alfalfa hay, and corn stalk hay. The composition of each mixture was proportioned to correspond to 50 kg of pelleted feed on a dry matter basis. All raw materials were dried to a constant weight and then ground to a particle size suitable for pelletizing.

The pelleting process was carried out at the R&D pilot facility in Mersin, owned by MORYEM Agricultural R&D, a company affiliated with Ankara University Technopark. Pelleted feeds were dried in a moisture-free, ventilated environment until a constant moisture content was reached. Then, samples were taken for analysis in triplicate (n=3). Samples were analyzed in laboratory conditions accredited to TS EN ISO/IEC 17025 (Ankara Food Control Laboratory).

Three independent pellet batches were prepared for each feed type, and analyses were conducted using three subsamples from each batch. For plant-based quality analyses, representative samples were taken from field trials, with each replicate representing three plant samples. Drying, grinding, and homogenization processes were standardized for all samples. Nutritional Content and Chemical Analyses; Dry Matter (DM), Crude Protein and Nitrogen (N), Crude Fat (Ethanol Extraction), Crude Ash, NDF and ADF (Neutral and Acid Detergent Fiber), Crude Fiber, Relative Feed Value (RV). Vitamin and Amino Acid Analyses; Total Amino Acid, Vitamins A, D, E and C. Mineral Matter Analysis (ICP-OES); Ca, Mg, K, Zn and other macro/micro elements were determined using standard calibration solutions (Merck, Germany).

Figure 3: Images of moringa leaves, moringa plantation area and moringa leaf harvest

Moringa leaves and pellet samples were extracted with methanol and stored at -20 °C until analysis. Total Phenolic Compound, Total Flavonoid, DPPH Radical Scavenging Activity, ABTS Radical Scavenging Activity, FRAP (Iron Reducing Power), Lycopene and Carotenoid analyses were performed. Dry Matter, pH and Titratable Acidity, Antioxidant Activity, Total Phenolic and Flavonoid analyses were performed on garlic stem and capsule residues obtained from the Kastamonu-Taşköprü region.

An in vitro ruminal digestion experiment was conducted in the laboratories of the Department of Animal Nutrition and Nutritional Diseases, Faculty of Veterinary Medicine, Erciyes University. Total gas production during rumen fermentation was determined using the in vitro gas production technique developed by Menke et al. (1979). 200 ± 10 mg of dried feed sample, 20 mL of buffer (buffer + macromineral + micromineral + reduction + resazurin mixture), and 10 mL of rumen fluid inoculum were added to 100 mL Fortuna brand glass syringes (Haberle Labortechnik, Germany) and incubated at 39 °C. Eight replicates were made for each mixture, and three blank samples (only buffer and rumen fluid) were used. A total of 48 syringes (8 × 6 mixtures) were incubated. At the end of the 24-hour incubation, the total gas volume (mL) in the syringes was read directly from the syringes. Gas samples were then transferred to an infrared methane analyzer (Sensor Europe GmbH, Erkrath, Germany) via a three-way stopcock, and the methane content (%) was read on the computer screen. Metabolic energy (ME) and degree of organic matter digestion (OMSDgas) were calculated using the equations developed by Menke and Steingass (1988), along with total gas production per hour. After gas measurement after 24 hours of incubation, pH was measured in the remaining fermentation broth using a digital pH meter (Mettler Toledo). Lactic acid and volatile fatty acids (VFA) analyses were performed on samples stored at -20 °C after the addition of 25% metaphosphoric acid (1 mL acid / 4 mL rumen fluid). Lactic acid concentration was determined spectrophotometrically according to the lithium lactate standard (Tekin and Kara, 2020). Volatile fatty acids (acetic, propionic, butyric, isobutyric, valeric, isovaleric, hexanoic, capranoic acid) were analyzed using a GC-FID (Gas Chromatograph – Flame Ionization Detector) device (Ersahince and Kara, 2017). The amount of ammonia nitrogen (NH_3-N) was measured by UV-VIS spectrophotometer using the Megazyme commercial kit (K-AMIAR 02/20, Wicklow, Ireland).

3. RESULTS AND DISCUSSION

The preliminary findings of this study reveal that the designed feed formulations, developed through the integration of four distinct agricultural residues corn field waste, alfalfa hay, garlic

stalks and capsules, and Moringa oleifera leaves present promising potential as sustainable feed ingredients. Each component was selected based on its availability, nutrient profile, and environmental compatibility, aiming to establish a circular model that converts local biomass residues into value-added feed materials.

Overall trends revealed that the five feed formulations exhibited a balanced structure in terms of crude protein, fiber, and mineral composition (Figure 4). The inclusion of *Moringa oleifera* leaves markedly enhanced the crude protein content of the mixtures while improving antioxidant capacity and the presence of bioactive compounds, which positively influenced microbial fermentation. The amino acid profile of Moringa particularly its richness in methionine, leucine, and threonine (Makkar & Becker, 1997; Anwar et al., 2007) supports microbial protein synthesis and enhances nitrogen utilization efficiency in ruminants. Moreover, its high calcium, iron, and potassium content contributes to mineral balance and rumen microbial activity, both of which are essential for maintaining digestive stability.

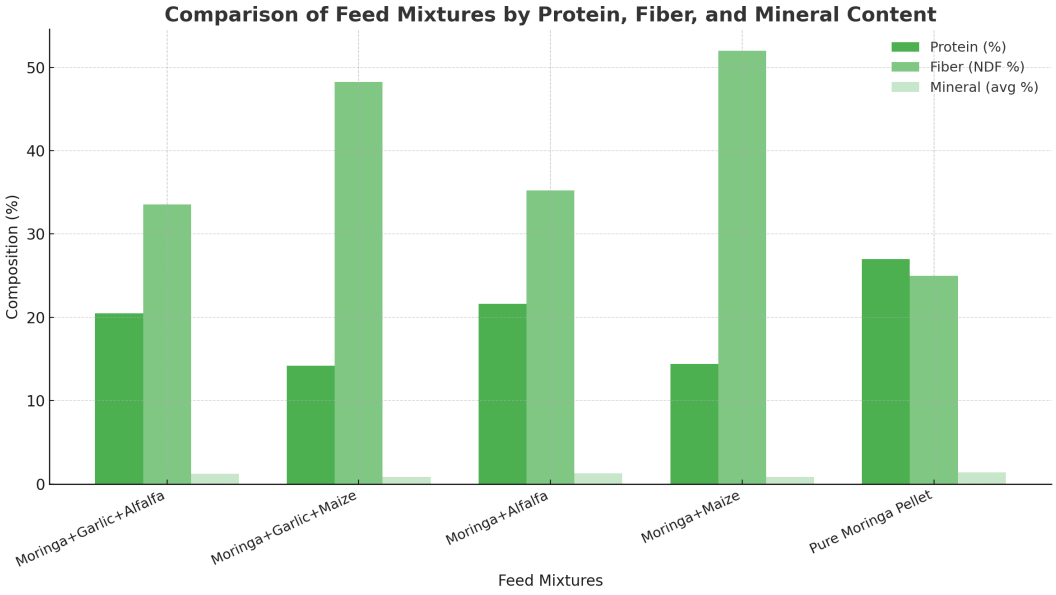

Figure 4: Comparison of Feed Mixtures by Protein, Fiber, and Mineral Content

Conversely, corn field residues and alfalfa hay served as fibrous carbon sources that supported structural integrity and rumen functionality. Their high neutral detergent fiber (NDF) content sustains the activity of cellulolytic bacterial populations within the rumen ecosystem (Van Soest, 1994). This complementary biochemical relationship between Moringa's highly digestible protein fraction and the fibrous constituents of corn and alfalfa resulted in a synergistic effect on the nutritional efficiency of the formulated feeds.

This synergism is consistent with previous findings where *Moringa oleifera* was used as a functional feed component in ruminant nutrition. For example, Nouman et al. (2014) reported that Moringa leaf meal increased gas production and microbial biomass yield, improving rumen fermentation efficiency in vitro (Figure 5). Similarly, Mendieta-Araica et al. (2013) found that substituting alfalfa with Moringa leaves in dairy cow diets enhanced dry matter intake and milk yield, while reducing methane emissions. In line with these results, Sarwatt et al. (2004) demonstrated that supplementing goat diets with Moringa leaves under Tanzanian conditions significantly improved body weight gain and feed conversion efficiency.

From a biochemical perspective, these formulations not only align nutritionally but also show ecological and functional compatibility with the literature. The secondary metabolites present in Moringa such as flavonoids, tannins, and saponins may contribute to maintaining rumen

microbial balance while mitigating excessive protein degradation (Soliva et al., 2005; Patra & Saxena, 2011). Such modulation supports improved nutrient conversion efficiency and reduces nitrogen losses, thus contributing to environmental sustainability.

From a sustainability perspective, the utilization of locally available agricultural residues as feed ingredients in this study provides multifaceted benefits not only by reducing production costs, but also by mitigating agricultural waste accumulation, greenhouse gas emissions, and supporting rural development. The systematic integration of crop residues into feed manufacturing contributes to the practical implementation of a circular bioeconomy model,

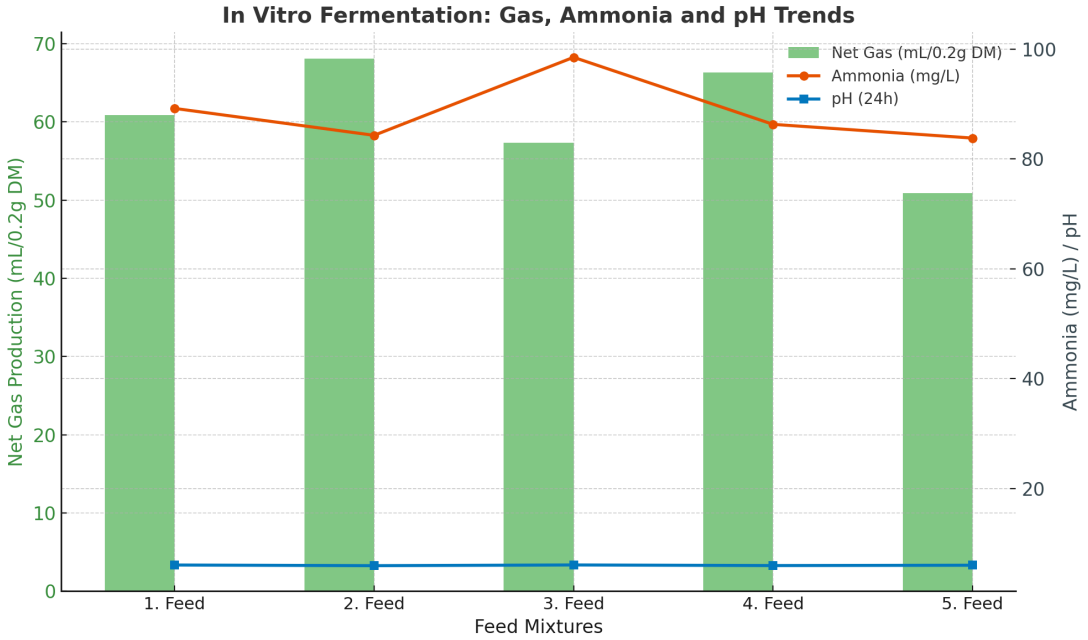

Figure 5: In Vitro Fermentation

which remains an emerging but promising concept in Türkiye. This approach aligns directly with the principles of the European Green Deal, particularly its emphasis on resource-efficient production systems and the Farm to Fork Strategy, which seeks to establish sustainable and climate-resilient livestock production chains.

From an economic standpoint, the development of such alternative feed formulations holds the potential to strengthen domestic feed production capacity, reduce dependency on imported raw materials, and retain economic value within local agricultural ecosystems. The valorization of low-cost residues such as corn stalks, alfalfa hay, and *Moringa oleifera* leaves creates new income opportunities for farmers and enhances the resilience of rural economies. This transformation supports national objectives related to agricultural self-sufficiency, food sovereignty, and rural innovation, ultimately contributing to a more inclusive and locally grounded bioeconomy.

In ecological terms, the controlled reintegration of biomass residues into the production cycle contributes to soil protection, lower carbon emissions, and restoration of natural nutrient cycles. Moreover, the incorporation of *Moringa oleifera* a species highly tolerant to drought and heat stress into feed systems offers a strategic advantage in adapting agricultural production to climate change conditions. This adaptation is consistent with both Türkiye's National Climate Change Strategy and the EU Climate Adaptation Policy Framework, reinforcing the shared goals of low-carbon, resource-efficient food systems.

From an environmental performance perspective, the physiological observations obtained under limited irrigation conditions confirmed the strong adaptive capacity of *Moringa oleifera* to semi-arid climates. Throughout the cultivation period, the plant maintained stable chlorophyll content, leaf water status, and biomass production, indicating its ability to sustain photosynthetic activity and metabolic integrity despite drought stress. These findings are consistent with earlier studies reporting *Moringa oleifera*'s remarkable drought tolerance and water-use efficiency (Nouman et al., 2013; Santos et al., 2019; Aydin et al., 2021). In particular, its ability to maintain stomatal conductance and regulate osmotic balance enables continued growth even under prolonged water limitation (El-Kholy et al., 2020).

Moringa oleifera exhibits high water-use efficiency (WUE) and balanced physiological responses through efficient nitrogen uptake and a well-coordinated root–leaf interaction. Under drought stress, the plant enhances proline accumulation and activates antioxidant defense mechanisms including superoxide dismutase (SOD), catalase (CAT), and peroxidase (POD) which protect cell membrane stability and mitigate oxidative damage (Abd El-Gawad et al., 2021; Rivas et al., 2020). These traits not only limit biomass loss but also help maintain the nutritional quality of the plant under adverse climatic conditions.

In Türkiye, recent field trials have demonstrated that *Moringa oleifera* can be successfully cultivated in Mediterranean, Southeastern Anatolia, and selected Central Anatolian microclimates (Demirbaş et al., 2022; Erdem et al., 2023). Particularly in provinces such as Mersin, Hatay, and Şanlıurfa, the species has shown the ability to regrow from the stem base under mild winter conditions, allowing for three to four harvests per year in semi-arid environments. These findings suggest that Moringa can be established as a perennial, drought-resilient feed source in Türkiye, contributing to the country's broader drought adaptation and water efficiency strategies.

The drought tolerance, physiological plasticity, and regrowth potential of *Moringa oleifera* position it as a strategic species for the development of climate-smart feed systems. Compared to conventional forages, its lower irrigation requirement and high biomass yield significantly enhance irrigation water-use efficiency (IWUE) and reduce pressure on freshwater resources. Therefore, integrating Moringa into national feed production systems directly aligns with Türkiye's National Water Efficiency Policy and the European Green Deal's objectives for climate-neutral and resource-efficient agriculture.

From a technical perspective, the development of these feed formulations also contributes to the national innovation ecosystem supported by the TÜBİTAK 1507 program. The project is a successful example of an applied R&D process that strengthens collaboration between academia, industry, and agriculture. This work, conducted through systematic formulation development and laboratory-scale evaluations, provides a strong foundation for scaling up nutritionally balanced, environmentally friendly, and economically viable feed systems.

Overall, these findings highlight two key contributions of the study: reducing the global protein gap and developing climate-adapted feed formulations. The approach taken here demonstrates that the circular valorization of biomass resources, when combined with climate-resilient species such as Moringa oleifera, can pave the way for more sustainable, self-sufficient, and low-carbon agricultural systems.

4. FUTURE PERSPECTİVES

To fully realize the potential of Moringa oleifera (M. oleifera) as an eco-friendly and nutritionally beneficial livestock feed source, several fundamental research areas must be addressed. Future studies should focus on developing improved processing methods that enhance the bioavailability of M. oleifera's bioactive compounds. Scientific investigation into

enzymatic treatments, optimized drying techniques, and controlled fermentation processes is crucial to making M. oleifera nutrients more accessible after processing. Furthermore, the formulation of balanced feed compositions that effectively integrate M. oleifera into livestock diets should be prioritized. Research must explore optimal combinations that maximize nutrient intake, promote animal growth, and improve overall welfare.

Ongoing studies should also investigate how M. oleifera supplementation affects livestock across different production stages. Long-term trials are needed to evaluate its effects not only on growth and feed conversion efficiency but also on reproductive performance, disease resistance, and animal welfare. Given the variability of bioactive compound concentrations in M. oleifera, further investigation into the influence of cultivation conditions and varietal differences is required. Identifying optimal cultivation practices and extraction methods that maximize beneficial compound concentrations will improve M. oleifera's efficacy as a sustainable feed ingredient.

At the molecular level, research should aim to elucidate the mechanisms underlying M. oleifera's immunomodulatory properties. Studies focusing on the interactions between its bioactive compounds and immune pathways, antioxidant defense systems, and gut microbiota are essential to determine its full potential as a natural immunostimulant in livestock feeding. Understanding these biological mechanisms will enhance its value as a health-supportive additive during stress periods in farm animals.

Additionally, environmental assessment methods and economic modeling tools are required to compare M. oleifera's sustainability advantages over conventional feed crops. Life Cycle Assessment (LCA) studies should evaluate its capacity to reduce greenhouse gas emissions, water use, and land degradation relative to corn and soybean. Economic analyses are also needed to determine cost-benefit ratios and feed price reductions, alongside improvements in animal health and productivity.

As M. oleifera gains recognition as a core feed ingredient, regulatory frameworks ensuring its safe use in livestock systems must be established. Comprehensive safety evaluations and compliance with international feed standards will facilitate its integration into global commercial feed markets. Raising consumer awareness about M. oleifera's advantages will help stimulate market demand for sustainable livestock production. Successful adoption will depend on collaborative partnerships among researchers, agricultural stakeholders, and policymakers to develop science-based implementation strategies for the livestock sector.

Ultimately, M. oleifera represents a valuable, sustainable, and nutrient-rich feed material for agricultural applications. Advancements in processing optimization, feed formulation, molecular research, and environmental-economic evaluation will further strengthen its role in addressing modern global challenges related to food security, animal health, and environmental sustainability.

5. CONCLUSİON

Within the scope of this project, *Moringa oleifera* is evaluated as an alternative feed source in livestock nutrition, providing a strategic solution for sustainable production and environmental efficiency. Owing to its high protein, amino acid, vitamin, and mineral content, Moringa is expected to enhance the performance, digestibility, and immunity of calves when used in combination with agro-industrial residues such as garlic harvest waste, corn stalks, and alfalfa hay in formulated feed mixtures.

The project aims to reduce dependence on high-cost and environmentally intensive feed inputs such as soybean meal and corn, while promoting locally sourced, low-carbon feed formulations that align with sustainable agricultural goals. By leveraging Moringa's underutilized potential

in Türkiye, the project will contribute to the development of climate-resilient feed systems and economically viable production models, particularly in water-stressed agricultural regions.

Moringa-based feed formulations serve not only as a nutrient-rich alternative but also as a natural feed additive that supports animal immunity, mitigates oxidative stress, and improves growth and overall performance. The planned *in vitro* and *in vivo* trials will scientifically validate these effects, providing evidence-based support for reducing Türkiye's dependency on imported protein feed sources.

Expected project-related outcomes include:

1. *Optimum inclusion rate*: Incorporating 10–15% Moringa is expected to improve feed conversion efficiency and weight gain in calves.

2. *Processing technology*: Development of new drying and pelleting methods will enhance flavonoid retention and improve feed quality.

3. *Economic feasibility*: Incorporating locally produced Moringa leaf powder may offer up to a 40% cost reduction compared to soybean meal.

4. *Environmental contribution*: Compared to conventional feed sources, Moringa cultivation offers a threefold lower carbon footprint and reduced water consumption, directly contributing to environmental sustainability objectives.

Future Perspective: This project represents one of the **first systematic scientific evaluations** of Moringa's applicability in Türkiye's livestock sector. The findings will provide a foundation for **farmer training programs, cooperative-based production models**, and **collaborative R&D efforts with the domestic feed industry**. Furthermore, scaling up Moringa cultivation in Türkiye will support **rural development, feed security, and climate adaptation strategies**.

In conclusion, this project positions *Moringa oleifera* as a **transformative feed component** with nutritional, environmental, and economic benefits. By integrating Moringa into livestock feeding systems, the project will strengthen Türkiye's feed self-sufficiency capacity and advance the transition toward a **climate-smart and Green Deal-aligned agricultural model**.

ABSTRACT

Extraction, separation, and characterization of bioactive compounds from horticultural crops are essential for linking plant phytochemistry and health promoting functions. This work focuses on recent advances in chromatographic methodologies applied to the analysis of phytochemicals in fruits, vegetables, and other horticultural products. One of the most important steps in this concept is the optimized sample preparation, such as solid phase extraction, liquid–liquid partitioning, and cleanup steps to reduce matrix interferences. High Performance Liquid Chromatography (HPLC), coupled with different detectors such as RID (Refractive Index Detector), DAD (Diode Array Detector), UV (Ultraviolet Detector), and Fluorescent detectors are applied for the determination of a range of phytochemicals which serve as quality parapeters as well as studies on abiotic and biotic stress responses in plants. However, electrospray ionization mass spectrometry (HPLC ESI MS), is shown as the backbone for profiling phenolics, flavonoids, and other nonvolatile metabolites with high sensitivity and selectivity. Gas Chromatography (GC), frequently as GC–MS after derivatization, is effective for volatile compounds as well as FID (Flame Ionization Detector) for determination of fatty acid constituents in horticultural samples. Thin-Layer Chromatography (TLC) and High-Performance TLC (HPTLC) are recognized for rapid screening and fingerprinting of crude extracts, and can be combined with bioassays for activity directed fractionation. Innovative methods, including countercurrent chromatography and two-dimensional liquid chromatography, provide improved capabilities. However, there are still challenges like overlapping compounds (coelution), interference from other substances (matrix suppression), and the absence of standard reference materials. To deal with these issues, methods like using different types of separation, advanced mass spectrometry, and internal standards are used. In summary, chromatography is very important for better understanding the active compounds in fruits and vegetables. It helps us measure them more accurately, understand their structure, and ensure consistent quality in functional foods.

Keywords: Chromatography, Phytochemicals, Quality parameters, Detectors

INTRODUCTION

Horticultural crops including fruits, vegetables, herbs, and ornamental plants—are not only essential components of global diets but are also recognized as rich sources of biologically active compounds, commonly referred to as bioactive compounds. These phytochemicals, such as polyphenols, flavonoids, anthocyanins, alkaloids, carotenoids, glucosinolates, and vitamins, have garnered significant attention in recent decades due to their well-documented health-promoting properties. Numerous epidemiological and clinical studies have demonstrated the antioxidant, anti-inflammatory, antimicrobial, and even anticancer potential of these compounds, linking high fruit and vegetable intake with a reduced risk of chronic diseases such as cardiovascular disease, diabetes, and certain types of cancer (Abedelmaksoud et al., 2025).

The composition and concentration of these bioactive compounds in horticultural products are influenced by a variety of factors, including species, cultivar, ripeness stage, environmental conditions, agricultural practices, and post-harvest handling (Francini et al., 2022) . Consequently, precise profiling of these chemicals is essential for nutritional labeling, functional food development, breeding programs, authenticity verification, and optimization of post-harvest technology.

However, the analysis of bioactive chemicals within complex plant matrices poses significant challanges. Plant tissues exhibit chemical diversity and frequently comprise a blend of structurally analogous chemicals in differing quantities. Moreover, many bioactives exhibit instability, susceptible to degradation under light, oxygen, or heat, or exist in conjugated or bound forms necessitating prior hydrolysis or transformation. In this context, advanced analytical methods are crucial for the precise extraction, separation, identification, and quantification of these substances with high reliability (Altemimi et al., 2017).

Among these techniques, chromatography stands out as a prominent standard for phytochemical analysis. Chromatographic techniques, including high-performance liquid chromatography (HPLC), gas chromatography (GC), and thin-layer chromatography (TLC), facilitate the separation of distinct components from complex plant extracts based on to their physicochemical characteristics. When paired with selective detectors—such as ultraviolet-visible (UV-Vis) spectrophotometry, fluorescence detection, or mass spectrometry (MS)—or utilized alongside other instruments (e.g., GC-MS, LC-MS/MS), these methodologies facilitate both qualitative identification and quantitative analysis at trace levels, even within complex matrices (Custódio-Mendoza et al., 2024).

Chromatographic profiling is also principle step for identifying biomarkers that are important for nutrition or medicine, monitoring changes during crop growth and storage, and ensuring quality control in functional food and nutraceutical production. It also makes it easier to exploration of underutilized or indigenous horticultural species, which may have novel bioactive profiles.

This paper aims to comprehensively review the application of chromatographic techniques in the analysis of bioactive compounds in horticultural crops. It will cover the essential steps of sample preparation and extraction, describe the principles and advances in major chromatographic methodologies, highlight specific examples in fruit and vegetable research, and discuss current challenges and future directions in the field.

Sample Preparation and Extraction for Chromatographic Analysis

Before chromatography, the bioactive compounds must be efficiently extracted from horticultural samples such as leaves, fruits, seeds, peels and etc. The choice of extraction technique, solvent system, and cleanup strongly influences chromatographic outcomes.

Innovations in extraction such as ultrasound-assisted, microwave-assisted, supercritical fluid and deep eutectic solvent extraction have been reported (Nguyen et al., 2024).

Patra et al. (2022) investigated the general extraction of bioactives and the subsequent chromatographic separation. Extraction must mitigate matrix interference (pigments, sugars, lipids) while preserving the integrity of target molecules. Post-extraction, purification procedures (solid phase extraction, liquid-liquid partitioning) may be employed to improve the quality and simplify the extract for chromatography.

Chromatographic Techniques: Principles and Applications

Thin-Layer Chromatography (TLC)

TLC is often employed as a preliminary screening tool. Thin-Layer Chromatography (TLC) is described as an analytical separation technique that operates on a planar stationary phase (a thin layer of sorbent such as silica gel coated on glass, aluminum, or plastic). Compounds in a sample are separated as the mobile phase (solvent) moves across the layer by capillary action, carrying different molecules at different rates according to their physicochemical properties (such as polarity and adsorption affinity) (Poole, 2003).It is cost-effective, provides rapid fingerprinting of phenolics and flavonoids in plant extracts. For instance, Joshi et al. (2024) compared eight solvent systems for TLC profiling of phenolics in plant extracts. Although TLC has some advantages such as simplicity, low cost, and inimal sample preparation, it also has certain limitations, including lower resolution, semi-quantitative results at best, and lower reproducibility compared to column chromatography.

Gas Chromatography (GC) and GC-MS

Gas Chromatography (GC) is primarily employed for the detection and quantification of volatile and semi-volatile organic compounds, such as aroma compounds, essential oils and fatty acids (Joshi et al., 2024). When it is coupled with mass spectrometry (GC-MS), enable accurate structural identification of analytes. In GC, the mobile phase is an inert carrier gas, commonly helium or hydrogen that transports the vaporized sample through a capillary column coated with a stationary phase, where separation occurs based on the compounds' volatilities and interactions with the column (Putri el., 2022). In horticultural research, GC and its coupling with mass spectrometry (GC-MS) are extensively used for the separation, identification, and quantification of volatile organic compounds from plants which are primarily responsible for their aroma and taste. GC typically requires an extraction or sampling method such as headspace sampling, solid phase microextraction (SPME) or dynamic/trap-adsorbent methods; for example, static headspace and dynamic headspace techniques capture plant-emitted VOCs, often via SPME fibres (e.g., DVB/CAR/PDMS) prior to GC-MS analysis (Makhlouf et al., 2024).

Gas chromatography when equipped with a Flame Ionization Detector (FID), is primarily used for the detection and quantification of fatty acids, particularly polyunsaturated fatty acids such as omega-3 and omega-6. The FID provides high sensitivity and a wide linear dynamic range for hydrocarbons, making it ideal for analyzing methyl esters of fatty acids (FAMEs) derived from plant oils and other horticultural products (Toishimanov et al., 2024)

The advantages of GC/GC MS in horticulture encompass elevated sensitivity for volatile analytes, excellent repeatability, comprehensive spectral libraries for identification, and suitability for profiling fragrance compounds, stress-related volatiles, and flavor indicators. However, Gas Chromatography (GC) is best suited for the analysis of volatile, thermally stable, and low molecular weight compounds, but it faces limitations when applied to complex plant matrices, such as co-elution of analytes and insufficient resolution. When coupled with mass spectrometry (GC-MS), additional challenges may arise, including peak overlap, reduced

sensitivity for low-abundance compounds, and limited effectiveness in detecting highly polar, high-boiling, or thermally labile analytes (Gin and Imwinkelried, 2018).

High-Performance Liquid Chromatography (HPLC) and Related Hyphenated Techniques

HPLC (and its faster variant, Ultra-HPLC) is widely employed to separate non-volatile bioactive compounds such as phenolic acids, flavonoids, carotenoids and sugars. HPLC is a liquid phase separation technique wherein a liquid mobile phase, typically a combination of water and organic solvent chemicals, is pushed under high pressure through a column containing a stationary phase, such as reversed phase C18, C8, phenyl, or C30 for pigments, with analytes partitioning between the mobile and stationary phases based on their physicochemical affinities (Ali, 2022).

The fundamental components of an HPLC system consist of a high-pressure pump, solvent delivery system (mobile phase), injection port, chromatographic column (stationary phase), and a detector (or detectors) that transform separated analyte zones into signals. Key considerations in HPLC for horticultural bioactives are column type (for example C18, C8, phenyl), mobile phase composition (aqueous solvents often acidified plus organic modifiers such as methanol or acetonitrile), detector choice (UV/Vis absorbance, diode array detector (DAD), fluorescence detector (FLD), mass spectrometric (MS) detector or Refractive index (RID) detector) and sample preparation to mitigate matrix effects. With UV/Vis or DAD detection one monitors absorbance at one or many wavelengths (e.g., DAD can scan 190–800 nm enabling spectral confirmation) and this is widely used for phenolics and flavonoids (Park et al., 2024). Fluorescence detectors offer higher sensitivity for compounds with native or derivatized fluorescence and are primarily used for the determination of polyamines, hormones, and amino acids (Zheng et al., 2017; Rao et al., 2023). Mass spectrometric detectors (HPLC–MS, UPLC–MS/MS) offer structural insights, exceptional sensitivity, and the capability to correlate phytochemical profiles with biological activity through comprehensive fingerprinting and quantification of trace elements. The review by Jorge Antonio Custódio Mendoza et al. (2024) elucidates the application of both conventional and sophisticated chromatography techniques, including reversed phase HPLC and UHPLC MS, for the detection of phenolic phytochemicals in food products. In the research area of pigments like carotenoids, reversed phase HPLC employing C30 columns and suitable mobile phase gradients (e.g., methanol, methyl tert-butyl ether, water) with DAD or APCI MS detection has effectively separated and quantified lycopene, β-carotene, lutein, and their isomers (Londoño-Giraldo et al.,2021). Modern combined chromatographic techniques (HPLC–MS, UPLC–MS/MS) are currently considered essential for correlating phytochemical profiles with biological activity; however, precise consideration is required for column selection, mobile phase optimization, detector configuration, and matrix cleanup (Sharma and Yadav, 2023).

Application in Horticultural Crops

Although chromatographic research has predominantly concentrated on medicinal plants, the same analytical principles are equally relevant to horticultural crops such as fruits, vegetables, and ornamentals—where bioactive compounds substantially affect nutritional value, sensory quality, shelf life, and overall marketability.

Chromatographic techniques have been extensively utilized to analyze polyphenols and flavonoids in fruit skins and peels, quantify carotenoids in brightly colored vegetables such as carrots and bell peppers, and isolate secondary metabolites like alkaloids and glucosinolates in *Brassica* species.

Furthermore, chromatography is significantly employed in evaluating fruit quality across diverse horticultural practices including different fertilization methods, light or water treatments, and canopy management (Aguilera et al., 2020) as well as in breeding programs where metabolite fingerprints facilitate cultivar differentiation and associate chemical profiles with desirable characteristics (Ürek et al, 2021). Such techniques also supports plant physiology such as alternate bearing (Güney et al., 2023) and stress-biology studies where researchers use chromatographic separation to monitor changes in phytochemical levels in response to abiotic stresses (e.g., drought, salinity, temperature) (Çoban and Aras, 2023) or biotic pressures (e.g., pathogens, pests) Endes (2025), thereby providing markers of resilience and informing crop improvement. Although systematic reviews specifically targeting horticultural crops are less abundant, broader reviews on plant-based foods provide relevant insights. For instance, Abedelmaksoud et al. (2025) highlight the variety of bioactive chemicals in plant-derived products and call for advanced analytical techniques, such as chromatographic methods, for their characterization. Moreover, in the context of agricultural processing, byproducts like peels and pomace have been subjected to extraction and subsequent chromatographic analysis to assess their potential for value-added uses (Nguyen et al., 2024). From a methodological perspective, Cetinkaya (2025) reports that chromatographic techniques are the predominant methods employed for the detection, separation, and quantification of flavonoids in diverse fruit species. These applications collectively underscore the pivotal function of chromatography in evaluating crop quality, monitoring phytochemical diversity among cultivars, environments, and stresses, and measuring the effects of processing and storage on bioactive content.

Challenges and Methodological Considerations

Despite the efficacy of chromatographic technologies in assessing horticulture crops, numerous persistent challenges restrict their routine implementation. A significant challenge is the intricate composition of plant matrices, which frequently contain sugars, fibers, pigments, and lipids that disrupt both separation and detection methods. Standardization presents a significant challenge; variations in sample preparation, chromatographic conditions, and detector calibration can result in inadequate reproducibility and interfere with meaningful comparisons across studies—an issue emphasized by Custódio Mendoza et al. (2024), who advocate for the establishment of harmonized protocols. Sensitivity frequently compromises efficiency; whereas high-resolution methods such as HPLC-MS/MS provide superior detection capabilities, they are laborious, expensive, and necessitate extensive data analysis proficiency. The extensive structural diversity of bioactive chemicals, characterized by variations in polarity, volatility, and stability, necessitates the use of many chromatographic methods. Researchers often require the integration of methodologies, such as employing gas chromatography (GC) for volatile molecules and high-performance liquid chromatography (HPLC) for non-volatiles, as illustrated by Joshi et al. (2024) in their study of glycosides and aglycones. Moreover, simple separation of chemicals is insufficient; precise structural elucidation sometimes necessitates integration with mass spectrometry (MS) or nuclear magnetic resonance (NMR), thereby increasing complexity and cost—a consideration examined by Hurkul et al. (2024) in their study of plant extracts. Ultimately, in horticultural quality control, the substantial expense and technical requirements of advanced chromatographic techniques frequently restrict their practicality, particularly beyond specialized research contexts.

Future Prospects and Recommendations

To enhance the efficacy and significance of chromatographic methods in the analysis of bioactives from horticulture products, many prospective strategies are becoming essential. Initially, the standardization and verification of methodologies, namely in sample preparation,

selection of chromatographic columns, mobile phase compositions, and detection parameters, are crucial for ensuring reproducibility and facilitating significant comparisons across various crops, laboratories, and studies. Standardized protocols would enhance collaboration and facilitate data integration on a global scale. Secondly, the incorporation of high-throughput platforms like ultra-performance liquid chromatography (UPLC) and other rapid screening methodologies can expedite the analysis of various cultivars, environmental conditions, and post-harvest treatments, thereby facilitating extensive phenotyping or breeding initiatives. Third, integrating chromatographic results with bioactivity studies (e.g., antioxidant or antibacterial evaluations) augments the functional significance of chemical profiling. According to Shakeel (2023), this integration connects analytical chemistry and functional assessment, enabling researchers to prioritize molecules with genuine biological significance. Fourth, broadening chromatographic analysis to encompass underutilized by-products and waste streams such as peels, seeds, and pomace constitutes a sustainable valorization strategy. Nguyen et al. (2024) emphasize the bioactive abundance of these fractions and their potential applications in the circular bioeconomy. Fifth, as environmental issues escalate, sustainable chromatographic methods utilizing eco-friendly solvents, reduced sample processing, and energy-efficient instruments are becoming increasingly significant. Hurkul et al. (2024) emphasize advancements in extraction and chromatographic methodologies that conform to green chemistry concepts. Finally, the implementation of sophisticated hyphenated methodologies such as LC-MS/MS, GC×GC-MS, and untargeted metabolomics unveils new possibilities in identifying hitherto uncharacterized chemicals and their dynamic profiles within horticulture matrices. Kiani et al. (2022) investigated this in algae, and the technology is readily applicable to fruit and vegetable systems, facilitating extensive metabolic fingerprinting and functional annotation.

Conclusion

Chromatographic techniques are essential for the precies analysis of bioactive chemicals in horticulture crops. Chromatography facilitates the separation, identification, and quantification of various phytochemicals in complex plant matrices, ranging from detecting using TLC to high-sensitivity quantification using HPLC MS/MS. Despite present limitaions related to standardization, matrix complexity, throughput, and cost, the increasing significance of bioactive chemicals for nutrition, health, and the sustainable use of horticultural by-products guarantees the continued evolution of chromatographic technologies. The future lies on integrated, high-throughput, sustainable methodologies that connect phytochemical profiles to biological functions and crop quality.

ABSTRACT

Volatile organic compounds (VOCs) play a central role in defining the aroma and flavor quality of horticultural crops. This study focuses on the chemical composition, biosynthesis, and analytical characterization of aroma volatiles in fruits and vegetables, and explores their impact on sensory perception and product quality. Main classes of volatiles, including aldehydes, esters, terpenoids, and sulfur-containing compounds, are derived from lipid, amino acid, carotenoid, and phenylpropanoid pathways as well as enzymatic reactions including oxidation, methylation, and glycosylation, which all contribute to their structural diversity. It is important to maintain a dynamic balance between free and bound (glycosidic) forms of aroma compounds, because bound compounds can be released during ripening or processing to enhance aroma intensity. Analytical advances such as headspace SPME, GC–MS, GC×GC, and GC–olfactometry have expanded our ability to detect low-abundance and odor-active volatiles in complex matrices. Several studies in different horticultural plants illustrate how volatile profiles are effected by cultivar, environmental conditions, and postharvest treatment, with key compounds like (E)-2-hexenal, linalool, and esters correlating strongly with perceived aroma. Challenges remain in linking chemical data with sensory characteristics and in managing matrix suppression and low detection thresholds. Nonetheless, understanding VOC composition and regulation offers opportunities for breeding, postharvest handling, and product development aimed at improving flavor quality in horticultural produce.

Keywords: Aroma profile, Gas Chromatography, Fruit quality, Flavor development, Sensory evaluation

1. INTRODUCTION

Horticultural crops such as fruits, vegetables, and ornamentals not only supply nutrients but also contain aroma and flavor compounds, which are the key determinants of consumer choice. Among these quality traits, aroma (the olfactory impression of volatile compounds) and flavor (a composite sensation of taste + aroma + mouth-feel) play especially significant roles. In recent years, advances in analytical chemistry (e.g., GC–MS, GC×GC–TOF MS), genomics, and metabolomics have markedly accelerated our understanding of the volatile constituents of horticultural crops and their regulation (Abbas et al., 2023).

Volatile organic compounds (VOCs) are typically present at trace concentrations (often < 0.01 % of fresh weight in fruits), yet they are major sensory drivers because of their low odor thresholds and the remarkable sensitivity of human olfaction (Forney, 2001). Their contribution to consumer acceptance and apparent freshness, ripeness, and quality is increasingly being documented (Abbas et al., 2023).

In fleshy fruits such as apple, peach, and tomato, the major chemical classes of volatiles include esters, alcohols, aldehydes, ketones, terpenoids, and apocarotenoids (El Hadi et al., 2013). In a detailed review of peach aroma volatiles, Li et al. (2023) highlight how ripening-related changes in esters, lactones, and terpenoids contribute to peach flavour and how newer omics approaches are uncovering regulatory genes. In the case of tomato (a major vegetable/fruit crop), the flavour is increasingly seen as being determined not only by sugars and acids but by a subset of ~25-30 key VOCs among the >400 molecules detected; many derive from amino acids, fatty acids and carotenoids (Kaur et al., 2023).

Vegetables likewise have distinctive volatile profiles. In *Brassica* vegetables (broccoli, cauliflower, kohlrabi, Brussels sprouts), sulphur-compounds (isothiocyanates, nitriles), along with aldehydes and alcohols, dominate the volatile fraction. However, cooking and cultivar dramatically affect profiles. Cooking generally reduced many alcohols but increased some isothiocyanates (Wieczorek and Jeleń, 2019).

These findings highlight how important volatile compounds are for the aroma and flavor of fruits and vegetables. Different crop types and even different varieties have unique volatile profiles, which are shaped by how these compounds are made, controlled, and changed during processing. As new tools like GC×GC TOF MS allow scientists to detect and compare hundreds of volatile compounds (e.g., more than 1,500 found in tomato and pepper by Guan et al., 2025), it's becoming easier to connect these chemicals with how food smells and tastes—and use that knowledge in crop breeding. Scientists are also learning more about the genes and enzymes involved, such as transcription factors and glycosyl transferases, which help manage how aroma compounds are stored and released in fruits. This opens up new possibilities for improving flavor through genetic or metabolic engineering (Qin et al., 2025).

Nevertheless, major knowledge gaps remain: in many crops the full complement of flavour-active volatiles is still unknown, the regulation of fluxes and release (bound vs free forms) is incompletely described, the effect of complex pre- or post-harvest interventions on volatile networks is only partly understood, and the integration of sensory, metabolomic and genomic/epigenomic data remains challenging.

Therefore, this study aimed to summarize current knowledge on volatile compounds in horticultural crops, focusing on their sensory roles, biosynthesis, regulation, and responses to pre- and post-harvest conditions. It also explores strategies for aroma/flavor improvement and highlights key gaps to guide future research and crop quality enhancement.

Major Volatile Compound Classes and Their Contribution to Aroma/Flavor

Volatile compounds in horticultural crops mostly originate from four principal precursor pathways: fatty acid derivatives (e.g., C6 aldehydes/alcohols), terpenoids, phenylpropanoids/benzenoids (derived from amino acids), and breakdown products of carotenoids/apocarotenoids (Mostafa et al., 2022).

Typical aroma compounds categorized into esters (fruity), aldehydes (green/ grassy), alcohols, ketones, terpenes (floral/citrus), lactones, sulfur-containing volatiles, and phenyl/benzenoid (spicy/floral) volatile groups (Abbas et al., 2023).

Esters are among the most potent aroma contributors in many fruits. Their low odor thresholds and fruity/floral characteristics make them key quality markers. For example, esters such as methyl butanoate, ethyl hexanoate, and methyl hexanoate are primary contributors to strawberry flavor. In a comprehensive inheritance study, esters were shown to be highly heritable, and several QTLs (Quantitative Trait Loci) related to ester production were identified across strawberry cultivars (Rey-Serra et al., 2022). However, studies showed that aldehydes and alcohols decrease during ripening while esters increase (Dadwal et al., 2025). Simillary, in pear fruits, esters such as hexyl acetate and amyl acetate increase with maturity and dominate fresh fruit aroma (Shi et al., 2025). A shift in ester/aldehyde ratio can influence perception toward “green” versus “ripe fruit” aroma, e.g., in cherries where higher C6 aldehydes and lower ester levels were associated with off-herbaceous flavour (Villavicencio et al., 2021).

Aldehydes such as hexanal and (E)-2-hexenal are key green leaf volatiles in various horticultural crops, including strawberries, where they enhance fresh, herbaceous, and unripe fragrance profiles. C6 and C9 aldehydes, along with associated alcohols such as (Z)-3-hexenol, are biosynthesized through the lipoxygenase (LOX)–hydroperoxide lyase (HPL) pathway, generally accumulating in unripe, freshly harvested, or mechanically damaged tissues (Villavicencio et al., 2021; Klee and Tieman, 2018). Aldehydes, including benzaldehyde and (E)-2-nonenal, were associated with fruity and nutty sensory characteristics in melon (Majithia et al., 2021). In strawberries, these chemicals are especially prevalent during the initial ripening phases and are more linked to the feeling of freshness than to the flavor of fully ripe fruit. In the case of Korean 'Seolhyang' strawberries, short-term high CO_2 storage effectively sustained hexanal and (E)-2-hexenal concentrations while inhibiting undesirable aldehydes and ketones throughout shelf life, hence keeping favorable freshness characteristics (Kim et al., 2022). Pear investigations indicated that aldehyde accumulation is affected by storage conditions, with hexanal levels increasing at low temperatures (Shi et al., 2025).Nonetheless, although these aldehydes enhance freshness, their excessive accumulation may lead to unwelcome "cut grass" or "green bean" aromas, particularly in the setting of ripe fruit.Common chemical categories encompass esters, aldehydes, alcohols, ketones, terpenes, lactones, sulfur-containing volatiles, and phenyl/benzenoid volatiles. In horticultural fruits and vegetables, the predominant volatiles comprise esters (fruity), terpenes (floral/citrus), C6 aldehydes (green/grassy), and phenylpropanoids (spicy/floral) (Abbas et al., 2023).

Terpenes, comprising monoterpenes (C_{10}), sesquiterpenes (C_{15}), and their oxygenated derivatives, are a highly diversified and prevalent category of plant volatile organic compounds (VOCs). These chemicals are vital in plant-environment interactions and significantly contribute to the scent and flavor profiles of several fruits, flowers, and herbs. Terpenes frequently convey citrus, flowery, pine, woody, spicy, or resinous characteristics based on their structure and concentration (Jin et al., 2025). Monoterpenols, including linalool, geraniol, and nerol, are the predominant aroma-active volatiles in grapes and citrus, particularly in fragrant grape varieties such as Muscat and citrus peel oils (Lin et al., 2019). These substances impart sweet, flowery, and citrus-like

characteristics, particularly concentrated in the skins and glandular tissues of the fruit. In mango (Mangifera indica), monoterpenes including α-pinene, limonene, carene, and myrcene predominantly characterize the peel scent and exhibit considerable variation among cultivars, affecting consumer perceptions of ripeness and freshness (Mesquita et al., 2022).

Linalool and nerolidol are significant contributors to the floral aroma of oolong and green teas derived from tea leaves (Camellia sinensis), with their production being heavily influenced by light, harvest season, and enzymatic glycosidic hydrolysis (Lin et al., 2023). Basil (Ocimum basilicum), a herb recognized for its essential oil composition, contains terpenes such as eucalyptol, linalool, and methyl chavicol, which provide its distinctive spicy and sweet fragrance. Environmental factors, genotype, and developmental stage substantially influence their relative abundance (Güney et al., 2021). Phenylpropanoids and other benzenoids, derived from phenylalanine through the shikimate route, encompass aromatic chemicals such as benzaldehyde, phenethyl alcohol, and eugenol, which impart floral, spicy, or almond-like characteristics. Although their contribution is sometimes less prominent than that of esters in several fruits, they are nonetheless important for the overall scent development in horticulture crops (Abbas et al., 2023).

Many volatile fragrance molecules in fruits and other plant-derived foods are present not only in their free, volatile form but also in a glycosidically bound, non-volatile precursor state. The bonded volatiles are conjugated with sugar moieties, making them odorless until enzymatically or chemically hydrolyzed. Qin et al. (2025) assert that glycosidically bound volatiles provide a significant latent reservoir of aroma-active chemicals that may be liberated during fruit ripening, postharvest storage, thermal processing, or fermentation. The review emphasizes that the emission of these bound volatiles substantially influences the evolution of fragrance profiles, especially during late ripening phases or following tissue damage. Qin et al. underscore the significance of both natural glycosidases and microbial enzymes in facilitating this conversion, therefore affecting the sensory quality of horticultural products.

Biosynthetic Pathways and Regulation of Volatile Compounds

The synthesis of volatile aroma compounds in horticulture crops is controlled by complex biosynthetic pathways and is strictly regulated by genetic, environmental, and physiological variables. Mostafa et al. (2022) reported that the majority of aroma volatiles are produced via four principal metabolic pathways: the fatty acid pathway, yielding aldehydes, alcohols, and esters; the amino acid pathway, resulting in phenylpropanoids and benzenoids; the terpenoid pathway, originating from mevalonate or MEP pathways; and the carotenoid/apocarotenoid degradation pathway. Progress in transcriptomics and genomics has enabled researchers to pinpoint certain genes, enzymes, and regulatory elements implicated in these pathways. Li et al. (2023) discovered genes associated with ester and lactone production in peach and elucidated their transcriptional control during fruit ripening. In addition to heredity, environmental and physiological factors considerably affect volatile profiles. Cultivar, maturity stage, light exposure, temperature, and hormonal signaling, particularly ethylene and auxin, influence the production and emission of volatile chemicals, as outlined by Abbas et al. (2023). Postharvest treatment and storage are critical; for example, Shi et al. (2025) indicated that holding pear fruit at ambient temperature increased ester buildup, while cold storage inhibited fragrance formation and the expression of biosynthetic genes such as PcLOX2 and PcADH1. The sensory impression of scent is not solely determined by particular volatiles. Factors such as odour activity values (OAVs), chemical thresholds, synergistic or suppressive interactions, and the impact of the non-volatile matrix (including sugars, acids, and phenolics) all determine the final flavour profile. An example is the herbaceous off-flavour in cherry, attributed not to a singular volatile ingredient but to a modified volatile mixture interacting with the fruit's matrix

(Villavicencio et al., 2021). Although the majority of research emphasizes culinary crops, volatile chemicals are equally crucial in ornamental and floricultural plants. Zhou et al. (2023), in a review of fragrant flowers, emphasized the influence of chilling stress and epigenetic mechanisms, including DNA methylation, on volatile production and floral scent in roses.

Factors Affecting Volatile Composition and Aroma Quality

The volatile composition and aroma quality of horticultural crops are affacted by a combination of genetic, developmental, hormonal, and environmental factors. Different cultivars exhibit distinct volatile fingerprints, making varietal selection a key determinant of aroma and flavor potential. Abbas et al. (2023) highlight that cultivar identity significantly affects both free and glycosidically bound aroma compounds in fruit. Maturity and ripening stage also play a pivotal role; volatile profiles evolve dynamically during development, with esters generally increasing as fruit matures, while green leaf volatiles like C6 aldehydes tend to decline. In sweet cherry, Villavicencio et al. (2021) found that herbaceous off-flavor was linked to delayed ripening and persistently high levels of hexanal and other aldehydes. Environmental conditions before and after harvest, including light exposure, temperature, water and nutrient availability, orchard microclimate, and harvest timing, further influence volatile biosynthesis and emission. Qin et al. (2025) demonstrated that shading in grape clusters led to a reduction in bound terpenoids, showing how light intensity can affect precursor pools. Postharvest handling, storage conditions, and processing techniques also markedly alter volatile profiles. Cold storage, modified atmospheres, and mechanical processing (such as cutting, peeling, or cooking) can either diminish aromatic quality or shift the balance of key volatiles. In pear, for instance, Shi et al. (2025) observed that room temperature storage accelerated ester accumulation and aroma development compared to low-temperature storage, correlating with enhanced expression of ester biosynthetic genes. In addition to external factors, hormonal regulation plays a vital internal role. Ethylene, auxin, and jasmonates are key signaling molecules that influence the onset of ripening and the activation of volatile biosynthesis pathways. The review by Ke et al. (2025) specifically emphasizes the emerging role of auxin in modulating the expression of genes involved in volatile organic compound (VOC) production, underscoring its broader regulatory role beyond growth and development. Collectively, these factors interact across molecular, physiological, and environmental levels to shape the final aroma profile and sensory perception of horticultural products.

Applications and Future Prospects

Understanding the biosynthesis and regulation of volatile compounds in horticultural crops presents promising opportunities for improving flavor quality, optimizing postharvest management, and expanding industrial applications. Breeding programs increasingly focus on identifying specific volatiles correlated with consumer preference to guide the development of more flavorful cultivars. In tomato, for instance, genetic loci associated with volatile biosynthesis are being actively exploited to enhance aroma and taste attributes (Kaur et al., 2023). In addition to conventional breeding, progress in metabolic engineering and genome editing, especially CRISPR/Cas9 technologies—has facilitated the exact alteration of essential aroma-related genes, such as alcohol acyltransferases (AATs), lipoxygenases (LOX), and terpene synthases. Zhang et al. (2023) studied the increasing potential of these technologies for designing customized aroma profiles in economically significant crops. Volatile compounds function as sensitive biomarkers for assessing postharvest quality. Volatile organic compound profile can signify fruit maturity, flavor potential, early decay, or an outbreak of storage problems. Sun et al. (2025) highlighted significant implications for the advancement of non-invasive, real-time monitoring technology. In addition to their role in fresh produce, volatiles, particularly terpenoids, have commercial value across industries such as food and beverage

flavoring, perfumery, cosmetics, and even biofuel production. Abbas et al. (2023) emphasized the extensive use of horticulturally sourced volatiles, underscoring their importance beyond the consumer sector for fresh produce.

Knowledge Gaps and Challenges

Despite significant progress, many aspects of volatile compound regulation in horticultural crops remain unclear. The conversion of bound to free volatiles, along with transcriptional and epigenetic controls, is still not fully understood, as noted by Qin et al. (2025). Additionally, how volatiles interact with non-volatile compounds like sugars, acids, and phenolics—and how these combinations influence flavor perception—has not been well studied. Linking specific volatile organic compounds (VOCs) to consumer preferences is also challenging, due to the complexity of aroma mixtures and the effects of compound interactions such as suppression or synergy, as shown in cherry studies where no single VOC could explain off-flavors (Villavicencio et al., 2021). Environmental and agronomic factors affecting volatile profiles vary widely by crop and region and are poorly characterized. Post-harvest processes such as peeling, cooking, or packaging can alter the stability and release of aroma compounds, yet these effects remain under-researched in many fresh produce items. Finally, while molecular tools and metabolic engineering offer exciting possibilities for improving flavor, turning these advances into practical breeding strategies or industry-scale applications is still a major hurdle.

Conclusion

Volatile organic compounds are fundamental determinants of aroma and flavor in horticultural crops. The last half-decade (2020-2025) has seen substantial progress in identifying volatile compound classes, biosynthetic pathways, genetic regulation and the influence of pre-/post-harvest factors. Yet, translating this knowledge into improved aroma/flavor remains a frontier. Integrating metabolomics, sensory science, genomics and agronomy offers promise for developing horticultural crops with superior aroma and flavor, while also unlocking wider industrial applications of plant-derived volatiles.

ÖZET

Bu araştırma, Akdeniz iklim koşullarında Gelemen üçgülü (*Trifolium meneghinianum* Clem.) ve arpanın (*Hordeum vulgare* L.) yalın ekimleri ile farklı tohumluk oranlarındaki karışımlarının (%100 Gelemen üçgülü, %100 Arpa, %20 Gelemen üçgülü+%80 Arpa, %40 Gelemen üçgülü + %60 Arpa, %60 Gelemen üçgülü + %40 Arpa, %80 Gelemen üçgülü + %20 Arpa) ot verimi, yem kalitesi ve yabancı ot gelişimi üzerindeki etkilerini belirlemek amacıyla yürütülmüştür. Deneme, 2024-2025 kış yetiştirme mevsiminde Çukurova Üniversitesi Ziraat Fakültesi Tarla Bitkileri Bölümü Araştırma ve Uygulama arazisinde, tesadüf blokları deneme desenine göre üç tekerrürlü olarak kurulmuş ve yürütülmüştür. Araştırma sonuçları, toplam kuru biyomas veriminin 591.0 kg/da ile 906.2 kg/da arasında değiştiğini ve en yüksek verimin saf arpa ekiminden elde edildiğini göstermiştir. Yabancı ot bakımından en yüksek kuru yabancı ot biyoması saf ekim Gelemen üçgülünde (190.6 kg/da) gözlenmiş, arpanın karışıma katılma oranı arttıkça yabancı ot baskısı belirgin şekilde azalmıştır. Karışım uygulamalarında 10 familyaya ait 18 yabancı ot türüne rastlanmış ve Gelemen üçgülünün yalın ekimi ve arpa ile farklı tohumluk oranlarındaki karışımlarında yabani yulaf (*Avena fatua* L.) ve yabani hardalın (*Sinapis arvensis* L.) yabancı ot kompozisyonundaki oranı yüksek olduğu ortaya çıkmıştır. Yem

kalitesi bakımından ise en yüksek ham protein oranı saf Gelemen üçgülünde (%20.0) saptanmıştır. Karışım uygulamalarında ham protein oranı orta düzeyde seyretmiş, nispi yem değeri ise saf ekim Gelemen üçgülünde en yüksek (152.2) değer göstermiştir. Elde edilen bulgular, yalın ekim arpada ve arpa oranının yüksek olduğu karışım uygulamalarında, arpanın hem yüksek kuru ot verimi sağladığını hem de yabancı ot kontrolünde avantaj sunduğunu ortaya koymuştur. Bunun yanında, Gelemen üçgülünün karışımdaki oranının artırılması yem kalitesi açısından önemli bir katkı sunmuştur.

Anahtar Kelimeler: Arpa, Gelemen üçgülü, kalite, verim, yabancı ot

THE EFFECTS OF DIFFERENT SEEDING RATIOS OF GELEMEN CLOVER AND BARLEY MIXTURES ON FORAGE YIELD, QUALITY TRAITS, AND WEED SUPPRESSION

ABSTRACT

This study was conducted to determine the effects of pure sowing of Gelemen clover (*Trifolium meneghinianum* Clem.) and barley (*Hordeum vulgare* L.), as well as their mixtures at different seeding ratios (100% Gelemen clover, 100% barley, 20% Gelemen clover + 80% barley, 40% Gelemen clover + 60% barley, 60% Gelemen clover + 40% barley, 80% Gelemen clover + 20% barley), on biomass yield, forage quality, and weed development under Mediterranean climatic conditions. The field experiment was conducted during the 2024-2025 winter growing season at the Research and Application Area of the Department of Field Crops, Faculty of Agriculture, Çukurova University, Adana, Türkiye. The trial was arranged in a randomized complete block design with three replications. The findings indicated that the total dry biomass yield varied from 591.0 kg/da to 906.2 kg/da, and the highest yield was recorded in the sole barley treatment. The highest dry weed biomass (190.6 kg/da) was observed in the sole Gelemen clover treatment, while weed pressure markedly decreased as the proportion of barley in the mixture increased. In the mixture treatments, 18 weed species belonging to 10 families were identified, and it was revealed that wild oat (*Avena fatua* L.) and wild mustard (*Sinapis arvensis* L.) constituted a high proportion of the weed composition in both sole Gelemen clover and its mixtures with barley at different seeding ratios. In terms of forage quality, the highest crude protein content (20.0%) was determined in sole Gelemen clover. In the mixture treatments, protein content remained at moderate levels, whereas the relative feed value reached its maximum (152.2) in the sole Gelemen clover plots. The findings demonstrated that sole barley cultivation and mixture treatments with higher barley proportions not only provided greater dry forage yield but also offered an advantage in weed control. In addition, increasing the proportion of Gelemen clover in the mixtures contributed significantly to forage quality.

Keywords: Barley, Gelemen clover, yield, quality, weed suppression

GİRİŞ

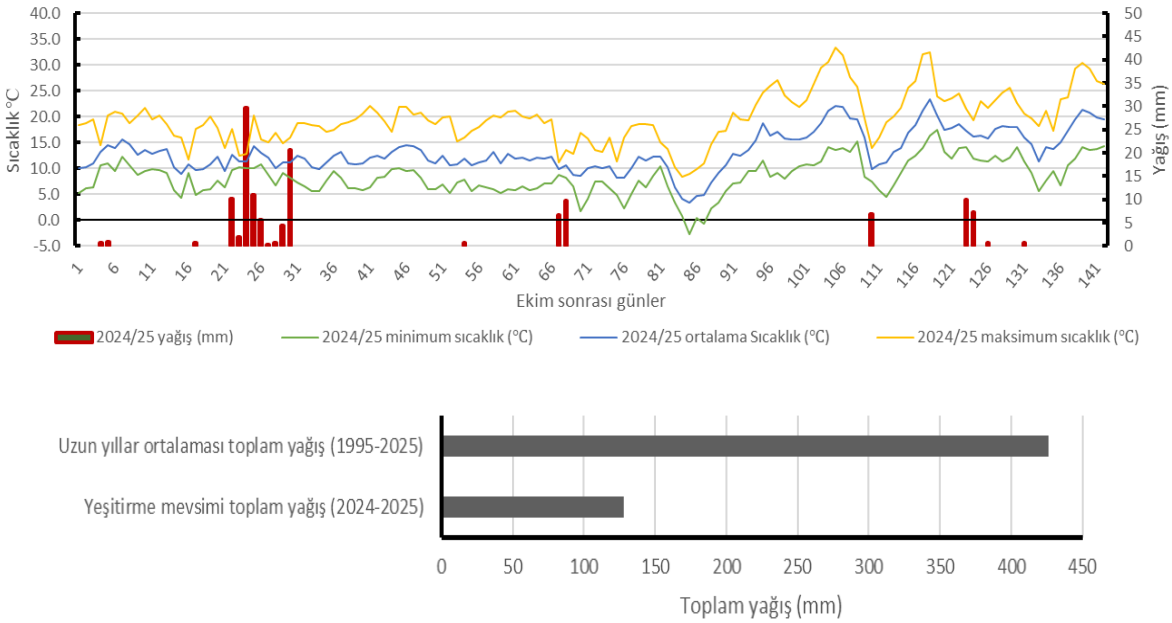
Yem bitkileri üretimi, verimliliklerini büyük oranda kaybetmiş çayır-mera alanları üzerindeki baskının azalması ve hayvancılığın sürdürülebilirliği açısından stratejik bir öneme sahiptir. Artan nüfus ve hayvansal ürün talebi, yem kaynaklarının çeşitlendirilmesini ve kalite ile verimin aynı anda iyileştirilmesini zorunlu kılmaktadır. Bu bağlamda, farklı bitki türlerinin karışım halinde ekilmesi hem tarımsal ekosistemlerin üretkenliğini artıran hem de hayvan beslenmesinde denge sağlayan önemli bir uygulama olarak öne çıkmaktadır (De Silva vd., 2023). Bunun yanında, baklagil ve tahıl türlerinin birlikte yetiştirildiği karışık ekim sistemleri, dünya genelinde düşük maliyetle yüksek verimlilik ve yem kalitesi sağlamasının yanında yabancı ot kontrolü açısından da öne çıkan alternatifler arasında değerlendirilmektedir (Sleugh vd., 2000; Lithourgidis vd., 2011; Bedoussac vd., 2015).

Karışık ekim sistemlerinde baklagiller, simbiyotik azot fiksasyonu yoluyla toprağın besin döngüsüne önemli katkılar sağlamakta ve yetiştirildikleri alanlarda azot gübrelemesi ihtiyacını azaltmaktadır. Bunun yanında, tahıllar topraktaki azot alımı için baklagillere göre rekabet üstünlüğü sağlamasından dolayı baklagillerin büyüme ve gelişmeleri için daha fazla atmosferik azot fikse etmesini teşvik etmektedir (Giambalvo vd., 2011; Raza vd., 2023). Bu durum, özellikle azotlu gübre girdisinin azaltılmasında ekolojik ve ekonomik bir avantaj sağlamaktadır (Annicchiarico ve Tomasoni, 2010). Ayrıca, baklagillerin ham protein içeriğinin yüksek olması (Solomon vd., 2011), yemlerin besleyici değerini artırmakta ve ruminantların protein ihtiyacını karşılamada önemli bir rol oynamaktadır. Tahılların ise hızlı büyüme, yoğun kardeşlenme ve güçlü kök yapıları sayesinde yüksek kuru madde verimi sağlamaktadır (Peltonen-Sainio vd., 2009). Bu nedenle, baklagil-tahıl karışımları, her iki tür grubunun avantajlarını bir araya getiren tamamlayıcı sistemler olarak dikkat çekmektedir.

Yabancı ot rekabeti bakımından da karışık ekim sistemlerinin avantajı açıktır. Saf olarak kültüre alınan biçok baklagil yembitkisi yabancı otlarla rekabet edememekte ve buna bağlı olarak yabancı ot yoğunluğu yüksek seviyelere ulaşabilmektedir (Petraki vd., 2025). Buna karşılık tahıl ağırlıklı karışımlar, hızlı büyüme ve güçlü toprak örtüsü oluşturma özellikleri sayesinde yabancı ot gelişimini baskılamaktadır (Banik vd., 2006). Dönmez ve Hatipoğlu (2023), suni mera tesisinde koruyucu bitki olarak karışıma dahil edilen arpanın yabancı ot yoğunluğunu azalttığını bildirmişlerdir.

Son yıllarda yapılan çalışmalar, tahıl-baklagil karışımlarının başarısında ekolojik koşulların yanı sıra, tür uyumu ve türlerin karışımdaki tohumluk oranlarının kritik faktörler olduğunu göstermiştir (Ross vd., 2003; Salama ve Badry, 2015; Dönmez vd., 2024). Nitekim Lithourgidis vd. (2006), fiğ ile yulaf ve tritikalenin farklı tohumluk oranlarındaki karışımlarının ot verimi ve ot kalitesini inceledikleri araştırmada başarı için tür seçiminin önemini vurgulamış ve baklagil-tahıl türlerinin tohumluk karışımının 65:35 oranında tutulmasının hem verimi hem de kaliteyi optimize ettiğini bildirmişlerdir. Osman ve Nersoyan (1986), yüksek ot verimi ve ot kalitesi için tahıl-baklagil karışımlarında türlerin tohumluk oranlarının 66:33 olması gerektiğini bildirmişlerdir.

Bu araştırmada, Gelemen üçgülü (*Trifolium meneghinianum* Clem.) ve arpanın (*Hordeum vulgare* L.) yalın ekimleri ile farklı tohumluk oranlarındaki karışımlarının ot verimi, ot kalitesi ve yabancı ot gelişimi üzerindeki etkisinin tespit edilmesi amaçlanmıştır.



MATERYAL VE METOT

Deneme alanı, iklim ve toprak özellikleri

Deneme, Çukurova Üniversitesi Ziraat Fakültesi Tarla Bitkileri Bölümü Araştırma ve Uygulama arazisinde 2024-2025 kış yetiştirme mevsiminde yürütülmüştür. Araştırmanın yürütüldüğü deneme alanının deniz seviyesinden yüksekliği 33 m'dir. Deneme alanından alınan

toprak örnekleri Çukurova Üniversitesi Ziraat Fakültesi Toprak Bilimi ve Bitki Besleme Bölümü laboratuvarında analiz edilmiştir. Analiz sonuçlarına göre; toprak pH'nın 7.24, organik madde içeriğinin %1.42, kireç içeriğinin %32.7 ve toprak tekstürünün killi yapıda olduğu anlaşılmıştır.

Denemenin yürütüldüğü Adana iline ait 2024-2025 yetiştirme mevsimi ve uzun yıllar ortalaması iklim değerleri Şekil 1'de verilmiştir (Anonim, 2025).

Şekil 1. Denemenin yürütüldüğü Adana iline ait 2024-2025 yetiştirme mevsimi ve uzun yıllar ortalaması iklim diyagramı

Akdeniz ikliminin hüküm sürdüğü Adana ilinde, uzun yıllar ortalaması toplam yağış 426.1 mm olurken, 2024-2025 yetiştirme mevsiminde toplam yağış 128.2 mm olarak gerçekleşmiştir (Şekil 1). Bunun yanında, araştırmanın yürütüldüğü Ocak-Nisan ayları (ekimden sonra 32-141 günler arası) arasında 42 mm yağış gerçekleşmiş ve söz konusu aylarda ciddi kuraklık gözlenmiştir. Diğer taraftan ekimden sonra 83-89 günler arası sıcaklıklar 0 °C'nin altına düşmüş (Şekil 1) ve don zararı ortaya çıkmıştır.

Deneme deseni ve uygulamalar

Deneme tesadüf blokları deneme desenine göre 3 tekerrürlü olarak kurulmuş ve yürütülmüştür. Her parsel 5 m uzunluğunda 6 sıradan oluşmuş ve sıra arası mesafe 20 cm olarak ayarlanmıştır. Araştırmada materyal olarak, Karadeniz Tarımsal Araştırma Enstitüsü Müdürlüğünden temin edilen Gelemen üçgülünün Yörem55 çeşidi ve Doğu Akdeniz Tarımsal Araştırma Enstitüsü Müdürlüğünden temin edilen Arpanın Ay çeşidi (yazlık) kullanılmıştır. Araştırmada Gelemen üçgülü ve arpanın yalın ekimleri ile farklı tohumluk oranlarındaki karışımları (%100 Gelemen üçgülü, %100 Arpa, %20 Gelemen üçgülü+%80 Arpa, %40 Gelemen üçgülü+%60 Arpa, %60 Gelemen üçgülü+%40 Arpa, %80 Gelemen üçgülü+%20 Arpa) test edilmiştir.

Ekim, bakım ve hasat işlemleri

Araştırmada yaz dönemi boş bırakılan deneme alanı, erken sonbaharda toprak işleme ve tesviye işlemlerinin ardından ekime hazır hale getirilmiştir. Ekim öncesi türlerin tohumları çimlenme testine tâbi tutulmuş ve saf ekimlerinde Gelemen üçgülünün 2 kg/da, arpanın 16 kg/da tohumluk miktarları dikkate alınarak, test edilen karışım uygulamalarının tohumluk miktarları Gençkan (1985)'a göre hesaplanmıştır. Ekim işlemi 01.12.2024 tarihinde, markörle açılan sıralara

türlerin tohumları karıştırılarak aynı sıraya elle yapılmıştır. Deneme alanına ekimle birlikte dekara saf 5 kg N ve saf 5 kg P_2O_5 olacak şekilde 20:20:0 taban gübresi uygulanmıştır. Karışımda yer alan türlerin homojen çıkışını sağlayabilmek amacıyla ekimden sonra bir defa olmak üzere, araştırma süresince toplamda dört defa sulama yapılmıştır. Denemenin yürütüldüğü sürede yabancı ot mücadelesi yapılmamıştır. Deneme alanında yaprak bitleri gözlenmiş ve "*Acetamiprid*" etken maddeli insektisit ile mücadele edilmiştir. Hasat işlemi Gelemen üçgülünün %40-50 çiçeklenme döneminde olduğu 21.04.2025 tarihinde, 5-7 cm yükseklikten el orağı ile gerçekleştirilmiştir.

İncelenen özellikler

Hasatta 50 x 50 cm boyutlarındaki çerçeve, her bir parselde 3 adet olacak şekilde tesadüfi olarak yerleştirilmiş ve çerçeve içinde kalan ot biçilmiştir (Dönmez vd., 2024). Her parselde 3 örnekleme alanından biçilen ot laboratuvara götürülüp karışımda yer alan türler ve yabancı ot türleri elle ayrıştırılmıştır. Ayrıştırılan bu türler kese kağıtlarına yerleştirilerek 70°C'de 48 saat etüvde kurutulmuş ve sabit ağırlığa gelen her bir türün ayrı ayrı kuru ağırlıkları belirlenmiştir. Üç örnekleme alanında her tür için belirlenen kuru ağırlıkların ortalaması alınarak her bir türün parseldeki kuru ağırlığı tespit edilmiş ve gerekli dönüşümler yapılarak karışımda yer alan türler ve yabancı ot türlerinin dekara verimi hesaplanmıştır. Araştırmada yer alan karışım türleri ile yabancı ot türlerinin kuru ot verimi değerleri toplanmış ve toplam kuru biyomas verimi hesaplanmıştır.

Araştırmada karışım uygulamalarında bulunan yabancı ot türleri Davis (1965), Anonim (2008) ve Gökten ve Tansı (2015)'ya göre belirlenmiştir. Ayrıca, her karışım uygulamasında tespit edilen yabancı ot türlerinin ağırlığa göre yabancı ot kompozisyonundaki oranları aşağıdaki eşitlik yardımıyla saptanmıştır (Dönmez ve Hatipoğlu, 2023).

Türün yabancı ot kompozisyonundaki oranı

$$(\%)=\frac{\text{Parselde tespit edilen yabancı ot türünün kuru ağırlığı}}{\text{Parseldeki toplam kuru yabancı ot ağırlığı}} \times 100$$

Etüvde kurutulan Gelemen üçgülü ve arpaya ait kuru örnekler öğütülerek 1 mm'lik elekten geçirilmiştir. Öğütülen örneklerin ham protein oranı Kjeldahl yöntemi ile belirlenmiştir (N konsantrasyonu x 6.25). Karışım türlerinin NDF ve ADF oranları Van Soest vd. (1991) tarafından açıklandığı gibi yarı otomatik ANKOM220 lif analiz cihazı (ANKOM Technology, Macedon, NY, ABD) kullanılarak belirlenmiştir. Nispi yem değeri Sheaffer vd. (1995) tarafından açıklanan aşağıdaki eşitlikler yardımıyla hesaplanmıştır.

Sindirilebilir Kuru Madde Oranı (SKMO) = $88.9 - (0.779 \times \%\text{ADF})$

Kuru Madde Tüketimi (KMT) = $\frac{120}{\%\text{NDF}}$

Nispi Yem Değeri (NYD) = $\text{SKMO} \times \text{KMT} \times 0.775$

Verilerin değerlendirilmesi

Araştırmadan elde edilen veriler tesadüf blokları deneme desenine göre MSTAT-C (Michigan State University V. 2.10) istatistik paket programında varyans analizine tâbi tutulmuştur. Önemli çıkan özellik ortalamaları Duncan çoklu karşılaştırma testi ile $P<0.05$ önem düzeyinde karşılaştırılmıştır (Yurtsever, 2011).

BULGULAR VE TARTIŞMA

Toplam kuru biyomas verimi

Araştırmada Gelemen üçgülü ve arpanın yalın ekimleri ile farklı tohumluk oranlarındaki karışımlarından saptanan toplam kuru biyomas verimi ortalamaları Çizelge 1'de verilmiştir.

Çizelge 1'de izlendiği gibi, farklı karışım uygulamalarında saptanan toplam kuru biyomas verimi 591.0 kg/da (%100 Gelemen üçgülü) ile 906.2 kg/da (%100 Arpa) arasında değişmiş ve bu değişimin istatistiki olarak önemli olduğu ortaya çıkmıştır. Araştırmada toplam kuru biyomas verimi bakımından yalın ekim arpa, %20 Gelemen üçgülü+%80 Arpa (851.7 kg/da), %60 Gelemen üçgülü+%40 Arpa (887.6 kg/da) ve %40 Gelemen üçgülü+%60 Arpa karışımları hariç, test edilen diğer karışım uygulamalarına göre önemli derecede daha yüksek değer göstermiştir. Karışım uygulamalarının ortalaması olarak toplam kuru biyomas verimi ortalaması ise 789.4 kg/da olarak tespit edilmiştir. Bu sonuçlar, yalın ekim arpa ve bunun yanında Gelemen üçgülü ile arpanın %40 ve daha yüksek tohumluk oranlarındaki karışımlarının daha yüksek kuru biyomas verimi verdiğini ortaya koymaktadır. Yalın arpa ekiminde ve arpanın karışımdaki tohumluk oranlarının %40 ve daha fazla olduğu karışım uygulamalarında toplam kuru biyomas veriminin yüksek seviyelere ulaşması, arpanın yüksek kardeşlenme eğiliminde olması ve hızlı büyüme yeteneğine bağlı olarak rekabet üstünlüğü sağlaması (Ross vd., 2004) ile açıklanabilir. Benzer şekilde Dönmez vd. (2024), baklagil-buğdaygil karışımlarında buğdaygil oranı arttıkça kuru ot veriminin arttığını ve özellikle buğdaygil ağırlıklı karışımların verim açısından üstün olduğunu bildirmişlerdir. Ayrıca Chen vd. (2004), karışık ekimdeki türlerin su, besin ve ışık yönünden rekabet ettiklerini ve bu rekabetin karışım otu veriminde önemli farklılıklara neden olduğunu bildirmişlerdir. Salama (2020), baklagil-tahıl karışımında türlerin sırasıyla %75-%25 oranında karıştırılmasının yalın ekimlere göre daha yüksek verim verdiğini rapor etmişlerdir.

Çizelge 1. Gelemen üçgülü ve arpanın yalın ekimleri ile farklı tohumluk oranlarındaki karışımlarından saptanan toplam kuru biyomas verimi, Gelemen üçgülü kuru ot verimi, arpa kuru ot verimi ve kuru yabancı ot verimi ortalamaları

Karışım Uygulamaları	Toplam kuru biyomas verimi (kg/da)**	Gelemen üçgülü kuru ot verimi (kg/da)**	Arpa kuru ot verimi (kg/da)**	Kuru yabancı ot verimi (kg/da)**
Gelemen üçgülü (%100)	591.0 c^{+}	400.3 a	- -	190.6 a
Arpa (%100)	906.2 a	- -	893.5 a	12.6 d
%20 Gelemen üçgülü + %80 Arpa	851.7 a	201.9 b	636.3 b	13.5 d
%40 Gelemen üçgülü + %60 Arpa	795.4 ab	206.0 b	562.4 bc	27.0 cd
%60 Gelemen üçgülü + %40 Arpa	887.6 a	226.3 b	623.5 b	37.8 bc
%80 Gelemen üçgülü + %20 Arpa	704.8 bc	216.8 b	441.8 c	46.2 b
Ortalama	**789.4**	**250.3**	**631.5**	**54.6**

$^{+}$) Aynı sütunda benzer küçük harflerle gösterilen ortalamalar arasında Duncan testine göre $P<0.05$ önem düzeyinde istatistiki olarak fark yoktur.

**) $P\leq0.01$ düzeyinde önemli.

Gelemen üçgülü kuru ot verimi

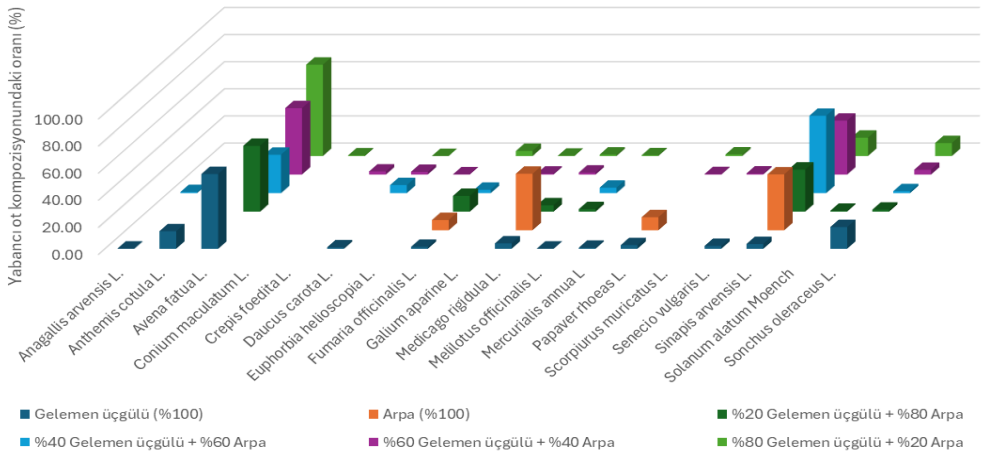
Yalın ekim Gelemen üçgülü ile Gelemen üçgülü ve arpanın farklı tohumluk oranlarındaki karışımlarından saptanan Gelemen üçgülü kuru ot verimi ortalamaları Çizelge 1'de verilmiştir.

Çizelge 1'de görüldüğü üzere, Gelemen üçgülü kuru ot verimi ortalaması 201.9 kg/da (%20 Gelemen üçgülü+%80 Arpa) ile 400.3 kg/da (Gelemen üçgülü %100) arasında değişmiş ve bu değişimin istatistiki olarak önemli olduğu ortaya çıkmıştır. Araştırmada Gelemen üçgülü kuru ot verimi bakımından yalın ekim Gelemen üçgülü, test edilen diğer karışım uygulamalarına göre önemli derecede daha yüksek değer göstermiştir. Bunun yanında, en düşük Gelemen üçgülü kuru ot verimi ortalaması %20 Gelemen üçgülü + %80 karışımında tespit edilirken, Gelemen üçgülünün arpa ile yer aldığı karışım uygulamaları söz konusu karışımla benzer istatistiki grupta yer almıştır. Karışım uygulamalarının ortalaması olarak Gelemen üçgülü kuru ot verimi ortalaması ise 250.3 kg/da olarak saptanmıştır. Yalın ekim Gelemen üçgülünün yabancı otlara, Gelemen üçgülü ile arpanın farklı tohumluk oranlarındaki karışım uygulamalarında ise Gelemen üçgülünün yabancı otlar ve arpaya karşı rekabet üstünlüğü gösteremediği söylenebilir. Nitekim Caballero vd. (1995), farklı tohumluk oranlarındaki baklagil tahıl karışımlarında, baklagil türünün tahıllarla rekabet edemediğini ve buna bağlı olarak verim kayıplarının ortaya çıktığını rapor etmişlerdir.

Arpa kuru ot verimi

Araştırmada yalın ekim arpa ve arpanın Gelemen üçgülü ile farklı tohumluk oranlarındaki karışımlarından saptanan arpa kuru ot verimi ortalamaları Çizelge 1'de verilmiştir.

Çizelge 1'de izlendiği üzere, arpa kuru ot verimi 441.8 kg/da (%80 Gelemen üçgülü+%20 Arpa) ile 893.5 kg/da (Arpa %100) arasında değişmiş ve bu değişimin istatistiki olarak önemli olduğu ortaya çıkmıştır. Araştırmada arpa kuru ot verimi ortalaması yalın ekim arpada, test edilen diğer karışım uygulamalarına göre önemli derecede daha yüksek değer göstermiştir. Bunun yanında arpa kuru ot verimi ortalaması %80 Gelemen üçgülü+%20 Arpa karışımında, %40 Gelemen üçgülü+%60 Arpa karışımı hariç test edilen diğer karışım uygulamalarına göre önemli derecede daha düşük değer göstermiştir. Karışım uygulamalarının ortalaması olarak ortalama arpa kuru ot verimi ise 631.5 kg/da olarak tespit edilmiştir. Bu sonuçlar, yüksek kardeşlenme eğiliminde olan arpanın yabancı otlara ve Gelemen üçgülü ile karışımlarında rekabet üstünlüğü olduğunu ortaya koymaktadır (Salama, 2020).



Kuru yabancı ot verimi

Araştırmada Gelemen üçgülü ve arpanın yalın ekimleri ile farklı karışım uygulamalarında saptanan kuru yabancı ot verimi ortalamaları Çizelge 1'de verilmiştir.

Çizelge 1'de de görüldüğü üzere, farklı karışım uygulamalarında kuru yabancı ot verimi ortalaması 12.6 kg/da (Arpa %100) ile 190.6 kg/da (Gelemen üçgülü %100) arasında değişmiş ve bu değişimin istatistiki olarak önemli olduğu ortaya çıkmıştır. Araştırmada kuru yabancı ot verimi ortalaması yalın ekim Gelemen üçgülünde, diğer karışım uygulamalarındakine göre önemli derecede daha yüksek değer verirken, kuru yabancı ot verimi ortalaması yalın ekim arpa ve benzer istatistiki grupta yer alan %20 Gelemen Üçgülü+%80 Arpa karışımında, diğer karışım uygulamalarındakine göre önemli derecede daha düşük değer göstermiştir. Bu sonuçlar, arpanın karışımda yer alan Gelemen üçgülünün yanında (Çizelge 1) yabancı otlara karşı rekabet avantajının olduğunu, Gelemen üçgülünün ise yabancı otlara karşı rekabet edemediğini ortaya koymaktadır. Coruh ve Tan (2016) çokyıllık baklagil tesisinde arkadaş bitki olarak kullanılan tahıl türlerinin yabancı ot kontrolünde başarı sağladığını bildirmişlerdir. Nitekim bizim çalışmamızda da arpanın karışıma katılma oranının artmasıyla kuru yabancı ot verimi linear olarak azalmıştır.

Yabancı ot türlerinin kompozisyondaki oranı

Araştırmada Gelemen üçgülü ve arpanın yalın ekimleri ile farklı tohumluk oranlarındaki karışımlarından saptanan yabancı ot türlerinin yabancı ot kompozisyondaki oranları Şekil 2'de verilmiştir.

Şekil 2. Gelemen üçgülü ve arpanın yalın ekimleri ile farklı tohumluk oranlarındaki karışımlarından saptanan yabancı ot türlerinin yabancı ot kompozisyonundaki oranları

Şekil 2'de görüldüğü üzere, Gelemen üçgülü ile arpanın farklı karışım uygulamalarında *Apiaceae* familyasından 2 tür, *Asteraceae* familyasından 4 tür, *Brassicaceae* familyasından 1 tür, *Euphorbiaceae* familyasından 2 tür, *Fabaceae* familyasından 3 tür, *Papaveraceae* familyasından 2 tür, *Poaceae* familyasından 1 tür, *Primulaceae* familyasından 1 tür, *Rubiaceae* familyasından 1 tür ve *Solanaceae* familyasından 1 tür olmak üzere toplam 18 tür tespit edilmiştir. Araştırmada Gelemen üçgülünün yalın ekiminde ve Gelemen üçgülünün arpa ile farklı tohumluk oranlarındaki karışımlarında yabani yulaf (*Avena fatua* L.) ve yabani hardalın (*Sinapis arvensis* L.) yabancı ot kompozisyonundaki oranı yüksek olurken (Acar vd., 2011), yalın ekim arpada yabani yulaf gözlenmemiş ve yabancı ot kompozisyonundaki yabani hardal oranı %41.2 olmuştur. Bunun yanında yalın ekim arpada yabancı ot kompozisyonundaki sert yonca (*Medicago rigidula* L.) oranı ise %41.7 olarak saptanmıştır.

Ham protein oranı

Araştırmada Gelemen üçgülü ve arpanın yalın ekimleri ile farklı karışım uygulamalarından saptanan ham protein oranı ortalamaları Çizelge 2'de verilmiştir.

Çizelge 2'de de görüldüğü üzere, farklı karışım uygulamalarında ham protein oranı ortalaması %13.4 (Arpa %100) ile %20 (Gelemen üçgülü %100) arasında değişmiş ve bu değişimin istatistiki olarak önemli olduğu ortaya çıkmıştır. Yalın ekim Gelemen üçgülünde ham protein oranı ortalaması, benzer istatistiki grupta yer alan yalın ekim arpa ve Gelemen üçgülünün arpa ile farklı tohumluk oranlarındaki karışım uygulamalarındakine göre istatistiki olarak önemli derecede daha yüksek değer vermiştir. Diğer taraftan, Gelemen üçgülü ve arpanın yalın ekimleri ile farklı karışım uygulamalarının ortalaması olarak ortalama ham protein oranı ise %15.1 olmuştur. Bir baklagil olan Gelemen üçgülünün buğdaygillere göre daha yüksek protein oranına sahip olması ve karışım uygulamalarında arpanın Gelemen üçgülüne göre kompozisyondaki oranının fazla olması, yalın Gelemen üçgülünün diğer karışım uygulamalarına göre daha yüksek ham protein oranına sahip olmasının nedeni olarak gösterilebilir (Salama ve Badry, 2015; Yucel vd., 2018). Nitekim De Santis vd. (2004), baklagil bitkilerinin yapraklarının yumuşak dokulu olduğunu ve buğdaygillere göre daha yüksek protein oranına sahip olduğunu rapor etmiştir.

NDF oranı

Araştırmada Gelemen üçgülü ve arpanın yalın ekimleri ile farklı tohumluk oranlarındaki karışım uygulamalarından saptanan NDF oranı ortalamaları Çizelge 2'de verilmiştir.

Çizelge 2'de görüldüğü gibi, farklı karışım uygulamalarında NDF oranı ortalaması %38.3 ile %62.5 arasında değişmiş ve bu değişimin istatistiki olarak önemli olduğu ortaya çıkmıştır. Araştırmada NDF oranı ortalaması yalın ekim Gelemen üçgülünde, benzer istatistiki grupta yer alan yalın ekim arpa ile arpa ve Gelemen üçgülünün farklı tohumluk oranlarındaki karışımlarındakine göre önemli derecede daha yüksek değer göstermiştir. Bunun yanında, farklı karışım uygulamalarının ortalaması olarak ortalama NDF oranı ise %55.3 olarak tespit edilmiştir. NDF bitkinin olgunluk düzeyini belirleyen ve çiftlik hayvanlarının yem alımını doğrudan etkileyen orandır (Yavuz vd., 2009). NDF oranı düştükçe sindirilebilirlik artmakta ve çiftlik hayvanlarının yem alımı da artmaktadır (Pedraza vd., 2017). Araştırmamızda yalın ekim Gelemen üçgülü, arpanın yalın ekimi ve Gelemen üçgülü ile farklı tohumluk oranlarındaki karışımlarına göre daha yüksek NDF oranı değeri vermiştir (Salama, 2015).

Çizelge 2. Gelemen üçgülü ve arpanın yalın ekimleri ile farklı tohumluk oranlarındaki karışımlarından saptanan ham protein, NDF, ADF oranı ve nispi yem değeri ortalamaları

Karışım Uygulamaları	Ham protein oranı (%) **	NDF oranı (%) **	ADF Oranı (%) ö.d.	Nispi yem değeri **
Gelemen üçgülü (%100)	20.0 a	38.3 b	33.9	152.2 a
Arpa (%100)	13.4 b	62.5 a	37.5	89.0 b
%20 Gelemen üçgülü + %80 Arpa	13.9 b	59.5 a	38.9	91.7 b
%40 Gelemen üçgülü + %60 Arpa	14.4 b	56.9 a	37.4	98.3 b
%60 Gelemen üçgülü + %40 Arpa	13.7 b	58.4 a	38.3	94.7 b
%80 Gelemen üçgülü + %20 Arpa	15.3 b	56.4 a	36.2	100.2 b
Ortalama	**15.1**	**55.3**	**37.0**	**104.3**

+) Aynı sütunda benzer küçük harflerle gösterilen ortalamalar arasında Duncan testine göre P<0.05 önem düzeyinde istatistiki olarak fark yoktur.

**) P≤0.01 düzeyinde önemli, ö.d.: önemli değil (P>0.05)

ADF oranı

Araştırmada Gelemen üçgülü ve arpanın yalın ekimleri ile farklı tohumluk oranlarındaki karışım uygulamalarından saptanan ADF oranı ortalamaları Çizelge 2'de verilmiştir.

Çizelge 2'de izlendiği gibi, araştırmada yer alan türlerin yalın ekimleri ile farklı karışım uygulamalarında saptanan ADF oranı ortalaması %33.9 ile %38.9 arasında değişmiş ve bu değişimin istatistiki olarak önemli olmadığı bulunmuştur. Araştırmada en düşük ADF oranı ortalaması yalın ekim Gelemen üçgülünde tespit edilirken, ADF oranı ortalaması bakımından söz konusu karışım uygulamasını %36.2 ile %80 Gelemen üçgülü+ %20 Arpa karışımı ve %37.4 ile %40 Gelemen üçgülü + %60 Arpa karışımı izlemiştir. Bunların yanında, farklı karışım uygulamalarının ortalaması olarak ortalama ADF oranı ise %37.0 olmuştur.

Nispi yem değeri

Gelemen üçgülü ve arpanın yalın ekimleri ile farklı tohumluk oranlarındaki karışımlarından saptanan nispi yem değeri ortalamaları Çizelge 2'de verilmiştir.

Çizelge 2'de görüldüğü gibi, Gelemen üçgülü ve arpanın yalın ekimleri ile farklı tohumluk oranlarındaki karışımlarında nispi yem değeri ortalaması 89.0 ile 152.2 arasında değişmiş ve bu değişimin istatistiki olarak önemli olduğu ortaya çıkmıştır. Nispi yem değeri ortalaması yalın ekim Gelemen üçgülünde, benzer istatistiki grupta yer alan diğer karışım uygulamalarındakine göre önemli derecede daha yüksek değer göstermiştir. Bunun yanında, farklı karışım uygulamalarının ortalaması olarak ortalama nispi yem değeri 104.3 olmuştur. Nispi yem değeri, NDF ve ADF değerleri ile negatif ilişkide bulunan ve yemin kalitesini rakamsal olarak ifade eden bir indekstir (Yavuz vd., 2009; Cinar vd., 2019). Nispi yem değerine göre, Ball vd. (2001) tarafından (151'den yüksek; en yüksek kalite, 151-125; yüksek kalite, 124-103; iyi, 102-87; orta, 86-75; kötü ve 75'den daha düşük; çok kötü) yemin kalitesi kategorize edilmiştir. Bu değerlere göre yalın Gelemen üçgülü en yüksek kalitede yer alırken, yalın arpa ve Gelemen üçgülünün arpa ile karışımları orta sınıfta yer almıştır.

SONUÇ

Araştırma bulguları, yüksek kardeşlenme eğiliminde olan arpanın yalın ekiminde ve özellikle arpa oranı yüksek karışım uygulamalarında, hem yüksek kuru ot verimi verdiğini hem de yabancı ot kontrolünde avantaj sağlandığını ortaya koymuştur. Diğer taraftan, yalın ekilen Gelemen üçgülünde ve Gelemen üçgülünün karışımdaki oranının artırılması ile yem kalitesinin arttığı anlaşılmıştır. Bu araştırma, karışık ekim sistemleri ile kaba yem üretimi yapacak üreticilere ön bilgi verecek olup, yapılacak araştırmalar için kaynak oluşturacaktır.

ÖZET

Doku kültürü, bitki biyoteknolojisinde güçlü bir araç olmasının yanı sıra meyve yetiştiriciliğinde sürdürülebilir, verimli ve kaliteli üretim sistemlerinin geliştirilmesine önemli katkılar sağlamaktadır. Meyve yetiştiriciliğinde doku kültürü uygulamaları, bitkilerin klonal çoğaltımı yoluyla genetik olarak homojen materyal elde edilmesini ve genetik modifikasyonlar aracılığıyla hastalıklara karşı daha dirençli hale getirilmesini mümkün kılmaktadır. Bu teknikler, meyve türlerinin üretiminde hastalıksız ve yüksek kaliteli bitkiler elde edilmesini sağlarken, aynı zamanda belirli fonksiyonel bölgelerin ve metabolik bileşiklerin gelişimi üzerinde olumlu etkiler yaratmaktadır. Son yıllarda yapılan araştırmalar birçok meyve türünde doku kültürü ve mikroçoğaltım tekniklerinin yüksek başarı oranlarına ulaştığını ortaya koymuştur. Meristem kültürü, hızlı çoğaltımın yanı sıra genetik olarak daha stabil ve ticari değeri yüksek bitki materyallerinin elde edilmesine olanak tanımaktadır. Ancak, doku kültürü uygulamaları genetik stabilite kaybı, kalus kalitesinin düşmesi, fenolik madde salınımı, kontaminasyon ve adaptasyon sürecindeki zorluklar gibi bazı sınırlayıcı faktörlerle karşı karşıyadır. Bu sorunların aşılabilmesi için uygun eksplant seçimi, kültür ortamı bileşiminin optimize edilmesi, uygun büyüme düzenleyicilerinin kombinasyonu ve ışık koşullarının kontrolü büyük önem taşımaktadır. Doku kültürü tekniklerindeki ilerlemeler, yalnızca üretim verimliliğini değil, aynı zamanda çevresel sürdürülebilirliği de artırmaktadır. Geleneksel yöntemlere göre daha az alan ve su kullanımı gerektiren bu teknikler, özellikle su kaynakları sınırlı bölgelerde avantaj sağlamaktadır. Ayrıca, doku kültürüyle üretilen bitkilerin hastalıklara karşı daha dirençli ve genetik olarak kararlı olması, uzun vadede meyve yetiştiriciliğinde

ekonomik kazanç, çevresel denge ve biyolojik çeşitliliğin korunması açısından önemli bir potansiyel sunmaktadır.

Sonuç olarak, meyvecilikte doku kültürü uygulamaları; başarı oranları, karşılaşılan zorluklar ve çözüm stratejileri açısından değerlendirildiğinde, modern tarımda sürdürülebilir üretimi destekleyen ve gelecekte daha geniş uygulama alanı bulması beklenen yenilikçi bir teknolojik yaklaşım olarak öne çıkmaktadır.

Anahtar Kelimeler: Doku kültürü, *in vitro* teknikler, meyve türleri, mikroçoğaltım

ADVANCES, CHALLENGES, AND SOLUTION STRATEGIES IN TISSUE CULTURE APPLICATIONS OF FRUIT SPECIES

ABSTRACT

Tissue culture is a powerful and versatile tool in plant biotechnology, contributing significantly to the development of sustainable, efficient, and high-quality fruit production systems. In fruit cultivation, tissue culture enables the production of genetically homogeneous material through clonal propagation and the enhancement of disease resistance through genetic modification. These techniques not only ensure the production of disease-free and high-quality plants but also promote the development of specific functional tissues and metabolic compounds. Recent research has demonstrated the high effectiveness of tissue culture and micropropagation methods in numerous fruit species. Meristem culture facilitates rapid plant multiplication and allows the production of genetically stable and commercially valuable plant materials. However, tissue culture applications face several challenges, including genetic instability, reduced callus quality, phenolic exudation, contamination, and difficulties during the acclimatization stage. Overcoming these limitations requires careful explant selection, optimization of culture medium composition, appropriate combinations of growth regulators, and control of environmental conditions such as light and temperature. Advancements in tissue culture methodologies not only improve production efficiency but also contribute to environmental sustainability. Compared to conventional propagation techniques, tissue culture requires less space and water, offering particular advantages in regions with limited natural resources. Furthermore, tissue-cultured plants—with their enhanced genetic stability and disease resistance—provide long-term economic benefits, environmental resilience, and support for biodiversity conservation in fruit cultivation.

In conclusion, when evaluated in terms of success rates, challenges, and solution strategies, tissue culture applications in fruit growing represent an innovative technological approach that supports sustainable and environmentally friendly practices in modern agriculture and holds great potential for broader use in the future.

Keywords: Tissue culture, *in vitro* techniques, fruit species, micropropagation

1. GIRIŞ

Doku kültürü, bitki biyoteknolojisinin en kapsamlı ve etkili yöntemlerinden biri olarak, meyve türlerinin üretiminde önemli bir rol oynamaktadır. Bu teknik, genetik olarak homojen ve sağlıklı bitki materyalleri elde edilmesine olanak tanırken, aynı zamanda bitkilerin klonal çoğaltılması ve genetik modifikasyon süreçlerinde temel bir yapı taşı oluşturur (Silva ve ark., 2019; Espinosa-Leal ve ark., 2018). Meyve yetiştiriciliği, dünya genelinde artan gıda talebi ve sınırlı tarım alanları nedeniyle sürdürülebilir ve verimli üretim sistemleri geliştirme ihtiyacı taşımaktadır. Doku kültürü uygulamaları bu bağlamda, hastalıklara karşı dirençli ve yüksek verimli bitki türlerinin yetiştirilmesinde dikkate değer başarılara ulaşmıştır (Wada ve ark., 2020; Abebaw ve ark., 2021).

Meyve türlerinin doku kültürü ile üretimi, bitkilerin genetik potansiyelini en optimize şekilde kullanabilmekte ve üreticilere yüksek kalite ve hastalıksız ürünler sunabilmektedir. Özellikle meristem kültürü, bu süreçte yüksek hız ve genetik istikrar sağlamakla birlikte, tarım ekonomisinde ve gıda güvenliğinde ciddi katkılar sağlamaktadır (Wada ve ark., 2020; Chavan ve ark., 2024). Doku kültürü yöntemleri, bitkilerin gelişimsel süreçlerinin kontrol edilmesi ve özelleştirilmesi için de kullanılmakta, bu da meyve türlerinin istenen fiziksel ve kimyasal özelliklere sahip olması açısından büyük önem taşımaktadır (Espinosa-Leal ve ark., 2018; Galatalı ve ark., 2021).

Bununla birlikte, meyve doku kültürü uygulamaları bazı zorluklarla da karşı karşıya kalmaktadır. Genetik stabilite kaybı, kalus kalitesinin düşmesi, kontaminasyon ve adaptasyon problemleri gibi konular, bu yöntemlerin etkinliğini kısıtlamaktadır (Silva ve ark., 2019; Galatalı ve ark., 2021; Godana ve ark., 2023). Bu sorunların üstesinden gelebilmek için eksplant seçimi, kültür ortamı bileşimi, büyüme düzenleyicileri ve ışık koşulları gibi parametrelerin optimize edilmesi büyük öneme sahiptir (Espinosa-Leal ve ark., 2018; Costa ve ark., 2019). Ayrıca, doku kültürü tekniklerinin çevresel sürdürülebilirliğe sağladığı katkılar da göz ardı edilmemelidir; bu uygulamalar geleneksel yöntemlere kıyasla daha az alan ve su tüketmektedir, bu da özellikle su kaynaklarının kısıtlı olduğu bölgelerde büyük avantaj sağlamaktadır (Wada ve ark., 2020; Bhakta ve ark., 2020).

Sonuç olarak, doku kültürü uygulamaları, meyve yetiştiriciliğinde yenilikçi bir teknolojik yaklaşım olarak dikkat çekmekte ve sürdürülebilir üretim sistemlerinin geliştirilmesinde önemli bir rol oynamaktadır. Bu uygulamaların başarısı, karşılaşılan zorluklarla başa çıkma stratejileri ile daha da pekiştirilebilir. Gelecekte, doku kültürü tekniklerinin daha geniş uygulama alanları bulması ve modern tarımın temel unsurlarından biri olarak ön plana çıkması beklenmektedir (Shishodia ve ark., 2025; Hasan ve ark., 2020).

Meyve bitkileri, kaliteli tohum üretiminin güç olması, çelikle çoğaltmanın sınırlı verim göstermesi veya hastalık taşıma riskinin yüksek olması gibi nedenlerle, doku kültürü teknikleri için son derece uygun materyaller sunmaktadır. Doku kültürü, aseptik koşullarda hücrelerin, dokuların ya da organların çoğaltılması ve rejenerasyonu yolu ile klonal çoğaltma, temiz materyal elde etme, genetik ıslah ve koruma gibi birçok avantaj sağlar. Örneğin, bu teknikler hastalıksız anaç üretiminden, nadir veya zorlu çoğaltılan meyvecilerin çoğaltılmasına kadar geniş bir uygulama alanına sahiptir. Bu bağlamda, meyve türlerinde doku kültürü uygulamalarının faydaları büyük olsa da, özgül meyve türlerine uyarlanması sırasında birtakım teknik ve pratik zorluklar ortaya çıkmaktadır.

Bu çalışmada, meyve türlerinde doku kültürü bağlamında üç ana başlık altında konular ele alınacaktır: (1) gelişmeler/yenilikler, (2) karşılaşılan zorluklar ve (3) çözüm stratejileri. Son bölümde, bulguların özeti ile birlikte ileriye dönük öneriler sunulacaktır.

2. Doku kültürü uygulamalarında gelişmeler

2.1 Mikrokültür ve klonal çoğaltma

Meyve türlerinde klonal çoğaltma amacıyla doku kültürü tekniklerinin artan şekilde kullanıldığına dair çok sayıda çalışma vardır. Örneğin, yüksek verimli ve hastalıksız anaç üretimi için mikroçoğaltma sistemleri başarıyla uygulanmaktadır (Correia ve ark., 2024). Ayrıca, meyve türlerine özel besi ortamlarının ve düzenleyicilerin optimize edilmesiyle çoğaltma oranlarında iyileşme kaydedilmiştir (Güney, 2019; Georgieva ve ark., 2021).

Mikrokültür, bitki biyoteknolojisinde önemli bir konum kazanmış bir tekniktir ve meyve türlerinin klonal çoğaltma süreçlerinde hayati bir rol oynamaktadır. Bu yöntem, genetik olarak homojen ve patojenlerden arınmış bitkilerin hızla üretilmesini sağlarken, tarımsal verimliliği artırmak için de kritik bir mekanizmadır (Hailu ve ark., 2022; Sharma ve ark., 2023). Klonal çoğaltmada, belirli bir bitkiden alınan eksplantların (örneğin meristematik dokular) laboratuvar ortamında çoğaltılması ve gelişim sürecinin yönlendirilmesi hedeflenir. Böylece, istenen karakteristiklere sahip bitkilerin yüksek miktarda ve kısa sürede üretilmesi mümkün hale gelir (Hailu ve ark., 2022).

Mikrokültür tekniği, özellikle tarım endüstrisinde çeşitli avantajlar sunmaktadır. Bu yöntemle üretilen bitkiler, saha koşullarında en az direnç gösterecek şekilde hastalıklara karşı daha dayanıklı hale getirilmektedir (Sharma ve ark., 2023). Bitkilerin farklı gelişim aşamalarında, kültür ortamında kullanılan büyütme düzenleyicileri, organogenez sürecini etkileyerek bitkilerin kök ve sürgün gelişimini optimize eder (Elyazid ve ark., 2021). Bunun yanı sıra, mikrokültür uygulamaları, bitki türlerinin genetik çeşitliliğini artırarak yeni genotiplerin oluşturulmasına yardımcı olur; bu durum, meyve türlerinin genetik kaynaklarının korunması ve iyileştirilmesi açısından önem taşır (Hailu ve ark., 2022; Cappelletti ve ark., 2016; Güney, 2023).

Ancak mikrokültür ve klonal çoğaltma uygulamaları bazı güçlükler içermektedir. Özellikle transplantasyon sonrası aklimatizasyon süreci büyük zorluklar içermektedir. Laboratuvar ortamında sağlanan yüksek nem düzeyleri, bitkilerin dış ortam koşullarında kurumasına neden olabilmekte ve bu da toprağa aktarılan bitkilerin sağlığını etkilemektedir (Moreno-García ve ark., 2025). Ayrıca, genetik stabilite kaybı ve mikroorganizma kontaminasyonları gibi sorunlar, klonal çoğaltmanın verimliliğini tehdit eder (Nguyen & Ho, 2019; Jiang ve ark., 2015). Bu sıkıntıların aşılması için, eksplant seçimi ve kültür ortamlarının optimize edilmesi hayati öneme sahiptir. Özellikle, ideal büyüme faktörlerinin belirlenmesi ve uygulanması başarılı bir mikrokültür süreci için kritik öneme sahiptir (Wijerathna-Yapa ve ark., 2022).

Gelişmiş mikrokültür teknikleri, su kullanımını önemli ölçüde azaltarak çevresel sürdürülebilirliğe de katkıda bulunmaktadır. Düşük alan ihtiyacı, yerel ekosistemler üzerindeki baskıyı azaltmakta ve uzun vadede tarımsal üretkenliğin artırılmasına yardımcı olmaktadır (Hailu ve ark., 2022; Yasemin ve Beruto, 2024). Gelecekte, mikrokültür ve klonal çoğaltma uygulamalarının daha fazla yaygınlaşması ve çeşitli meyve türleri için optimize edilmiş tekniklerin geliştirilmesi beklenmektedir, bu da meyve yetiştiriciliğinde sürdürülebilir bir yaklaşımın temelini oluşturacaktır (Domingues ve ark., 2024).

2.2 Somatik embriyogenez, organogenez

Somatik embriyogenez (SE) ve organogenez, bitki doku kültürü uygulamalarında önemli rol oynayan iki temel rejeneratif süreçtir. Bu süreçler, meyve türlerinin klonal çoğaltımının gerçekleştirilmesinde ve genetik çeşitliliğin artırılmasında kritik öneme sahiptir (Wang ve ark., 2023; Guan ve ark., 2016). Somatik embriyogenez, bitki hücrelerinin, embriyo benzeri yapılar oluşturmak için dedifferentiyasyon ve yeniden farklılaşma sürecine girmesi olarak tanımlanabilir. Bu yöntem, genetik çeşitliliğin korunmasında ve araştırmalarda potansiyel

taşımaktadır, çünkü homojen ve hastalıksız bitki materyalleri üretebilme yeteneğine sahiptir (Mohammadi ve ark., 2023; Silva ve ark., 2009).

Somatik embriyogenez sürecinde uygun bir eksplant seçimi ve büyüme düzenleyicilerinin (auxin ve sitokinin gibi) kullanımı büyük önem taşır (Silva ve ark., 2009). Örneğin, Passiflora türlerinde yapılan araştırmalar, zygotik embriyoların kullanımı ile somatik embriyogenez sürecinin etkinliğinin artırılabileceğini göstermektedir (Fernando ve ark., 2007). Somatik embriyogenez, bitkilerin nadir hastalıklara ve çevresel stres faktörlerine karşı dayanıklılığını artırmak için de kullanılmaktadır (Mohammadi ve ark., 2023). Dolayısıyla, bu teknik, genetik mühendislik ve elde edilen embriyoların genetik stabilitesini göz önünde bulundurarak, gelecekte çeşitli meyve türlerinin geliştirilmesinde önemli bir araç olarak dikkate alınmalıdır (Aroonluk ve ark., 2019).

Diğer bir önemli süreç ise organogenezdir. Organogenez, doku kültürü ortamında bitkisel organların (kök, dal, yaprak) oluşumunu ifade eder. Bu süreç, normal şartlarda bitkinin gelişimi sırasında meydana gelen doğal olayları taklit ederek, belirli bir organ oluşturma kapasitesine sahip hücrelerin belirlenmesini sağlar (Huh ve ark., 2017; Rodge ve Patil, 2020). Organogenez, özellikle büyük hacimlerde ve kısa sürelerde bitki üretiminin sağlanmasında önemli bir rol oynamaktadır (Debnath ve Arigundam, 2020). Bunun yanı sıra, organogenez ile elde edilen bitkiler genellikle daha az genetik varyasyon gösterirler, bu da ekonomik olarak avantaj sağlayan homojen bir üretim sağlar (Karakoyun ve ark., 2023).

Organogenez sürecinde, bitki büyüme düzenleyicilerine (özellikle BAP ve NAA gibi hormonlar) uygun kombinasyonların kullanılması, değişik organların oluşumunu sağlar (Huh ve ark., 2017). Bu uygulamalar, bitki gelişiminde farklı aşamalarda kritik olduklarından, genç yapraklar ve kollar genellikle bu süreçte en ideal eksplantlar olarak tercih edilir (Debnath, 2007). Bu bağlamda, organogenez ve somatik embriyogenez süreçlerinin birlikte kullanımı, bitki kültüründeki tekrar eden sorunları minimize etmekte ve daha sağlıklı bir çoğaltım süreci sağlamaktadır (Ali-Dinar ve ark., 2021).

Ayrıca, hem somatik embriyogenez hem de organogenez süreçlerinde elde edilen callus, genellikle genetik modifikasyonlar için bir başlangıç materyali olarak kullanılmaktadır. Callus hücre grupları, embriyo ve organ oluşumunun yanı sıra, genetik materyalin transferi için de yararlı bir platform sunmaktadır (Zhang ve ark., 2022; Elsheikh ve ark., 2013). Bu nedenle, somatik embriyogenez ve organogenez, yalnızca bitki biyoteknolojisi için değil, aynı zamanda tarımsal verimlilik açısından da büyük bir potansiyele sahiptir.

2.3 Hastalıklardan ari materyallerin çoğaltımı

Meyve türlerinde hastalıksız anaç elde edilmesi büyük önem taşır. Doku kültürü yöntemi, anaç materyallerinin virus veya viroidlerden arındırılmasında yaygın olarak kullanılmaktadır. Bu yolla sağlıklı ve homojen anaç üretimi mümkün kılınmış, pazara sunulan materyal kalitesi artmıştır (Penna ve Jain, 2023).

Hastalıklar, bitki üretiminde en büyük tehditlerden biridir ve meyve türlerinde verim kayıplarına neden olan önemli faktörler arasında yer alır. Hastalıklardan ari materyallerin çoğaltımı, bitki biyoteknolojisinde ve tarım pratiğinde kritik bir öneme sahiptir. Bu yöntem, bitkilerin sağlıklı ve genetik olarak homojen materyallerden elde edilmesini sağlar, böylece hem verimlilik artar hem de ürün kalitesi yükselir (Huh ve ark., 2017).

In vitro bitki kültürü, hastalıklardan ari materyallerin üretiminde tercih edilen yöntemlerden biridir. Bu süreçte, hastalık taşıyan bitkilerin maksimum derecede dezenfekte edilmesi ve yapılan kültür işlemlerinin mikroorganizmalar açısından temiz bir ortamda gerçekleştirilmesi gereklidir (Huh ve ark., 2017). Eksplantların temizliği ve hastalıksız olması, başarılı bir doku kültürü sürecinin temelini oluşturur. Literatürde, sağlıklı eksplantların kullanımı ile yapılan in

vitro çoğaltım yöntemlerinin, bitki kökenli hastalıkların kontrolünde etkili olduğu kanıtlanmıştır (Şener ve Kurt, 2022).

Özellikle meyve türleri, hastalıklara karşı hassasiyetleri nedeniyle in vitro kültür ortamında korunma ve çoğaltım işlemlerinin titizlikle yapılması gerekmektedir. Örneğin, *Passiflora edulis* gibi türlerin hastalıklardan ari bitki materyalleri ile çoğaltılması, bu bitkilerin hem üretiminde hem de sürdürülebilirliğinde olumlu sonuçlar vermektedir (Huh ve ark., 2017). Ayrıca, bu türlerin mikrokültür teknikleri ile hastalıklardan ari bir şekilde çoğaltılması, hem üretim sürecinin hızlanmasına hem de sağlık açısından daha kaliteli ürünlerin elde edilmesine yardımcı olmaktadır (Ngomuo ve ark., 2014; Güney, 2023).

Hastalıksız bitki materyallerinin elde edilmesi sırasında kullanılan büyüme düzenleyicileri (auxinler, sitokininler), bitki gelişimini etkileyerek sağlıklı ve dayanıklı materyallerin üretilmesine katkı sağlar. Bunun yanı sıra, in vitro çoğaltma süreçleri, bitkilerin genetik çeşitliliğini korurken, aynı zamanda sağlıklı bireylerin üretimini mümkün kılar. Bu süreçler, sağlıklı çeşitli bitkilerin elde ediliminde önemli bir yöntem sunar (Gaínza-Cortés ve ark., 2015).

Hastalıksız materyallerin çoğaltılması, tarımda yalnızca verim kaybını önlemekle kalmaz; aynı zamanda bitkilerin yüksek kaliteli ürünler vermesini de destekler. Alınan hastalıksız eksplantlar ile elde edilen bitkiler, genellikle daha dayanıklı ve verimlidir (Şener ve Kurt, 2022). Bu durum, hastalıklara karşı direnci artıran özelliklerin kazandırılmasına ve bu sayede daha sürdürülebilir tarım uygulamalarının oluşmasına olanak tanır (Gaínza-Cortés ve ark., 2015).

2.4 Optimizasyon ve biyoteknolojik entegrasyon

Doku kültürü sistemlerinde besi ortamlarının, hormon kombinasyonlarının ve rejenerasyon protokollerinin optimize edilmesiyle verim artışı sağlanmıştır. Ayrıca, moleküler markırlar, genetik transformasyon ve omik teknolojiler doku kültürü ile entegre edilmeye başlanmıştır (Pithiya ve ark., 2022).

Meyve türlerinde doku kültürü uygulamaları, mikrokültür, somatik embriyogenez, temiz materyal üretimi ve biyoteknolojik entegrasyon gibi alanlarda önemli ilerlemeler göstermiştir. Bu gelişmeler, meyve bahçeciliği ve anaç üretiminde kalite ve sürdürülebilirliği artırma potansiyeli taşımaktadır (Güney, 2019).

Kültür koşullarının optimize edilmesi, bitki dokusunun büyümesi ve gelişimi için gerekli olan ideal ortamın sağlanmasını içerir. Bu, genellikle besin ortamlarının bileşimi, pH düzeyi, ışık yoğunluğu ve sıcaklık gibi faktörlerin dikkatlice ayarlanmasını gerektirir. Örneğin, bitki büyüme düzenleyicileri olan auxin ve sitokininlerin kombinasyonları, somatik embriyogenez ve organogenez süreçlerinde kritik rol oynar; bu nedenle bu hormonların dozajlarının optimize edilmesi, başarılı doku kültürü uygulamalarında başarıya ulaşmada kilit faktördür (Qiang ve ark., 2020; Hesami ve ark., 2020).

Son yıllarda, biyoteknolojinin sunduğu yenilikler, bu optimizasyon süreçlerinin daha da geliştirilmesini mümkün kılmaktadır. Gelişmiş teknikler, mikro akışkan sistemler ve biosensörler gibi biyoteknolojik aletlerin kullanımı, doğru ve hızlı değerlendirme yaparak bitki kültürü koşullarının optimize edilmesini sağlamaktadır (Shishodia ve ark., 2025; Jamshidi ve ark., 2019). Bu tür entegre sistemler, özellikle metabolit sentezini artırmak ve bitkilerin besin verimliliğini sağlamak için kullanılmaktadır.

Bunlara ek olarak, bitki kültür teknikleri ve genetik mühendisliği uygulamalarının bir araya getirilmesi, etkinliğin artırılmasında önemli bir rol oynamaktadır. Yenilikçi yöntemlerle, belirli bitki türlerinin genetik özellikleri üzerinde değişiklikler yapılarak, daha yüksek kaliteli ve hastalıklara dayanıklı bitki çeşitleri elde edilebilir. Örneğin, Amerikan ginsenginin *(Panax quinquefolius*) doku kültürü uygulamalarının optimizasyonu, ginsenosid üretimini artırmaya

yönelik önemli katkılar sağlamıştır (Qiang ve ark., 2020; Nawrot-Chorabik & Pietrzykowski, 2018).

Hastalıksız bitki materyalleri elde etmek için in vitro koşulların optimize edilmesi, biyoteknolojik yöntemlerle birleştiğinde, bitki üretiminde sürdürülebilir bir yaklaşım sunar (Karim, 2022; Hesami ve ark., 2020). İleri biyoteknolojik yöntemler, bitki doku kültüründe olası kontaminasyonların önlenmesi ile ilgili çözümler geliştirmekte, bu da daha sağlıklı bitki materyallerinin elde edilmesine yardımcı olmaktadır (Rawal & Keharia, 2019; Mahna, 2013).

Bu bağlamda, özellikle yüksek değerli metabolitlerin üretimi için, hücre kültürlerinin optimum koşullarda yürütülmesi önem taşımaktadır. Bitki hücre kültürü ile elde edilen biyoaktif bileşenler, hem gıda hem de ilaç sektöründe kullanılabilen önemli doğal ürünlerdir. Örneğin, bitki hücre kültürü teknikleri, cilt bakımında kullanılan doğal antioksidanların üretiminde önemli bir rol oynamaktadır (Bouzroud ve ark., 2023; Georgiev ve ark., 2018). Metabolitlerin bu tür süreçler aracılığıyla üretilmesi, ticari pazarda büyük bir fırsat sunmakta, aynı zamanda doğanın korunmasına yarar sağlamaktadır.

3. Karşılaşılan Zorluklar

3.1 Kontaminasyon, aseptik koşul, maliyet

Doku kültürü sistemlerinde kontaminasyon (bakteri, fungus, vb.) hâlâ en yaygın teknik sorundur. Birçok meyve türü için anaç materyali güçlü sterilizasyon gerektirirken, bu aşamada rejenerasyon yeteneği azalabilmektedir. (Pithiya ve ark., 2022). Ayrıca, aseptik ortam, enerji tüketimi ve iş gücü maliyetleri doku kültürünün genişletilmesini sınırlamaktadır (Pandey ve ark., 2024).

Bitki doku kültürü uygulamalarında en yaygın sorunlardan biri kontaminasyondur. Kontaminasyon, genellikle bakteriyel ve fungal patojenlerin doku kültürü ortamında üremesi ile meydana gelir ve bu durum, bitki gelişimini olumsuz yönde etkileyebilir (Akdemir ve ark., 2016). Aseptik koşulların sağlanmaması, örneğin sterilizasyon işlemlerinin yetersiz yapılması, kontaminasyon riskini artırır. Kontaminasyonla başa çıkılması gerektiğinden, mikroorganizmalara karşı etkili önlemler alınması büyük önem taşır; bu genellikle steril ortam koşullarında ve uygun malzemelerle sağlanmalıdır (Tekdal, 2020).

Aseptik koşulların sağlanması, doku kültürü başarı oranını doğrudan etkileyen bir faktördür. Uygun aydınlatma, sıcaklık, nem ve aseptik şartların oluşturulması, bitki hücrelerinin veya dokularının sağlıklı bir şekilde gelişebilmesi için gereklidir. Aksi takdirde, ortamda bulunan patojenlerin kontrol altına alınamaması, doku kültürlerinin çökmesine ve beklenen sonuçların elde edilememesine yol açar. Örneğin, ortam kültürlerinde kullanılan besin çözeltilerinin mineral ve vitamin içeriğinin titizlikle optimize edilmesi gerekir, zira bu koşullar, bitki hücrelerinin gelişimini etkileyebilir (Okudur ve Ercan, 2016).

Doku kültürü süreçlerinin maliyetleri, genellikle küçük ölçekli işletmeler için engelleyici bir faktör olarak ortaya çıkmaktadır. Doku kültürü laboratuvar ekipmanları, steril malzemeler ve besin çözeltileri gibi giderler, başlangıç maliyetlerini artırmaktadır. Bunun yanı sıra, enerji tüketimi ve iş gücü maliyetleri de etkin bir doku kültürü sürecinin gerektirdiği önemli masraf kalemleridir. Yüksek maliyetler, küçük çiftçiler veya yeni girişimler için doku kültürlerinin uygulanabilirliğini zorlaştırabilir (Can ve Gürel, 2023).

3.2 Genotip bağımlılığı

Meyve türlerinde veya çeşitlerinde doku kültürü protokollerinin geliştirilmesi büyük ölçüde genotipe bağlıdır; yani bir çeşitte işe yarayan protokol başka bir çeşitte başarısız olabilir. Örneğin, muz (*Musa spp.*) için yapılan bir derlemede somatik embriyogenez etkinliğinin genotipe göre büyük farklılık gösterdiği belirtilmiştir.

Genotip bağımlılığı, belirli bir bitki genotipinin, doku kültürü koşullarında ne derece farklı bir performans sergilediğini gösterir. Farklı genotipler, benzer çevresel koşullara maruz kaldıklarında bile, farklı gelişim yolları izleyebilirler. Örneğin, bazı genotiplerin daha yüksek çoğaltım oranlarına sahip olduğu, bazılarının ise belirli hastalıklara karşı daha dirençli olduğu gözlemlenmiştir. Genotip bağımlılığı, bitki doku kültürü süreçlerinde düzgün bir şekilde göz önüne alınmalıdır, çünkü bu durum, istenen özelliklere sahip bitkilerin seçiminde ve elde edilmesinde kritik öneme sahiptir.

Özellikle, bitkisel ürünlerin kalitesinin artırılmasında ve genetik çeşitliliğin korunmasında genotip bağımlılığı belirleyici bir faktördür. Farklı genotiplerin doku kültürü ve genetik modifikasyon teknikleri ile bir araya getirilmesi, daha iyi verimliliğe ve hastalıklara karşı dirençli bitkilerin yetiştirilmesine olanak tanır.

3.3 Akklimatizasyon

İn vitro üretilmiş bitkilerin sera/mezopotamya aşamasından dış ortama adaptasyonu (akklimatizasyon) sıkıntılıdır. Bu aşamada yaşayabilirlik, kök gelişimi, stres toleransı gibi faktörler başarısız olma nedenlerindendir.

Akklimatizasyon, mikro ortamdan makro ortama geçişi ifade eder ve genellikle bitkilerin dış ortamdaki sıcaklık, nem, ışık ve besin koşullarına adapte olmasını kolaylaştıran aşamaları içerir. Bu süreç, laboratuvar ortamında üretilen bitkilerin, bitki örtüsünün nem seviyeleri, sıcaklık değişimleri ve güneşli veya karanlık gibi çevresel faktörlere karşı dayanıklılık kazanmasına yardımcı olur (Güney, 2023; Akyüz ve ark., 2024). Akklimatizasyon, kriterler ve protokoller belirlenmiş bir süreçtir. Genellikle, bitkilerin laboratuvar ortamındaki mikro iklim koşulları ile dış ortamın iklim koşulları arasındaki farkların yavaşça azaltılması hedeflenir. İlk aşama, bitkilerin dış ortamda maruz kalacağı stres faktörlerine programlanmasıdır.

Dış koşullara adaptasyon, bitkinin fiziksel ve metabolik süreçlerinin çevrelerine etkili bir şekilde yanıt vermesini sağlamaktadır. Bu adaptasyon, bitkilerin stres toleransını artırarak kuraklık, aşırı sıcaklık veya soğuk hava gibi zorlu koşullara karşı daha dirençli hale gelmelerine yardımcı olur. Mikoriza aşılamasının bu süreçte etkili olduğu belirlenmiştir; doku kültürü ile üretilen bitkilerin dış koşullara alıştırılmasında önemli bir rol oynar.

Meyve türleri, dış ortamın iklimsel koşullarına uyum sağlama sürecinde çeşitli zorluklarla karşı karşıya kalabilir. Özellikle, su eksikliği ve aşırı sıcaklık gibi stres koşulları, bitkilerin gelişimini olumsuz etkileyebilir. Bu gibi koşullarda, akklimatizasyon sürecinin başarılı bir şekilde yürütülmesi, bitkilerin adaptasyon yeteneğini artırarak dış ortam entegrasyonunu sağlar (Güney, 2019).

3.4 Genetik stabilite ve somaklonal varyasyon

Bitki doku kültürü, klonal çoğaltmanın sağlanmasında ve bitkilerin ıslahında geniş uygulamalara sahip bir tekniktir. Ancak, bu süreç aynı zamanda genetik stabilite ve somaklonal varyasyon gibi önemli zorlukları da beraberinde getirir. Somaklonal varyasyon, in vitro çoğaltım esnasında ortaya çıkan genetik veya epigenetik değişikliklerdir ve bu değişiklikler, bitkilerin belirli özelliklerini etkileyebilir (Guan ve ark., 2016; Vítámvás ve ark., 2019; Beaudoin ve ark., 2021).

Genetik stabilite, bir bitki türünün genetik yapısının, doku kültürü uygulamaları sırasında değişmeden kalma yeteneğidir. Bu stabilitenin korunması, özellikle tarımsal uygulamaların sürdürülebilirliği açısından kritik öneme sahiptir. Genetik stabilitenin sağlanması, bitkilerin tutarlı özellikler göstermesini ve bu sayede yüksek verimlilikle elde edilmesini garanti eder. Doku kültürü süreçlerinde meydana gelen genetik değişiklikler, özellikle çoğaltım aşamasında istenmeyen varyasyonların oluşmasına sebep olabilir (Das ve ark., 2016; Mallaya ve

Ravishankar, 2012; Wang ve ark., 2013). Örneğin, bir bitkinin belirli hastalıklara karşı direncini artırmak amacıyla yapılan doku kültürü çalışmaları, bazen istenmeyen somaklonal varyasyonlara yol açarak genetik istikrarı tehlikeye atabilir (Li ve ark., 2010).

Somaklonal varyasyon, doku kültürü ortamında hücrelerin stres altında kalmalarından kaynaklanan genetik değişikliklerdir. Bu varyasyonlar, kromozomal yeniden düzenlenmeler, DNA metilasyon değişiklikleri ve nokta mutasyonları gibi süreçler sonucu meydana gelir (Beaudoin ve ark., 2021; Regalado ve ark., 2015). Somaklonal varyasyonlar, genellikle olumlu ya da olumsuz etkiler doğurabilir; bazı durumlarda, istenen özelliklere sahip yeni bitki çeşitlerinin elde edilmesine fırsatlar doğururken, diğer durumlarda ise istenen genetik profilin kaybedilmesine yol açabilir (Akomeah ve ark., 2018; Velasco & Fernandez, 2022).

Bu bağlamda, somaklonal varyasyonların kontrolü ve yönetimi, bitki doku kültürü süreçlerinde büyük bir zorluk teşkil etmektedir. Genetik çeşitliliği artırmanın yanı sıra, tüketicilerin beklentilerine uygun, hastalıklara dayanıklı ve yüksek verim sağlayan bitki türlerinin geliştirilmesinde somaklonal varyasyonların olumlu yönleri ortaya çıkabilmektedir (Wang ve ark., 2013; Wang ve ark., 2022). Somaklonal varyasyonlar, ayrıca tarımsal ıslah süreçlerinde alternatif bir yöntem olarak kullanılarak, yeni çeşitlerin oluşturulmasına ve bunların adaptasyon kabiliyetinin artırılmasına katkıda bulunabilir (Shiddalingeswara ve ark., 2014).

4. Çözüm Stratejileri

4.1 Protokol optimizasyonu ve standardizasyon

Her meyve türü ve çeşidi için özel protokoller geliştirilmesi önerilmektedir. Bu bağlamda farklı hormon kombinasyonları, besi ortamları, sterilizasyon yöntemleri sistematik olarak teste tabi tutulmalıdır (Güney, 2019; Güney, 2023). Örneğin, yüksek çilek (*Fragaria* × *ananassa*) veya yaban mersini (*Vaccinium spp.*) gibi türlerde başarılı protokoller yayımlanmıştır (Correia ve ark., 2024).

Doku kültürü tekniklerinin etkinliğini artırmak için kesin protokollerin geliştirilmesi ve standartlaştırılması kritik öneme sahiptir (Üstünsoy ve ark., 2018). Üretim süreçlerindeki tutarlılığı sağlamak amacıyla her tür bitki için özel ve optimize edilmiş büyüme ortamları gereklidir. Besin ortamları, büyüme düzenleyicileri ve diğer kültürel faktörlerin sistematik bir değerlendirmesi, farklı türlerin ihtiyaçlarını karşılayacak şekilde yapılmalıdır. Protokollerin optimize edilmesi, hem ekonomik verimliliği artırır hem de bitki sağlığını iyileştirir (Uzer ve Özaslan, 2023).

4.2 Bioreaktör ve otomasyon teknolojilerinin entegrasyonu

Makroskala klonal çoğaltma için bioreaktör sistemleri, otomasyon ve robotik katmanlar geliştirilebilir. Böylece iş gücü ve maliyet düşürülebilir, üretim verimliliği artabilir. (Pithiya ve ark., 2022).

Bioreaktörler, bitki doku kültürü uygulamalarında yüksek verimlilik sağlamak için önemli araçlardır. Otomasyon teknolojilerinin entegrasyonu ile birlikte, doku kültürü süreçlerinin kontrolü daha kolay hale getirilir; bu, hem süreç sürekliliğini sağlar hem de hataları en aza indirir (Uslu ve ark., 2020). Bu tür gelişmeler, üretim kapasitesinin artırılmasına ve laboratuvar verimliliğinin optimizasyonuna katkıda bulunarak, sürdürülebilir tarımsal üretim için gerekli olan kritik bir akım yaratmaktadır.

4.3 Genotip seçimi ve anaç materyali kullanımı

Doku kültürü süreçlerinde başlangıç materyali olarak uygun, sağlıklı ve yüksek çoğaltılabilirlik gösteren genotiplerin seçilmesi önemlidir. Anaç materyallerin kullanımı, çoğaltma verimliliğini artırabilir.

Doku kültürü süreçlerinde genotip seçimi, bitkilerin elde edileceği anaç materyali ile doğrudan ilişkilidir. Farklı genotiplerin, doku kültürü süreçlerinde gösterdikleri farklı performanslar, istenilen özellikleri taşıyan bireylerin seçilmesini zorunlu kılmaktadır (Bayılmış ve Özçelik, 2017). Genetik olarak stabil ve hastalıklara dayanıklı anaç materyallerinin kullanımı, doku kültürü uygulamalarında başarılı sonuçlar elde edilmesini sağlamaktadır.

4.4 Akklimatizasyonun iyileştirilmesi

İn vitro aşamadan sera ve saha koşullarına geçişi daha etkin kılmak için akklimatizasyon protokolleri geliştirilmelidir (ışık, CO_2, nem, sıcaklık yönetimi). Bu aşamada mikroskobik ve moleküler göstergeler izlenebilir.

Laboratuvar ortamında üretilen bitkilerin dış ortama adaptasyonu, akklimatizasyon sürecinin iyileştirilmesi ile sağlanabilir. Bu süreçte, bitkilerin dış ortam koşullarına yavaş yavaş maruz bırakılması, genellikle başarılı akklimatizasyon için bir strateji olarak benimsenmektedir. Bitkilerin su, ışık ve nem koşullarına yavaşça alıştırılması, sağlıklı bir adaptasyon sürecinin geliştirilmesinde kritik bir yere sahiptir. Akklimatizasyon süreçlerinin optimize edilmesi, doku kültürü ile üretilen bitkilerin sağlığı ve büyüme performansını önemli ölçüde artırabilir (Güney, 2019; Güney, 2023).

4.5 Moleküler izleme ve genetik stabilitenin korunması

Somaklonal varyasyonu kontrol altına almak için rutin genetik izleme (örneğin, moleküler markerlarla) yapılmalı, alt kültür sayıları sınırlandırılmalı, uygun hormon rejimleri kullanılmalıdır (Guan ve ark., 2016).

Bitki doku kültürü süreçlerinin başarıyla yürütülmesi için genetik stabilitenin korunması büyük önem taşır. Genetik değişikliklerin izlenmesi, somaklonal varyasyonların kontrolü açısından önemli bir adımdır. Moleküler izleme teknikleri, genetik çeşitliliğin ve değişimlerin değerlendirilmesine olanak tanır; böylece, hastalık ve çevresel stres faktörlerine dayanıklı bitki materyallerinin geliştirilmesi kolaylaşır. Genetik stabiliteyi korumak amacıyla gen etkileşimlerinini biçimlendirilmesi ve izlenmesi, başarıyla görev yapan bitkisel fonksiyonlar için zemin hazırlamaktadır.

5. Sonuç ve İleriye Dönük Perspektifler

Bitki doku kültürü, modern tarım ve bitki biyoteknolojisi uygulamalarında önemli bir yer tutmakta; özellikle meyve türlerinde hızlı çoğaltma, hastalıklardan arındırılmış anaç üretimi, genetik ıslah ve genetik kaynakların korunması gibi hedeflere ulaşmada büyük potansiyel sunmaktadır. Bu teknikler sayesinde meyve üretiminde kalite, verimlilik ve çevresel sürdürülebilirlik önemli ölçüde artırılabilir.

Bununla birlikte, meyve türlerinde doku kültürü uygulamalarının geniş ölçekli ve ticari düzeye taşınması hâlâ birtakım zorluklarla sınırlıdır. En yaygın teknik engeller arasında kontaminasyon riski, genotipe özgü protokol gerekliliği, akklimatizasyon aşamasında düşük başarı oranı, genetik stabilitenin korunması ve maliyet/iş gücü gereksinimleri yer almaktadır.

Bu zorlukların üstesinden gelebilmek amacıyla geliştirilen çeşitli çözüm stratejileri, doku kültürü sistemlerinin daha verimli ve sürdürülebilir biçimde uygulanmasını mümkün kılmaktadır. Üzerinde durulan başlıca stratejiler aşağıda özetlenmiştir:

Protokol optimizasyonu ve standardizasyonu: Her bitki türü ve genotipi için en uygun büyüme düzenleyicileri ve besin ortamlarının belirlenmesi, rejenerasyon başarı oranlarını doğrudan etkilemektedir.

Bioreaktör ve otomasyon teknolojilerinin entegrasyonu: Özellikle ticari üretimde verimliliği artırmak ve insan kaynaklı hataları en aza indirmek için otomasyon sistemleri kritik bir rol

oynamaktadır. Bioreaktör sistemleri, büyük hacimli çoğaltım süreçlerinde üretim maliyetlerini düşürebilir.

Genotip seçimi ve elit anaç materyali kullanımı: Doku kültürüne yüksek yanıt veren genotiplerin seçimi, hem rejenerasyon oranlarını artırmakta hem de genetik kararlılığı korumaya yardımcı olmaktadır.

Akklimatizasyon ve dış ortam adaptasyonunun iyileştirilmesi: İn vitro koşullarda üretilen bitkilerin sera ve tarla koşullarına başarılı şekilde geçiş yapabilmesi için ışık, nem, sıcaklık ve substrat gibi çevresel faktörlerin optimize edilmesi gerekmektedir.

Moleküler izleme ve genetik stabilitenin korunması: Somaklonal varyasyonları izlemek ve genetik homojenliği sağlamak amacıyla moleküler marker teknolojileri ve genetik analiz yöntemleri giderek daha yaygın kullanılmaktadır.

Ekonomik analiz ve ticari ölçek planlaması: Üretim sürecinin toplam maliyetinin değerlendirilmesi ve ölçeklenebilirliğin ekonomik boyutta analiz edilmesi, teknolojinin tarımsal üretime entegrasyonunu kolaylaştırmaktadır.

Bu stratejilerin bütüncül olarak ele alınması, sadece meyve türlerinde değil, tüm bitki doku kültürü uygulamalarında başarıyı artıracaktır. Ayrıca, biyoteknolojik araçların (örneğin gen düzenleme, marker destekli seleksiyon) doku kültürü ile entegre edilmesi, hem bitki ıslah süreçlerini hızlandırmakta hem de tarımsal sürdürülebilirliğe katkı sağlamaktadır.

ÖZET

Artan dünya nüfusu ve buna paralel olarak yükselen gıda talebi, meyve yetiştiriciliğinde hastalıklara dayanıklı genotiplerin geliştirilmesini zorunlu hale getirmiştir. Bitkisel üretimde karşılaşılan patojen kaynaklı hastalıklar, verim ve kalite kayıplarının yanı sıra ekonomik zararların da başlıca nedenlerinden biridir. Bu durum, üreticileri kimyasal pestisitlere bağımlı hale getirmekte, ancak yoğun kimyasal kullanımı hem çevresel sürdürülebilirlik hem de insan sağlığı açısından önemli riskler taşımaktadır. Bu nedenle, hastalıklara dayanıklı genotiplerin ıslah edilmesi, kimyasal kullanımını azaltarak çevreye duyarlı üretim sistemlerinin oluşturulmasında stratejik bir rol oynamaktadır. Moleküler markır teknolojileri, meyve türlerinde genetik dayanıklılığın belirlenmesi ve ıslah programlarının yönlendirilmesinde son derece etkili araçlardır. Bu yöntemler, mevcut kültür çeşitleri ve yeni genotipler arasındaki genetik varyasyonun ortaya çıkarılmasında yüksek doğruluk ve tekrarlanabilirlik sağlar. SNP (tek nükleotid polimorfizmleri) ve SSR (Basit dizi tekrarları) gibi moleküler markırlar, hastalık dayanıklılığı ile ilişkili gen bölgelerinin tespit edilmesine ve QTL (nicel özellik lokusları) analizleriyle direnç genlerinin haritalanmasına olanak tanımaktadır. Bu yaklaşımlar, işaretleyici destekli seleksiyon (MAS) uygulamalarının etkinliğini artırarak, klasik ıslah sürecini hızlandırmakta ve genetik çeşitliliğin korunmasına katkı sağlamaktadır. Son yıllarda yapılan çalışmalar, elma, şeftali, badem, ceviz, antepfıstığı, armut ve ayva gibi meyve türlerinde dayanıklılıkla ilişkili genlerin tanımlandığını ve bu genlerin biyoinformatik araçlar aracılığıyla karakterize edildiğini ortaya koymaktadır. Bu kapsamda, gen ekspresyon analizleri, fonksiyonel genomik ve proteomik çalışmalar, dayanıklılıkla ilişkili genetik mekanizmaların aydınlatılmasında yeni bir perspektif kazandırmıştır. Ayrıca, farklı genotiplerin çevresel stres

koşullarına tepkilerinin değerlendirilmesi, dayanıklılığın fizyolojik ve biyokimyasal yönlerinin anlaşılmasına katkı sağlamaktadır.

Sonuç olarak, moleküler markır temelli hastalık dayanıklılığı araştırmaları, sürdürülebilir meyve yetiştiriciliği ve çevre dostu üretim sistemlerinin geliştirilmesinde güçlü bir biyoteknolojik araç olarak öne çıkmaktadır. Bu yaklaşımlar, yalnızca hastalıklarla mücadelede değil, aynı zamanda gıda güvenliğinin sağlanması, biyolojik çeşitliliğin korunması ve tarımsal üretimde sürdürülebilirliğin artırılması açısından da geleceğe yönelik büyük bir potansiyel sunmaktadır.

Anahtar Kelimeler: Moleküler markırlar, meyve türleri, hastalık etmenleri, marköre dayalı seleksiyon (MAS)

ABSTRACT

The increasing global population and the corresponding rise in food demand have made the development of disease-resistant genotypes in fruit cultivation a necessity. Pathogen-induced diseases encountered in plant production are among the main causes of yield and quality losses, as well as significant economic damage. This situation forces producers to rely heavily on chemical pesticides; however, excessive chemical use poses serious risks to both environmental sustainability and human health. Therefore, breeding disease-resistant genotypes plays a strategic role in reducing chemical dependency and establishing environmentally friendly production systems. Molecular marker technologies are highly effective tools for determining genetic resistance in fruit species and guiding breeding programs. These methods provide high accuracy and reproducibility in revealing genetic variation between existing cultivars and newly developed genotypes. Molecular markers such as SNPs (Single Nucleotide Polymorphisms) and SSRs (Simple Sequence Repeats) enable the identification of genomic regions associated with disease resistance and the mapping of resistance genes through QTL (Quantitative Trait Loci) analyses. Such approaches enhance the efficiency of Marker-Assisted Selection (MAS), accelerate traditional breeding processes, and contribute to the conservation of genetic diversity. Recent studies have reported the identification and bioinformatic characterization of resistance-related genes in several fruit species, including apple, peach, almond, walnut, pistachio, pear, and quince. Furthermore, gene expression analyses, functional genomics, and proteomics have provided new insights into the molecular mechanisms underlying disease resistance. Evaluating the responses of different genotypes to environmental stress factors also contributes to understanding the physiological and biochemical aspects of resistance.

In conclusion, molecular marker-based studies of disease resistance represent a powerful biotechnological approach for developing sustainable and eco-friendly fruit production systems. These strategies not only support effective disease management but also contribute to food security, biodiversity conservation, and the long-term sustainability of agricultural production.

Keywords: Molecular markers, fruit species, disease agents, marker-based selection (MAS)

1. GIRIŞ

Meyve üretiminde verim, kalite ve sürdürülebilirliği tehdit eden hastalık etmenlerinin artan etkisi, modern ıslah programlarında biyoteknolojik yenilikler ve DNA tabanlı moleküler markör teknolojilerinin entegrasyonuyla hastalıklara genetik düzeyde dirençli, yüksek verimli ve çevresel streslere uyumlu meyve genotiplerinin geliştirilmesine yönelik çalışmlar yaygınlaşmaya başlamıştır (Goswami ve ark., 2022).

Moleküler markörler, hastalıklara karşı genetik direncin belirlenmesinde güçlü bir araç olarak kullanılmakta; genotipler arasındaki varyasyonları tanımlayarak ıslahçılara yüksek düzeyde hassasiyet sağlamaktadır. Bu yöntemler sayesinde genetik olarak dirençli bireylerin tespiti mümkün olmakta ve ıslah sürecinde en uygun genotiplerin seçilmesi kolaylaşmaktadır. Ayrıca, markör destekli analizler, patojenlerin genetik yapısının incelenmesine ve konak–patojen etkileşimlerinin daha iyi anlaşılmasına katkı sağlamaktadır. Son yıllarda elma, çilek ve badem gibi farklı meyve türlerinde yürütülen araştırmalar, moleküler markörlerin kullanımıyla hastalık direncini artırmaya yönelik stratejilerin başarıyla uygulanabileceğini göstermektedir. Örneğin, çilek genotiplerinde Phytophthora ve antraknoz etmenlerine karşı dayanıklılık, markör analizleriyle belirlenmiş ve bu sayede dirençli varyetelerin geliştirilmesi sağlanmıştır. Benzer şekilde, elma ve bademde de genetik temelli direnç analizleri, hastalıklara dayanıklı genotiplerin erken dönemde seçilmesine olanak tanımaktadır.

Moleküler markörlerin meyve genotiplerinde hastalık direncinin belirlenmesinde kullanımı, modern bitki ıslahında stratejik bir araç hâline gelmiştir. Bu yöntemler, yalnızca hastalıkların önlenmesine katkı sağlamakla kalmayıp, genetik çeşitliliğin korunması ve sürdürülebilir tarımsal üretimin desteklenmesi açısından da büyük önem taşımaktadır. Bununla birlikte, mevcut literatürün özellikle bazı meyve türleri için sınırlı veri sunduğu dikkate alındığında, daha kapsamlı ve güncel araştırmalara ihtiyaç duyulmaktadır. Bu çalışma, meyve genotiplerinde genetik direncin değerlendirilmesinde moleküler markörlerin uygulama potansiyelini inceleyerek, biyoteknolojik ilerlemelerin hastalık direncinin artırılmasındaki rolünü ortaya koymayı amaçlamaktadır.

2. Moleküler Markörler ve Hastalık Direncindeki Önemi

Moleküler markörler (SSR, AFLP, RAPD, SNP gibi) bitki genomundaki genetik varyasyonları tanımlamada kritik öneme sahiptir. Bu markörler, özellikle hastalık direncinin genetik temelini daha iyi anlamamıza yardımcı olur ve ıslah sürecini hızlandırır. Domateste yapılan kapsamlı çalışmalar, marker-assisted selection (MAS) uygulamaları sayesinde Tomato yellow leaf curl virus, Fusarium oxysporum, Phytophthora infestans ve Cladosporium fulvum gibi patojenlere karşı dirençli hatların geliştirildiğini göstermiştir (Lee ve ark., 2015). Benzer şekilde, elma ve çilek gibi türlerde genom tabanlı markörlerin geliştirilmesi, hem kalite özelliklerinin hem de hastalık direncinin bir arada seçilmesini sağlamıştır. Böylece genetik ıslah süreçlerinde klasik yöntemlerin çok ötesinde bir doğruluk ve hız elde edilmiştir (Han ve ark., 2020; Labadie ve ark., 2020).

Moleküler markörler, tarım ve bitki ıslahı alanında, özellikle hastalıklara dayanıklılık özelliklerinin belirlenmesinde büyük bir öneme sahiptir. Bu markörler, genetik çeşitliliğin belirlenmesi, hastalıklara karşı dirençli çeşitlerin seçimi ve ıslah çalışmalarının desteklenmesi gibi birçok alanda kullanılmaktadır. Özellikle ceviz, badem, elma, antepfıstığı ve çilek gibi bahçe bitkileri üzerinde yapılan araştırmalar, moleküler markörlerin tarımsal üretimi nasıl etkilediğini açıkça göstermektedir. Ceviz hastalıkları, özellikle antraknoz gibi fungal hastalıklar, bu tür bitkilerin üretiminde ciddi sorunlar yaratmakta olup, moleküler markörler bu hastalıklarla mücadelede önemli bir araç olarak kullanılmaktadır. Örneğin, Bitlis ilinde ceviz antraknozu üzerindeki çalışmalarda, Ophiognomonia leptostyla'nın moleküler karakterizasyonu detaylandırılmış ve bu markörler aracılığıyla hastalığa karşı dayanıklılığın

artırılması hedeflenmiştir (Koç ve ark., 2020). Elmada yapılan çalışmalar da moleküler markörlerin önemini vurgulamaktadır. Van Gölü havzasında yetiştirilen elma ağaçlarında, Erwinia amylovora'nın neden olduğu ateş yanıklığı hastalığının saptanması ve yaygınlık oranının belirlenmesi amacıyla moleküler teknikler kullanılmıştır (Kıpçak ve Akköprü, 2017). Bu bağlamda, moleküler markörler, hastalığa karşı direnç göstermeyen çeşitlerin belirlenmesinde de etkin bir yöntem olarak kullanılmaktadır. Çilek bitkileri de moleküler markörlerin etkili olduğu bir diğer alandır. Çilek alanlarında yapılan araştırmalarda, *Botrytis cinerea* gibi fungal hastalıkların moleküler analizleri ile hastalık kontrolü ve dayanıklılık kaynaklarının belirlenmesi üzerine çalışmalar yapılmaktadır (Uysal ve Erkılıç, 2022). Çilek bitkisinde, antraknoz (*Colletotrichum spp.*) ve fitofthora (*Phytophthora spp.*) gibi fungal patojenler, ciddi hastalıklara yol açmakta ve verim kaybına neden olmaktadır. Antraknoz, özellikle çilek meyvelerinde çürümeye yol açarak ürün kalitesini düşürmekte, buna ek olarak fitofthora hastalığı kök çürümesine neden olarak bitkinin gelişimini olumsuz etkilemektedir (Ertek ve ark., 2022). Bu patojenler, uygun çevresel koşullarda hızla yayılmakta ve çilek yetiştiriciliği için ekonomik kayıplara yol açmaktadır (Koc & Karabulut, 2019). Özellikle sıcaklık ve nem oranındaki değişimler, bu hastalıkların meydana gelmesinde kritik rol oynamaktadır (Ağçam, 2022). Bu tür patojenlerin moleküler teknikler ile tespiti, hastalıklara karşı alınacak tedbirlerin zamanında uygulanmasına olanak sağlamaktadır. Badem bitkileri üzerindeki araştırmalar da benzer süreçleri göstermektedir. Moleküler markörler, hastalık direncinin belirlenmesinde kullanılmaktadır. Ceviz ve badem gibi bitkilerin çeşitli türlerinin hastalıklara karşı genetik dayanıklılık seviyeleri, moleküler markörlerle belirlenebilmektedir. Bu bağlamda, genotipler arasında hastalıklara dayanıklılık düzeyi belirgin bir şekilde farklılık göstermekte ve bu farklılıklar moleküler markörlerle net bir şekilde tespit edilebilmektedir. Moleküler markörlerin bahçe bitkileri üzerindeki etkisi, hastalıklara karşı direnç geliştirme ve verimliliği artırma konusunda kritik bir rol oynamaktadır. Özellikle ceviz, badem, elma, antepfıstığı ve çilek gibi bitkilerde hastalık direncinin artırılması için bu markörlerin kullanılması, tarımda verimlilik ve kaliteyi artırma potansiyeli taşımaktadır (Palacıoğlu ve ark., 2020).

3. Genetik Çeşitlilik, Fenotipik Özellikler ve Direnç Mekanizmaları

Meyve genotiplerinde genetik çeşitlilik, fenotipik özellikler ve direnç mekanizmaları üzerine yapılan araştırmalar, tarım biyoteknolojisi ve bitki ıslahı alanında kritik öneme sahiptir. Genetik çeşitlilik, bitkilerin hastalıklara, zararlılara ve çevresel stres faktörlerine karşı dayanıklılığını belirleyen temel unsurlardan biridir. Farklı genotiplerin patojenlere verdiği tepkiler, direnç mekanizmalarının çeşitliliğini ve bu mekanizmaların ıslah programlarındaki önemini ortaya koymaktadır. Örneğin, çarkıfelek meyvesinde (*Passiflora edulis*) yürütülen çalışmalar, genotipler arasında hastalıklara duyarlılıkta belirgin farklılıklar bulunduğunu ve bu çeşitliliğin dirençli bireylerin seçimi açısından kritik olduğunu göstermiştir (Castro ve ark., 2018). Benzer şekilde, elma (*Malus × domestica*) genomunun yeniden dizilenmesiyle elde edilen veriler, yabani türlerle gerçekleşen doğal melezleşmelerin dayanıklılık gen havuzunu zenginleştirdiğini ve modern çeşitlerde "seçici süpürme bölgeleri" oluşturduğunu ortaya koymuştur (Duan ve ark., 2017). Bu durum, yabani akrabalardan genetik materyal aktarımının hastalık direncinin geliştirilmesinde stratejik bir araç olduğunu göstermektedir. Ayrıca, ceviz, badem, antepfıstığı ve çilek gibi bahçe bitkilerinde yürütülen genetik çalışmalar da benzer biçimde direnç genlerinin belirlenmesi ve çeşit geliştirme çalışmalarına önemli katkılar sağlamaktadır (Pal ve ark., 2024).

Genetik çeşitliliğin artırılması, yalnızca dayanıklı genotiplerin geliştirilmesi açısından değil, aynı zamanda meyve kalitesi ve fizyolojik performansın iyileştirilmesi bakımından da büyük önem taşımaktadır. Bu bağlamda moleküler markör teknolojileri, dayanıklılığın belirlenmesi, genetik varyasyonun haritalanması ve ıslah programlarında doğru genotiplerin seçimi için etkin

biçimde kullanılmaktadır. Elmada yapılan genom-genişlik ilişkilendirme analizleri (GWAS), meyve asitliği, renk ve sertlik gibi kalite parametreleriyle ilişkili SNP bölgelerinin aynı zamanda hastalık toleransını düzenleyen metabolik yollarla bağlantılı olduğunu göstermiştir (Han ve ark., 2020). Çilekte gerçekleştirilen flavonoid temelli metabolit QTL (mQTL) analizlerinde ise antosiyanin ve fenolik bileşik birikiminin savunma tepkileriyle doğrudan ilişkili olduğu belirlenmiştir (Labadie ve ark., 2020).

Fenotipik özellikler, genetik temellerle birlikte değerlendirildiğinde bitkilerin çevresel streslere ve patojen saldırılarına karşı uyum kapasitesini belirlemektedir. Çilek gibi mikrobiyal patojenlere maruz kalan bitkilerde fenotipik özelliklerin izlenmesi, dayanıklı çeşitlerin seçimi açısından önemli ipuçları sunmaktadır (Abas ve ark., 2024). Ayrıca, melatonin gibi biyokimyasal bileşiklerin bitkilerde savunma tepkilerini aktive ederek hastalıklara karşı dayanıklılığı güçlendirdiği ve stres toleransını artırdığı gösterilmiştir (Hao ve ark., 2025). Genetik çeşitlilik, fenotipik özellikler ve direnç mekanizmalarının birlikte değerlendirilmesi, hastalıklara dayanıklı, yüksek verimli ve çevresel streslere uyumlu meyve çeşitlerinin geliştirilmesinde büyük bir potansiyel taşımaktadır. Bu alanlardaki bilimsel ilerlemeler, sürdürülebilir tarım uygulamalarına katkı sağlamakta ve gelecekte daha dirençli meyve genotiplerinin geliştirilmesi için güçlü bir temel oluşturmaktadır (Xu ve ark., 2022; Kumari ve ark., 2023).

4. Moleküler ve Genetik Yaklaşımlarla Direnç Geliştirme

Moleküler ve genetik yaklaşımlar, bahçe bitkileri gibi tarımsal ürünlerde hastalık direncinin geliştirilmesinde merkezi bir rol oynamaktadır. Modern tarım uygulamalarında, bitkilerin patojenlere, zararlılara ve iklim değişikliğinin neden olduğu stres koşullarına karşı dayanıklılığını artırmak amacıyla genetik ve biyoteknolojik teknikler yaygın biçimde kullanılmaktadır. Bu kapsamda, moleküler markör teknolojileri, genetik mühendislik ve genom düzenleme sistemleri, hastalıklara karşı dirençli bitki çeşitlerinin geliştirilmesinde etkili araçlar olarak öne çıkmaktadır (Kıymacı ve ark., 2023; Güneş, 2024).

Moleküler ıslah, klasik seleksiyon yöntemlerinin ötesine geçerek genetik temelli ve hedefe yönelik bir yaklaşıma olanak tanır. Marker-destekli seleksiyon (MAS), marker-destekli geriye melezleme (MABC) ve marker-destekli gen piramitleme (MARS) yöntemleri, birden fazla direnç geninin aynı bitkide birleştirilmesini ve bu genetik kombinasyonun kalıcı hâle getirilmesini sağlar (Jiang, 2013). Bu teknikler, kahverengi çürüklük, antraknoz ve kök ur nematodu gibi kompleks patojenlere karşı dayanıklılık kazandırmada önemli başarılar sunmuştur (Lee ve ark., 2015). Benzer şekilde, genomik seleksiyon (GS) ve kantitatif özellik lokusu (QTL) haritalama yöntemlerinin entegre biçimde uygulanması, hem verim hem de hastalık direnci özelliklerinin eş zamanlı iyileştirilmesine olanak tanımaktadır. Papaya (*Carica papaya* L.) üzerine yapılan genom yeniden dizileme çalışmalarında, dar genetik tabanın markör çeşitliliğini sınırladığı; ancak yüksek polimorfizm gösteren SSR markörlerinin geliştirilmesiyle ıslah etkinliğinin artırılabileceği belirlenmiştir (Nantawan ve ark., 2022). Bu durum, genetik varyasyonun genişletilmesi ve transkriptomik ile metabolomik gibi çoklu omik yaklaşımların ıslah programlarına entegre edilmesinin önemini vurgulamaktadır.

Genetik markörler, türler arasında genetik çeşitliliği değerlendirmek, dayanıklılık genlerinin lokalizasyonunu belirlemek ve istenilen özelliklerin seleksiyonunu desteklemek amacıyla kullanılmaktadır. Domates gibi birçok kültür bitkisinde yürütülen çalışmalarda, belirli patojenlere karşı direnç seviyeleri genetik analizlerle saptanmış ve marker destekli seleksiyon (MAS) yöntemleriyle yüksek verim ve dayanıklılık gösteren genotipler geliştirilmiştir (Kıymacı ve ark., 2023). Bununla birlikte, genetik mühendisliği ve CRISPR/Cas9 gibi ileri genom düzenleme teknolojileri, belirli gen bölgelerinin hedeflenmesiyle bitkilerde hastalık direncinin artırılmasına olanak tanımaktadır. Örneğin, eukaryotik başlatma faktörü (eIF4)

geninin düzenlenmesi yoluyla bitkilerde viral hastalıklara karşı genetik güvenliğin güçlendirilebileceği gösterilmiştir (Güneş, 2024). Bu tür hedefe yönelik yaklaşımlar, genetik çeşitliliğin korunmasını desteklerken, bitkilerin çevresel streslere karşı daha dirençli hâle gelmesini de sağlamaktadır. Ayrıca, genetik transformasyon teknikleri de direnç geliştirmede önemli bir yer tutmaktadır. Çarkıfelek meyvesinde yapılan transgenik çalışmalar, viral enfeksiyonlara karşı dayanıklılığın artırılabileceğini ortaya koymuştur (Correa ve ark., 2015). Turna yemişinde (*Vaccinium macrocarpon*) yüksek epikutiküler wax içeriğini belirleyen QTL'nin tanımlanması, hem su kaybını azaltarak fizyolojik direnci artırmakta hem de patojen girişine karşı doğal bir bariyer görevi görmektedir (Erndwein ve ark., 2023).

Bitki beslenmesi ve çevresel faktörler de moleküler düzeyde hastalık direncini etkileyen önemli bileşenlerdir. Örneğin, bor bileşiklerinin bitkilerde savunma mekanizmalarını güçlendirdiği ve belirli elementlerin dengeli uygulanmasıyla patojenlere karşı dayanıklılığın artırılabileceği bildirilmiştir (Gedük ve ark., 2020). Moleküler biyokimya temelli araştırmalar, bitkilerin spesifik besin gereksinimlerinin karşılanmasıyla dayanıklılık tepkilerinin optimize edilebileceğini göstermektedir (Küçükyumuk ve Bayındır, 2023). Moleküler ve genetik yaklaşımlar, bahçe bitkilerinde hastalık direncinin artırılmasında inovatif, etkili ve sürdürülebilir çözümler sunmaktadır. Markör destekli seleksiyon, genom düzenleme ve genetik mühendisliği gibi ileri tekniklerin yanı sıra, bitki beslenmesi stratejilerinin optimize edilmesi de ıslah programlarının başarısını artırmaktadır. Bu yaklaşımlar, gelecekte farklı bitki türlerinde uygulanarak, hastalıklara daha dayanıklı ve verimli bahçe bitkilerinin geliştirilmesine öncülük etmektedir (Karakurt ve ark., 2020).

5. Geleceğe Yönelik Genomik ve Biyoteknolojik Stratejiler

Geleceğe yönelik genomik ve biyoteknolojik stratejiler, tarımsal üretimde sürdürülebilirlik, verimlilik ve hastalık direncinin artırılması açısından büyük önem taşımaktadır. Genetik biyoteknoloji, bahçe bitkileri gibi tarımsal ürünlerin hastalıklara karşı dayanıklılığını güçlendirmek, ürün kalitesini iyileştirmek ve çevresel streslerin etkisini azaltmak için giderek daha fazla kullanılmaktadır. Bu bağlamda, son yıllarda hızla gelişen yeni nesil dizileme (NGS), tüm genom dizileme (WGS), RNA-seq ve CRISPR/Cas9 gibi hedefe yönelik gen düzenleme teknolojileri, bitkilerde direnç genlerinin hızlı ve doğru biçimde tanımlanmasını ve düzenlenmesini mümkün kılmaktadır (Jiang, 2013; Li ve ark., 2022). Bu gelişmeler, genetik ağların karmaşık yapısını çözümlemeye, gen ekspresyon kalıplarını incelemeye ve direnç mekanizmalarının moleküler temellerini anlamaya olanak sağlamaktadır. Örneğin, CRISPR/Cas9 teknolojisi ile belirli gen bölgelerinin düzenlenmesi sayesinde bitkilerde viral ve fungal patojenlere karşı genetik dayanıklılık kazandırılabilmektedir (Kolchenko ve ark., 2023). Bu sayede, hastalık kaynaklı verim kayıplarının önüne geçilmekte ve çevresel stres faktörlerine daha toleranslı genotiplerin geliştirilmesi mümkün olmaktadır.

Moleküler markörlerin (SSR, SNP) kullanımı, direnç genlerinin belirlenmesi ve dayanıklı genotiplerin ıslah programlarına entegre edilmesi açısından hâlen temel bir strateji konumundadır. Özellikle elma (*Malus* × *domestica*) gibi türlerde yapılan genom analizleri, modern çeşitlerde belirli allel sıklıklarının artış gösterdiğini ve bunların selektif ıslah süreçlerinde bilinçli olarak seçildiğini göstermektedir (Shamshin ve ark., 2018; Zhen ve ark., 2018). Bu durum, markör destekli seleksiyonun, modern ıslah programlarının başarısında vazgeçilmez bir araç hâline geldiğini göstermektedir. Buna ek olarak, QTL haritalama ve genetik eşleştirme analizleri, verim, meyve kalitesi, asitlik ve şeker içeriği gibi özelliklerle ilişkili gen bölgelerinin tanımlanmasını sağlamaktadır. Örneğin, elma genotiplerinde yapılan çalışmalar, kaliteyle ilişkili genlerin aynı zamanda hastalık toleransını etkileyen metabolik yollarda yer aldığını göstermektedir (Guan ve ark., 2015). Böylece, hem dayanıklı hem de üstün kalite özelliklerine sahip yeni çeşitlerin geliştirilmesi mümkün olmaktadır. Geleceğe yönelik

bir diğer önemli yaklaşım, yabani akrabaların ve egzotik gen kaynaklarının ıslah programlarına entegre edilmesidir. Bu genetik kaynaklar, hem biyotik hem de abiyotik streslere karşı direnç genlerinin çeşitliliğini artırarak, entegre dayanıklılık stratejilerinin temelini oluşturmaktadır (Costa ve ark., 2018). Ayrıca, yerel çeşitlerin genetik karakterizasyonu ve korunması da, biyolojik çeşitliliğin sürdürülmesi ve yerel adaptasyon kapasitesinin geliştirilmesi açısından stratejik bir öneme sahiptir (Saucedo ve ark., 2018; Zun-Chun ve ark., 2016).

Genomik ve biyoteknolojik stratejilerin entegrasyonu, modern tarımın en güçlü araçlarından birini temsil etmektedir. Yeni nesil dizileme teknolojileri, moleküler markör sistemleri ve gen düzenleme yaklaşımları sayesinde, genetik çeşitlilikten en üst düzeyde yararlanılarak çevresel değişimlere karşı daha dirençli, yüksek verimli ve kaliteli meyve çeşitlerinin geliştirilmesi mümkün olacaktır. Bu yenilikçi yaklaşımlar, sürdürülebilir tarım uygulamalarına ve küresel gıda güvenliğine önemli katkılar sunmaktadır (Kolchenko ve ark., 2023; Gostinčar ve ark., 2025).

6. Sonuç

Meyve genotiplerinde hastalıklara karşı genetik direncin moleküler markörlerle belirlenmesi, modern bitki ıslahında devrim niteliğinde bir ilerleme olarak değerlendirilmektedir. Moleküler markör teknolojileri, genetik çeşitliliğin tanımlanması, dayanıklılık genlerinin belirlenmesi ve uygun genotiplerin seçilmesiyle ıslah sürecini önemli ölçüde hızlandırmaktadır. Bu yaklaşımlar, çevresel faktörlerden etkilenmeyen, tekrarlanabilir ve yüksek doğrulukta sonuçlar sağlayarak klasik seleksiyon yöntemlerinin ötesine geçmiştir. Yapılan araştırmalar, moleküler markörlerin kullanımıyla hastalık direncine ilişkin genetik mekanizmaların net bir biçimde ortaya konabildiğini ve bu sayede dirençli genotiplerin etkin biçimde tespit edilip ıslah çalışmalarında kullanılabildiğini göstermektedir. Bu yöntem, yalnızca hastalıklara karşı direnç kazandırmakla kalmayıp; aynı zamanda yüksek verim, kalite ve adaptasyon kapasitesine sahip meyve çeşitlerinin geliştirilmesine olanak tanımaktadır.

Moleküler biyoteknoloji uygulamaları, hastalıklara dayanıklı çeşitlerin geliştirilmesinin yanı sıra, doğal genetik kaynakların korunması ve yerel çeşitlerin ıslah programlarına dâhil edilmesi açısından da stratejik önem taşımaktadır. Bu durum, özellikle iklim değişikliğine bağlı biyotik ve abiyotik stres faktörlerine karşı tarımsal sistemlerin dayanıklılığını güçlendirmekte ve genetik çeşitliliğin sürdürülebilir yönetimini desteklemektedir. Sonuç olarak, moleküler markörlerin ve genomik araçların meyve ıslahına entegrasyonu, sürdürülebilir tarım ve gıda güvenliği açısından temel bir bilimsel stratejidir. Bu yaklaşımlar, gelecekte hastalıklara karşı daha dayanıklı, yüksek kaliteli ve çevresel değişimlere uyumlu meyve çeşitlerinin geliştirilmesine olanak tanırken, tarımsal üretim sistemlerinin uzun vadeli verimliliğini ve istikrarını da güvence altına alacaktır.

ÖZET

Bu çalışma, Yozgat İli Damızlık Sığır Yetiştiricileri Birliği'ne üye 112 işletmede yetiştirilen Siyah Alaca (Holstein) sığırlarının süt verim özelliklerini ortaya koymak amacıyla yürütülmüştür. Çalışmada, 2003–2022 yılları arasında düzenli olarak kaydedilen toplam 1840 baş ineğe ait süt verim kayıtları değerlendirilmiştir. Araştırmada incelenen işletmelerde, 305 günlük süt verimi ortalama 7375 litre, laktasyon süresi 358 gün, kuru dönem süresi 59 gün olarak belirlenmiştir. Ayrıca, döl verim özellikleri kapsamında servis periyodu ortalama 139 gün, buzağılama aralığı ise 419 gün olarak hesaplanmıştır. Elde edilen veriler, 305 günlük süt verimi (305 GSV), laktasyon süresi (LS) ve kuru dönem (KD) üzerine; buzağılama yılı, parite, buzağılama mevsimi, buzağılama yaşı ve işletme koşullarının etkilerini incelemek amacıyla değerlendirilmiştir.

Sonuçlar, çevresel faktörlerin ve işletme koşullarının süt verimi ve döl verimi özellikleri üzerinde önemli düzeyde etkili olduğunu ortaya koymaktadır. Özellikle buzağılama mevsimi ve parite faktörleri, süt verim düzeylerinin değişkenliğinde belirleyici rol oynamıştır. Elde edilen bulgular, Yozgat ilinde yetiştirilen Siyah Alaca sığırlarının mevcut verim düzeylerini ortaya koymakla birlikte, bölgesel hayvan ıslahı programlarının gelecekteki hedeflerinin belirlenmesine katkı sağlayacak niteliktedir. Bu kapsamda, genetik parametrelerin doğru şekilde belirlenmesi ve uygun seleksiyon stratejilerinin uygulanması, bölgesel süt sığırcılığı verimliliğinin artırılması açısından büyük önem taşımaktadır. Ayrıca, elde edilen sonuçların Türkiye genelindeki Siyah Alaca yetiştiriciliği verileriyle karşılaştırılması, bölgesel farklılıkların ortaya konulmasına olanak sağlamaktadır.

Bu bulguların, sürdürülebilir süt sığırcılığına yönelik ıslah çalışmalarına rehberlik edeceği ve gelecek nesillerde daha yüksek verim ve döl performansına sahip Siyah Alaca sürülerinin yetiştirilmesine katkı sağlayacağı düşünülmektedir.

Anahtar Kelimeler: Siyah Alaca Süt Sığırı, Süt Verim Özellikleri, Genetik Parametreler, Hayvan Islahı, Yozgat

INVESTIGATION OF MILK YIELD AND REPRODUCTIVE PARAMETERS OF HOLSTEIN CATTLE RAISED IN YOZGAT PROVINCE

ABSTRACT

This study was conducted to investigate the milk yield characteristics of Holstein cattle raised in 112 farms that are members of the Yozgat Cattle Breeders' Association. A total of 1,840 milk yield records belonging to Holstein cows, recorded regularly between 2003 and 2022, were evaluated. The average 305-day milk yield was found to be 7,375 liters, while the mean lactation length and dry period were determined as 358 days and 59 days, respectively. In terms of reproductive traits, the average service period was calculated as 139 days and the calving interval as 419 days. The study further examined the effects of factors such as calving year, parity, calving season, age at calving, and herd conditions on milk production traits including 305-day milk yield (305-DMY), lactation length (LL), and dry period (DP). The findings indicated that environmental factors and herd management practices had significant effects on both milk yield and reproductive performance. In particular, parity and calving season were found to play a decisive role in the variability of milk yield levels.

These results not only provide an overview of the current production levels of Holstein cattle raised in Yozgat province but also contribute valuable insights into the future targets of regional breeding programs. Accurate determination of genetic parameters and the implementation of appropriate selection strategies are of crucial importance for improving dairy cattle productivity in the region. Moreover, the results allow for comparisons with Holstein production data across Turkey, thus highlighting regional differences and production dynamics.

It is anticipated that the findings will serve as a guiding tool for sustainable dairy cattle breeding programs, contributing to the development of Holstein herds with higher milk yield and improved reproductive performance in future generations.

1.GİRİŞ

Dünyada 2020 yılında inek, manda, keçi, koyun ve diğer çiftlik hayvan türlerinden üretilen toplam süt miktarı 910.419 milyon ton olup bu üretim içinde en yüksek payı (%81) inek sütü oluşturmaktadır (FAO, 2022).

Türkiye'de sığır popülasyonun genetik yapısı değişmiş ve toplam popülasyon içerisindeki sütçü kültür ve melez sığır genotiplerinin sayısı hızlı bir şekilde artarken yerli sığır ırklarının toplam sayısı azalmıştır. Tablo 1'de sunulan verilere göre 1990 yılında Türkiye toplam sığır popülasyonu içinde kültür ve kültür melezlerinin toplam sığır varlığı içindeki oranı yaklaşık %44 iken, 2024 yılında 16.824.208 başa ulaşan toplam sığır popülasyonu içinde kültür ve kültür melezlerinin oranı %94 olarak değişmiştir (TÜİK, 2025).

Tablo 1. Türkiye tür ve ırklarına göre büyükbaş hayvan sayılarının yıllar içinde değişimi

Türkiye tür ve ırklarına göre büyükbaş hayvan sayıları

Türkiye'ye ithal edilen ilk kültür sığır ırkı her ne kadar Siyah Alaca (Holstein) olmasa da, ülkemizde yürütülen erken dönem melezleme ve ıslah çalışmalarında çeşitli nedenlerle bu ırk uzun süre ön plana alınmamıştır. Bu dönemde yerli ırkların ıslahı, kombine verimli tiplerin kullanımı, bölgesel iklim uyumu ve kamu işletmelerinin o günkü yetiştiricilik hedefleri daha baskın olmuş; bu nedenle Siyah Alaca bazı projelerde ikincil planda tutulmuştur. Ancak 1980'lerden sonra çiğ süt talebinin artması, yem teknolojisinin gelişmesi, örgütlü süt pazarlamasının yaygınlaşması ve yüksek verimli genotiplere ulaşımın kolaylaşmasıyla birlikte Siyah Alaca'nın üstün süt verim potansiyeli saha koşullarında çok daha belirgin biçimde ortaya çıkmıştır. Bugün gelinen noktada Siyah Alaca, hem saf yetiştiricilikte hem de melezleme programlarında Türkiye'de en yaygın kullanılan ve yetiştirici tarafından en çok kabul gören kültür ırkı durumundadır. Bununla birlikte, ülkemizde yetiştirilen yerli Siyah Alaca popülasyonunun süt ve döl verimi özelliklerini tanımlamak, çevre faktörlerinin etkisini ortaya koymak, uygun damızlıkların seçimini kolaylaştırmak ve genetik ilerlemeyi hızlandırmak amacıyla çok sayıda araştırma, saha projesi ve birlik kayıt sistemi devreye sokulmuştur. Böylece hem ithal edilen genetik materyalin ülke koşullarındaki performansı izlenebilmekte hem de Türkiye'ye özgü Siyah Alaca sürülerinin ıslah hedefleri daha gerçekçi biçimde belirlenebilmektedir (Karakoyunlu, 2024).

Yozgat ili hayvancılık bakımından önemli bir potansiyele sahip olup tarımsal işletmelerin büyük kısmında hayvancılık, bitkisel üretimle birlikte yürütülmektedir. Geçmişte daha çok yerli ırklara dayanan hayvan varlığı, son yıllarda kültür ve kültür melezi ırkların yaygınlaşmasıyla birlikte önemli ölçüde değişmiştir. Yozgat İl Tarım ve Orman Müdürlüğü (2024) verilerine göre ilde süt sığırcılığında Simmental ve melezleri ilk sırayı alırken, Merkez, Akdağmadeni,

Çekerek, Kadışehri, Sarıkaya ve Sorgun ilçelerinde süt sığırcılığının yanı sıra besicilik de yaygın olarak yapılmaktadır. Buna karşılık dağlık köylerde hâlâ yerli ırk hayvancılık sürdürülürken, diğer ilçelerde kültür ve kültür melezi hayvanlar hâkimdir. Kültür ırkına yönelişle birlikte ilde süt verimi her geçen gün artmakta, kurulan ve 1.080 üyesi bulunan Damızlık Sığır Yetiştiricileri Birliği aracılığıyla da yetiştiricilerin örgütlenmesi ve ekonomik açıdan güçlendirilmesi hedeflenmektedir. Tablo 2'de Yozgat ili büyükbaş hayvan varlığı verilmiştir.

Tablo 2. Yozgat ili büyükbaş hayvan varlığı

Yozgat Büyükbaş Hayvan Varlığı						
Yıl	**Sığır Kültür**	**Sığır Melez**	**Sığır Yerli**	**Sığır Toplam**	**Manda**	**Büyükbaş Toplam**
2021	136.199	91.150	11.484	238.833	3.820	242.653
2022	130.136	82.889	6.214	219.239	3.321	222.560
2023	138.260	77.615	7.655	223.530	3.033	226.563

Siyah Alaca sığırların süt tipi ırklarında vücut önden arkaya doğru yavaş yavaş genişler ve derinlik artar. Bedenleri ince ve narin yapılıdır, kemik çıkıntıları belirgindir. Baş yapısı asil ve zarif, deri ince ve yumuşak olup boyunda dikey kıvrımlar oluşturur. Vücut tüyleri kısa ve parlaktır; süt damarları uzun ve belirgindir; memeler dolgun ve büyüktür (İnal ve ark., 2016). Siyah Alaca sığırlarda ergin canlı ağırlık dişilerde 500–700 kg, erkeklerde ise 800–1000 kg; cidago yüksekliği ise yaklaşık 147 cm'dir. Düvelerde en uygun ilkine tohumlama yaşı 15 ay olup bu yaşta ortalama canlı ağırlık 360 kg'dır. Siyah Alaca ırkında gebelik süresi ortalama 9 aydır ve ilk buzağı genellikle 24–27 aylık yaşta alınmaktadır. Siyah Alaca buzağılar ortalama 40 kg doğum ağırlığıyla dünyaya gelir. Ancak Siyah Alaca sığırlar meme ve ayak rahatsızlıklarına karşı nispeten hassas olduklarından mera koşullarına tam olarak uygun değildir (Alpan ve Arpacık, 2002; İnal ve ark., 2016; Özdemir, 2024).

2. MATERYAL VE METOD

Araştırma materyalini, Yozgat Damızlık Sığır Yetiştiricileri Birliği'ne üye işletmelerden alınan, Siyah Alaca Sığırlara ait soy kütüğü kayıtları (hayvanların kulak numaraları, ana ve babalarının kulak numaraları, doğum tarihi, buzağılama tarihi, 305 gün süt verimi, laktasyon süresi, servis peryodu, buzağılama aralığı ve kuruda kalma süresi) oluşturmuştur. Çalışmada, 2003–2022 yılları arasında düzenli olarak kaydedilen toplam 1840 baş ineğe ait süt ve döl verim kayıtları değerlendirilmiştir.

Veriler analize hazırlanırken; yıl ve laktasyon sırası gruplarında hayvan sayısı 100'ün altında olanlar, ölü doğum, yavru atma, hastalık veya sakatlık gibi nedenlerle sürüden çıkarılanlar ile kayıtları düzensiz olan ya da aşırı (uç) değer gösteren hayvanlar değerlendirmeye alınmamıştır.

Verim özelliklerinden 305 günlük süt verimi (305 GSV), laktasyon süresi (LS) ve kuruda kalma süresine (KKS) etkili olduğu düşünülen buzağılama yaşı, buzağılama mevsimi, buzağılama yılı, işletme (sürü) koşulları ve laktasyon sırası gibi faktörlerin belirlenmesinde Minitab 17 istatistik paket programından yararlanılmıştır. İlk aşamada tüm faktörler modele dâhil edilmiş, daha sonra "step-down" yaklaşımı uygulanarak istatistiksel bakımdan önemsiz olan etkiler modelden sırasıyla çıkarılmış ve $P \leq 0,01$ düzeyinde anlamlılık gösteren faktörler modelde tutulmuştur (Ulutaş, 1998). Anlamlı bulunan grupların ortalamaları arasındaki farklar ise Tukey çoklu karşılaştırma testi ile değerlendirilmiştir (Sheskin, 2004; Karaağaç, 2019).

Çalışmanın ikinci aşamasında, 305 GSV, LS ve KKS üzerine etkili olduğu ilk analizlerde belirlenen sabit faktörlere ek olarak hayvanın doğrudan genetik etkisini de içeren bireysel hayvan modeli (animal model) kurulmuş ve söz konusu özelliklere ait genetik (additif) ve fenotipik varyans–kovaryans bileşenleri MTDFREML paket programı kullanılarak tahmin edilmiştir (Boldman ve ark., 1995). Üçüncü aşamada ise bu varyans bileşenleri temel alınarak hayvanların damızlık değerleri En İyi Doğrusal Yansız Tahmin (BLUP- Best Linear Unbiased Prediction) yöntemi ile hesaplanmıştır. Çevresel faktörlerin etkisini test etmek için kullanılan doğrusal modeller aşağıda verilmiştir.

İBY, SP, BA, GBTS, LSV, 305-GSV, LS, özelliklerine etki eden makro çevre faktörlerinin etkilerinin analizi için Varyans Analizi Tekniği (General Linear Model) kullanılmıştır. İstatistik olarak etkisi önemli bulunan faktörlerin ortalamaları Tukey Çoklu Karşılaştırma Testine göre karşılaştırılmıştır (Sheskin, 2004). Çevresel aktörlerin etkilerinin incelenmesinde Karaağaç, (2019)'ın belirttiği aşağıda verilen model kullanılmıştır:

$$Y_{ijklm}=\mu+ a_i+ b_j+ c_k+ d_l +b_{yx}(X_{ijklm})+ b_{yz}(Z_{ijklm})+ (İl*Mevsim)_{ij} + (İl*Yıl)_{ik} + (Mevsim*Yıl)_{jk} + e_{ijklm}$$

Bu modelde;

Y_{ijklm} : i. İldeki, j. Buzağılama mevsimindeki, k. Buzağılama yılında, l. Laktasyon sırasındaki m. ineğin üzerinde durulan döl (SP, GBTS, BA) ve süt (LSV, 305GSV, LS) verim özelliğe ilişkin gözlem değeri

μ : popülasyon ortalamasını,

a_i : i. buzağılama ilinin etki miktarını (i: 1-9),

b_j : j. buzağılama mevsiminin etki miktarını (j: 1-4; Kış-İlkbahar-Yaz-Sonbahar), c_k : k. Buzağılama yılının etki miktarını (k:1-12; 2012-2022),

d_l : l. laktasyon sırasının etki miktarını (l: 1-3; 1-3),

b_{yx} : Y'nin X'e göre regresyon katsayısını (doğrusal etki) (İBY'nın 1 ay değişimine karşı üzerinde durulan özellikteki değişim miktarı)

b_{yz} : Y'nin Z'ye göre regresyon katsayısını (doğrusal etki) (Buzağılama yaşının 1 yıl değişimine karşı üzerinde durulan özellikteki değişim miktarı)

$(İl* Yıl)_{ij}$; $(il*Mevsim)_{ik}$= İl* Yıl ve il*Mevsim interaksiyon terimi $(Mevsim*Yıl)_{jk}$= Mevsim*Yıl özellik arasındaki interaksiyon terimi e_{ijklm} : Hatayı (rasgele etki miktarını) ifade etmektedir.

3. BULGULAR VE TARTIŞMA

3.1. 305 Gün Süt Verimi (305 GSV)

İneklerde laktasyon süresi 305 gün olarak kabul edilir. Bundan dolayı normal koşullarda 305 günden kısa süren laktasyonlar tamamlanmış olarak kabul edilir ve düzeltme yapılmaz. Örneğin 290 gün süren bir laktasyon verimi, 305 günlük verim olarak değerlendirilir. Damızlık veya kasaplık olarak satılmak, ölüm, yavru atma vb. genotipe bağlı olmayan nedenlerle tamamlanamayan laktasyonlar, tamamlanmamış laktasyonlar olarak isimlendirilmektedir. Bu laktasyonlar da; laktasyon, 180 günden kısa ise değerlendirilmemekte, 180 günden uzun ise de 305 güne göre geliştirilmiş düzeltme katsayıları kullanılarak 305 güne tamamlanmaktadır (Boztepe ve ark. 2015). Araştırmada elde edilen 305 gün süt verimi üzerine etkili çevre faktörleri Tablo 3'de sunulmuştur.

Tablo 3. Siyah Alaca ineklerde 305 gün süt verimi üzerine etkili çevre faktörleri

		N	$\bar{X} \pm S_{\bar{x}}$	P
İşletme Büyüklüğü	1-5 baş	125	7506.81 ± 158.61^{A}	<0.001

	Yaz	434	7335.50 ± 84.74^{A}	
	Sonbahar	431	6944.07 ± 97.02^{B}	

^{AB}: Aynı sütunda farklı harfleri taşıyan grup ortalamaları arası farklar önemlidir (P<0.05)

Tablo 3'de görüldüğü üzere, Siyah Alaca ineklerde 305 günlük süt verimi işletme büyüklüğü, laktasyon sırası ve buzağılama mevsiminden önemli derecede etkilenmiştir (P<0,001). Çok küçük (1–10 baş) ve çok büyük (>200 baş) işletmelerdeki ineklerin süt verimleri daha yüksek bulunurken, orta büyüklükteki işletmeler daha düşük bir grupta yer almıştır. Laktasyon sırasının ilerlemesiyle süt verimi artmış ve en yüksek değerler 4. ve 5. laktasyonda belirlenmiştir. Kış ve ilkbaharda buzağılayan inekler daha yüksek süt verimi gösterirken, sonbaharda buzağılayan ineklerin süt verimi anlamlı olarak daha düşük olmuştur. Farklı harf taşıyan ortalamalar arasındaki farklar istatistiksel olarak önemlidir (P<0,05).

Siyah Alaca ineklerde 305-GSV özelliğinin tanımlayıcı fenotipik değerlerini belirlemeye yönelik yapılan araştırmalar Tablo 4'de verilmiştir.

Tablo. 4. 305 GSV ile ilgili yapılan bazı araştırma sonuçları

Irk	**Araştırıcı**	**Araştırma Yapıldığı Yer**	**305GSV (kg)**
Siyah alaca	Parlak ve Kandır (2015)	Afyonkarahisar	6884.1
	Alkoyak ve Çetin (2018)	Kırşehir	8986
	Keser (2016)	Tekirdağ	5630.1
	Soyudal (2017)	Bursa	8450
	Sarar ve Tapkı (2017)	Koçaş Tarım İşletmesi	6588.4
	Kheirabadi ve Alijani (2014)	İran	9059

Bu çalışmada Yozgat ilinde Siyah Alaca ineklerde 305 günlük süt verimi 7375 kg olarak belirlenmiştir. Bu değer, Afyonkarahisar'daki (6884 kg; Parlak ve Kandır, 2015) ve Koçaş

Tarım İşletmesi'ndeki (6588 kg; Sarar ve Tapkı, 2017) bildirişlerden yüksek, Bursa (8450 kg; Soyudal, 2017) ve Kırşehir (8986 kg; Alkoyak, 2016) sonuçlarından ise daha düşüktür. İran'da bildirilen 9459 kg'lık ortalama ise yoğun seçilim ve üstün besleme koşullarını yansıttığından bölge koşullarımızdan beklenen değerin üzerindedir. Buna göre Yozgat'taki sürülerin süt verim düzeyi, ülkemizdeki pek çok bölgesel çalışmayla karşılaştırılabilir hatta bir kısmından yüksektir; ancak bakım-besleme ve sürü yönetimindeki farklılıkların azaltılmasıyla bu ortalamanın daha üst düzeylere çıkarılabileceği anlaşılmaktadır.

3.2. Laktasyon Süresi (LS)

Çalışmada elde edilen laklasyon verisi ile ilgili veriler Tablo 5'de sunulmuştur.

Tablo 5. Siyah Alaca ineklerde laktasyon süresi üzerine etkili çevre faktörleri

		N	$\bar{X} \pm S_{\bar{x}}$	P
İşletme Büyüklüğü	1-5 baş	101	371.11 ± 6.41^{A}	0.044
	6-10 baş	114	359.41 ± 6.17^{ABC}	
	11-50 baş	531	351.04 ± 2.87^{BC}	
	51-200 baş	42	344.00 ± 10.40^{C}	
	>200 baş	629	366.77 ± 2.80^{AB}	
Laktasyon Sırası	1	725	360.18 ± 2.46^{AB}	0.040
	2	393	368.62 ± 3.60^{A}	
	3	186	345.12 ± 4.97^{BC}	
	4	78	359.53 ± 7.28^{AB}	
	5	35	336.31 ± 11.71^{C}	
Buzağılama Mevsimi	Kış	397	364.21 ± 3.49^{AB}	0.023
	İlkbahar	365	366.62 ± 3.44^{A}	
	Yaz	308	355.03 ± 3.96^{BC}	
	Sonbahar	347	352.29 ± 3.62^{C}	

ABC: Aynı sütunda farklı harfleri taşıyan grup ortalamaları arası farklar önemlidir (P<0.05)

Tablo 5'e göre Siyah Alaca ineklerde laktasyon süresi; işletme büyüklüğü, laktasyon sırası ve buzağılama mevsiminden anlamlı şekilde etkilenmiştir (P<0,05). En uzun laktasyonlar küçük işletmelerde (1–5 baş) ve çok büyük işletmelerde (>200 baş) görülürken, 51–200 başlık işletmelerde laktasyon süresi en düşük düzeyde belirlenmiştir. Laktasyon sırası ilerledikçe laktasyon süresinde kısalma eğilimi ortaya çıkmış, özellikle 2. laktasyondaki inekler en uzun laktasyonu göstermiş, 5. laktasyondakiler ise en kısa grupta yer almıştır. Mevsim bakımından ise ilkbahar ve kışın buzağılayan ineklerin laktasyonları daha uzun sürmüş, sonbaharda buzağılayanların laktasyonları daha kısa gerçekleşmiştir. Bu bulgular, laktasyonun yalnızca hayvanın potansiyeline değil, işletme yönetimi ve mevsimsel koşullara da duyarlı olduğunu göstermektedir.

Türkiye'nin farklı bölgelerinde Siyah Alaca ineklerle yapılan çalışmalarda laktasyon süresi (LS) değerleri geniş bir aralıkta rapor edilmiştir. Türkiye geneli için 319–364 gün (Kumlu ve Akman, 1999; Özkök, 2006; Şahin, 2009; Genç, 2014), İç Anadolu'da ise çoğunlukla 295–325 gün, bazı çalışmalarda ise 326–398 gün arasında değerler bildirilmiştir (Özçelik, 1994; Duru ve Tuncel, 2002; Erdem ve ark., 2007; Bakır ve ark., 2009; Şahin ve Ulutaş, 2010; Keser, 2016;

Sarar ve Tapkı, 2017; Alkoyak ve Çetin, 2018; Karaağaç, 2019). Bu araştırmada hesaplanan ortalama LS değerlerinin söz konusu çalışmaların önemli bir kısmıyla benzer veya daha uzun olması, bu dönemde sürülerde süt verimini artırmaya yönelik seleksiyonun ve buna eşlik eden daha iyi besleme-yönetim uygulamalarının, memede süt sentez süresini uzatmasıyla açıklanabilir.

3.3. Kuruda Kalma Süresi (KKS)

Çalışmada elde edilen kuruda kalma süresi ile ilgili veriler Tablo 6'da sunulmuştur.

Tablo 6. Siyah Alaca ineklerde kuruda kalma süresi üzerine etkili çevre faktörleri

		N	$\bar{X} \pm S_{\bar{x}}$	P
İşletme Büyüklüğü	1-5 baş	101	56.97 ± 1.06^{B}	0.003
	6-10 baş	114	58.18 ± 1.10^{B}	
	11-50 baş	531	57.72 ± 0.55^{B}	
	51-200 baş	42	62.17 ± 1.67^{A}	
	>200 baş	629	59.57 ± 0.43^{AB}	
Laktasyon Sırası	1	725	58.03 ± 0.44^{B}	0.043
	2	393	59.13 ± 0.59^{B}	
	3	186	59.11 ± 0.78^{B}	
	4	78	59.26 ± 1.34^{B}	
	5	35	62.60 ± 1.75^{A}	
Buzağılama Mevsimi	Kış	397	58.59 ± 0.61	0.651
	İlkbahar	365	58.25 ± 0.64	
	Yaz	308	58.97 ± 0.59	
	Sonbahar	347	58.88 ± 0.61	

AB: Aynı sütunda farklı harfleri taşıyan grup ortalamaları arası farklar önemlidir ($P<0.05$)

Sonuç olarak, araştırmada Siyah Alaca ineklerin kuruda kalma sürelerinin genel olarak **57–60 gün bandında** seyrettiği, ancak işletme ve yaşa bağlı olarak bu sürenin **56,97 günden (1–5 baş işletmeler)** başlayıp **62,17 güne (51–200 baş işletmeler)** kadar çıkabildiği belirlenmiştir. Benzer şekilde laktasyon sırası ilerledikçe kuru sürenin hafifçe uzadığı ve **1. laktasyonda 58,03 gün olan** sürenin **5. laktasyonda 62,60 güne** yükseldiği görülmüştür. Bu bulgular, özellikle daha büyük ve yaşlı hayvanların bulunduğu sürülerde doğum sonrası döneme hazırlığı güçlendirmek, meme dokusunun yenilenmesini sağlamak ve bir sonraki laktasyonda yüksek süt verimini sürdürebilmek amacıyla kuru dönemin sahada bilinçli olarak üst sınıra yakın uygulandığını göstermektedir.

Bu çalışmada kuruda kalma süresi (KKS) **59 gün** olarak hesaplanmıştır ve bu değer süt sığırcılığında "önerilen 45–60 gün" aralığına oldukça yakındır. Ancak literatürdeki bazı çalışmaların bundan belirgin şekilde **daha uzun** kuru dönemler bildirdiği görülmektedir. Örneğin çeşitli çalışmalarda KKS'nin 65 gün (Duru ve Tuncel, 2002), 67 gün (Topaloğlu ve Güneş, 2004), 68 gün (Özçakır ve Bakır, 2003), 79 gün (Bakır ve ark., 2009), 82 gün (Erdem ve ark., 2007), 82 gün (Şahin ve Ulutaş, 2010), 86 gün (Koçak ve ark., 2007) ve Sarar ve Tapkı (2017)'de 67 gün olarak saptamışlardır.

Çalışmada tespit edilen **59 günlük** değer, bu çalışmaların önemli bir bölümünden **daha kısadır.** Ayrıca, 59 günlük KKS ne çok kısa (buzağı gelişimini ve meme dokusunun yenilenmesini riske sokacak kadar) ne de çok uzun (döl verimini geciktirecek kadar) bir süredir. Bu da çalışmada değerlendirilen işletmelerde kuru dönemlerin düzenli izlendiğini ve doğuma hazırlığın çoğunlukla zamanında yapıldığını göstermektedir.

3.4. Servis Periyodu (SP)

Çalışmada elde edilen servis peryodu ile ilgili veriler Tablo 7'de sunulmuştur.

Tablo 7. Siyah Alaca ineklerde servis periyodu üzerine etkili çevre faktörleri

		N	$\bar{X} \pm S_{\bar{x}}$	P
İşletme Büyüklüğü	1-5 baş	125	148.16 ± 5.76^{A}	0.046
	6-10 baş	159	142.26 ± 5.35^{A}	
	11-50 baş	667	133.73 ± 2.58^{AB}	
	51-200 baş	61	122.77 ± 8.16^{B}	
	>200 baş	828	146.70 ± 2.38^{A}	
Laktasyon Sırası	1	911	139.64 ± 2.21^{AB}	0.040
	2	526	148.39 ± 3.03^{A}	
	3	245	132.62 ± 4.35^{AB}	
	4	105	141.07 ± 6.27^{AB}	
	5	53	127.09 ± 9.02^{B}	
Buzağılama Mevsimi	Kış	510	146.54 ± 3.12^{A}	0.010
	İlkbahar	465	145.06 ± 2.96^{A}	
	Yaz	434	136.22 ± 3.30^{B}	
	Sonbahar	431	134.56 ± 3.20^{B}	

^{AB}: Aynı sütunda farklı harfleri taşıyan grup ortalamaları arası farklar önemlidir ($P<0.05$)

Araştırmada Siyah Alaca ineklerde servis periyodu ortalamalarının 122,77 ile 148,39 gün arasında değiştiği ve çevresel faktörlere duyarlı olduğu belirlenmiştir. Bu değerler saha koşullarında döl veriminin kısmen geciktiğini göstermektedir. Servis periyodu işletme büyüklüğüne göre önemli düzeyde farklılık göstermiştir (P=0,046). En kısa servis periyodu 51–200 başlık işletmelerde 122,77 gün olarak saptanırken (B), 1–5 baş, 6–10 baş ve >200 başlık işletmelerde SP'nin 142–148 gün arasında ve daha uzun olduğu görülmüştür (A). Bu durum orta büyüklükteki işletmelerin tohumlama ve döl verimi yönetimini daha etkin yaptığını, çok küçük ve çok büyük ölçekli işletmelerde ise ilk tohumlama zamanının gecikebildiğini düşündürmektedir.

Laktasyon sırası da servis periyodu üzerine etkili olmuştur (P=0,040). İkinci laktasyondaki inekler en uzun servis periyoduna (148,39 gün) sahip olurken, 5. laktasyondakiler 127,09 gün ile en kısa grupta yer almıştır (B). Bu bulgu, orta yaşlı ineklerde doğum sonrası dönemde döl tutmanın biraz daha gecikebildiğini, yaşlı ineklerde ise sürüden çıkarılma baskısına bağlı olarak daha kısa SP uygulandığını göstermektedir. Buzağılama mevsimi bakımından kış ve ilkbaharda buzağılayan ineklerin servis periyotları daha uzun (146,5 ve 145,1 gün) bulunmuş, yaz ve sonbaharda buzağılayanlarda ise SP 134–136 güne düşmüştür (P=0,010). Bu durum kış ve

erken ilkbahar dönemlerinde negatif enerji dengesi, barınak koşulları ve döl tutmanın gecikmesi gibi etmenlerin etkili olabileceğini göstermektedir.

Sonuç olarak, bu çalışmada elde edilen servis periyodu değerleri, incelenen sürülerde döl veriminin çevresel ve işletme kaynaklı faktörlerden etkilendiğini; özellikle küçük ve çok büyük ölçekli işletmeler ile kış-ilkbahar döneminde buzağılayan ineklerde östrus tespiti, ilk tohumlama zamanı ve döl tutma başarısının iyileştirilmesiyle bu sürenin kısaltılabileceğini ortaya koymaktadır.

Bizim çalışmamızda Siyah Alaca ineklerde servis periyodu (SP) ortalaması **139 gün** olarak belirlenmiştir. Bu değer, süt sığırı işletmelerinde "ideale yakın" kabul edilen **60–90 gün** aralığının (Akman ve ark., 2001) ve yetiştiricilerin pratikte hedeflediği **100–110 gün** düzeyinin (Boztepe ve ark., 2015) üzerindedir. Türkiye'de bazı işletmelerde bildirilen SP değerleriyle karşılaştırıldığında da bizim bulgumuzun görece uzun olduğu görülmektedir.

Türkiye'de araştırma yapan Özçelik, (1994) 95–133 gün; Özçelik ve Arpacık, (2000) 114 gün; Koçak ve ark., (2007) 87–100 gün; Duru ve Tuncel, (2002); 93 gün; Sehar ve Özbeyaz, (2005) 109 gün; Bilgiç ve Alıç, (2005) 95 gün; Erat ve ark., (2013) 77–137 gün olarak tespit etmişlerdir.Buna göre 139 günlük SP'nin, özellikle kurumsal işletmelerde bildirilen çoğu değerden **daha uzun** olduğu söylenebilir. Bu fark; işletmelerde kızgınlık tespitinin yeterince hassas yapılamaması, ilk tohumlama zamanının gecikmesi, doğum sonrası dönemdeki metabolik/sosyal stresler veya süt verimi yüksek ineklerde döl tutmanın fizyolojik olarak biraz daha geç gerçekleşmesiyle ilişkili olabilir. Dolayısıyla bu işletmelerde SP'nin 110–120 gün bandına çekilmesi, hem yılda bir buzağı hedefini destekleyecek hem de laktasyonlar arası aralığın kısaltılmasıyla sürü verimliliğini artıracaktır.

3.5. Buzağılama Aralığı (BA)

Çalışmada elde edilen buzağılama aralığı ile ilgili veriler Tablo 8'de sunulmuştur.

Tablo 8. Siyah Alaca ineklerde buzağılama aralığı üzerine etkili çevre faktörleri

		N	$\bar{X} \pm S_{\bar{x}}$	P
İşletme Büyüklüğü	1-5 baş	125	428.16 ± 5.76^{A}	0.049
	6-10 baş	159	422.26 ± 5.35^{A}	
	11-50 baş	667	413.73 ± 2.58^{AB}

	Sonbahar	431	414.56 ± 3.20^{B}	

[AB]: Aynı sütunda farklı harfleri taşıyan grup ortalamaları arası farklar önemlidir (P<0.05)

Araştırmada Siyah Alaca ineklerde buzağılama aralığı ortalamalarının yaklaşık **402–428 gün** arasında değiştiği belirlenmiştir. Bu değerler, ideal kabul edilen 365 günün üzerinde olup sürülerde döl veriminin çevresel ve yönetimsel faktörlerden etkilendiğini göstermektedir. Buzağılama aralığı işletme büyüklüğüne göre önemli düzeyde farklılık göstermiştir (P=0,049). En kısa BA 51–200 başlık işletmelerde **402,77 gün** olarak saptanırken, 1–5 baş, 6–10 baş ve >200 başlık işletmelerde bu süre **422–428 gün** aralığında ve daha uzun bulunmuştur. Bu sonuç, orta büyüklükteki işletmelerde döl verimi yönetiminin daha başarılı olduğunu, çok küçük ve çok büyük ölçekli işletmelerde ise tohumlama zamanının veya döl tutmanın gecikebildiğini düşündürmektedir.

Laktasyon sırası ile buzağılama aralığı arasındaki farklar istatistiksel olarak önemli bulunmamıştır (P=0,300). Bununla birlikte 2. laktasyondaki ineklerin BA'sı **428,39 gün** ile nispeten daha uzun, 5. laktasyondakilerin ise **407,09 gün** ile daha kısa gerçekleşmiştir. Bu durum yaşlı ineklerde sürüden çıkarılma baskısına bağlı olarak daha sık buzağılama hedeflendiğini düşündürmektedir. Buzağılama mevsimi BA üzerinde etkili olmuştur (P=0,018). Kış ve ilkbaharda buzağılayan inekler **425–427 gün** ile daha uzun aralıklarda buzağılamış, buna karşılık yaz ve sonbaharda buzağılayanlarda bu süre **414–416 güne** düşmüştür. Kış-ilkbahar dönemlerinde enerji dengesi ve çevre koşullarına bağlı döl tutma gecikmelerinin bu farkı oluşturduğu değerlendirilmektedir."

Sonuç olarak, bu çalışmada belirlenen buzağılama aralıkları saha koşullarında döl veriminin hedeflenen 365 günün üzerinde seyrettiğini, özellikle küçük ve çok büyük ölçekli işletmeler ile kış-ilkbahar döneminde buzağılayan ineklerde östrus tespiti, zamanlı tohumlama ve doğum sonrası bakımın iyileştirilmesiyle bu sürenin kısaltılabileceğini ortaya koymaktadır.

Süt verim yönlü ineklerde BA'nın, 340-370 gün arasında olmak üzere, ortalama 365 gün (1yıl) olması istenmektedir. Bu değerlerden sapmalar süt veriminin azalmasına yol açmaktadır (Akman, 1997). Yine Boztepe ve ark. (2015) tarafından BA'nın 365-390 gün (12-13 ay) arasında tutulması önerilmektedir.

Bu çalışmada buzağılama aralığı (BA) **yaklaşık 406 gün** olarak hesaplanmıştır. Bu değer, süt sığırı işletmeciliğinde "ideal" kabul edilen **365 gün/yılda bir buzağı** hedefine göre uzun olmakla birlikte, Türkiye'de Siyah Alaca sürüler üzerinde yapılmış birçok çalışmanın bildirdiği değerlerden **daha kısa** ya da **onlara oldukça yakındır.**

Türkiye'de farklı iller ve işletmelerde yapılan çalışmalarda BA'nın genellikle **390–430 gün** aralığında değiştiği görülmektedir. Bazı çalışmalarda 420 günün üzerinde değerler rapor edilmiştir (Özçelik, 1994; Bilgiç ve Alıç, 2005; Koçak ve ark., 2007; Bakır ve ark., 2009; Şahin ve Ulutaş, 2010; Sarar ve Tapkı, 2017).

Bu farkın temel nedeni, aynı çalışmada belirlenen **servis periyodunun 139 gün** gibi nispeten uzun bir düzeyde seyretmesi ve buna 59 günlük kuruda kalma süresinin eklenmesiyle gebelik aralığının bir miktar uzamasıdır. Nitekim literatürde BA'nın uzamasının çoğu kez **SP'nin uzamasını** takip ettiği, yani sorun kaynağının çoğunlukla tohumlamaya geç başlama veya geç döl tutma olduğu bildirilmektedir (Özçelik ve Arpacık, 2000; Duru ve Tuncel, 2002; Sehar ve Özbeyaz, 2005; Erdem ve ark., 2007). Dolayısıyla 406 günlük değer, hem ülkemizdeki bazı işletmelerinde bildirilen 417–430 günlük değerlerden **daha kısa** olması bakımından olumlu, hem de 365 günlük hedefe hâlâ **iyileştirme payı** olduğunu göstermesi bakımından dikkat çekicidir.

Bu sonuçlar, incelenen illerde döl verimi yönetiminin tamamen yetersiz olmadığını; kızgınlık tespiti, ilk tohumlama yaşı/doğum sonrası ilk tohumlama zamanı ve besleme-nedenli doğum

sonrası gecikmelerin azaltılmasıyla BA'nın 390–395 gün bandına çekilebileceğini göstermektedir.

4. SONUÇ

Bu çalışmada Yozgat ilinde yetiştirilen Siyah Alaca sığırların 2003–2022 yılları arasında tutulan 1.840 başlık kayıtları değerlendirilmiş ve bölgedeki sürülerin hem süt verimi hem de döl verimi bakımından Türkiye ortalamalarıyla karşılaştırılabilir düzeyde olduğu görülmüştür. Laktasyon süresinin 358 gün ve kuru dönem süresinin 59 gün düzeyinde gerçekleşmesi, işletmelerde sağım ve kurutma yönetiminin genel olarak doğru yapıldığını, sürenin hem çok kısalmadığını hem de gereksiz yere uzatılmadığını ortaya koymuştur. İşletme büyüklüğü, laktasyon sırası ve buzağılama mevsimi gibi çevresel faktörlerin 305-GSV, laktasyon süresi ve kuru dönem üzerine anlamlı etkilerinin bulunması, bölgedeki verim farklılıklarının yalnızca genetik değil, büyük ölçüde yönetim kaynaklı olduğunu da göstermektedir.

Döl verimi bakımından hesaplanan **139 günlük servis periyodu** ve **yaklaşık 406 günlük buzağılama aralığı** ise sürülerde hedeflenen 365 gün/yılda bir buzağı düzeyine tam olarak ulaşılamadığını, ancak Türkiye'de farklı illerde Siyah Alacalar için bildirilen 390–430 günlük değerlere göre daha iyi bir seviyenin yakalandığını ortaya koymaktadır Bu durum, çalışma materyalinin saha koşullarını iyi yansıttığını, ancak kızgınlık tespiti, ilk tohumlama zamanının belirlenmesi, doğum sonrası negatif enerji dengesinin azaltılması ve kış–ilkbahar buzağılamalarında barınak-besleme yönetiminin güçlendirilmesiyle döl verimi göstergelerinin 390 gün bandına çekilebileceğini düşündürmektedir. Nitekim 51–200 başlık işletmelerde BA'nın 402,8 gün, SP'nin ise 122,8 gün olması; orta ölçekli iyi yönetilen işletmelerde üreme performansının belirgin biçimde daha iyi olduğuna işaret etmektedir.

Elde edilen bulgular bütün olarak değerlendirildiğinde, Yozgat ilindeki Siyah Alaca sürülerinin verim düzeyinin artırılmasında yalnızca genetik ilerlemenin değil, **işletme büyüklüğüne uygun sürü yönetimi modellerinin, mevsime duyarlı besleme programlarının ve döl verimi odaklı kayıt-izleme sistemlerinin** birlikte kullanılması gerektiği anlaşılmaktadır. Bu veriler, bölgeye özgü seleksiyon hedeflerinin daha gerçekçi olarak tanımlanmasına imkân vermekte ve DSYB kayıtlarının düzenli tutulmasının bölgesel ıslah programları için ne kadar kritik olduğunu göstermektedir.

DOĞUM ÖNCESI KONDİSYON YÖNETİMİNİN SÜT SIĞIRLARINDA ÜREME PERFORMANSINA ETKİLERİ

Doç. Dr. Orhan ERMETİN

Yozgat Bozok Üniversitesi, Ziraat Fakültesi, Zootekni Bölümü

Email: orhan.ermetin@yobu.edu.tr

ORCID: 0000-0002-3404-0452

ÖZET

Süt sığırcılığında üretkenlik yalnızca süt verimi ile sınırlı olmayıp, üreme performansı, metabolik sağlık ve genel sürü refahı ile doğrudan ilişkilidir. Doğum öncesi dönem, bu bağlamda kritik bir geçiş sürecini temsil etmekte olup, ineklerin metabolik adaptasyonları, enerji dengesi ve hormonal düzenlemeleri üzerinde belirleyici rol oynamaktadır. Bu dönemde uygulanan kondisyon yönetimi, doğum sonrası dönemde ortaya çıkabilecek negatif enerji dengesi, metabolik bozukluklar ve düşük fertilite gibi sorunların önlenmesinde stratejik bir faktördür. Vücut kondisyon skoru (VKS), ineklerin enerji rezervlerini ve yağ dokusu durumunu değerlendirmede en yaygın kullanılan araçtır. Araştırmalar, optimal VKS düzeyinde (genellikle 3,0–3,5) doğuma giren ineklerin daha yüksek döl tutma oranlarına, daha kısa servis periyoduna ve daha sağlıklı bir laktasyon başlangıcına sahip olduklarını ortaya koymaktadır. Buna karşın, düşük kondisyonlu ineklerde doğum sonrası kızgınlıkların geciktiği, fertilitenin zayıfladığı ve süt veriminin olumsuz etkilendiği bildirilmektedir. Yüksek BCS değerleri ise metabolik stres, doğum güçlüğü ve yem alımında azalma riskini beraberinde getirmektedir.

Beslenme stratejileri, özellikle kuru dönem ve geçiş dönemi boyunca, enerji dengesi ve metabolik sağlık açısından kritik öneme sahiptir. Negatif enerji dengesi (NED), yüksek düzeyde yağ mobilizasyonu ve ketozis gibi sorunlara yol açarak üreme performansını olumsuz etkilemektedir. Ayrıca, insülin, leptin, IGF-I ve progesteron gibi hormonların enerji dengesiyle ilişkili olarak üreme fonksiyonları üzerinde belirleyici olduğu vurgulanmaktadır. Bu nedenle, doğum öncesi dönemde uygun beslenme programlarının uygulanması, kondisyon kayıplarının sınırlanması ve metabolik hastalıkların önlenmesi, sürülerin üretkenliği ve sürdürülebilirliği açısından vazgeçilmezdir. Sonuç olarak, doğum öncesi kondisyon yönetimi yalnızca bireysel hayvan sağlığına değil, aynı zamanda işletme ekonomisine ve uzun vadeli ıslah programlarına da katkı sağlayan temel bir yönetim aracıdır.

Anahtar Kelimeler: Vücut Kondisyon Skoru, Negatif Enerji Dengesi, Üreme Performansı, Süt Sığırı, Kondisyon Yönetimi

IMPACT OF PREPARTUM BODY CONDITION MANAGEMENT ON REPRODUCTIVE PERFORMANCE OF DAIRY COWS

ABSTRACT

Productivity on a dairy farm isn't confined to milk yield; it's tightly woven with performance, metabolic health, and the overall welfare of the herd. The pre-parturient period marks a transition when cows undergo metabolic adjustments, shift their energy balance, and experience sweeping hormonal changes. Managing body condition during this window is a move to forestall postpartum issues such as negative energy balance (NEB), metabolic disorders, and a dip in fertility. The body condition score (BCS) stands as the adopted yardstick for gauging energy reserves and adiposity in dairy cattle. Evidence from the literature points out that cows entering the calving window with a BCS in the corridor—somewhere between 3.0 and 3.5—tend to boast higher conception rates, experience briefer service intervals, and enjoy a more robust lactation curve. On the side, animals saddled with a low BCS frequently display postponed estrus, diminished fertility, and a slump in milk yield; while those perched at the opposite extreme with an excessively high BCS are prone to metabolic disturbances, dystocia, and a noticeable dip in feed intake.

Well-designed nutrition programs during the pre-calving period and the subsequent transition phase are essential for keeping a cow’s energy balance on an even keel and its metabolism stable. A negative energy balance (NEB) triggers mobilization, opens the door to ketosis, and dampens reproductive performance. Meanwhile, hormones such as insulin, leptin, IGF-I, and progesterone, tightly interwoven with energy metabolism, exert an influence on function. Consequently, implementing pre-partum feeding strategies, preventing steep body-condition declines, and sidestepping metabolic disorders are key to boosting herd productivity and ensuring long-term sustainability. All told, managing pre-partum condition isn't just a driver of each animal’s health; it also feeds into farm economics and the success of long-range breeding improvement programs. For that reason, it should be seen as a bedrock management tool in dairy operations.

Keywords: Body Condition Score, Negative Energy Balance, Reproductive Performance, Dairy Cows, Condition Management

1.GİRİŞ

Süt sığırcılığı hayvansal üretimin başlıca alanlarından biridir ve ekonomi ile toplum açısından stratejik değer taşır. Sürdürülebilir süt üretimi büyük ölçüde besleme düzeyi, rasyon bileşimi ve besin dengesine dayanır. Dengeli bir besleme programı yalnızca yüksek süt verimini değil, döl verimini, bağışıklık yeterliliğini ve genel hayvan sağlığını da korur (McDonald ve ark., 2011; NRC, 2021).

Yetersiz ya da dengesiz besleme metabolik bozukluklara, döl tutmama sorunlarına ve süt verimindeki dalgalanmalara zemin hazırlar. Enerji ile protein dengesi korunamadığında negatif enerji dengesi gelişir ve bu durum doğum sonrasında ketozis ile yağlı karaciğer riskini yükseltir (Butler, 2014).

Modern süt sığırcılığında besleme yönetimi yalnızca rasyon yazmaktan ibaret değildir. Yem kalitesinin düzenli analizi, hayvanın içinde bulunduğu fizyolojik evreye göre besin planlaması ve uygulamanın sürekli izlenmesi bu kapsamın parçasıdır (NASEM, 2021; Tricarico ve ark., 2020; von Keyserlingk ve ark., 2013). Bu nedenle besleme yönetimi verimlilik, hayvan refahı ve çevresel sürdürülebilirlik için sektörün temel direklerinden sayılır (Walsh ve ark., 2011; Butler, 2003; Cardoso ve ark., 2020). Besin maddelerinin yetersiz ya da dengesiz verilmesi belirgin verim kaybına hatta hayvan ölümlerine yol açabilir. Bunun doğal sonucu olarak dönemsel tarımsal gelir ve kârlılık düşer, uzun vadede işletme değeri zayıflar ve varlıkların sürdürülebilirliği riske girer (Kalantari ve ark., 2016; VandeHaar ve ark., 1998; Brady ve ark., 2021; Liebe ve ark., 2020).

Yüksek verimli sürülerde dölleme ve süt üretimiyle kaybolan besin öğeleri ancak yeterli ve dengeli içerikli konsantre yemlerle telafi edilebilir. İnek ve gebelik döneminde yavrunun sağlıklı gelişimi için protein, vitamin ve mineral gereksinimlerinin eksiksiz karşılanması yaşama gücünü ve doğum sonrası süt verimini destekler (NASEM, 2021; Cardoso ve ark., 2020). Üreticinin pik laktasyonda protein gereksiniminin başlangıç ve son evrelere göre daha yüksek olduğunu bilip rasyonu buna göre ayarlaması teknik yetiştiricilik açısından kritiktir. Sonuç olarak süt sığırı beslemesinde gereksinimlerin dengeli karşılanması, canlı ağırlık kaybı ile sindirim bozukluklarının en aza indirilmesi ve hayvan sağlığının korunması sürdürülebilir ve kârlı üretimin önkoşuludur (VandeHaar ve St-Pierre, 1998; NASEM, 2021).

Alınan besin öğeleri önce yaşamsal gereksinimleri karşılamak için kullanılır. İhtiyaçlar karşılandıktan sonra artan enerji sırt, bel, kaburga hattı ile kuyruk sokumu, döş ve genital bölge çevresinde yağ olarak depolanır. Enerji alımı düştüğünde önce bu periferik yağ depoları mobilize edilerek gereksinimler karşılanır. Enerji açığı sürerse mobilizasyon artar. Vücut kondisyonu canlı hayvanda yağ kütlesinin yağ dışı dokuya, yani kas ve iskelete oranını ifade eder (Wright ve Russel, 1984).

2. VÜCUT KONDİSYON SKORU (VKS) VE ÖNEMİ

Vücut kondisyon skoru (VKS), laktasyonda ya da kuru dönemdeki ineklerin canlı ağırlık ve vücut ölçülerinden bağımsız biçimde, vücut yağlarının gözle değerlendirilmesine dayanır (Hady ve ark., 1994; Gallo ve ark., 1996). Sığırlar başta olmak üzere birçok türde enerji rezervlerini yani yağ dokusunu belirlemede en pratik yöntemlerden biri kabul edilir (Tapkı ve ark., 2005). Uygulama çoğu zaman besleme amaçlı düşünülse de VKS'nin süt verimi, sürü sağlığı, üreme performansı ve hayvan refahı üzerinde belirleyici etkileri vardır ve bu etkiler doğrudan işletmenin kârlılığına yansır (Bewley ve Schutz, 2008; Yolcu, 2024).

Sahada VKS, hayvanın belirli odak bölgelerindeki deri altı yağ kalınlığına bakılarak verilen bir puandır; canlı ağırlık ya da ölçülerden bağımsız çalışır (Serin, 2004). Günlük uygulamada amaç, zayıf ile yağlı hayvanı ortak bir dilde sınıflandırmaktır. Son yıllarda sürü yönetiminde

besleme, refah, bakım ve sağlık uygulamalarının yanında ek bir göstergeye dönüştü ve verimi artırmaya yönelik kararları destekler hale geldi (Koçyiğit, 2017). Sübjektif olsa da hızlı, pratik ve düşük maliyetlidir; bu sayede her inek için uygun bakım-besleme planı çıkarılabilir, sürüde kondisyon birliği sağlanabilir (Domecq ve ark., 1997; Roche ve ark., 2009; Singh ve ark., 2018). Ayrıca yalnızca kondisyonu değil, üreme başarısı ve verimlilik hakkında da fikir verir; sütçü ineklerde doğum öncesi ve sonrası üreme sonuçlarıyla bağlantısı gösterildiği için sahada hedeflenen fertiliteye ulaşmada işe yarar bir rehberdir (Serin, 2004).

Süt verimine odaklı seleksiyon zaman içinde üreme performansını aşağı çekebilir ve bazı sağlık risklerini büyütebilir. Bu nedenle VKS'yi düzenli aralıklarla izlemek, enerji rezervlerini takip etmek ve bu bilgiye dayalı sürü yönetimi uygulamak önemlidir. Vücut yağını dolaylı ama güvenilir biçimde tahmin etmek, laktasyon boyunca uygun kondisyona tutunmayı sağlar; bunun sonucu olarak süt verimi daha istikrarlı seyreder, üreme ve metabolik hastalık olasılığı azalır, işletme kârlılığı desteklenir (Suriyasathaporn ve ark., 1998).

VKS değerlendirilirken yaş, ırk ve vücut büyüklüğü gibi hayvansal faktörler dikkate alınmalıdır. Yaşlı ineklerin gençlere göre daha düşük puanlara eğilimli olduğu bildirilmiştir. Irklar arasında vücut yağ dağılımı ile enerji depolama kapasitesi farklılık gösterir; örneğin Jersey ve Siyah Alaca gibi sütçü ırklar çoğu zaman Simental gibi kombine verimli ırklara kıyasla daha yüksek VKS sergiler ve etçi ırklar sütçü ırklardan daha fazla vücut yağı taşır. Ayrıca küçük ve orta cüsseli ırkların büyük ırklara göre daha yüksek kondisyon puanlarına sahip olabildiği belirtilmiştir (Choy, 2002; Kara, 2015).

Ferguson ve ark. (1994) skorlamanın pratik, yalın ve yetiştiricinin kolayca uygulayabileceği bir çerçevede olması gerektiğini vurgular. Ward (2003) ise yöntemin göründüğü kadar kolay olmadığını, sağlıklı bir puanlama için deneyim gerektiğini ve çiftlik sistemlerine entegrasyonun her zaman sorunsuz ilerlemediğini belirtir. Bu gözlemler, sığırlarda vücut enerji rezervlerini belirlemeye yönelik alternatif yaklaşımların araştırılmasını hızlandırmıştır. Yöntem değişse de amaç aynıdır: hayvanın vücut yağ düzeyini, dolayısıyla enerji durumunu değerlendirmek. Nitekim süt sığırlarında yağ durumu süt verimi, erken laktasyon gereksinimleri ve üreme performansı gibi birçok süreci etkiler (Erdem ve Atasever, 2004; Kara, 2015).

3.VÜCUT KONDİSYON SKORU VE ÖLÇÜM YÖNTEMLERİ

Vücut kondisyon skoru bazı çalışmalarda bağımsız bir ölçüm olarak kullanılır, son yıllarda ise kimi sınıflandırma şemalarının parçası olarak ele alınır. Uygulamada temel dayanak kuyruk sokumu, bel ve sağrı bölgelerindeki yağ dokusunun görsel ya da palpasyonla incelenmesidir (Uğur, 2014). Süt sığırlarında yağlılık düzeyini hızlı ve pratik biçimde belirlemek için uygundur. Birkaç farklı skala vardır; üçlü, dörtlü, yedili, dokuzlu sistemler bildirilmiştir. En sık kullanılan ise 1-5 arası beşli skala. Bu sistemde 1 aşırı zayıf, 5 aşırı yağlı hayvanı ifade eder. Ayrıca 0,25 ya da 0,5'lik ara puanlar ölçümü daha hassas hale getirir (Serin, 2004; Diler, 2011; Diler ve Aydın, 2015; Varışlı ve Tekin, 2011).

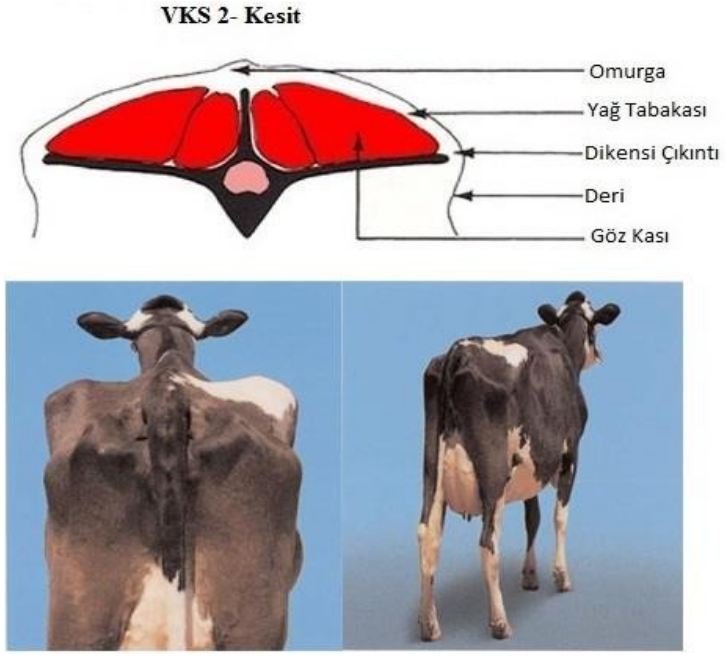
Daha nesnel sonuçlar için VKS ölçümlerinde ultrason kullanımı yaygınlaşmıştır. Yöntem belirli frekanstaki ses dalgaları ile özellikle sırt bölgesindeki deri altı yağ kalınlığını ölçer. Gözleme dayalı skorlara kıyasla daha tutarlı çıktılar sağlayabilir ve tekrar ölçümlerde operatör etkisini azaltır (Ayres ve ark., 2009; Koçyiğit, 2017). Üretici açısından VKS'nin anlaşılır, pratik ve kolay uygulanabilir olması kritik bir gerekliliktir. Ferguson ve ark. (1994) yalın bir skorlama çerçevesinin sahada benimsenmesini kolaylaştırdığını vurgular. Ward (2003) ise doğru puanlamanın eğitim ve deneyim istediğini, bu nedenle bazı işletmelerde sisteme tam uyum sağlanamadığını belirtir. Bu gözlemler vücut enerji rezervlerini belirlemeye yönelik alternatif yaklaşımların geliştirilmesini teşvik etmiştir. Özellikle süt sığırlarında vücut yağ oranı süt verimi, laktasyon sürecindeki metabolik denge ve üreme performansı üzerinde doğrudan etkilidir (Erdem ve Atasever, 2004).

Vücut kondisyon skoru sistemi önce Jefferies (1961) tarafından koyunlar için 0-5 arası bir ölçekle tanımlandı. Daha sonra besi sığırlarına, ardından süt sığırlarına uyarlandı. Lowman ve ark. (1976) süt sığırlarında 1-5 arası skala ile standardizasyon sağladı. Pryce ve ark. (2001) 1-5 arası puanlamanın sektör genelinde standartlaşması gerektiğini bildirdi (Jefferies, 1961; Lowman ve ark., 1976; Pryce ve ark., 2001).

Tek ve evrensel bir VKS sistemi yoktur. Ülkeler kendi iklimine, yetiştirme hedeflerine ve ırklarına uygun ölçekler geliştirmiştir. Örneğin Avustralya'da Earle (1976) 1-8 arası bir sistem önermiştir. İngiltere'de Mulvany (1977) 0-5 arası altı düzeyli bir yaklaşım sunmuştur. Amerika'da Wildman ve ark. (1982) ile Edmonson ve ark. (1989) 1-5'lik beşli skalayı yaygınlaştırmıştır. Yeni Zelanda'da Garinger ve McGowan (1982) 1-10 arası onlu bir sistem kullanmıştır. Danimarka'da Landsverk (1992) 1-9 arası puanlamayı uygulamıştır. Tablo 1'de bu farklı sistemlerde normal kondisyon aralıkları özetlenmiştir (Bewley ve Schutz, 2008; Earle, 1976; Mulvany, 1977; Wildman ve ark., 1982; Edmonson ve ark., 1989; Garinger ve McGowan, 1982; Landsverk, 1992; Kara, 2015; Canatan, 2013).

Tablo 1. VKS belirlemede farklı puanlama sistemlerinde normal kondisyon aralıkları

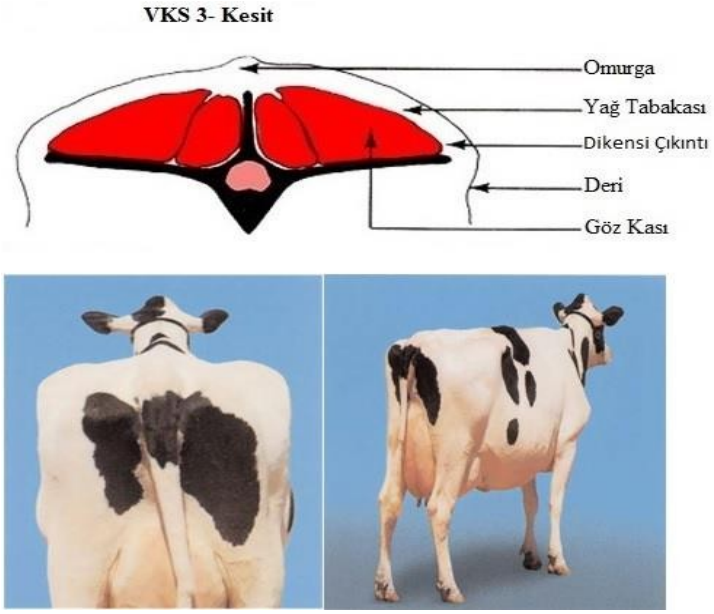
Puanlama sistemleri	**1-8**	**1-5**	**1-9**	**1-10**
Normal kondisyon aralığı	4,5-5,5	3,0-3,75	5,0-7,0	5,5-7,0



Günümüzde süt sığırlarında vücut kondisyon skorunun belirlenmesinde en yaygın kullanılan yöntem, **Edmonson ve ark. (1989)** tarafından geliştirilen beşli skala sistemidir. Bu sistem, İngiltere, Avustralya, Yeni Zelanda ve Amerika'da kullanılan farklı kondisyon değerlendirme yöntemlerinin karşılaştırılması ve uyarlanması sonucunda oluşturulmuştur. Pratik uygulanabilirliği, görsel kolaylığı ve üretici tarafından hızlı şekilde öğrenilebilir olması nedeniyle günümüzde araştırmacılar ve yetiştiriciler tarafından tercih edilen standart yöntem haline gelmiştir.

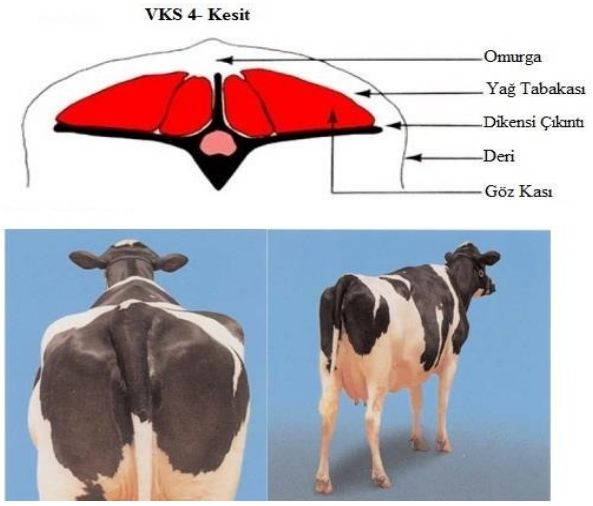
Vücut kondisyon skoru 1 olan inekler oldukça zayıf, hatta kaşektik görünümde olup belirgin kemik çıkıntılarına sahiptir. Pelvis kemikleri ve bel omurları ince deri altında kolayca fark edilir. Açlık çukuru derindir ve kısa kaburgalar ayrı kemik parçaları gibi seçilebilir. Kuyruk sokumu çevresinde derin çukurluklar bulunur ve deri bu bölgede katlanmış bir görünüm sergiler (Kara, 2015; Canatan, 2013). Bu durum, hayvanda aşırı zayıflığın en belirgin göstergelerindendir.(Şekil 1).

Şekil 1. Vücut kondisyon skoru 1.0 olan bir ineğin görünüşü (Kara, 2015)



Vücut kondisyon skoru 2 olan inekler genellikle erken laktasyon döneminde ciddi negatif enerji dengesi (NEB) yaşayan hayvanlardır. Bu inekler oldukça zayıf görünmekle birlikte sağlık durumu genellikle stabildir; ancak düşük kondisyon süt ve döl verimini olumsuz etkiler. Sırt hattı belirgin, fakat omurlar tek tek seçilemez. Kısa kaburgalar belirgin olsa da daha bütünleşik bir yapıdadır. Kalça kemiği ile oturak yumrusu arasındaki açı belirgindir ve ligament çizgileri keskin şekilde fark edilir. Sağrı kasları hafif dolgunluk gösterirken kemik çıkıntıları hâlâ belirgindir. Kuyruk sokumu bölgesi çukur görünümlü olup, kemiklerin üzerinde az miktarda yağ dokusu bulunur. (Şekil 2).

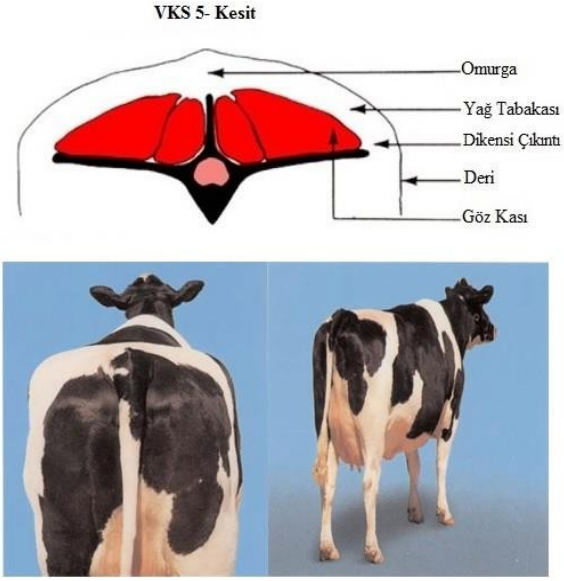
Şekil 2. Vücut kondisyon skoru 2.0 olan bir ineğin görünüşü (Kara, 2015)



Vücut kondisyon skoru 3 olan inekler, genellikle laktasyonun büyük bölümü için ideal durumdadır (Şekil 3). Sırt hattı hâlâ seçilebilir olsa da omurlar yuvarlak bir görünüm kazanmıştır. Kısa kaburgalar yaklaşık 1–1,5 cm kalınlığında doku ile kaplı olup, daha düşük

skorlu ineklerdeki kadar keskin değildir. Kalça ve oturak yumruları belirginliğini korur ancak aralarındaki açı giderek U biçimine dönüşmüştür. Bu kemikler arasındaki açı hâlâ fark edilebilir düzeydedir. Kuyruk sokumu çevresi hafif çukur görünümlü olup, önceki skorlardaki gibi deri kıvrımı bulunmaz (Kara, 2015; Canatan, 2013).

Şekil 3. Vücut kondisyon skoru 3.0 olan bir ineğin görünüşü (Kara, 2015)



Vücut kondisyon skoru 4 olan inekler, fazla kondisyonlu ve etli bir görünüme sahiptir. Arkadan bakıldığında kemik çıkıntıları neredeyse düzleşmiştir. Sırt çizgisi belirgin değildir ve kısa kaburgalar sadece elle kontrol edildiğinde fark edilir. Kalça kemiği ile oturak yumrusu yuvarlaklaşmış, bu bölgelerdeki yağ birikimi açıkça görülür. Kuyruk sokumu çevresi dolgun olup, deri kıvrımı bulunmaz. Kalça ve oturak yumruları arasındaki yapı U şeklini almış, açlık çukuru ise dışbükey bir form kazanmıştır (Kara, 2015; Canatan, 2013). Sağrı bölgesinde yağlanma belirgindir. (Şekil 4).

Şekil 4. Vücut kondisyon skoru 4.0 olan bir ineğin görünüşü (Kara, 2015)

Vücut kondisyon skoru 5 olan inekler aşırı yağlıdır ve bu durum metabolik hastalıklar, topallık ve üreme problemleri açısından ciddi risk taşır. Hayvanın vücut yapısı tamamen yuvarlak görünür; omurga ve omurlar fark edilmez, sırt düzleşmiştir. Kısa kaburgalar gözle seçilemez, yalnızca elle hissedilebilir. Bel, kalça ve kuyruk bölgelerinde kemik çıkıntıları kaybolmuştur. Kalça kemiği ile oturak yumrusu arasındaki bölge tamamen yağla doludur ve aradaki açı düz

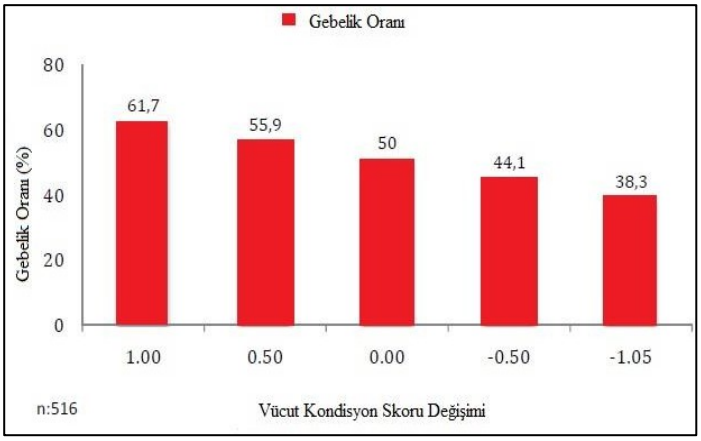
bir çizgi hâline gelmiştir. Kuyruk sokumu çevresi dolgun, açlık çukuru ise dışbükey görünümde olur. Şekil 5'de örnek resim verilmiştir (Kara, 2015; Canatan, 2013).

Şekil 5. Vücut kondisyon skoru 2.0 olan bir ineğin görünüşü (Kara, 2015)

Vücut kondisyon skoru, süt inekleri için kuru dönemin başlangıcı, buzağılama, doğum sonrası ilk ay, orta ve geç laktasyon olmak üzere beş dönemde ölçülmesi önemli ve kritiktir. Özellikle ilk buzağılamadaki kondisyon, doğum sonrası performans ve sonraki laktasyonları belirgin biçimde etkiler. 1–5 ölçeğinde ideal VKS döneme göre değişir. Ölçüm sıklığı işletmenin büyüklüğü, personel ve hedeflere göre planlanmalı; pratikte doğumda, ilk tohumlamada, laktasyon ortasında, kuruya ayrılmadan ~90–100 gün önce ve kuru dönem sonunda değerlendirme önerilir. İlgili dönemler ve hedef VKS'ler Tablo 2'de özetlenmiştir (Kellogg, 2010; Kara, 2015).

Tablo 2. Çeşitli dönemlerde ideal VKS aralıkları

Laktasyon Evresi	**VKS**
Kuru başlangıcı	3,5-4,0
Buzağılama (İnek)	3,5-4,0
Doğumdan bir ay sonra	2,5-3,0
Orta laktasyon	3
Geç laktasyon	3,25-3,75
Buzağılama (Düve)	3,5



Arslan ve Tufan (2010), süt sığırlarında vücut kondisyon skorunun verim özelliklerine bağlı olarak laktasyon süresince değişkenlik gösterdiğini ve bu nedenle belirli aralıklarla değerlendirilerek ardışık ölçümlerin karşılaştırılmasının önemli olduğunu vurgulamışlardır.

4.VÜCUT KONDİSYONUNUN FERTİLİTE ÜZERİNDEKİ BELİRLEYİCİ ETKİLERİ

Süt sığırlarında vücut kondisyon skorunun (VKS) laktasyon dönemlerine göre değiştiği uzun süredir bilinmektedir. Wildman ve ark. (1982) farklı evrelerde VKS'nin anlamlı biçimde farklılaştığını, ileri dönemde değişimin daha durağan seyrettiğini bildirmiştir. Aynı çalışmada persistensi yüksek ineklerin ortalama VKS'sinin daha yüksek olduğu, kondisyon düzeyi arttıkça servis periyodunun uzama eğilimi gösterdiği belirtilmiştir. Buna karşılık Butler (2003)

doğumda kondisyonu yüksek ineklerde servis periyodunun daha kısa olabildiğini saptamıştır (Wildman ve ark., 1982; Butler, 2003).

Edmonson ve ark. (1989) VKS'nin süt ve döl verimiyle yakından ilişkili olduğunu ve bu nedenle sürü yönetiminde düzenli kondisyon takibinin yararlı bir araç sayılması gerektiğini vurgulamıştır. Butler (2003) dönemsel VKS değişimlerinin enerji metabolizmasıyla bağlantılı olduğunu, doğum sonrası dönemde artan kondisyon kaybının hastalık ve fertilite sorunlarını sıklaştırabildiğini belirtmiştir (Edmonson ve ark., 1989; Butler, 2003).

Şekil 6. Doğumdan sonra VKS ve fertilite arasındaki ilişki (Ferguson ve Galligan, 1993; Kara, 2013)

Gearhart ve ark. (1990) ile Ruegg (1991) ideal kondisyon düzeyinin ineğin fizyolojik durumuna ve laktasyon evresine göre değiştiğini ifade etmiştir. Linn (1991) doğumdan sonra kondisyondaki kayıp arttıkça gebelik oranının azaldığını, bir puandan az kayıpta yaklaşık %50, iki puanı aşan kayıpta ise %21 gebelik oranı görüldüğünü bildirmiştir (Gearhart ve ark., 1990; Ruegg, 1991; Linn, 1991).

Ruegg ve ark. (1992) ile Van Horn ve Wilcox (1992) doğum dönemi için ideal VKS aralığını 3,0 ile 3,75, laktasyonun tepe noktasında 2,25 ile 2,75, kuru dönemde 3,0 ile 3,75 olarak önermiştir. Waltner ve ark. (1993) izlem verilerine dayanarak doğum sayısı arttıkça kondisyon kaybının da arttığını göstermiştir. Ferguson ve Galligan (1993) bir puanın altındaki orta düzey kondisyon kaybının üreme performansını belirgin olumsuz etkilemediğini, ancak çok zayıf (<2,5) ya da aşırı yağlı (>3,5) ineklerde riskin yükseldiğini bildirmiştir (Ruegg ve ark., 1992; Van Horn ve Wilcox, 1992; Waltner ve ark., 1993; Ferguson ve Galligan, 1993).

Ruegg ve Milton (1995) doğumda düşük kondisyonda buzağılayan ineklerde gebelik başına tohumlama sayısının arttığını ve servis süresinin uzama eğilimi gösterdiğini rapor etmiştir. Ancak doğumdaki VKS'nin ilk östrus, ilk tohumlama aralığı ve servis periyodu üzerindeki etkileri istatistiksel olarak anlamlı bulunmamıştır. Ferguson ve ark. (1994) kuruya ayrılmadan önce, laktasyonun yaklaşık 200. günü ile kuruya çıkarma arasında VKS'nin 2,75 ile 3,50 aralığında tutulmasını ve kuruya ayrılan ineklerde 3,25 ile 3,50 puan hedeflenmesini, böylece doğum sonrası risklerin azaltılmasını önermiştir. Gallo ve ark. (1996) düşük verimli ineklerde en düşük VKS'nin laktasyonun üçüncü ayında, yüksek verimli ineklerde ise dördüncü ayında görüldüğünü; bu azalmanın orta ve geç dönemde telafi edildiğini bildirmiştir (Ruegg ve Milton, 1995; Ferguson ve ark., 1994; Gallo ve ark., 1996).

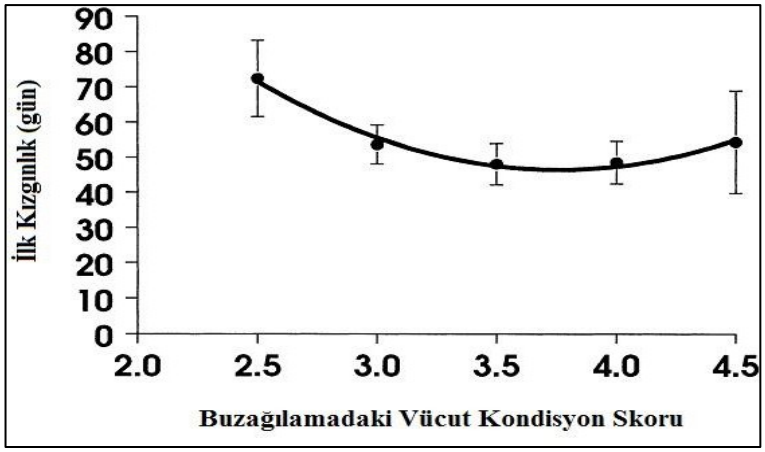
Domecq ve ark. (1997) kuru dönem, erken laktasyon ve doğum sonrası VKS değişimlerinin gebelik oranıyla ilişkisini incelemiş; modele ekledikleri laktasyon sayısı, ilk 120 gün süt verimi ve doğum ile laktasyonun dördüncü haftasındaki VKS değişkenleri arasında, 120 günlük süt verimindeki artışın gebelik oranını yükselttiğini, laktasyonun 30. günündeki VKS düşüşünün

ise gebelik oranını azalttığını göstermiştir. Laktasyonun ilk ayında bir puandan az kondisyon kaybeden ineklerin ilk tohumlamada gebe kalma olasılıklarının, bir puandan fazla kaybedenlere göre yaklaşık %50 daha yüksek olduğu bildirilmiştir. Çalışma, gözlenen sağlık sorunlarının gebelik sonucundan çok VKS ve süt verimiyle ilişkili olduğunu ve özellikle kuru dönem ile doğumdan sonraki ilk 30 günde kondisyon izlemenin ilk tohumlamada başarısızlık riskini öngörmede değerli olduğunu vurgulamıştır (Domecq ve ark., 1997).

Markusfeld ve ark. (1997) aşırı kondisyon kaybının üreme performansını olumsuz etkilediğini bildirmiştir. Domecq ve ark. (1997) daha az kondisyon kaybeden ineklerde enerji dengesinin daha hızlı kurulduğunu ve bunun daha iyi döl verimiyle sonuçlanmasının beklendiğini desteklemiştir. Drame ve ark. (1999) hem VKS düzeyinin hem de kaybının ilk tohumlama aralığı ve servis periyodunu öngörmede yararlı göstergeler olabileceğini rapor etmiştir. Diğer çalışmalar da kuru dönem, doğum ve doğum sonrası evrelerde VKS düzeyi ile değişim eğrisinin, ovaryum fonksiyonlarının yeniden başlaması dahil, üreme performansında belirleyici rol oynadığını göstermiştir (Markusfeld ve ark., 1997; Domecq ve ark., 1997; Drame ve ark., 1999; Ruegg, 1991; Loeffler ve ark., 1999; Prandi ve ark., 1999).

Pryce ve Løvendahl (1999) laktasyonun belirli evrelerinde vücut yağ oranındaki ya da VKS'deki düşüklüğün östrus siklusunun sürekliliğini ve üreme başarısını etkileyebildiğini göstermiştir. Buna paralel olarak Drame ve ark. (1999) doğum sonrası düzenli VKS izlemesiyle saptanacak kondisyon kayıplarının ilk tohumlama aralığı ve servis periyodunu tahminde yararlı olacağını belirtmiştir (Pryce ve Løvendahl, 1999; Drame ve ark., 1999).

Yaylak ve Kaya (2000) yüksek süt verimine yönelik seleksiyon ve üretim uygulamalarının üreme ve sağlık sorunlarına yakalanma riskini artırabileceğini bildirmiştir. VKS'nin düzenli takibi, enerji rezervlerinin izlenmesine ve bu sayede sürü yönetiminin iyileştirilmesine imkân verir. Kondisyon büyük ölçüde depo yağlara bağlı olduğundan doğru ve düzenli değerlendirme ile laktasyon boyunca ideal kondisyona yakın seyir sağlanabilir; bu da süt verimini optimize eder, üreme ve sağlık problemlerini azaltır. Pratikte VKS genellikle erken laktasyonda hızla düşer, pik süt veriminden sonra kademeli olarak yükselir ve bu artış kuru dönemde de sürebilir (Yaylak ve Kaya, 2000).



Düşük fertilite ve yavru verimi süt sığırçılığında önemli sorunlardır. Genotip, hastalıklar, iklim, bakım ve besleme ile süt verimi düzeyi gibi etmenler belirleyicidir. Bu etmenlerin etkisiyle ortaya çıkan düşük ya da yüksek VKS de fertiliteyi olumsuz etkileyebilir. Nitekim bazı çalışmalarda uygunsuz kondisyonun döl veriminde düşüşe yol açtığı bildirilmiştir (Richards ve ark., 1986; Loeffler ve ark., 1999; Moreira ve ark., 2000).

Gillund ve ark. (2001) vücut yağ mobilizasyonuna bağlı VKS değişimlerinin fertilitedeki düşüşlerle ilişkili olduğunu; doğum sonrası 0,5 puanı aşan VKS kaybının döl veriminde azalmaya ve gebelik başına tohumlama sayısında artışa yol açtığını bildirmiştir. Pryce ve ark. (2001) VKS'nin laktasyon boyunca kilit bir değişken olduğunu, erken laktasyon kadar diğer kritik evrelerdeki VKS değişimlerinin de östrusun yeniden başlaması ve üreme başarısı üzerinde etkili olabileceğini vurgulamıştır. Bu nedenle dönemsel VKS düzeyleri ve dönemler arası VKS kayıpları yakından izlenmelidir (Gillund ve ark., 2001; Pryce ve ark., 2001).

Doğum sonrası VKS'de 0,5 puandan fazla düşüş genellikle döl verimini azaltır. Doğum ile ilk tohumlama arasındaki dönemde yaklaşık bir puanlık kayıp ilk tohumlama aralığını uzatır ve ilk tohumlamada gebelik olasılığını düşürür. Bir puanı aşan kayıplar gebelik başına tohumlama sayısını belirgin biçimde artırır (Ferguson ve Galligan, 1993; Walsh ve ark., 2011; Roche ve ark., 2013; Carvalho ve ark., 2014; Akbar ve ark., 2015; Pinedo ve ark., 2022).

Friggens (2003) doğumda zayıf kondisyonda olan ineklerin rezervlerini doğumdan sonra hızla yerine koyabilseler bile bunun üreme açısından dezavantaja dönüşebildiğini; hedefin altında

kondisyonda buzağılayan ineklerde ilk kızgınlığın daha geç görüldüğünü göstermiştir (Şekil 7) (Friggens, 2003).

Şekil 7. Buzağılamadaki VKS ile ilk kızgınlık zamanı arasındaki ilişki (Ferguson ve Galligan, 1993; Kara, 2013)

Moreira ve ark. (2000) doğumda VKS'si düşük ineklerde anöstrus süresinin uzadığını, ilk tohumlamada gebelik oranının düştüğünü bildirdi. Üreme başarısı kaliteli ovum üretimi ve embriyonun gebeliği sürdürmeye dönük sinyal üretimi gibi ardışık basamaklara bağlıdır ve bu basamaklar hayvanın önceki ile mevcut enerji dengesiyle yakından ilişkilidir (Moreira ve ark., 2000; Stockdale, 2001).VKS doğum öncesinde ve sonrasında doğal olarak değişir. Doğumda çok düşük ya da çok yüksek VKS ile erken laktasyonda hızlı VKS kaybı genelde olumsuz enerji dengesi ve düşük döl verimiyle birliktedir. Bu yüzden doğum için yaklaşık 3,0–3,25 aralığı ve erken dönemde sınırlı VKS kaybı önerilir. Bu yaklaşım hem sağlık göstergelerini hem de üreme sonuçlarını iyileştirir (Roche ve ark., 2009; Walsh ve ark., 2011; Carvalho ve ark., 2014; Roche ve ark., 2013; Akbar ve ark., 2015; Pinedo ve ark., 2022).

Friggens (2003) doğumda zayıf kondisyondaki ineklerde ilk kızgınlığın daha geç görülebildiğini gösterdi. Kim ve Suh (2003) laktasyonu beş dönemde inceleyerek VKS'nin özellikle doğum ve erken laktasyonda belirgin dalgalandığını rapor etti (Friggens, 2003; Kim ve Suh, 2003). Erdoğan ve Alaçam (2003) tohumlama dönemindeki VKS'nin ilk ve üçüncü tohumlamada gebelik oranı, gebelik başına tohumlama sayısı, doğum ile ilk tohumlama aralığı ve yeniden gebe kalma süresi gibi temel göstergelerle yakından ilişkili olduğunu bildirdi. Ayrıca kondisyonu yüksek ineklerin doğum sonrası daha fazla kondisyon kaybettiğini, daha az kuru madde tükettiğini ve postpartum sağlık sorunlarını daha sık yaşadığını not etti (Erdoğan ve Alaçam, 2003).

Yaylak (2003) doğumdaki VKS ile kondisyon kaybının üreme parametreleri üzerinde istatistiksel olarak anlamlı bir etkisi bulunmadığını, ancak VKS'nin 3,50 ve üzeri olduğunda döl veriminin daha yüksek gerçekleşebildiğini ifade etti. Ryan ve ark. (2003) buzağılama döneminde VKS'nin yaklaşık 3 civarında tutulmasının üreme performansını desteklediğini ve bu hedefin kuru dönemde dengeli besleme ile sağlanabildiğini vurguladı (Yaylak, 2003; Ryan ve ark., 2003).

Roche ve ark. (2007) laktasyon boyunca, özellikle tohumlama dönemi ile doğum–tohumlama aralığında VKS kaybının döl verimi açısından kritik olduğunu vurguladı. Postpartum ilk östrus ve ilk tohumlamanın gecikmesi doğum aralığını uzatır, yıllık buzağı hedefinden sapmalara ve toplam süt üretiminde azalmaya yol açar. Düşük gebelik oranları tohumlama sayısını artırır ve ekonomik kaybı büyütür (Roche ve ark., 2007). Bewley ve ark. (2008) buzağılama ile erken laktasyondaki VKS değişimlerinin sağlık ve üremeyi olumsuz etkileyebildiğini bildirdi. Erken laktasyonda sınırlı kayıp fizyolojik olarak kabul edilebilir, yine de yetiştiricilerin bu kaybı en

aza indirmeyi hedeflemesi önerilir. Roche ve ark. (2009) buzağılama VKS'si ile süt ve döl verimi ile sağlık sorunları arasındaki ilişkinin doğrusal olmadığını gösterdi. Buna göre doğumdaki ideal aralık 3,0–3,25'tir. 3,0'ın altında süt ve döl verimi düşme eğilimindedir, 3,5 ve üzerindeki değerlerde kuru madde tüketimi azalır ve metabolik hastalık riski yükselir (Bewley ve ark., 2008; Roche ve ark., 2009).

VKS takibi oranları yaklaşık olarak ABD'de %5, Avrupa'da %1,7, Türkiye'de %0,08 düzeyindedir. Çimen (2010) VKS'nin gelişmiş ülkelerde kârlılık açısından önemli bir yönetim aracı olduğunu belirtir. Kuru dönemde aşırı yağlılık doğum güçlüğü, sonun atılamaması ve yem tüketiminde azalma ile birlikte ketozis, yağlı karaciğer ve süt humması riskini artırır. Kızgınlık, ovulasyon ve implantasyon olumsuz etkilenir ve döl verimi geriler (Çimen, 2010).

Varışlı ve Tekin (2011) yağ mobilizasyonuna bağlı VKS değişimlerinin fertiliteyi düşürebildiğini bildirdi. VKS ölçümü uygun kondisyonda kalmayı destekleyen pratik bir araçtır. Tohumlama döneminde düşük VKS'nin döl verimini olumsuz etkileyebileceği rapor edilmiştir, ancak bu etkinin bazı çalışmalarda istatistiksel olarak anlamlı bulunmadığı da belirtilmiştir (Varışlı ve Tekin, 2011).

Roche ve ark. (2013) VKS'nin kuru dönem, buzağılama, erken laktasyon ve tohumlama dönemlerinde düzenli olarak değerlendirilmesini önerdi ve dönemlere ait önerilen aralıkları Tablo 3'te topladı (Roche ve ark., 2013; Kara, 2015).

Tablo 3. Belirli dönemler ve hedef kondisyon skorları

Süt Sığırları	İnekler	Düveler
Kuru dönem (Buzağılamadan 7-8 hafta once)	2,5-3	-
Buzağılamadan 3 hafta önce	2,5-3	2,5-3
Tohumlama öncesi	2-3	2-2,5

5. SONUÇ

Kârlı süt sığırcılığı yılda bir buzağıya ve yüksek süt verimine dayanır. Bunu fizyolojiye uygun bakım ve besleme sağlar. Enerji durumunu izlemek için en pratik araç vücut kondisyon skorudur (VKS). VKS, kondisyona bağlı üreme, süt ve sağlık risklerini erken fark ettirir. Sürü yönetimini ve rasyon planını somut veriye bağlar. Birçok ülkede bu işlem rutindir. Bizde yaygınlaşması için saha örgütlenmesi, eğitim ve uzman personel gerekir. Sürü düzenli izlenirse verimlilik kalıcı biçimde artar.

Kuru dönemde orta kondisyonu korumak esastır. Bu durum sonraki laktasyonda süt miktarını, süt bileşimini ve döl verimini belirler. Aşırı yağ döl verimini düşürür. Metabolik sorunları artırır. İlk kızgınlık, ilk tohumlama ve gebe kalma olasılığını olumsuz etkiler. Bu yüzden kuru dönemde VKS düzenli izlenir. Gereksiz yağlanma ve hızlı kayıplar engellenir. Hayvanlar skora göre gruplandırılır. Rasyon her gruba göre düzenlenir. Yılda bir buzağı hedefi için doğumdan sonra yaklaşık 80 gün içinde yeniden gebelik planlanır. Bu hedef doğum sonrası yönetimle kazanılır ve işletmenin sonucunu doğrudan etkiler.

VKS'nin düzenli kullanımı yüksek verime selekte sürülerde artan üreme ve sağlık risklerini kontrol etmeye yardım eder. Ölçüm sıklığı işletmenin ölçeğine ve iş akışına uygun seçilir. İş gücünü aksatmayacak bir program izlenir. Kararlar tek bir ölçüme değil dönemler arası değişime dayanır. Çünkü doğum öncesi ile doğum sonrası skor farkı tohumlama sayısını, ilk tohumlamada gebelik oranını ve açık günleri tek değerlerden daha iyi açıklar.

ÖZET

Türkiye'de çayır meralar, 1998 yılına kadar çeşitli düzenlemeler ile yönetilmeye çalışılmıştır. Çayır meralar ile ilgili müstakil bir kanun ilk kez 1998 yılında 4342 sayılı Mera Kanunu olarak çıkarılmıştır. 1998'de kabul edilen 4342 sayılı Mera Kanunu kapsamındaki, kanun uygulamaları Tarım ve Orman Bakanlığı Bakanlık İl Müdürlükleri marifeti ile yürütülmektedir. Mera Kanunu ile 13.1 mil. ha mera alanda mera tespiti, 12.7 mil.ha alanda mera tahditi, 8.1 mil.ha alanda ise mera tahsisi yapılmıştır. Ülke genelinde 37 ilde 442.859 ha alanda kiralama yapılmış, 2959 adet mera ıslahı ve amenajmanı projesi ile 2.2 mil.ha mera alanı, mera ıslahı ve amenajmanı projesi kapsamına alınmış ve ıslahı yapılmıştır. Mera vasıf değişikliğini içeren Mera Kanunun 14. maddesi ile 406,6 bin ha mera alanı, mera vasfı dışına çıkarılmıştır.

4342 sayılı Mera Kanununun kabul edilişinden itibaren geçen süre içerisinde kanun uygulamaları ile kanunun zayıf ve eksik kaldığı bir çok yönü ön plana çıkmıştır. Mera kanunu ile mera alanlarında işgal ve tecavüzlerin yeterince önlenemediği, ilgili birimlerce tutulan tutanakların gereğinin yapılmadığı, mera kiralamalarının sınırlı düzeyde kaldığı, kiralanan meraların bir kısmında yem bitkisi, tahıl yetiştirildiği, 14. Madde ile mera kayıplarının sürekli arttığı, özellikle son yıllarda organize sanayi bölgeleri için mera vasfı dışına çıkarılan mera alanlarında artış olduğu, uygulanan ıslah projelerinde uygulamalarda süreklilik sağlanamadığı, kendisine tahsisi yapılan merada hayvan sahiplerinin amenajman ilkelerine uymadıkları, otlatma bedelleri ödemedikleri, il otlatma planlarına uymadıkları söylenebilir. Belirtilen bu durumlara karşı uygulanacak cezai müeyyidelerin bir kısmının olmadığı bir kısmının ise uygulanmadığı belirlenmiştir. Mera alanlarının korunması, tekniğine uygun kullanılması, verimliliklerinin artması ve sürdürülebilirliklerinin sağlanması için yetersiz kalan Mera Kanununda bazı değişikliklerin yapılması zaruri hale gelmiştir denilebilir.

Anahtar Kelimeler: Mera Kanunu, uygulama, sürdürülebilirlik, tesbit, tahdit, tahsis

PROBLEMS AND SOLUTIONS EMERGING IN THE APPLICATIONS OF RANGE LAW IN TÜRKİYE

ABSTRACT

In Turkey, range were tried to be managed with various regulations until 1998. An independent law regarding range was first enacted in 1998 as the Range Law Numbered. 4342. The law implementations within the scope of the Range Law Numbered. 4342, which was accepted in 1998, are carried out by the Provincial Directorates of the Ministry of Agriculture and Forestry. With the range Law, range determination was made in 13.1 mil. hectares of range land, range restriction was made in 12.7 mil. hectares of range land, and range allocation was made in 8.1 mil. hectares of range land. Leases were made in 442,859 hectares of land in 37 provinces throughout the country, 2959 range improvement and management projects and 2.2 mil. hectares of range land were included in the scope of range improvement and management projects and their improvement was carried out. With clause 14. of the Range Law, which includes the change in range qualification, 406.6 thousand hectares of range land have been excluded from range qualification.

In the period since the enactment of the Range Law Numbered. 4342, many aspects of the law that are weak and incomplete have come to the forefront with the implementation of the law. It can be said that occupation and encroachment in range areas could Numberedt be prevented sufficiently with the range law, the necessary procedures for the minutes kept by the relevant units were Numberedt carried out, range rentals remained limited, fodder plants and grains were grown in some of the leased range, range losses have been constantly increasing with clause 14, especially in recent years, there has been an increase in range areas excluded from range qualification for organized industrial zones, continuity in the implementation of the implemented improvement projects could Numberedt be ensured, animal owners in the range allocated to them did Numberedt comply with the management principles, did Numberedt pay grazing fees, and did Numberedt comply with the provincial grazing plans. It was determined that some of the penal sanctions to be applied against these specified situations were Numberedt implemented and some were Numberedt implemented. It can be said that it has become necessary to make some changes in the Range Law, which is insufficient, in order to protect range areas, use them according to their technique, increase their productivity and ensure their sustainability.

In this study, the missing and unimplemented aspects of the Range Law are discussed.

Keywords: Range Law, application, determination, limitation, allocation

1. GIRIŞ VE MERA YÖNETIMI TARIHÇESI

Türkiye'de mera, yaylak ve kışlakların yönetimi, tarihsel süreç boyunca tek bir yasal mevzuat altında toplanamamış, bu durum da yönetimde ciddi dağınıklıklara ve sorunlara yol açmıştır. 1998 yılına kadar mera uygulamaları, farklı kurumların sorumluluğunda ve çok sayıda farklı kanun hükümleri çerçevesinde yürütülmekteydi. Bu parçalı yapının hukuki dayanakları arasında Osmanlı döneminde 1858 tarihli Kanunname-i Arazi, 1924 tarihli Köy Kanunu, 1930 tarihli Belediyeler Kanunu, 1945 ve 1950 tarihli Çiftçiyi Topraklandırma Kanunu, 1956 tarihli Orman Kanunu, 1973 tarihli Toprak ve Tarım Reformu Kanunu ve 1985 tarihli İmar Kanunu gibi mevzuatlar yer almaktaydı. Bu durum, meraların bütüncül bir yaklaşımla korunmasını ve yönetilmesini oldukça zorlaştırmaktaydı. Meralar, bu karmaşık hukuki yapıdan, **28 Şubat 1998** tarihinde yürürlüğe giren ve bu alanlara özgü ilk yasal düzenleme olan **4342 Sayılı Mera Kanunu** ile kurtulmuştur.

2. 4342 Sayılı Mera Kanunu ile Gelen Yenilikler

Kanun, mera, yaylak ve kışlakların korunması, tespit edilmesi, sınırlandırılması (tahdit), tahsis edilmesi (kullanım amacı belirleme) ve ıslahının sağlanmasını temel amaç olarak belirlemiştir. Bu düzenleme ile birlikte, mera alanlarının teknik olarak otlatma ilkelerine uygun olarak kullanılması zorunluluğu getirilmiş, alanların sürdürülebilir verimliliği hedeflenmiştir.

Mera Kanununu ile gelen bazı yenilikler şunlardır;

- **Tespit, Tahdit ve Tahsis:** Mera alanlarının tespit, tahdit ve tahsis işlemleri yapılmış, ihtiyaca göre yeni alanlar mera olarak tescil edilmiştir.
- **Sürdürülebilirlik:** Meraların verimliliklerinin sürdürülebilir hale getirilmesi için otlatma ilkelerine uyulma zorunluluğu getirilmiştir.
- **Kiralama Yetkisi:** İhtiyaç fazlası ve ıslaha muhtaç alanların, uygun projelerle özel sektöre kiraya verilmesine imkân tanınmıştır.
- **Otlatma Hakkı ve Ücreti:** Mera alanını kullanan köy ve belde halkına otlatma hakkı verilmiş, bu hak karşılığında otlatma ücreti ödeme yükümlülüğü getirilmiştir.
- **Islah Çalışmaları:** Verim ve kalite artışı için mera alanlarının devlet eliyle ıslah edilmesine başlanılmıştır.
- **Vasıf Değişikliği:** İl Mera Komisyonlarınca uygun görülen meraların vasfının değiştirilebileceği belirtilmiştir.

2. Mera Yönetiminin Kurumsal Yapılanması ve Uygulamalar

Mera Kanunu'nun yürürlüğe girmesiyle birlikte, mera yönetimi **Tarım ve Orman Bakanlığı** çatısı altında bir kurumsal hiyerarşi ile örgütlenmiştir. Bu yapının merkezinde Bakanlığa bağlı Bitkisel Üretim Genel Müdürlüğü bünyesindeki Çayır Mera ve Yem Bitkileri Daire Başkanlığı yer almaktadır. Yerelde ise valilikler, İl Tarım ve Orman Müdürlükleri ve bu müdürlüklere bağlı Çayır Mera Yem Bitkileri Şubeleri sorumludur. Karar organı olarak İl Mera Komisyonları görev yaparken, uygulamada Teknik Ekipler ve Mera Yönetim Birlikleri bulunmaktadır.

Kanun uygulamaları kapsamında 2023 yılı sonu itibarıyla toplam **13.147.701 hektar** alan tespit edilmiş, bu alanın **12.740.779 hektarı** tahdit edilmiş ve bunun **8.302.548 hektarı** tahsis edilmiştir (BUGEM, 2024).

2.1. Mera Kiralamaları ve Islah Çalışmaları:

Mera alanlarının kullanımında önemli bir yer tutan kiralama faaliyetleri 2006 yılında başlamıştır. 2006 ile 2023 yılları arasında yapılan kiralamalar Çizelge 1'de görülmektedir.

Çizelge 1.Mera Kanununa göre yapılan kiralamalar

Yıllar	Kiralanan İl Sayısı	Kiralanan Toplam Alan (ha)	Uzun Süreli (ha)	Mevsimlik (ha)	Kiralama Bedeli (TL)
2006	23	175.411,00	613,00	174.798,00	1.289.523,00
2007	30	205.936,00	696,00	205.240,00	323.656,00
2008	30	199.951,13	845,07	199.106,06	1.480.699,42
2009	31	200.809,36	737,26	200.072,10	1.326.394,79
2010	36	161.161,00	1.635,68	159.525,32	1.563.332,00
2011	35	137.338,54	3.651,94	133.686,60	2.897.131,56
2012	29	121.957,94	1.259,33	120.698,61	2.459.548,02
2013	24	392.092,14	665,04	391.427,10	3.937.363,90
2014	33	365.525,08	1.726,50	363.798,58	6.395.298,40
2015	30	208.551,00	4.494,00	204.057,00	5.792.997,00
2016	27	230.621,34	1.241,49	229.379,85	4.165.866,70
2017	32	251.565,43	3.983,78	247.581,65	5.196.513,50
2018	34	265.752,72	2.681,42	261.019,30	8.552.037,98
2019	33	257.974,38	25.779,02	232.195,37	9.474.320,78
2020	33	288.951,86	10.219,36	278.732,20	14.279.053,92
2021	35	351.172,09	6.696,87	344.475,22	17.762.941,45
2022	35	378.918,55	7.860,28	371.058,27	19.915.876,68
2023	37	451.684,20	8.824,40	442.859,80	27.910.064,19
Toplam			**83.610,44**		**134.722.619,29**

Anonim, 2024

Çizelge 1'de görüldüğü üzere 2023 yılına kadar toplam 37 farklı ilde mera kiralaması yapılmış ve uzun süreli kiralanan alan 2023 yılında 8.824 ha'a mevsimlik kiralama ise 442.859 ha'a ulaşmıştır. Bu kiralamalardan elde edilen toplam bedel ise **134.722.619,29 TL olarak gerçekleşmiştir.** Kiralamaların büyük çoğunluğu, yaklaşık **yüzde 99,5'i**, göçer hayvancılık yapan üreticilere ve işletme sahiplerine yönelik olup, uzun süreli ıslah amaçlı kiralamalar (83.610,44 ha) toplam kiralamaların küçük bir kısmını oluşturmuştur.

Tarım İl Müdürlüklerinin Üniversiteler ve Tarımsal Araştırma Enstitüleri ile birlikte yürütmüş olduğu Mera Islahı ve Amenajmanı projelerinin sayıları ve toplan alanları Çizelge 2'de görülmektedir

Bölgeler	Proje Sayısı (adet)	Alanı (ha)
Ege	**273**	**55.04**
Marmara	**381**	**79.62**
Akdeniz	**350**	**172.30**
İç Anadolu	**471**	**486.45**
Karadeniz	**593**	**363.39**
Doğu Anadolu	**632**	**915.09**
Güney Doğu Anadolu	**259**	**129.45**
Toplam	**2.959**	**2.201.34**

Anonim, 2024

Çizelge 2'de görüldüğü üzere 2023 yılı sonuna kadar 2959 adet Mera Islahı ve Amenajmanı projelesi yürütülmüş ve 2.2 mil.ha alan ıslah edilmiştir. En çok ıslah projesi Doğu Anadolu, İç Anadolu ve Karadeniz Bölgesinde yürütülmüştür Islah projelerinin sürdürülebilirliği anlamında ciddi sorunlar vardır. Bu projelerin süresi bittikten sonra ıslah edilen merada hayvanını otlatan üreticilerden toplanan otlatma ücretleri ile proje uygulamalarının daha öncesinde devlet tarafından yürütülen uygulamalara devam edilmesi gerekir. Ancak uygulamada bu pek mümkün olmamıştır. Proje süreleri bittiğinde uygulamalar devam ettirilmemiş otlatma planlarına uyulmamıştır, uyulmamaktadır (Hatipoğlu ve ark., 2021; Cevher ve ark., 2015). Bundan dolayı ıslah projelerinde sürdürülebilirliğin olduğu söylenemez. Bu projelerde en büyük sorun merayı kullananların otlatmanın temel ilkelerine uymamaları, otlatma ücreti toplanılmaması mera ıslahını ancak proje süresi ile sınırlı tutmaktadır. Islah projesi uygulanan meralar proje bitiş süresi sonrasında proje uygulanma sürecinin başındaki duruma tekrar dönmektedir diyebiliriz.

2.2. Mera Kayıpları: Tahsis Amacı Değişiklikleri

Mera Kanununun 14. Maddesi ile İl Mera Komisyonunca uygun görülen bazı meralarda tahsis amacı değişikliği yapılarak mera vasfı dışına çıkarılmıştır. Yıllar itibariyle mera vasfı dışına çıkarılan mera alanları Çizelge 3'de görülmektedir.

Çizelge 3. Mera kanunu 14.maddesine göre tahsis amacı değişiklikleri

Yıl	Madden	Turizm	Kamu Yatırımı	İmar Planı	Köy Kanunu	Ülke Güvenliği	Doğal Afet	EPDK	Jeotermal	Kentsel Dönüşüm	OSB	Elektronik Haberleşme	Geçici 3.Madde	Toplam

Anonim, 2024

Çizelge 3'de görüldüğü üzere Mera alanlarının korunmasında en büyük sorunlardan biri olan tahsis amacı değişiklikleri, Kanunun 14. maddesi kapsamında yürütülmektedir. 1998 ve 2023 yılları arasında, çeşitli kamu yararı gerekçeleriyle toplam 406.601,47 hektarlık mera alanının vasfı değiştirilmiştir. Bu kaybın en büyük payını sırasıyla İmar Planları (185.438,13 ha), Kamu Yatırımları (86.054,27 ha) ve Ülke Güvenliği (62.745,75 ha) konuları oluşturmaktadır. Buna

göre istatistiklerde 14.6 mil.ha olan, tesbit alanı olarak 13.1 mil. ha olan mera alanlarının 406.601 ha ı mera vasfından çıkarılmıştır.

3. Mera Kanunu Uygulamalarında Ortaya Çıkan Bazı Sorunlar

4342 Sayılı Mera Kanunu'nun 27 yıllık uygulamasında hem yasal hem de idari-teknik düzeyde çözülmesi gereken önemli sorunlar birikmiştir.

3.1. Yasal ve Kurumsal Nitelikli Sorunlar:

1.Meraların hukuki sorumluluğunun Hazineyi temsilen Tarım ve Orman Bakanlığı'nda olmaması, Bakanlığın hukuki süreçlerde taraf olma yetkisini kısıtlamakta ve koruma çabalarını zayıflatmaktadır.

2. Mera alanlarının işgal ve tahrip edilmesine yönelik mevcut yaptırımların caydırıcılığı oldukça düşüktür; bu durum, meraların sürekli işgaline zemin hazırlamaktadır.

3. Kanunun 14. maddesi kapsamında yapılan vasıf değişiklikleri nedeniyle yaşanan sürekli mera kaybı, en büyük sorunlardan birini oluşturmaktadır. Bakanlığın ıslah ettiği, meralar bile mera vasfından çıkarılabilmektedir.

4. Büyükşehir Belediyesi Kanunu'nun yürürlüğe girmesiyle köy tüzel kişiliklerinin mahalleye dönüşmesi, mera kullanım hakkı sahipliği ve yönetimi konularında yeni hukuki ve idari sorunları beraberinde getirmiştir.

5. Mera Yönetim Birlikleri, mera idaresinde beklenen etkinliği gösterememiş ve çoğunlukla pasif kalmıştır.

6. Mera işgallerine karşı 3091 Sayılı Kanun'un (Taşınmaz Mal Zilyetliğine Yapılan Tecavüzlerin Önlenmesi Hakkında Kanun) uygulaması yetersiz kalmakta ve işgallere kalıcı bir çözüm getirememektedir.

3.2. İdari ve Teknik Nitelikli Sorunlar:

1. Mera alanlarının korunması ve denetlenmesi için görevli idari personel bulunmamaktadır. Bu durum, otlatma rejimlerinin sağlıklı bir şekilde uygulanmasını ve denetlenmesini engellemektedir.

2. Orman içi meralarda otlatmanın düzenlenmesi konusundaki eksiklikler, orman ve mera arasındaki hassas dengenin korunmasını zorlaştırmaktadır.

3. İl Mera Komisyonlarının yapısında, mera konusunda uzmanlaşmış teknik uzmanların yeterli çoğunlukta olmaması, kararların bilimsel ve hukuki açıdan sağlam temellere oturtulmasını engellemektedir.

4. Vasıf değişikliklerinde, özellikle Organize Sanayi Bölgeleri gibi bazı kamu yatırımları için ot bedelinin alınmaması, mera alanı kayıplarını artırmaktadır.

5.Bazı kamu kurumlarının 14. madde izin süreci tamamlanmadan mera alanlarında faaliyetlere başlaması, yasal süreçlerin ihlal edildiğini göstermektedir.

4. Önerilen Kanunu Değişiklikleri

Mevcut sorunların üstesinden gelmek ve meraların korunmasını sağlamak amacıyla, kanun değişikliği yapılmalıdır. Bu öneriler, yasal, kurumsal, idari ve mali alanlarda köklü değişiklikleri öngörmektedir.

4.1. Kurumsal ve Hukuki Çözümler:

1. **Hukuki Sorumluluğun Transferi ve Taraf Olma Yetkisi:** Meraların hukuki sorumluluğu, Hazineyi temsilen **Tarım ve Orman Bakanlığı'na** verilerek, Bakanlığın davalarda taraf olma yetkisi sağlanmalıdır.

2. **Mera Muhafaza Memuru Kadrosu:** Mera alanlarını işgal ve tahrip olaylarından korumak için, Kanuna özel yetkilerle donatılmış **"Mera Muhafaza Memuru"** kadrosunun ihdası zorunludur.

3. **Mera Yönetiminin Yeniden Düzenlenmesi:** Etkinliği düşük olan Mera Yönetim Birlikleri kaldırılmalı, mera idaresindeki sorumluluk muhtar ve yeni ihdas edilecek mera muhafaza memuruna devredilmelidir.

4. **Cezai İşlemde Güçlendirme:** Mera işgali ve tahrip eylemlerine karşı 3091 Sayılı Kanun uygulamasının yetersizliği göz önüne alınarak, daha caydırıcı yaptırımlar için **Ceza Muhakemesi Kanunu'na (CMK)** atıf yapılmalıdır.

5. **Tanım ve Kapsam Genişletilmesi:** Büyükşehir yasasıyla köy tüzel kişiliği sona eren yerleşimler için **"kırsal mahalle"** tanımı yapılarak, Mera Kanunu uygulamalarının bu yerlerde devamı sağlanmalıdır.

4.2. Koruma ve Kullanım Esaslarına Yönelik Çözümler:

1. **Vasıf Değişikliğinde Ot Bedeli Zorunluluğu:** Mera vasfı değişikliklerinde (Devlet Denetleme Kurulu'nun önerisine uygun olarak) meranın ekonomik değeri olan **ot bedelinin** kesinlikle alınma zorunluluğu, kanuna eklenmelidir.

2. **İzinsiz Faaliyet Yasağı:** Tahsis amacı değişikliği talebi sonuçlanıp resmi izinler alınmadan mera alanlarında herhangi bir faaliyete (inşaat, hafriyat vb.) başlanması kesinlikle yasaklanmalı ve bu yasağı ihlal edenlere ağır para cezaları getirilmelidir.

3. **Yasaklar ve Yaptırımlar:** Kanuna, meranın işgali, üzerindeki ağaçların kesilmesi, tıbbi bitki sökümü, hafriyat veya inşaat molozu dökülmesi, doğal çimin kesilmesi, kum, çakıl, taş, toprak gibi malzeme alınması ve her tür inşaat (ev, yapı) yapılması gibi eylemleri kesin olarak yasaklayan ve bunlara karşılık yüksek para cezaları öngören hükümler eklenmelidir.

4. **Islah Edilmiş Meraların Vasıf Değişikliklerinin Önlenmesi:** Islah programına alınmış mera alanlarının vasıf değişikliği yapılmaması engellenerek, korunması sağlanmalıdır.

5. **Gelirlerin Mera Islahına Tahsisi:** Mera gelirleri ve tahsil edilen para cezaları, köylerde Muhtarlık, diğer yerlerde ise İl Müdürlüğü Döner Sermaye bünyesinde açılacak **Mera Özel Hesabına** yatırılmalı ve bu tutarların **sadece mera ıslahı ve yönetimi için kullanılması** kanuni bir zorunluluk haline getirilmelidir.

6. **Otlatma Hakkı ve Otlatmanın Teknik Kuralları:** Otlatma hakkı olmayanların otlatma yapması, otlatma periyoduna uyulmaması ve otlatma kapasitesinin üzerinde hayvan sokulması gibi kural ihlallerine verilecek cezalar kanuna eklenmelidir.

Bu detaylı düzenlemeler, meraların hem çevresel hem de ekonomik varlık olarak korunmasını ve sürdürülebilir bir şekilde yönetilmesini hedeflemektedir.

Sonuç

Mera Kanunu meralara mahsus özel bir kanun olması dolayısıyla kabul edildiği yıl itibariyle Türkiyede çok önemli bir açığı kapatmış bir kanundur ancak Kanun çıktıktan sonra uygulamaları ile birlikte bazı eksik yönleri ortaya çıkmıştır. Kanun mera alanlarının tespit, tahdit, tahsisi, kiralanması, ıslahı yönünde bir dizi yenilikleri beraberinde getirmiş olmakla birlikte mera işgallerini, amenajman ilkelerini engelleyememiş, uygulamalarda

sürdürülebilirlik sağlanamamıştır. Diğer taraftan tahsis değişikliğini içeren 14.madde ile mera alanlarının kayıpları son yıllarda hızla artmıştır. İl Mera Komisyonlarında yeterli mera uzmanının olmaması da bu alanların yeterince korunamamasına yol açıştır. Hayvancılığın en ucuz beslenme alanı olan doğal mera alanlarının korunması, verim ve kalitelerinde süreklilik sağlanması için kanunun bazı maddelerinde değişiklik yapılması gerekmektedir.

ÖZET

Orta Anadolu Bölgesi meraları, Türkiye'nin doğal çayır ve mera ekosistemleri içinde önemli bir yere sahiptir. Bu doğal kaynaklar; kaba yem kaynağı, biyolojik çeşitlilik ve erozyon kontrolü gibi birçok kritik öneme sahiptir. Ancak uzun yıllardır devam eden yanlış kullanım ve aşırı otlatma, bitki örtüsünün kaybına ve mera verimliliğinin azalmasına yol açmıştır. Türkiye'deki çayır mera alanı 14.6 milyon ha olup, Orta Anadolu Bölgesi meraları toplam mera alanının yaklaşık %33,3'ünü oluşturmaktadır. Bölge, karasal iklim özellikleri, yarı kurak toprak yapısı ve değişken topoğrafyası nedeniyle doğal bitki örtüsü açısından hassas alanlar içermektedir.

Çeşitli illerde yapılan vejetasyon etütleri, Orta Anadolu meralarının botanik kompozisyon açısından zengin ancak verim ve sürdürülebilirlik açısından zayıf durumda olduğunu, mera alanlarının büyük kısmının orta ve zayıf sınıfta yer aldığını ortaya koymuştur. Meralarda Poaceae (buğdaygiller) ve Fabaceae (baklagiller) familyalarından değerli yembitkilerinin oranı çok düşmüş olup, istilacı türlerin yaygınlığı %60'ın üzerinde ve çıplak alan oranı %30-45 civarındadır. Bitki örtüsündeki azalma, yem verimini düşürmekte ve hayvansal üretimi olumsuz yönde etkilemektedir. Kuru ot verimleri düşük seviyelerde olup, bu nedenle de mevcut otlatma kapasiteleri potansiyelin çok altındadır.

Bu bildiride Orta Anadolu bölgesi meralarında sürdürülen vejetasyon araştırmaları irdelenmiş ve Orta Anadolu Bölgesi meralarının sürdürülebilir kullanımı için; sürdürülebilir mera yönetimi kapsamında otlatma planlarının hazırlanması ve uygulanması, mera yönetim birliklerinin etkinleştirilmesi, çiftçilerin bilinçlendirilmesi gerektiği sonucuna varılmıştır.

Anahtar Kelimler: Orta Anadolu, mera, vejetasyon, sürdürülebilir mera yönetimi, biyoçeşitlilik

VEGETATION STUDIES CONDUCTED IN THE RANGELANDS OF THE CENTRAL ANATOLIA REGION

ABSTRACT

The pastures of the Central Anatolia Region hold a significant place within Turkey's natural meadow and rangeland ecosystems. These natural resources are critical for many purposes, including forage resources, biodiversity, and erosion control. However, long-standing misuse and overgrazing have led to vegetation loss and reduced rangeland productivity. Turkey's meadow and rangeland area is 14.6 million hectares, and meadow and rangeland area in the Central Anatolia Region constitute approximately 33.3% of the total meadow and rangeland area. The region contains vulnerable areas in terms of natural vegetation due to its continental climate, semiarid soil structure, and variable topography.

Vegetation studies conducted in various provinces have revealed that Central Anatolian rangelands are rich in botanical composition but poor in terms of productivity and sustainability. The proportion of valuable forage crops from the Poaceae and Fabaceae families has decreased significantly, the prevalence of invasive species exceeds 60%, and the proportion of bare graound is around 30-45%. The majority of rangelands are in the medium to poor range. The decline in vegetation reduces forage yields and negatively impacts animal production. Hay yields are low, and therefore current grazing capacity is far below potential.

In this presentation, vegetation researches conducted in the Central Anatolian rangelands were reviewed. From the review, it was concluded that sustainable use of Central Anatolian rangelands requires the preparation and implementation of grazing plans within the framework of sustainable rangeland management, the activation of rangeland management associations, and the raising of farmer awareness.

Keywords: Middle Anatolia, rangeland, vegetation, sustainable rangeland management, biodiversity

1.GİRİŞ

Ülkemizde doğal çayır meralar, insan beslenmesinde kullanılan hayvansal ürünlerin üretiminde girdi olarak kullanılan kaba yemin en önemli ve en ucuz kaynağını oluşturur. Aynı zamanda bu alanlar biyoçeşitlilik, erozyon kontrolü ve canlılar için doğal yaşam alanı olması açısından oldukça öneme sahiptirler. Ancak, ülkemizdeki çayır mera alanları yüzyıllardan beri tekniğine uygun olmayan kulanım sonucu bitki örtülerini önemli ölçüde kaybetmiş ve verimleri azalmıştır.

Türkiye'de bulunan çayır mera alanı 14.6 milyon ha olup, toplam yüzölçümün %18.94'lük bölümünü kaplamaktadır (TÜİK, 2025). Orta Anadolu meraları ise ülkemizdeki toplam mera alanının yaklaşık %33.3'ünü oluşturmaktadır (Ünal ve ark., 2012 a). Ülkemiz meralarında olduğu gibi Orta Anadolu meraları da buğdaygil, baklagil ve diğer familyaları içeren bitkilerle kaplı iken zamanla ağır ve erken otlatılmayla beraber bitki örtüsünün önemli bir kısmını kaybetmiş verimliliği azalmıştır.

Gün geçtikçe azalan mera alanlarında mevcut bitki örtüsünün iyileştirilmesi ve bu alanlardan en yüksek verimin sağlanması yönünde çalışmalar yapılması gerekmektedir. Meralarda yapılacak olan bu amenajman ve ıslah çalışmalarında ise planlanmanın doğru bir şekilde yapılması, yürütülmesi ve tamamlanması için mera vejetasyonu hakkında kantitatif verilerin bulunması gerekir (İspirli ve ark., 2016). Vejetasyon hakkındaki kantitatif bilgiler ise vejetasyon etüdü çalışmalarıyla sağlanır.

Bu bildiride Orta Anadolu bölgesi meralarında yapılan vejetasyon araştırmaları literatür ışığında irdelenmiştir.

2. ORTA ANADOLU BÖLGESİNİN GENEL ÖZELLİKLERİ

2.1 Coğrafi Konum

Orta Anadolu Bölgesi, Türkiye'nin yedi coğrafi bölgesinden biri olan İç Anadolu Bölgesi'nin merkezinde yer alır. Yüzölçümü yaklaşık 151.000 km² olan İç Anadolu Bölgesi, Türkiye topraklarının %21'ini kaplayarak Doğu Anadolu'dan sonra en büyük ikinci bölgedir (Anonim, 2025). Aksaray, Ankara, Çankırı, Eskişehir, Karaman, Kayseri, Kırıkkale, Kırşehir, Konya, Nevşehir, Niğde, Sivas ve Yozgat illerini içinde bulundurur.

Bölge, kuzeyde Karadeniz Bölgesi'nin iç sıradağlarının güney eteklerinden, güneyde ise Akdeniz Bölgesi ile Toros Dağları'nın kuzey eteklerinden sınırlanır. Doğuda Doğu Anadolu Bölgesi, batıda ise Ege ve Marmara Bölgeleri ile komşudur.

Orta Anadolu, geniş platolar, ovalar ve kapalı havzalarla kaplıdır. Yükselti genel olarak 900-1500 metre arasında değişir. Bölgenin ortasında yer alan Konya Ovası, Türkiye'nin en büyük ovası olup, tarımsal üretim açısından büyük öneme sahiptir. Ayrıca, Tuz Gölü gibi önemli doğal oluşumlar da bu bölgede bulunmaktadır (Anonim, 2025).

İç Anadolu Bölgesi'nin bu coğrafi özellikleri, hem doğal kaynakların dağılımını hem de insan yerleşimlerini ve ekonomik faaliyetleri şekillendirmiştir.

2.2 İklim Özellikleri

Orta Anadolu bölgesi, karasal iklim özelliklerinin etkisi altındadır. Yazlar sıcak ve kurak, kışlar ise soğuk ve yağışlı geçer. Orta Anadolu bölgesi ortalama olarak 300-400 mm civarında yağış alır. İlkbahar ayları bölgenin en yağışlı geçtiği zamanlardır. Yazlar oldukça kurak geçer ve mera alanları için olumsuz etiler yaratır.

Bölgede yaz ile kış arasındaki sıcaklık farkı fazladır. Yaz aylarında sıcaklıklar yüksek değerlerde seyrederken, kış aylarında sıcaklıklar sıfırın altına düşebilir.

Yağışların düşük olması ve yüksek buharlaşma oranı, toprak neminin yok olmasına neden olur. Ayrıca, kuru ve kurutucu rüzgarlar bitki örtüsünü tahrip ederek rüzgar erozyonuna neden olmaktadır. Bununla beraber bitki gelişimi yavaşlar ve çayır ve mera verimliliği azalır. Bu bölgede de görülen iklim değişikliğine bağlı kuraklık eğilimi, son yıllarda bölgedeki doğal bitki örtüsü kompozisyonunda da değişikliklere yol açmaktadır.

2.3 Toprak Özellikleri

Orta Anadolu bölgesi, yarı kurak iklim özelliklerine sahip geniş bozkır alanlarıyla kaplıdır. Bölge genel olarak kireçli, az organik maddeli ve su tutma kapasitesi yüksek topraklara sahiptir. Toprak yapısı çoğunlukla killi-tınlıdır. Yer yer tuzluluk probleminin yüksek olduğu bölgede alkali topraklar yaygındır. Orta Anadolu bölgesi meraları ağır ve yanlış otlatma sonucu erozyon riskiyle karşı karşıya gelmiş ve mera verimleri doğrudan etkilenmiştir.

Örneğin, Karaman ili Ayrancı ilçesi Divle köyünde yürütülen bir model mera projesinde toprakların ağır killi balçık yapıda olduğu, azot ve organik madde yönünden fakir ancak tuzluluk problemi içermediği saptanmıştır (Acar ve ark., 2023).

Ayrıca Eskişehir ili Karaören köyünde yapılan çalışmalarda, toprağın kumlu balçık yapıda olduğu ve orta derecede verimli bir mera örtüsüne sahip olduğu belirlenmiştir (Babalık ve Ercan, 2018). Bu durum, bölgedeki toprak yapısının yerel mikroklima ve topoğrafik unsurlara bağlı olarak çeşitlilik gösterdiğini ortaya koymaktadır.

3. ORTA ANADOLU MERALARININ DURUMU VE VEJETASYON ÖZELLİKLERİ

Orta Anadolu meraları, biyolojik çeşitlilik açısından zengin ve tarım ve hayvancılık bakımından kritik öneme sahip mera alanlarıdır. Fakat ülke genelinde olduğu gibi Orta Anadolu meralarında da ekosistem bozulmaları yaşanmış ve verim kayıpları ortaya çıkmıştır.

Karmaşık bitki sistemine sahip olan Orta Anadolu meraları, özellikle *Poaceae* (buğdaygiller) ve *Fabaceae* (baklagiller) familyalarına ait birçok bitki türü içermektedir. Orta Anadolu bölgesinde bulunan ve verim açısından öneme sahip bitki türleri; *Festuca ovina, Andropogon gryllus, Hedysarum varium, Thymus squarrosus, Artemisia fragrans, Medicago sativa* olarak saptanmıştır (Ünal ve ark, 2012 a)

Nevşehir'in Paşalı köyünde yapılan bir çalışmada 733 ha alanda otsu bitkiler, çalılar ve çimenler olmak üzere 78 bitki türü tespit edilmiştir. Türlerin 60 tanesi otsu bitki, 11 tanesi buğdaygil ve 7 tanesi çalı türü olarak belirlenmiştir (Fırıncıoğlu ve ark., 2008).

Sivas ili Çelebiler köyünde yapılan araştırmada 21 örneklem alanından 179 bitki türü kaydedilmiş ve bu alanlar biyoçeşitlilik açısından zengin olarak kabul edilmiştir (Ünal ve ark., 2016).

Orta Anadolu meralarının aşırı otlatma baskısı altında olduğu ve bu nedenle otsu bitkilerin azaldığı bazı çalı türlerinin (örneğin *Thymus spp*.) baskın hale geldiği belirlenmiştir(Bahar ve ark., 2024).

4. ORTA ANADOLU BÖLGESİ MERALARINDA YAPILAN ARAŞTIRMALAR

4.1 Yapılan Çalışmalardan Bazı Örnekler

'Ulusal Mera Kullanım ve Yönetimi Projesi' kapsamında Orta Anadolu Bölgesi meralarında toplam 16 ilde 1212 etüt noktasında çalışmalar yapılmıştır (Anonim, 2012). Yapılan çalışmalar sonucu elde edilen bulgulara göre;

Aksaray ilinde, 77 durakta vejetasyon etütü yapılmış 263 farklı tür tespit edilmiştir. Tespit edilen türlerin 35 adedinin (%13,4) buğdaygil, 36 adedinin (%13,7) baklagil ve 191 adedinin

(%72,9) diğer familyalara ait olduğu ortaya çıkmıştır. Çalışılan durakların 5'inin iyi (%3,54), 39'unun orta (%35,4) ve 33'ünün zayıf (%53,33) mera durumuna sahip olduğu tespit edilmiştir.

Ankara ilinde, 60 durakta vejetasyon etütü yapılmış 287 farklı tür tespit edilmiştir. Tespit edilen türlerin 34 adedinin (%11,9) buğdaygil, 47 adedinin (%16,4) baklagil ve 205 adedinin (%71,7) diğer familyalara ait olduğu ortaya çıkmıştır. Çalışılan durakların 2'si iyi (%3,33), 26'sı orta (%43,33) ve 32'si de zayıf (%53,33) mera durumuna sahip olmuştur.

Çankırı ilinde, 41 durakta vejetasyon etüdü yapılmış 329 farklı tür tespit edilmiştir. Tespit edilen türlerin 37 (%11,3) adedinin buğdaygil, 54 (%16,5) adedinin baklagil ve 237 (%72,3) adedinin diğer familyalara ait olduğu ortaya çıkmıştır. Çalışılan duraklarından, 1 durak çok iyi (%2,44), 3 durak iyi (%7,32), 24 durak (%58,54) orta ve 13 (%31,71) durak zayıf olarak tespit edilmiştir.

Eskişehir ilinde, 142 durakta vejetasyon etüdü yapılmış 275 farklı tür tespit edilmiştir. Tespit edilen türlerin 33 (%12,0) adedinin buğdaygil, 39 (%14,2) adedinin baklagil ve 202 (%73,7) adedinin diğer familyalara ait olduğu ortaya çıkmıştır. Çok iyi mera tespit edilememiş olup, 2 durak (%1,41) iyi, 88 durak orta (%61,97) ve 52 durak (%36,62) zayıf olarak tespit edilmiştir.

Karaman ilinde, 56 durakta vejetasyon etüdü yapılmış 142 farklı tür tespit edilmiştir. Tespit edilen türlerin 30 (%21,2) adedinin buğdaygil, 24 (%16,9) adedinin baklagil ve 87 (%61,2) adedinin diğer familyalara ait olduğu ortaya çıkmıştır. Çok iyi mera tespit edilememiş olup, 2 durak (%3,57) iyi, 39 durak orta (%69,64) ve 15 durak (%26,79) zayıf olarak tespit edilmiştir.

Kayseri ilinde, 60 durakta vejetasyon etüdü yapılmış 253 farklı tür tespit edilmiştir. Tespit edilen türlerin 27 (%10,7) adedinin buğdaygil, 42 (%16,7) adedinin baklagil ve 183 (%72,6) adedinin diğer familyalara ait olduğu ortaya çıkmıştır. Çok iyi mera tespit edilememiş olup, 2 durak (%3,57) iyi, 39 durak orta (%69,64) ve 15 durak (%26,79) zayıf olarak tespit edilmiştir.

Kırıkkale ilinde, 64 durakta vejetasyon etüdü yapılmış ve 184 farklı tür tespit edilmiştir. Tespit edilen türlerin 27 adedinin (%14,8) buğdaygil, 25 adedinin baklagil (%13,7) ve 131 adedinin (%71,6) diğer familyalara ait türler olduğu ortaya çıkmıştır. Yapılan değerlendirmeler sonucunda 1 durağın çok iyi (%1,56), 6 durağın iyi (%9,38), 41 durağın orta (%64,06) ve 16 durağın ise zayıf (%25,0) mera durumuna sahip olduğu belirlenmiştir.

Kırşehir ilinde, 36 durakta vejetasyon etüdü yapılmış ve 206 farklı tür tespit edilmiştir. Tespit edilen türlerin 26 (%12,7) adedinin buğdaygil, 31 (%15,1) adedinin baklagil ve 148 (%72,2) adedinin diğer familyalara ait türler olduğu tespit edilmiştir. Çalışılan duraklardan 1'i (%2,78) iyi, 29'u (%80,56) orta ve 6'sı (%16,67) da zayıf mera durumuna sahip olmuştur.

Konya ilinde, 278 durakta vejetasyon etüdü yapılmış ve 334 farklı tür tespit edilmiştir. Tespit edilen türlerin 47 (%14,1) adedinin buğdaygil, 38 (%11,4) adedinin baklagil ve 248 (%74,5) adedinin diğer familyalara ait olduğu ortaya çıkmıştır. Değerlendirmeler sonucunda 4 (%1,44) durak çok iyi, 25 (%8,99) durak iyi, 112 (%49,28) durak orta ve 137 (%40,29) durak zayıf olarak sınıflandırılmıştır.

Nevşehir ilinde, 31 durakta vejetasyon etüdü yapılmış ve 184 farklı tür tespit edilmiştir. Tespit edilen türlerin 15 (%8,2) adedinin buğdaygil, 15 (%8,2) adedinin baklagil ve 153 (%83,6) adedinin diğer familyalara ait olduğu ortaya çıkmıştır. Değerlendirmeler sonucunda çok iyi ve iyi mera durumları tespit edilemezken 19 (%61,29) durak orta ve 12 (%38,71) durak zayıf olarak sınıflandırılmıştır.

Niğde ilinde, 53 durakta vejetasyon etüdü yapılmış ve 137 farklı tür tespit edilmiştir. Tespit edilen türlerin 20 (%14,6) adedinin buğdaygil, 18 (%13,2) adedinin baklagil ve 98 (72,2) adedinin diğer familyalara ait olduğu ortaya çıkmıştır. Değerlendirmeler sonucunda 1 (%1,89) durak çok iyi, 2 (%3,77) durak iyi, 18 (%33,96) durak orta ve 32 (%60,38) durak zayıf olarak sınıflandırılmıştır.

Sivas ilinde, 103 durakta vejetasyon etüdü yapılmış ve 423 farklı tür tespit edilmiştir. Tespit edilen türlerin 45 (%10,7) adedinin buğdaygil, 70 (%16.6) adedinin baklagil ve 307 (%72,7) adedinin diğer familyalara ait olduğu ortaya çıkmıştır. Değerlendirmeler sonucunda çok iyi meraya rastlanmazken, 6 (%5,83) durak iyi, 62 (%60,19) durak orta ve 35 (%33,98) durak zayıf olarak sınıflandırılmıştır.

Yozgat ilinde, 44 durakta vejetasyon etüdü yapılmış ve 220 farklı tür tespit edilmiştir. Tespit edilen türlerin 31 (%14,1) adedinin buğdaygil, 30 (%13,7) adedinin baklagil ve 158 (%72,1) adedinin diğer familyalara ait olduğu ortaya çıkmıştır. Yapılan değerlendirme sonucunda çok iyi ve iyi mera durum sınıfına sahip mera tespit edilemezken 28 (%63,64) durağın orta ve 16 (%36,36) durağın ise zayıf mera durumuna sahip olduğu belirlenmiştir.

Ünal ve ark., (2012 b) Çankırı ili genelindeki mera alanlarında 2008 yılında meraların mevcut durumunu ve sağlığını belirlemek; uygun mera yönetim ve ıslah metotlarının geliştirilmesine zemin hazırlamak amacıyla 41 farklı durakta tekerlek nokta yöntemi ile vejetasyon etüdü yapmışlardır. Ayrıca toprak örnekleri alınarak fiziksel ve kimyasal analizler yapılmıştır. Bitki ile kaplı alan ortalama %65.19, çıplak alan %34.81 olarak bulunmuştur. Azalıcı bitki türleri oranı %14.72, çoğalıcı türler %24.80, istilacı türler %60.48 olarak belirlenmiştir. Meraların %90.2'si orta ve zayıf sınıfa girmiştir. 24 mera durağı riskli veya *sorunlu sağlık* durumunda olduğu değerlendirilmiştir. Çalışma sonunda, meralarda bozulma sürecinin hızlı şekilde devam ettiği, yönetim ve ıslah uygulamalarının acilen hayata geçirilmesi gerektiği sonucuna varılmıştır.

Babalık, (2019) Konya ili, Taşkent ilçesi, Ilıcapınar Yaylası merasında 2017-2018 yılları arasında meranın bitki ile kaplı alanını, botanik kompozisyonunu, otlatma kapasitesini, topraküstü ve toprakaltı biyokütlesini ve mera durumunu belirlemek amacıyla vejetasyon ölçümleri için transekt ve kuadrat yöntemlerini kullanmış, toprak analizleri yapmış ve verileri SPSS 20 ile istatistiksel olarak değerlendirmiştir. Bitki ile kaplı alan ortalaması %33.5 olarak tespit edilmiştir. Botanik kompozisyonda buğdaygiller %56.2, baklagiller %12.0, diğer familyalar %31.8 oranında yer almıştır. Topraküstü biyokütle 474.8 kg/da, toprakaltı biyokütle 820.5 kg/da olarak bulunmuştur. Otlatma kapasitesi 36.9 BBHB; mera durumu ise "orta" olarak belirlenmiştir. Sürdürülebilir mera yönetimi için doğal bitki örtüsünün korunması, otlatma kapasitesine uyulması ve mera alanlarında koruma uygulamalarının hayata geçirilmesi önerilmiştir.

Altıntaş ve ark., (2018) Tokat, Amasya ve Sivas illerinde ıslah edilmiş meraların sürdürülebilirliğini etkileyen faktörleri, üretici görüşleri doğrultusunda belirlemek ve mera ıslah çalışmalarının etkilerini değerlendirmek amacıyla 2018 yılında 188 üreticiyle anket ve probit regresyon modeli kullanılarak analiz yapmışlardır. Sosyo-ekonomik veriler, mera kullanımı, yem tüketimi, otlatma planı bilgisi gibi değişkenler değerlendirilmiştir. Ankete katılanların %68,62'si mera ıslahı ile kaba yem veriminde artış olduğu, % 61.17'si et ve süt veriminde artış olduğu, % 57.45'i hayvanlara evde besleme ile yedirilen yemde azalma olduğunu bildirmiştir. Üreticilerin çoğunun mera kanunu ve yönetmelikleri hakkında yeterli bilgiye sahip olmadıkları, mera Yönetim Birliklerinin yeterince etkin çalışmadıkları belirlenmiştir. Otlatma planına uyulmamasının sürdürülebilirliği tehdit ettiği saptanmıştır. Probit analizine göre üretici yaşı arttıkça sürdürülebilirliğe olan inancın azaldığı belirlenmiştir. Sonuç olarak mera ıslah çalışmalarının kısa vadede olumlu etkiler sağladığı belirlenmiştir. Ancak sürdürülebilirliğin sağlanması için üreticilerin bilgilendirilmesi, otlatma planlarına uyulması ve mera yönetiminin etkinliğinin büyük önem taşıdığı sonucuna varılmıştır.

Şahin ve ark., (2016) Nevşehir ili genelindeki meraların floristik yapısını belirlemek, bitki türlerinin çeşitliliğini ve otlatmaya karşı tepkilerini inceleyerek mera yönetimi ve sürdürülebilirliği açısından değerlendirmek amacıyla 2008 yılında 31 merada tekerlek-nokta

yöntemi ile toplam 12.400 noktada bitki örtüsü okuması yapmışlardır. Bitkiler "Flora of Turkey"'e göre teşhis edilmiştir. Türlerin otlatmaya tepkileri (azalıcı, çoğalıcı, istilacı) sınıflandırılmıştır.. İncelenen noktalarda toplam 183 bitki türü tespit edilmiştir, bunların 25'inin endemik olduğu, ortalama tür sayısının 27.3 olduğu saptanmıştır. Bitki türlerinin %90'ından fazlasının (164 tür) istilacı türlerden oluştuğu belirlenmiştir. En yaygın 4 familya; Poaceae (buğdaygiller), Asteraceae (papatyagiller), Lamiaceae (ballıbabagiller), Fabaceae (baklagiller) olarak belirlenmiştir. Bitki örtüsünün %44'ünün çıplak alanlardan oluştuğu, en baskın türlerin; *Festuca valesiaca*, *Poa bulbosa*, *Bromus tomentellus*, *Thymus sipyleus* olduğu saptanmıştır. Özellikle buğdaygil türlerinin il meralarında hâkim olduğu, meraların büyük kısmının orta ve zayıf verim sınıfında yer aldığı belirlenmiştir. Çalışma sonucunda Nevşehir meralarının floristik açıdan zengin, ancak istilacı türlerin çokluğu oluşturduğu, çıplak alan oranının yüksekliği ve meraların genel zayıf durumunun sürdürülebilir mera yönetiminin önemini ortaya koyduğunu açıklanmıştır. Bu zenginliğin korunması için uygun mera kullanımı ve ıslah tekniklerinin uygulanması önerilmiştir.

Kendir (1999), Ankara ili Ayaş ilçesinde doğal bir meranın bitki örtüsünü, yem verimini ve mera durumunu belirlemek ve ayrıca bitki türlerinin botanik kompozisyonunu ve otlatma kapasitesini ortaya koymak amacıyla 1997 ve 1998 yıllarında vejetasyon araştırmaları yapmıştır. Transekt yöntemi ile 100'er ölçüm yapılmıştır. Bitki türleri tespit edilip, botanik kompozisyonları ve dip kaplama oranları hesaplanmıştır. Toprak örnekleri alınarak analiz edilmiştir. Kuru ot verimleri familyalara göre hesaplanmış ve mera durumu değerlendirilmiştir. Araştırma bulguları, meranın yalnızca %14.46'sı bitki örtüsü ile kaplı, geri kalan kısmın çıplak alan olduğunu ortaya koymuştur. Bitki örtüsünün botanik kompozisyonunun; %49.65 buğdaygiller, %38.39 diğer familyalar ve %11.96 baklagillerden oluştuğu saptanmıştır. En yaygın türlerin, *Festuca ovina* (koyun yumağı) %49, *Thymus sipyleus* (kekik) %28, *Koeleria cristata* (sorguçlu gümüş otu) %15 olduğu belirlenmiştir. Yem veriminin, ortalama 102.12 kg/da olduğu ve verime en fazla katkı sağlayan bitki gurubunun buğdaygiller olduğu belirlenmiştir. Mera durumunun 3.71 ile "zayıf" mera olarak saptandığı açıklanmıştır. 1 büyükbaş hayvan için gerekli mera alanı 42.30 da olarak hesaplanmıştır. Ayaş merasının, erozyon ve aşırı otlatma nedeniyle ciddi bozulma gösterdiği, vejetasyonun zayıf olmasının, mera kalitesini düşürdüğü ve otlatma kapasitesini sınırladığı sonucuna varılmıştır.

SONUÇ

Bu literatür çalışması Orta Anadolu bölgesi meralarının vejetatif özelliklerini ve durumunu belirlemek amacıyla yapılan araştırmaları bir araya getirmek ve irdelemek amacıyla yapılmıştır. Derlenen literatür sonucunda Orta Anadolu meralarının Türkiye meralarının önemli bir kısmını oluşturduğu sonucuna varılmıştır. Yapılan çalışmalar, meraların, uzun süredir devam eden bilinçsiz kullanım, aşırı otlatma ve yetersiz mera yönetimi vs. nedenlerle ciddi bir biyolojik ve ekolojik bozulma süreci içerisinde olduğunu göstermiştir.

Çeşitli araştırmalarda Orta Anadolu bölgesi meralarının botanik kompozisyon açısından zengin, ancak verimsiz olduğu sonucuna varılmıştır. Poaceae (buğdaygiller) familyası hâkim olsa da, özellikle istilacı türlerin yaygınlığı (%60'ın üzerinde) ve yüksek oranda çıplak alanların (%30-45) varlığı, meraların verimlilik ve sürdürülebilirlik açısından zayıf durumda olduğunu göstermiştir.

Bitki örtüsündeki azalma yalnızca ekolojik bozulmayı değil, aynı zamanda yem verimi ve hayvansal üretim üzerinde de olumsuz etkiler yaratmaktadır. Çalışmalarda kuru ot verimlerinin oldukça düşük seviyelerde (örneğin 102.12 kg/da) olduğu ve 1 büyükbaş hayvan için ihtiyaç duyulan mera alanının 40 da'nın üzerine çıktığı görülmüştür. Bu durum, mevcut otlatma kapasitesinin aşılması halinde daha da büyük tahribatların yaşanabileceğini ortaya koymaktadır.

Yapılan çalışmaların ortak önerisi, sürdürülebilir mera yönetimi için:

- Otlatma planlarının hazırlanması ve uygulanması,
- Mera Yönetim Birlikleri'nin etkinleştirilmesi,
- Çiftçilerin eğitilerek mera yasaları konusunda bilinçlendirilmesi,
- Koruma altına alınmış deneme alanları oluşturularak doğal yenilenmenin teşvik edilmesi,
- Vejetasyon izleme çalışmalarının düzenli olarak yürütülmesi,

gibi tedbirlerin bir bütün olarak ele alınması gerektiğidir (Altıntaş ve ark., 2018; Ünal ve ark., 2012 a ve b).

Sonuç olarak, Orta Anadolu meralarının korunması, yalnızca bölgesel tarım ve hayvancılık bakımından değil, ülkenin genel biyoçeşitlilik ve toprak koruma stratejileri açısından da yaşamsal öneme sahiptir. Bu nedenle yapılacak tüm vejetasyon araştırmaları, sadece botanik kompozisyonu saptamakla kalmayıp, uzun vadeli mera yönetimi ve ıslah projelerine yön verecek veriler üretmelidir.

ÖZET

Dut'un anavatanı ve doğal yayılış alanı olan ülkemizde meyve yetiştiriciliği yapılan her bölgede dut yetiştirilmektedir. Dutun çoğaltılmasında vejetatif çoğaltma yöntemleri içerisinde çelikle çoğaltma yöntemi en fazla kullanılan yöntemdir. Bu konu ile ilgili yapılan çalışmalarda genellikle IBA'nin 4000–8000 ppm'lik konsantrasyonları kullanılmıştır. Kök gelişimini artırdığı ve bitki gelişimini düzenlediği bilinen köklenme üzerine pozitif etkileri olan bazı bakteri türleri bilinmektedir. Çalışmamızda Yozgat'tan selekte edilen bölgeye has karadutlarının IBA ve bakteri uygulamalarıyla çoğaltılması çalışması ilk kez denenmiştir. Yozgat ilinden seleksiyon ile belirlenmiş olan karaduta ait odun çelikleri mart ayında alınmış ve içeriğinde IBA (2000, 4000, 6000 ve 8000 ppm) ve içeriğinde *Pseudomonas fluorescens*, *Paenibacillus polymyx*, *Bacillus megaterium* ile *Pantoea agglomerans* bakteri türleri olan ticari biyopreparatın hem tekli hem de ikili kombinasyonları ile muamele edildikten sonra perlit+torf (1:1) ortamına dikilmiştir. Çelikler alttan ısıtmalı köklenme ortamında üç ay süre ile tutulduktan sonra sökülmüştür. Kontrol ve IBA'nın 2000 ppm dozunda köklenme olmamıştır. Uygulamalar içerisinde köklenme oranı en yüksek Bakteri + 6000 ppm IBA uygulamasında %50 olarak tespit edilmiştir. Çelik başına kök sayısı ortalama olarak 1,83 ile 2,97 adet, kök uzunluğu ise 2,5 ile 3,8 cm arasında değişmiştir. Uygulamaların köklerin toplam kuru madde oranına etkisi %50 ile 54,09 arasında olduğu ölçülmüştür. Köklenen çelikler saksılara alındıktan üç ay sonra canlılık oranlarına bakıldığında en yüksek oran %20 ile Bakteri + 6000 ppm IBA uygulamasından elde edilmiştir. Karadut fidan üretiminde Bakteri ve 6000 ppm IBA'nın birlikte uygulanması köklenmeyi artırmıştır. Bu konuda yapılan çalışmalarda kullanılan materyalin çeşit olmamasından kaynaklı genetik farklılıklar, çelik alma zamanı, köklendirme ortamının koşuları ve çelik alınan ağacın fizyolojik durumu gibi faktörlerin bir sonucu olarak farklı sonuçlar elde edilmiştir.

Anahtar Kelimeler: Karadut, odun çeliği, IBA, Bakteri.

EFFECT OF DIFFERENT IBA DOSES AND BACTERIAL APPLICATIONS ON ROOTING OF BLACK MULBERRY (*morus nigra l.)* WOOD CUTTINGS

ABSTRACT

Türkiye, which is the native and natural distribution area of mulberry, mulberry is grown in every region where fruit is cultivated. In the propagation of mulberry, the method of propagation by cuttings is the most widely used method among vegetative propagation methods. In the studies on this subject, 4000-8000 ppm concentrations of IBA were generally used. Some bacterial species known to increase root growth and regulate plant growth are known to have positive effects on rooting. In our study, the propagation of black mulberries selected from Yozgat province with IBA and bacteria treatments was tried for the first time. Blackberry cuttings were taken in March and treated with commercial biopreparation containing IBA (2000, 4000, 6000 and 8000 ppm) and Pseudomonas fluorescens, Paenibacillus polymyx, Bacillus megaterium and Pantoea agglomerans bacterial species in single and double combinations and then planted in perlite + peat (1:1) medium. Cuttings were kept in a bottom-heated rooting medium for three months and then removed. There was no rooting in control and 2000 ppm dose of IBA. The highest rooting rate among the treatments was 50% in the Bacteria + 6000 ppm IBA treatment. The average number of roots per cuttings ranged between 1.83 and 2.97 pcs and root length between 2.5 and 3.8 cm. The effect of the treatments on the total dry matter content of the roots was measured between 50 and 54.09%. Three months after the rooted cuttings were taken into pots, the highest rate of vitality was obtained from Bacteria + 6000 ppm IBA treatment with 20%. Co-application of bacteria and 6000 ppm IBA increased rooting in black mulberry seedling production. The reason for the different results obtained in studies on this subject may be due to genetic differences caused by the lack of variety in the material used, the time of cutting, the conditions of the rooting medium, and the physiological condition of the tree from which the cuttings were taken.

Keywords: Mulberry, cutting, IBA, Bacteria.

1. INTRODUCTION

Mulberry (Morus spp.) belongs to the Urticales order, Moraceae family, and Morus genus. Approximately 10-12 species are commonly cultivated. These species include: Black mulberry (*Morus nigra*), White mulberry (*Morus alba*), Chinese mulberry (*Morus australis*), African mulberry (*Morus mesozygia*), Mongolian mulberry (*Morus mongolica*), Texas mulberry (*Morus microphylla*), Red mulberry (*Morus rubra*), Linden-leaved mulberry (*Morus tiliaefolia*), Himalayan mulberry (*Morus serrata*), *Morus trilobata*, *Morus notabilis, Morus cathayana*, and *Morus liboensis*. Among these species, the mulberry species most commonly cultivated worldwide and in our country are *Morus alba* (white mulberry), *Morus nigra* (black mulberry), and *Morus rubra* (red mulberry) (Yaltırık, 1972; Vijayan et al., 2011). Turkey is one of the native habitats and natural distribution areas of the mulberry.

Mulberry cultivation can be easily carried out in every region of Turkey where fruit trees are grown. Mulberries thrive in warm, temperate and sunny regions. The optimum temperature range is 24–28 °C. As with many other plants, they continue to grow regularly in air temperatures ranging from 5 to 36 °C (Özgen, 2010). In mulberry production, vegetative methods such as grafting, layering, tissue culture and propagation by cuttings are employed. However, the high labour requirements and lack of trained personnel to perform grafting limit its success. Tissue culture propagation has not yet been widely adopted due to the need for specialised techniques and equipment. Propagation by cuttings is the most widely used method as it yields better results than other vegetative propagation methods (Güneş, 2013).

The success of propagation by cuttings depends on the type and variety of the cutting, the ecological conditions in which the parent plant is grown and the type of cutting. Therefore, these factors should be considered when researching the propagation of a species by cuttings. In cutting propagation methods, perlite is commonly used in rooting media and indole-3-butyric acid (IBA) is used to promote rooting (Ryu, 1977). Researchers studying the propagation of mulberry plants by cuttings have found that rooting-inducing hormones increase root formation (Şenel, 2002).

In propagation studies of mulberry plants using cuttings, commercially available IBA is generally used at a concentration of 4000–8000 ppm. Freshly cut cuttings are dipped into the prepared solution for 5–10 seconds and then planted in the rooting medium. Heating the root zone to 21–27 °C during the day and 16–21 °C at night will promote cell division and facilitate rooting, especially in the rooting of woody cuttings (Güneş, 2013). The purpose of applying plant growth regulators to cuttings is to promote root formation, accelerate rooting, and increase the number of roots per cutting (Özbek, 1991). In steel propagation applications, different doses of IBA hormone have mostly been used. In their study, Ünal et al. (1992) noted that IBA doses did not achieve maximum rooting rates. The success rate in the study conducted by Karadeniz and Şişman (2003) was 23.4% with a 2000 ppm IBA application. Koyuncu et al. (2003) achieved a rooting rate of 33.3% with a 5000 ppm IBA application. Erdoğan and Aygün (2006) reported a rooting rate of 60% with a 6000 ppm IBA application. Yıldız et al. (2009) reported a rooting rate of 24% with a 6000 ppm IBA application. Sezgin (2009) reported that the rooting success rate of cuttings treated with a 7000 ppm IBA application varied between 20% and 60%, depending on the parent plant. Ekizoğlu (20010) A rooting rate of 96.11% was achieved with a 2000 ppm IBA application to cuttings taken in November. Gökçek (2014) found that the best rooting of wood cuttings of the Horum Karadut variety was achieved with an 8000 ppm IBA dose. Terzioğlu (2015) obtained the highest rooting rate and root number with an 8000 ppm IBA application and the highest root length with a 4000 ppm IBA application. Yağlıoğlu (2015) achieved the highest rooting rate (48.3%) with a 6000 ppm IBA + 100 ppm SA (cinnamic acid) application to cuttings taken in November and January. Edizer et al. (2016) found the best

rooting rate to be 66.70%.The average root number was 3, the average root length was 43.40 mm, and the usable cutting rate for seedling production was 43.33%. At an IBA application of 8000 ppm, Altuncu (2019) achieved a rooting rate of 73.33% at a pH of 7.0 with a vertical cutting application. Macit (2019) found that the average rooting rate was 69.4% for cuttings dipped in a 6,000 ppm IBA solution and rooted for 60 days. 8% and 120 days in the rooting medium was 65.6%. Öz et al. (2021) reported that the highest rooting rate was obtained from cuttings dipped in a 6,000 ppm solution (66.7%) or a powdered IBA preparation (51.2%).

Some bacterial species belonging to the genera Agrobacterium, Bacillus, Streptomyces, Pseudomonas and Alcaligenes are known to promote root development and regulate plant growth. While these species have positive effects on rooting, using bacterial species and strains that promote and enhance rooting is crucial for ensuring ecosystem sustainability and minimising potential damage. Recent studies have demonstrated the impact of plant growth-promoting bacteria on plant health and productivity. Using biofertilizers composed of beneficial microorganisms compatible with nature, instead of synthetic chemicals, increases plant growth, maintains soil fertility, and significantly reduces environmental damage (O'connell, 1992). It has been determined in many studies that the application of non-pathogenic bacteria such as *Agrobacterium, Bacillus, Streptomyces, Pseudomonas,* and *Alcaligenes* to cuttings promotes root formation by synthesizing auxin (Patena et al., 1987; Srinivasan et al., 1996; Tripp and Stomp, 1997; Goto, 2012). Although the exact mechanism of root formation is not known, it is accepted that it involves the synthesis of certain phytohormones, such as auxin, the inhibition of ethylene synthesis and the mineralisation of nutrients (Steenhoudt & Vanderleyden, 2000; Goto, 2012). Ercişli et al. (2000) investigated the effects of 2000, 4000, 6000 ppm IBA and 3 different races of Agrobacterium rubi (A1, A16, A18) on the rooting of woody cuttings in Kütahya sour cherry. While no rooting was obtained in the control treatment, the highest rooting rate (70.0%) was obtained from the 2000 ppm IBA+A16 treatment. Çekiç et al. (2013) applied 6,000 ppm indole-3-butyric acid (IBA) and 2,000 ppm paclobutrazol to black mulberry wood cuttings. While there was no rooting in the control group, the application of 6,000 ppm IBA provided 11.6% rooting, the application of 2,000 ppm paclobutrazol provided 1.4% rooting and the combined application of 6,000 ppm IBA and 2,000 ppm paclobutrazol provided 60.5% rooting. A study examining the effects of IBA (500 and 1000 ppm) and bacterial (Bacillus T33, T7 and Microbacterium R23) applications on the rooting of blueberry (Myrtus communis L.) cuttings determined that applications increased rooting compared to the control. The highest rooting occurred in the Bacillus T33 (50%) and 500 ppm + T7 (68.89%) applications (Arıkan et al., 2015). Kınık and Çelikel (2017) investigated the effects of ten rhizobacterium strains and 1000 ppm auxin applications on the rooting of rosehip cuttings, finding that Bacillus megaterium and Pseudomonas fluorescens applications produced the highest rooting rate. In a subsequent study by Çınar (2019), the rooting rates of wood cuttings from bitter orange, trifoliate orange, Carrizo citrange and Troyer citrange rootstocks were investigated using 1000, 2000 and 4000 ppm of indole-3-butyric acid (IBA) in combination with the bacterial strains Agrobacterium rubi A-18 and Bacillus OSU-142. The highest rooting rates were observed in bitter orange rootstock with the 4000 ppm IBA + OSU-142 application (20.00%), and in trifoliate orange rootstock with the 1000 ppm IBA + OSU-142, 2000 ppm IBA + OSU-142, 4000 ppm IBA + OSU-142 and 1000 ppm IBA + A-18 applications. Applications of 4000 ppm IBA + A-18 (% 20.00) and ppm IBA + A-18 in Carrizo citrange were detected in the rootstock, as were applications of 1000 ppm IBA, 2000 ppm IBA and OSU-142 (% 13.33) in Troyer citrange.

2. MATERIAL METHOD

The study used wood cuttings of black mulberry selected from Çekerek in Yozgat as plant material (Figure 1). The study was conducted in the cutting propagation unit of the Faculty of Agriculture's greenhouses at Bozok University's Erdoğan Akdağ East Campus (Figure 2).

Figure 1. General appearance and fruit photographs of black mulberry trees

Figure 2. Taking wood cuttings and planting them in the rooting set

Rooting Materials

Auxin (IBA): Indole-3-butyric acid (IBA, Merck KGaA, Germany) was used at 2000, 4000, 6000, and 8000 ppm as an auxin-group growth regulator in the study.

Microorganism-Containing Fertilizer: A biopreparation containing the bacterial strains *Pseudomonas fluorescens, Bacillus megaterium, Paenibacillus polymyx,* and *Pantoea agglomerans* was used. Depending on the amount of chemical pesticide and fertiliser residue in the soil, moisture content, organic matter content, and temperature, these bacterial isolates can survive for at least 18 months after colonising the plant root zone in the soil.

Perlite: Commercial perlite was used as the rooting medium. Sterile and organic perlite weighs 70-90 $kg.m^{-3}$. Perlite, which doesn't decompose, is non-toxic, odorless, and white in color. It holds water for 50-60% of its volume.

Peat: This type of organic soil is formed by the cyclical accumulation of plant roots and stems over thousands of years, with plant activity increasing as water levels in lake beds drop. Plant death occurs as water levels rise in winter. This natural process is repeated over time.

Method

In the study, single and dual combinations of control, IBA (2000, 4000, 6000, and 8000 ppm), and bacteria treatments were used to enhance root development and formation in black mulberry wood cuttings (Table 1). The study was conducted with 3 replicates, with 10 cuttings per replicate. A total of 10 treatments x 3 replicates x 10 cuttings = 300 wood cuttings were used. The cuttings were kept in the rooting medium for 3 months (12 weeks). A 1:1 peat:perlite mixture was used as the rooting medium. The treated cuttings were planted in a fogging unit containing perlite:peat, heated under the ground at 20-25°C, with 90-95% relative humidity.

Table 1. Single and dual treatments of IBA and bacteria applied to cuttings

1. Control
2. Bacteria
3. IBA (2000 ppm)
4. IBA (4000 ppm)
5. IBA (6000 ppm)
6. IBA (8000 ppm)
7. Bacteria + IBA (2000 ppm)
8. Bacteria + IBA (4000ppm)
9. Bacriteria+ IBA (6000 ppm)
10. Bacteria + IBA (8000 ppm)

Preparation and planting of wood cuttings: Wood cuttings were prepared from the base and middle parts of the shoots, 12-15 cm long. They were stored in polyethylene bags in the cold storage of the Faculty of Agriculture at 0ºC and 80% humidity until the trial was established. After the treatments were prepared and applied, two-thirds of the cuttings were planted in perlite/peat, a rooting medium. In the control treatment, two-thirds of the cuttings were immersed in distilled water before planting in the rooting medium.

Preparation and application of auxin (IBA): Cuttings were dipped for 5 seconds in an IBA solution prepared at 2000, 4000, 6000, and 8000 ppm before planting.

Preparation and application of microorganism-containing fertilizer: 500 ml of a solution containing four different bacterial strains was mixed homogeneously with 5 liters of sterile water and 250 g of granulated sugar as an adhesive. Cuttings were kept in the prepared bacterial solution for 6 hours (Figure 3). Cuttings to be treated with bacteria + IBA were kept in the bacterial solution for 6 hours, then immersed in the prepared IBA solution at different doses for 5 seconds before being planted (Figure 3).

Figure 3. IBA doses and bacterial preparation

Measurements Performed in the Study

The observations and analyses were conducted after the cuttings planted in the rooting medium were kept in a perlite+peat medium for 3 months (12 weeks) that callus formation rate (%), rooting rate (%), root length (cm), root number (number/cutting), fresh root weight (g), dry root weight (g), dry root ratio (%) and viability ratio of living cuttings after seedling formation (%) were measured.

Statistical Analysis

The study employed a randomized plot design. Data collected were analyzed using a normality test, an ANOVA test, and arithmetic mean and percentage (%) values. Statistical analyses were performed using the SPSS 20.0 software package. The resulting percentage values were analyzed after angle transformation.

3. RESULTS AND DISCUSSION

The effects of single and dual applications of plant growth-promoting bacteria and IBA on the rooting parameters of blackberry wood cuttings were found to be statistically significant (Table 2 and Table 3).

The callus formation rate (%) was highest in the single and dual applications of IBA (6000 ppm), Bacteria + IBA (6000 ppm), and Bacteria + IBA (8000 ppm). When examining the rooting rate (%), the highest was determined to be 50.03% from the Bacteria + IBA (6000 ppm) application. In terms of the number of roots per cutting, the highest result among the applications was achieved with the Bacteria + IBA (6000 ppm) application. In terms of root length, the highest measurements were obtained at the Bacteria, IBA (6000 ppm), IBA (8000 ppm), Bacteria + IBA (4000 ppm), Bacteria + IBA (6000 ppm), and Bacteria + IBA (8000 ppm) doses (Table 2).

Table 2. Effect of different treatments on callus formation, rooting rate, root number, and root length in blackberry cuttings

Applications	Callus formation rate (%)	Rooting rate (%)	Number of roots (per cutting)	Root length (cm)
Control	6.67 f	0.00 g	0.00 d	0.00 c
Bacteria	13.30 e	3.33 f	1.83 c	**3.75 a**

IBA (2000 ppm)	6.67 f	0.00 g	0.00 d	0.00 c
IBA (4000 ppm)	26.67 d	16.67 e	2.13 bc	2.94 ab
IBA (6000 ppm)	**53.34 a**	33.35 b	2.18 b	**3.83 a**
IBA (8000 ppm)	40.00 b	30.07 c	2.17 b	**3.75 a**
Bacteria + IBA (2000 ppm)	13.33 e	3.33 f	1.83 c	2.53 b
Bacteria + IBA (4000ppm)	33.33 c	26.67 d	2.17 b	**3.51 ab**
Bacriteria+ IBA (6000 ppm)	**53.33 a**	**50.03 a**	**2.97 a**	**3.49 ab**
Bacteria + IBA (8000 ppm)	**53.33 a**	33.33 b	2.17 b	**3.43 ab**

Edizer et al. (2016) obtained the highest callus formation at 100% with 8000 ppm IBA application, followed by 3000 ppm IBA + 150 ppm NAA at 86.67% and 6000 ppm IBA at 80.003%. They determined that the lowest callus formation was 60.00% in cuttings treated with 4000 ppm IBA. Yıldız and Koyuncu (2000) stated that the callus formation rate decreased with the use of low BD doses. Macit (2019) determined the highest callus formation rates of 8.90% and 5.93% in his propagation study conducted at different planting and harvesting times on November 4 and December 17.

In woody plants, Ünal et al. (1992) reported that IBA doses did not achieve maximum rooting rates. The success rate in the study by Karadeniz and Şişman (2003) was 23.4% with a 2000 ppm IBA application, Koyuncu et al. (2003) reported a rooting rate of 33.3% with a 5000 ppm IBA application, Erdoğan and Aygün (2006) reported a rooting rate of 60% with a 6000 ppm IBA application, Yıldız et al. (2009) reported a rooting rate of 24% with a 6000 ppm IBA application, and Sezgin (2009) found that rooting success in cuttings treated with 7000 ppm IBA varied between 20% and 60% depending on the parent plant, Ekizoğlu (2010) achieved a rooting rate of 96.11% with a 2000 ppm IBA application in cuttings taken in November, Koç (2011) humidity content caused significant changes in rooting percentage. The highest rooting ratio (% 63,11) was observed in cutting planted in medium with 40% humidity. Gökçek (2014) found that an 8000 ppm IBA dose provided the best rooting in the rooting of wood cuttings of the Horum Karadut variety, Terzioğlu (2015) obtained the highest rooting rate and root number with 8000 ppm IBA, and the highest root length with 4000 ppm IBA application, Yağlıoğlu (2015) obtained the highest rooting rate (48.3%) with 6000 ppm IBA + 100 ppm SA (Cinnamic Acid) application in cuttings taken in November and January, Edizer et al. (2016) determined the best rooting rate (66.70%), average root number (3), average root length (43.40 mm), and usable cutting rate for seedling production (43.33%) At 8000 ppm IBA application, Altuncu (2019) obtained the highest rooting rate of 73.33% at pH 7.0 and vertical cutting application. Macit (2019) found that the average rooting rate for cuttings dipped in a 6000 ppm IBA solution and left in a rooting medium for 60 days was 69.4%, the average rooting rate for cuttings kept in the rooting medium for 90 days was 72.8%, and the average rooting rate for cuttings kept in the rooting medium for 120 days was 65.6%. Öz et al. (2021) reported that the highest rooting rate was obtained from cuttings dipped in a 6000 ppm solution (66.7%) or powdered IBA preparation (51.2%). Çekiç et al. (2013) applied 6000 ppm indole butyric acid (IBA) and 2000 ppm Pacroburazol to blackberry wood cuttings. While there was no rooting in the control group, the 6000 ppm IBA application resulted in 11.6%, the 2000 ppm Paclobutrazol application resulted in 1.4%, and the combined application of 6000 ppm indole butyric acid (IBA) and 2000

ppm Paclobutrazol resulted in 60.5% rooting. In a study examining the effects of IBA (500 and 1000 ppm) and bacterial (Bacillus T33, T7, Microbacterium R23) on the rooting of myrtle (Myrtus communis L.) cuttings, it was determined that the applications increased rooting compared to the control, with the highest rooting occurring in the Bacillus T33 (50%) and 500 ppm + T7 (68.89%) applications (Arıkan et al., 2015). Kınık and Çelikel (2017) investigated the effects of 10 rhizobacterial strains and 1000 ppm auxin application on the rooting of rosehip cuttings and found the highest rooting rates with Bacillus megaterium and Pseudomonas flourescens applications. Çınar (2019) investigated the effects of 1000, 2000, and 4000 ppm IBA alone and in combination with Agrobacterium rubi A-18 and Bacillus OSU -142 bacterial strains on citrus, trifoliate, Carrizo citrus, and Troyer citrus rootstock wood cuttings. The highest rooting rate was observed in the Citrus rootstock with 4000 ppm IBA + OSU-142 (20.00%) application, For the three-leaf rootstock, the highest rooting rates were achieved with 1000 ppm IBA + OSU-142, 2000 ppm IBA + OSU-142, 4000 ppm IBA + OSU-142, 1000 ppm IBA + A-18, 2000 ppm IBA + A-18, and 4000 ppm IBA + A-18 (20.00%) applications, In the Carrizo rootstock, 4000 ppm IBA + OSU -142 (20.00%) applications, and in the Troyer rootstock, 1000 ppm IBA, 2000 ppm IBA, and OSU-142 (13.33%) applications.

In our study, when examined in terms of age and dry root weight, the Bacteria+IBA (6000 ppm) application yielded the highest values. The dry root ratio ranged between 50.40% and 54.16%. The percentage of surviving seedlings among rooted seedlings was highest with the Bacteria+IBA (6000 ppm) treatment (Table 3). The effects of different treatments on fresh and dry root weights, dry root ratio, and the percentage of surviving seedlings in black mulberry cuttings were found to be significant. In our study, when fresh and dry root weights were examined, the Bacteria+ IBA (6000 ppm) treatment yielded the highest values. The dry root ratio, calculated by dividing dry root weights by fresh root weights, ranged from 50.40% to 54.16%. The highest percentage of surviving seedlings among rooted seedlings was obtained from the Bacteria+ IBA (6000 ppm) treatment. Özkan and Arslan (1996), at hardwood cuttings, the highest rooting ratio (56.67%) and average number of roots (2.53 pieces) were abtained by 4000 ppm, practical cutting ratio at plant production (33.33%) was determined by 2000 ppm and in other characteristics were found by 1000 ppm IBA concentrations.

Table 3. Effect of different treatments on fresh and dry root weight, dry root ratio, and percentage of surviving seedlings in blackberry cuttings

Applications	Fresh root weight (g)	Dry root weight (g)	Dry root ratio (%)	Survival rate of seedlings (%)
Control	0.00 c	0.00 c	0.00 b	0.00 d
Bacteria	2.45 b	1.33 b	54.02 a	0.00 d
IBA (2000 ppm)	0.00 c	0.00 c	0.00 b	0.00 d
IBA (4000 ppm)	2.59 b	1.34 b	52.08 a	0.00 d
IBA (6000 ppm)	2.76 b	1.47 b	52.06 a	20.17 c
IBA (8000 ppm)	2.82 b	1.43 b	51.77 a	22.20 b
Bacteria + IBA (2000 ppm)	2.30 b	1.18 b	50.40 a	0.00 d
Bacteria + IBA (4000ppm)	2.83 b	1.42 b	50.40 a	0.00 d
Bacriteria+ IBA (6000 ppm)	**4.16 a**	**2.27 a**	54.16 a	**33.33 a**
Bacteria + IBA (8000 ppm)	2.75 b	1.47 b	53.37 a	20.00 c

In conclusion, the study investigated the effects of single and double treatments of 0, 2000, 4000, 6000, and 8000 ppm IBA and bacteria on rooting of black mulberry wood cuttings. According to the results, the best rooting rate was 50.03%, and the best average root count of 2.97 per root was observed in cuttings treated with bacteria and 6000 ppm IBA. No rooting was observed in the control cuttings, which received no hormone treatment, or in cuttings treated with 2000 ppm.

Based on the findings, it can be concluded that applying Bacteria + 6000 ppm IBA to root black mulberry wood cuttings is the optimal growth regulator dose for rooting, root number, root length, and the number of usable cuttings for seedling production. The differing results in the literature on this subject may be due to factors such as genetic differences due to the lack of diversity in the material used, the ecological conditions in the rooting environment, the timing of cuttings, or the physiological condition of the tree from which the cuttings were taken.

ÖZET

Bu çalışma, Türkiye'nin farklı ekolojik bölgelerinde yürütülmüş mera vejetasyon etütlerini inceleyerek, ülke meralarının mevcut durumu ve vejetatif özelliklerini karşılaştırmalı olarak ortaya koymayı amaçlamaktadır. Literatür taramasına dayalı olarak gerçekleştirilen çalışmada Akdeniz, Ege, Marmara, İç Anadolu, Doğu Anadolu, Güneydoğu Anadolu ve Karadeniz bölgelerinde farklı vejetasyon etüd yöntemleri kullanılarak yapılan vejetasyon etüd çalışmaları sonucu elde edilen bulgular değerlendirilmiştir. İncelenen çalışmalarda; bitki ile kaplı alan oranı %15–95, buğdaygil oranı genellikle %30–45, baklagil oranı %10–25 ve diğer familya türleri oranı %35–50 arasında değişmektedir. Bölgesel farklılıklar bulunmakla birlikte, tüm bölgelerde azalıcı türlerin oranı düşerken istilacı türlerin oranı belirgin şekilde yüksek seyretmektedir. Meraların büyük çoğunluğu "zayıf" mera durumu sınıfında yer almakta; bu durum, uzun süreli erken ve ağır otlatma baskısı ile kuraklık gibi ekolojik streslerin yaygın etkisini yansıtmaktadır. Bulgular, ülke meralarının sürdürülebilirliğinin sağlanabilmesi için bölgeye özgü ıslah yöntemlerinin belirlenmesi, otlatma yönetiminin bilimsel esaslara göre düzenlenmesi ve mera kullanım politikalarının güçlendirilmesi gerektiğini göstermektedir.

Anahtar Kelimeler: Mera vejetasyonu, botanik kompozisyon, istilacı türler, mera durumu, Türkiye

RANGELAND VEGETATION SURVEY STUDIES CONDUCTED IN TURKEY

ABSTRACT

This study aims to comparatively reveal the current status and vegetative characteristics of Turkey's rangelands by examining rangeland vegetation surveys conducted across different ecological regions of the country. Based on a comprehensive literature review, the findings of studies carried out in the Mediterranean, Aegean, Marmara, Central Anatolia, Eastern Anatolia, Southeastern Anatolia, and Black Sea regions were evaluated. These studies employed transect, quadrat, point-frame, and loop methods to collect vegetation data. Across the studies examined, vegetation cover varied between 15% and 95%, while the proportion of grasses generally ranged from 30% to 45%, legumes from 10% to 25%, and other plant families from 35% to 50%. Although regional variations were observed, all regions exhibited a decline in the proportion of decreaser species, while the proportion of invasive species remained consistently high. The majority of the rangelands were classified as being in "poor" condition, reflecting the widespread impact of prolonged early and heavy grazing pressure combined with drought-related ecological stresses. The findings emphasize the need to identify region-specific improvement methods, establish scientifically based grazing management strategies, and strengthen rangeland use policies to ensure the sustainability of Turkey's rangelands.

Keywords: Rangeland vegetation, botanical composition, invasive species, rangeland condition, Türkiye

GİRİŞ

Dünya genelinde artan nüfus, iklim değişikliği ve doğal kaynakların sınırlılığı gibi faktörler, sürdürülebilir doğal kaynak kullanımını küresel ölçekte zorunlu hale getirmiştir. Bu kaynakların başında, sahip oldukları zengin biyoçeşitlilik ve hayvansal üretime yönelik kaliteli kaba yem sağlama potansiyelleriyle çayır ve mera alanları gelmektedir.

Meralar sadece yem üretimiyle sınırlı kalmayıp, toprak erozyonunu önleme, su rejimini düzenleme ve habitat çeşitliliği sağlama gibi birçok ekolojik hizmet sunmaktadır. Yağmur sularını sünger gibi emerek toprağa sızmalarını sağlayan bu alanlar, hem yer altı su kaynaklarını beslemekte hem de suyun yüzeysel akışını dengelemektedir.

Bununla birlikte, Türkiye'deki mera alanlarında uzun yıllardır süren aşırı ve zamansız otlatma uygulamaları, bu değerli alanların bozulmasına yol açmıştır. Ayrıca tarımsal mekanizasyonun gelişmesiyle birlikte meralar, tarla arazilerine dönüştürülerek azalmaya başlamıştır.

Ülkemizde 1940'larda yaklaşık 44 milyon hektar olan mera alanı, günümüzde 14,6 milyon hektara kadar düşmüş ve bu azalma sadece miktar olarak değil, niteliksel bozulmayı da beraberinde getirmiştir. Bugün birçok mera, besleme değeri düşük, istenmeyen türlerin hâkim olduğu bitki topluluklarıyla kaplı hale gelmiştir.

Meralar canlı bir ekosistem olup; iklim, topoğrafya, toprak yapısı ve biyotik faktörler tarafından şekillendirilen dinamik bir yapıya sahiptir. Bu nedenle, her bir meranın bitki örtüsü kendine özgü olup zaman içinde değişim gösterir. Bu değişimler ya daha verimli bir yöne ya da bozulmaya doğru olabilir. Bu çalışmalarla birlikte mera durumu, otlatma kapasitesi, bitki örtüsünün toprak koruma fonksiyonu gibi birçok parametre belirlenebilir.

Vejetasyon etüdünün başlıca amacı, meraların botanik kompozisyonunu ve yem verim potansiyelini ortaya koymak, ıslah gereksinimlerini belirlemek ve sürdürülebilir mera yönetimi için veri sağlamaktır. Böylece yalnızca hayvansal üretim değil, toprak ve su kaynaklarının korunması, biyoçeşitliliğin devamlılığı ve iklim direncinin artırılması da sağlanmış olur.

Sonuç olarak, Türkiye gibi yarı kurak iklim kuşağında yer alan bir ülkede, meraların korunması ve ıslah edilmesi büyük önem taşımaktadır. Bu amaçla yapılacak her türlü müdahale ve yönetim uygulamasının ilk adımı, bilimsel temelli bir vejetasyon analizi ile başlamalıdır.

GENEL TANIMLAR

1.1. Vejetasyon ve Vejetasyon Etüdü

Vejetasyon, belirli bir coğrafi alanın bir bölümünde, benzer yaşam koşullarına uyum sağlamış bitki türlerinin oluşturduğu toplulukların bütünüdür. Bu bitki toplulukları, bitki örtüsü olarak adlandırılır. Bitki örtüsü doğada rastlantısal olarak oluşmaz; aksine, belirli ekolojik faktörlerin etkisiyle şekillenmiş, floristik yapısı büyük ölçüde belirlenmiş, iklimsel koşullarla uyumlu, zamanla istikrar kazanmış ve bir ya da birkaç baskın tür tarafından tanımlanan birimler olarak değerlendirilir(Akman ve Ketenoğlu, 1987). Bitki örtüsü ekosistem hizmetlerinde temel rol oynar; örneğin, bitki örtüsü yağışları sünger gibi tutarak toprak erozyonunu önler ve akarsu kıyılarını stabilize eder. Bitkiler fotosentez yoluyla atmosferden karbondioksiti çekerek karbon havuzları oluşturur ve su kalitesini iyileştirir. Ayrıca vejetasyon, çok sayıda tür için yaşam ortamı sağlayarak biyoçeşitliliği destekler. Tüm bu işlevler, bitki topluluklarının ekosistem bütünlüğü ve sürdürülebilirliği açısından kritik önemde olduğunu göstermektedir(Mullins, 2020).

Vejetasyon etüdü, bir alandaki bitki topluluklarının tür kompozisyonu, örtü derecesi ve yapısal özelliklerinin sistematik olarak saptanmasıdır. Etüdler mevcut vejetasyon tiplerinin tanımlanmasına ve bunlar arasındaki farklılıkların anlaşılmasına olanak tanır(Babalık, 2004).

Türkiye'deki mera çalışmalarında vejetasyon etütleri, dominant yem bitkisi türlerinin belirlenmesi, mera sağlık durumunun değerlendirilmesi ve otlatma kapasitesinin saptanması gibi amaçlarla yaygın olarak kullanılmaktadır.

1.2. Bazı Vejetasyon Etüdü Yöntemleri

Mera ekosistemlerinde vejetasyon etüdü için çeşitli kantitatif yöntemler kullanılmaktadır. En yaygın teknikler arasında transekt, kuadrat, nokta çerçeve ve lup teknikleri yer alır. Transekt yönteminde saha boyunca uzanan bir hat üzerinde bitki ile kaplı alan, frekans ve botanik kompozisyon gibi parametreler ölçülürken, kuadrat yönteminde sabit büyüklükteki (örneğin 1×1 m²) kare alanlarda bitki yoğunluğu veya biyokütle belirlemesi yapılır. Nokta çerçeve metodunda transekt hattı üzerindeki belirli aralıklarda küçük bir çerçeve veya pim altından bitki örtüsü gözlenerek örtü oranı saptanır. Lup yöntemi ise benzer prensiple bir metal halkalı kare veya daire içinde bitkileri saymayı esas alır; örneğin 20 m'lik bir lup hattında 20 cm aralıklarla toplam 100 nokta ölçümü yapılarak örtü ve kompozisyon hesaplanabilir. Bu yöntemlerin her biri, çayır-meralarda bitki ile kaplı alan, botanik kompozisyon ve kuru ot verimi gibi temel örtü parametrelerini nicel olarak ortaya koymak için yaygın şekilde kullanılmaktadır(Babalık, 2004).

Farklı ekolojik temalara yönelik mera çalışmalarında da bu yöntemlerden faydalanılmaktadır. Örneğin Çaçan ve Başbağ (2016) çalışmasında Bingöl Yelesen–Dikme meralarında kuzey, güney, doğu ve batı olmak üzere dört bakı yönü ile 1700–1992 m yükseltilerinde toplam 12 ayrı mera kesiminde nokta çerçeve yöntemi uygulanmıştır. Her bir 50 m'lik hat boyunca 5 m aralıklarla noktalar alınmış, her noktada 10'ar bitki gözlemi yapılarak toplamda 4800 gözlem üzerinden örtü ve kompozisyon değerleri belirlenmiştir. Benzer şekilde Baykal vd. (2024) Erzurum-İspir'de bir lup hattı boyunca her 20 cm'de bir olmak üzere 100 nokta üzerinden bitki örtüsünü saptamış, *Poaceae, Fabaceae* ve diğer bitki gruplarının örtü oranlarını hesaplamıştır.

1.3. Vejetasyon Etüdünün Amaçları

Vejetasyon etüdü, ekosistemlerin bitkisel bileşiminin ortaya konması, tür çeşitliliğinin saptanması ve habitat özelliklerinin tanımlanması gibi genel ekolojik amaçlarla yapılan temel çalışmalardan biridir. Bu tür çalışmalar, bitki topluluklarını inceleyerek ekosistem yapısını ortaya koyar ve tür kompozisyonundaki farklılıkları belirler; bu sayede biyoçeşitliliğin izlenmesi ve ekosistem yönetimi için önemli veriler sağlar(Babalık, 2004). Özetle, vejetasyon etüdü çalışmaları ekosistemlerin tanımlanması, sınıflandırılması ve izlenmesine yönelik araştırmalar için vazgeçilmez bir araçtır.

Türkiye'de mera vejetasyon etütleri özellikle otlatma kapasitesi belirleme, mera durumu ve sağlığı değerlendirme, botanik kompozisyon analizi ve ıslah planlama gibi uygulamalı amaçlarla yürütülmektedir. Örneğin, Yavuz ve Karagül (2014) Düzce Esenli merasında uygulanan çeşitli ıslah yöntemlerinin mera otlatma kapasitesi ve bitki kompozisyonu üzerindeki etkilerini incelemiş; elde ettikleri verilerle mera yönetiminde kullanılacak ıslah stratejilerini değerlendirmişlerdir. İspirli vd. (2016) çalışmalarında ise doğal meralarda tespit edilen bitki türleri ve örtü oranları kullanılarak azalıcı, çoğalıcı ve istilacı türlerin yüzdelerini belirlemiş; bu verilerle meraların "iyi, orta, zayıf" durum sınıflaması yapılmış ve meraların yarıdan fazlasının ıslah programlarına öncelik verilmesi gerektiği ortaya konulmuştur.

Sonuç olarak, vejetasyon etütleri hem doğal habitatların izlenmesi ve biyoçeşitliliğin değerlendirilmesi hem de mera yönetimi uygulamalarında kritik bir araçtır. Elde edilen veriler, ekosistemlerin korunması ve izlenmesinde olduğu kadar meraların otlatma kapasitesi ve bitki kompozisyonu esas alınarak yapılan mera durumu değerlendirmesi ve ıslah planlaması kararlarında da temel bilgi kaynağı olarak kullanılmaktadır.

1.4. Vejetasyonu Etkileyen Faktörler

Bitki örtüsünün oluşumu ve dağılışı üzerinde temel olarak iklim, toprak özellikleri ve topografik koşullar etkilidir. İklim elemanları (sıcaklık, yağış, nem ve benzeri) bitkilerin büyüme döngülerini ve fenolojisini doğrudan belirler; uzun dönemde iklim değişimleri vejetasyon kompozisyonunu etkiler. Topografya ise yerel ölçekte mikroklimayı, toprak su rejimini ve besin maddelerini düzenleyerek bitki topluluklarının çeşitliliğini ve yapısını şekillendirir. Bunun yanı sıra, bitkiler arası rekabet ve hayvan otlatması gibi biyotik etkileşimler de bitki topluluklarının bileşimini etkilemektedir.

Örneğin kuzeye kıyasla güneye bakan yamaçlar daha fazla güneş ışınımı aldığı için bitki örtüsü daha sıcak ve kurak koşullara uyum gösterir. Öte yandan, yoğun otlatma baskısı altında kalan meralarda dayanıklı otsu türler çoğalırken niteliği yüksek vejetasyon azalır.

Bununla birlikte yapılan birçok çalışmada mera ıslahı ve amenajman uygulamalarının bitki örtüsünü iyileştiği bildirilmiş olup; üstten tohumlama, yabancı ot kontrolü, gübreleme ve otlatmanın düzenlenmesi gibi yöntemlerin meradaki bitki kaplılık oranını arttırdığı ve istenilen iyi türlerin oransal artışını sağladığı tespit edilmiştir. Benzer şekilde, koruma statüsü altındaki mera alanlarında otlatma kısıtlamaları ve bakım önlemleri sayesinde doğal vejetasyon yapılarının daha iyi muhafaza edildiği değerlendirilmiştir.

TÜRKİYE'DE VEJETASYON ETÜDÜ ÇALIŞMALARI

1.5. Akdeniz Bölgesi

Akdeniz Bölgesi'nde yapılmış birçok mera vejetasyon araştırmasına göre Akdeniz Bölgesi'nin meralarının büyük kısmında bitki örtüsü kompozisyonu bozulmuş durumda olduğu, buğdaygiller ve baklagillerin oranının ideal düzeylerin altına düştüğü buna karşın istilacı yabancı otlar ve düşük kaliteli türlerin baskın hale geldiği bildirilmiştir. Örneğin birçok merada baklagiller %10–20'yi geçmezken, istilacı türler bitki örtüsünün yarıdan fazlasını oluşturabilmektedir. Bitki ile kaplı alan oranı bazı alanlarda %30'un altına kadar düştüğünden, toprak yüzeyi büyük ölçüde açıkta kalarak erozyona maruz kalmaktadır. Bazı taban meralarda ise kaplılık %90'ı aşsa bile, bu örtü hayvanların yararlanamadığı dikenli ve acı otlardan oluşmaktadır. İncelenen meralardaki tür çeşitliliği genel olarak yüksek olsa da (20-30 familya, onlarca bitki türü), aşırı otlatma sonucunda kıymetli türlerin yerini istilacı türler aldığı için mera kalite sınıfı zayıf çıkmaktadır. Nitekim çoğu çalışmada mera durumunun "zayıf" ya da "çok zayıf" kategorisinde olduğu belirtilmiştir. Sadece birkaç merada (yüksek rakımlı ve daha az bozulmuş alanlarda) mera durumu "orta" bulunmuştur.

Bu bulguların temel nedenlerinin iklim ve yanlış mera yönetimi olduğu birçok çalışmada bildirilmiştir. Akdeniz ikliminin uzun yaz kuraklığı, mera bitkilerinin büyüme sezonunu kısaltarak tek yıllık ve düşük verimli türleri hâkim kılmaktadır. Çok daha önemlisi, uzun yıllar kontrolsüz ve yoğun otlatma meraların doğal dengesini bozmuştur. Kaliteli, otlatmaya duyarlı çok yıllıklar azalırken, otlatmaya dayanıklı çalılar ve yabancı otlar çoğalmıştır. Toprak yapısı ve eğim de lokal farklılıklara yol açmıştır; örneğin killi ve sığ topraklı, engebeli arazilerde bitki örtüsü daha zayıf kalmıştır.

Sonuç olarak, Akdeniz Bölgesi meralarının birçoğunda vejetasyon kompozisyonu yem kalitesi açısından arzu edilen düzeyde değildir. İstilacı ve değersiz türlerin baskın olduğu, verimin düşük ve mera durumunun zayıf olduğu tespit edilmiştir. Bu durum, iklimden ziyade mera yönetim hatalarına bağlı bozulmayı göstermektedir. Meraların yeniden sağlıklı ve verimli hale gelebilmesi için uygun ıslah çalışmaları (üstten tohumlama, gübreleme, dinlendirme ve benzeri) ile birlikte planlı otlatma (otlatma zamanı ve kapasitesine riayet) uygulanması önerilmektedir. Aksi halde, mevcut bozulma ilerleyerek meraların sürdürülebilir hayvancılık için sunduğu faydalar tamamen kaybolabilir.

Akdeniz Bölgesinde Yapılmış Bazı Çalışmalar:

Çınar vd. (2019) tarafından Adana İli Tufanbeyli İlçesine bağlı 5 köy merasında 2010 yılında yürütülen çalışmada her merada ki 12 hat üzerinde toplam 1200 noktada etüd çalışması yapılmış ve merada ki bitki türleri, kaplılık oranları ve mera kalite değerleri saptanmıştır. İncelenen meralarda bitki ile kaplılık oranı %90'ın üzerinde bulunmuş olup bitki örtüsünün ortalama botanik kompozisyonunun %36,9 buğdaygil, %22,0 baklagil, %41,1 diğer familyalara ait türlerden oluştuğu bildirilmiştir. Çalışmaya göre azalıcı türler ortalama %20,9, çoğalıcılar %11,9 oranında kalırken istilacılar %67,2'ye ulaşmıştır. Mera kalite puanları 2.40–3.92 aralığında hesaplanmış ve buna göre mera durumu zayıf sınıfına girmiştir. Sonuç olarak Tufanbeyli meralarında uzun yıllar erken ve aşırı otlatma yapılması, kaliteli bitkilerin yerini düşük kaliteli istilacı bitkilere bırakmasına yol açmıştır. Mera ıslahı ve otlatmanın kontrol altına alınması gerektiği vurgulanmıştır.

Öten vd. (2016) tarafından Antalya ilinin farklı ekolojik koşullara sahip 6 ilçesinde ki (Elmalı, Korkuteli, İbradı, Döşemealtı, Aksu, Manavgat) doğal mera alanlarında 2013 yılında yürütülen çalışmada 21 farklı mera noktasında modifiye tekerlekli nokta metodu ile bitki türleri ve kaplama durumları belirlenmiştir. Toplamda 176 farklı bitki türü saptanmış olup bunların 34'ü buğdaygil, 39'u baklagil ve 103'ü diğer familyalara ait türlerdir. İncelenen meralarda bitki ile kaplılık oranı %71,9 ile %95,1 arasında değiştiği ve botanik kompozisyonun genel ortalama olarak %19,3 buğdaygil, %22,1 baklagil ve %58,5 diğer familyalara ait türlerden oluştuğu bildirilmiştir. Mera durum sınıfları bazı alanlarda zayıf, bazı alanlarda ise orta bulunmuş; ancak mera sağlığı genelde "sağlıklı" (erozyon ve toprak açısından henüz kritik seviyede değil) olarak değerlendirilmiştir. Sonuç olarak yapılan çalışmada Antalya genelindeki doğal meraların tür çeşitliliğinin zengin olduğu ancak özellikle baklagil oranlarının düşük ve diğer familyaların baskınlığının dikkat çekici olduğu bildirilmiş olup meralardaki bitki örtüsü çoğunlukla zayıf durumda olduğundan, yöre meralarının ıslah edilmesi ve uygun otlatma planlarının yapılması tavsiye edilmiştir.

Babalık ve Sönmez (2010) tarafından yürütülen, Isparta ili merkez ilçeye bağlı Bozanönü köyü Kırtepe merasında ki 2005-2006 yıllarında iki vejetasyon dönemini kapsayan araştırmada transekt yöntemi kullanılmış olup bitki ile kaplı alan, botanik kompozisyon ve kuru ot verimi ölçülmüştür. Araştırma alanında 32 familyaya ait 129 bitki türü tespit edilmiş olup bitki ile kaplı alan değeri ortalama %18,3 olarak bulunmuş ve bu düşük kaplılığın, erozyon riskini yükselttiği bildirilmiştir. Botanik kompozisyonun %52,5'inin buğdaygillerden, %9,2'sinin baklagillerden ve %38,4'ünün diğer familyalara ait bitki türlerinden oluştuğu ve buğdaygillerin oranının nispeten yüksek olmasına rağmen bunların önemli bir kısmının tek yıllık kalitesiz otlardan oluştuğu, baklagillerin ise vejetasyonda yok denecek kadar az kaldığı vurgulanmıştır. Mera kuru ot verimi 80,3 kg/da olarak hesaplanmış ve bu verime göre bir büyükbaş hayvan biriminin 6 aylık otlatılması için yaklaşık 68 dekar mera gerektiği hesaplanmıştır. Sonuç olarak Bozanönü merasının, uzun yıllar aşırı otlatma sonucu çok zayıf duruma geldiği ve bitki örtüsünün büyük kısmının kaybolduğu, meranın verimsiz ve erozyona açık hale geldiği bildirilmiş olup meranın acilen dinlendirilmesi ve ıslah çalışmalarına tabi tutulması önerilmiştir.

Bilgen ve Özyiğit (2005) tarafında Antalya'nın Korkuteli ve Elmalı ilçelerine bağlı altı doğal mera alanının da 2003 yılında yürütülen araştırma da her bir merada arazi büyüklüğü ve yapısına göre belirlenen örnek alanlarda transekt yöntemi kullanılarak dip kaplama oranı (bitki ile kaplı alan) ve botanik kompozisyon ölçümleri yapılmıştır. Elmalı ilçesindeki Yalnızdam merasında bitki ile kaplı alan değeri %75,5 gibi nispeten yüksek bulunurken, diğer 5 merada bu oran %43'ün altında kalmıştır. En düşük kaplılık değeri Korkuteli Büyük Söğle merasında %29,8 olarak tespit edilmiştir. Meralardaki tür çeşitliliği genel olarak düşük bulunduğu, Yalnızdam'da 12 tür, Büyük Söğle'de 30 tür saptandığı ve bu sonuçlara göre inceleme

alanlarının flora açısından fakirleştiğini bildirilmiştir. Ayrıca tüm meralarda baklagil familyasından türlerin oranının çok düşük olduğu belirtilmiş olup botanik kompozisyonda buğdaygiller ve özellikle diğer familyalardan gelen otsu bitki türleri ağırlık kazanmıştır. Sonuç olarak Korkuteli ve Elmalı'daki doğal meraların durumu genel olarak zayıf olarak değerlendirilmiştir. Araştırma da bölgedeki meraların verimliliğini artırmak için uygun mera yönetimi ve ıslah çalışmalarının gerekliliğini vurgulamıştır.

1.6. Doğu Anadolu Bölgesi

Doğu Anadolu meralarında yapılan çok sayıda çalışmada genellikle mera bitki kompozisyonu %10–%60 arasında değişen oranlarda buğdaygillerden, %4–%33 oranlarında baklagillerden ve geri kalan oranlarda diğer familyalardan oluştuğu görülmüştür. Mera örtüsü çalışmalarda çoğu zaman %70–%90 civarında bulunurken, bazı yüksek kesimlerde %30–%40 düzeyinde bulunmuştur.

Araştırmalar, bu meraların verim ve kalite yönünden zayıf sınıfa girdiğini göstermektedir. Örneğin Bulgurcuk Köyü'nde bitkilerin %84,7'si istilacı türlerden oluşmuş ve mera "zayıf" olarak belirlenmiştir. Benzer şekilde Bingöl Çiçekyayla'da mera kalite derecesi 2,59 (zayıf) bulunmuş, kuru ot verimi düşük çıkmıştır. Çoğu çalışmada mera taşıma kapasitesi de düşük çıkmış ve sürdürülebilir otlatma için yetersiz olarak rapor edilmiştir.

Bu olumsuz durumların temel nedenleri, Doğu Anadolu'nun soğuk ve kurak iklimi ile birlikte aşırı otlatma baskısıdır. Kışlar uzun ve kar yağışlı, yazlar kısa olduğu için bitkiler yeterince gelişememekte; buna ek olarak kontrolsüz otlatma toprağı çıplak bırakmakta, erozyon ve verim kaybına yol açmaktadır. Toprak özellikleri ve eğimli araziler de mera kalitesini düşüren diğer faktörlerdir. Bu nedenle bölge meralarının iyileştirilmesi için otlatma yönetiminin düzenlenmesi, mera ıslah çalışmaları ve toprak verimliliğinin artırılması gereklidir.

Genel olarak, Doğu Anadolu meraları düşük verimli, istilacı tür baskısının yüksek olduğu alanlar olarak tanımlanabilir; bu durum bölgenin iklim ve arazi yapısından kaynaklanmakta ve sürdürülebilir kullanım için acil tedbirler alınmasını zorunlu kılmaktadır.

Doğu Anadolu Bölgesinde Yapılmış Bazı Çalışmalar:

Baykal vd. (2024) tarafından Erzurum İli, İspir İlçesi, Çayırözü Mahallesi merasında lup metodu kullanılarak yapılan çalışma 2020 yılında yürütülmüş ve toplam 59 takson tespit edilmiştir. Botanik kompozisyonda, buğdaygiller %21,33, baklagiller %19,46 ve diğer familya türleri %59,21 oranında bulunmuştur. Bitki kaplılık oranı %67,66 olarak hesaplanmış olup mera kalite derecesi 2,98 olarak belirlenmiş ve mera durumunun "zayıf" sınıfına girdiği ve Çayırözü yaylasının verim ve kalitesinin düşük olduğu bildirilmiştir.

Çaçan ve Balkan (2021) tarafından Elâzığ İli, Karakoçan İlçesi, Bulgurcuk Köyü merasında meranın bitki kompozisyonu, verimi ve mera durumu incelenmiş ve toplam 15 familyaya ait 39 bitki türü belirlenmiştir. Bitki kaplılık oranı %91,7 bulunmuş, kompozisyonda buğdaygiller %61,6, baklagiller %15,6, diğer familyalar %22,8 olarak tespit edilmiştir. Baskın tür *Aegilops triuncialis* (%35,8) olarak saptanmış, diğer baskın türler ise *Trifolium campestre, Hordeum bulbosum* türleri olduğu bildirilmiştir. Mera durumu "zayıf" olarak belirlenmiş; meradaki bitkilerin %84,7'sinin istilacı, %5,8'inin azalıcı, %9,5'inin çoğalıcı olduğu rapor edilmiştir.

Barlak (2012) tarafından Van İli, Çaldıran İlçesi, Başeğmez Köyü merasının bitki ile kaplı alanı, botanik kompozisyonu ve verimi incelenmiştir. Bitki kaplılık oranı %77 olarak bulunmuş, kompozisyonda buğdaygiller %11, baklagiller %7,6, diğer familyalar %81,4 oranında tespit edilmiştir. Kuru ot verimi 61,8 kg/da hesaplanmış, mera taşıma kapasitesi ve kalite düzeyi düşük bulunmuştur. Elde edilen bulgular üzerinden Başeğmez meralarının da düşük üretim potansiyeline sahip olduğunu bildirilmiştir.

1.7. Ege Bölgesi

Ege Bölgesinde yapılan çalışmalarda vurgulanan ortak bulgu, uzun yıllar kontrolsüz ve aşırı otlatmanın mera vejetasyonunu olumsuz etkilediği yönündedir. Aşırı otlatma sonucunda, yüksek yem değerine sahip narin türler azalmakta, onların yerine hayvanların tercih etmediği dikenli-yabancı otlar baskın hale gelmektedir. Ayrıca, yaz kuraklığı ve uygun olmayan toprak koşulları gibi çevresel etkenler de baklagiller başta olmak üzere faydalı bitkilerin gelişimini kısıtlayarak mera kalitesini düşürmektedir.

Sonuç olarak, Ege Bölgesi mera ekosistemlerinin sürdürülebilirliği için acilen tedbir alınması gerekmektedir. Çalışmalar, mevcut meraların bitki örtüsünü iyileştirmek ve verimliliğini arttırmak amacıyla otlatma baskısının azaltılmasını, meraların uygun tekniklerle ıslah edilmesini ve planlı mera yönetimi uygulanmasını önermektedir. Bu sayede meraların yeniden kaliteli bitki türleriyle kaplanması, erozyonun önlenmesi ve bölgenin hayvancılık faaliyetlerine sağladığı katkının sürdürülebilmesi mümkün olabilecektir.

Ege Bölgesinde Yapılmış Bazı Çalışmalar:

Babalık ve Kirazlı (2024) tarafından Aydın ili Karacasu ilçesi 1550 m rakımlı Taşoluk doğal merasında 2022 yılı vejetasyon döneminde gerçekleştirilen çalışmada lup ve kuadrat metotları kullanılarak botanik kompozisyon ve mera verimi incelenmiştir. Araştırma sonucunda merada 37 familyaya ait 147 bitki taksonu belirlenmiştir. En fazla türe sahip familyaların papatyagiller (17 tür), ballıbabagiller (13 tür) ve buğdaygiller (9 tür) olduğu bildirilmiştir. Bitki örtüsüyle kaplı alan oranı %44 olup botanik kompozisyonun %44,8'ini buğdaygiller, %31,2'sini baklagiller, %24,0'ünü diğer familyalar oluşturmaktadır. Mera alanında ölçülen kuru ot verimi 302,0 kg/da, otlatma kapasitesi 59.9 BBHB olarak hesaplanmıştır. Mera durumu "orta" sınıfta tespit edilen alanda, yoğun otlatma nedeniyle vejetasyonun tahrip olduğu gözlenmiştir. Çalışma, meranın iyileştirilmesi için otlatma baskısının azaltılmasını ve uygun ıslah yöntemlerinin uygulanmasını önermektedir.

Öten vd. (2022) tarafından Denizli ilinin 7 ilçesinden seçilen 12 doğal mera alanında yürütülen bu çalışma, modifiye tekerlekli lup yöntemi ile mera vejetasyon özelliklerini belirlemeyi amaçlamıştır. 2015 yılında yapılan vejetasyon etüdü sonucunda incelenen meralarda toplam 234 bitki türü tespit edilmiştir. Türlerin dağılımı incelendiğinde 51'inin buğdaygil, 56'sının baklagil ve 127'sinin diğer familyalara ait olduğu belirlenmiştir. Bitki ile kaplılık oranı meradan meraya değişmekle birlikte %41 ile %50 arasında bulunmuştur. Mera florasında en sık rastlanan türler, baklagillerden *Vicia sativa* (yabani fiğ), buğdaygillerden *Cynodon dactylon* (yayılıcı ayrık) ve diğer familyalardan *Carduus pycnocephalus* (bir devedikeni türü) olarak rapor edilmiştir. Botanik kompozisyon açısından, meralardaki türlerin %13'ü azalıcı, %22'si çoğalıcı ve %65'i istilacı grupta yer almaktadır. Bu sonuç mera bitki örtüsünün büyük ölçüde kalite kaybına uğrayıp yabancı otların hâkim hale geldiğini göstermektedir. Nitekim mera durum sınıflaması sonucunda 1 mera "riskli", 11 mera "zayıf" durumda bulunmuş; mera sağlığı değerlendirmesinde ise bazı alanlar "iyi", çoğunluğu "orta" olarak sınıflandırılmıştır. Çalışma, Denizli meralarında aşırı otlatma baskısının bitki kompozisyonunu olumsuz etkilediğini vurgulamakta ve meraların ıslahı için üstten tohumlama, tekrar ekim, yabancı ot mücadelesi gibi yöntemlerle birlikte otlatma planının düzenlenmesini önermektedir.

Aksu (2006) tarafından İzmir'in Aliağa ilçesinde bulunan yaklaşık 60 ha büyüklüğündeki bir doğal merada gerçekleştirilen bu araştırma, mera vejetasyonunun floristik bileşimini ve verim potansiyelini belirlemeyi amaçlayan bir yüksek lisans tez çalışmasıdır. 2002–2005 yılları arasında mera alanına 18 adet otlatmadan koruma kafesi yerleştirilmiş; vejetasyon ölçümleri korunan alanlarda quadrat (1,44 m²) yöntemi ile yapılmıştır. Elde edilen sonuçlara göre meranın kuru ot verimi ortalama 293,6 kg/da düzeyinde bulunmuş ve 180 günlük otlatma süresi için otlatma kapasitesi 48.66 BBHB olarak hesaplanmıştır. Bitki boyu ortalama 27 cm olup mera

yüzeyinin %66'sı bitki örtüsüyle kaplı bulunmuştur. Botanik kompozisyon (biyokütle ağırlığına göre) incelendiğinde, %65,6'sının buğdaygil, %6,1'inin baklagil ve %28,2'sinin diğer familya bitkilerinden oluştuğu tespit edilmiştir. Bu düşük baklagil oranı, meranın uzun yıllar yoğun ve plansız otlatılması nedeniyle arzu edilen baklagil türlerinin azalmasıyla ilişkilendirilmiştir. Araştırmada, meranın mevcut durumunun sürdürülebilir olmadığı belirtilmiş ve ivedilikle ıslah ile amenajman çalışmalarına başlanarak öncelikle meradaki bozulmanın durdurulması, ardından verim potansiyelini artırıcı önlemlerin alınması tavsiye edilmiştir.

1.8. Güneydoğu Anadolu Bölgesi

İncelenen çalışmalar bölge meralarının bitki örtüsü ve verim özelliklerinin genel olarak zayıfladığını göstermektedir. Yapılan çalışmalarda buğdaygiller ve baklagillerin botanik kompozisyondaki oranları oldukça düşük kalırken, diğer familyalardan yabancı otlar baskın konuma geçmiştir. Birçok mera alanında istilacı türler bitki çeşitliliğinin %90'ından fazlasını oluşturmakta, yem değeri yüksek azalıcı türlerin ise yok denecek kadar azaldığı bildirilmektedir. Bitkiyle kaplı alan oranlarının mera sağlığı açısından çoğunlukla yeterli düzeyde (%50–80 civarında) olduğu ancak kıraç ve aşırı otlatılan kesimlerde %30'un altına kadar düştüğü rapor edilmiştir. Tür zenginliği familya çeşitliliği bakımından yüksek olmakla birlikte, en fazla tür içeren grupların papatyagiller ve baklagiller gibi familyalardan çoğu otlatmaya dayanıklı tek yıllık türler olduğu belirtilmiştir. Özellikle kıraç alanlardaki meraların kuru ot üretiminin son derece düşük olduğu (örneğin Ergani'de 15–25 kg/ da) bununla birlikte taban meralarda nispeten yüksek ot verimi alınabildiği (örneğin Övündüler Köyü 425 kg/da kuru ot verimi) tespit edilmiştir. Tüm meralar floristik kompozisyon ve verim yönünden "zayıf" sınıfta yer alırken, bitki kaplılık oranı açısından çoğunlukla "sağlıklı" kabul edilmiştir.

Bölgedeki meraların bu durumda olmasının temel nedenleri yarı kurak iklim koşulları ve uzun yıllar kontrolsüz şekilde süren aşırı otlatmadır. Düşük ve düzensiz yağış, kaliteli ve çok yıllık mera bitkilerinin gelişimini sınırlandırırken, yıl boyu yoğun otlatma ise bitki örtüsünün hızla bozulmasına yol açmıştır. Sonuç olarak meralar istilacı, değersiz otların egemen olduğu, verimi ve yem kalitesi düşmüş alanlara dönüşmüştür. Bu gidişatı tersine çevirebilmek için mera alanlarının ıslah programlarına alınması, otlatma planlarının uygulanması, uygun gübreleme ve yabani ot mücadelesi gibi önlemlerin hayata geçirilmesi gerekmektedir. Aksi takdirde mera ekosistemlerindeki bozulma ilerleyecek ve bölge hayvancılığının kaba yem açığı büyümeye devam edecektir.

Sonuç olarak Güneydoğu Anadolu meraları yoğun otlatma ve iklimsel kısıtlar nedeniyle ciddi verim kaybına uğramış, kompozisyonları bozulmuştur. Acil ıslah ve sürdürülebilir mera yönetimi uygulanmadığı takdirde, meraların sağladığı ekolojik ve ekonomik faydaların daha da azalacağı bir çok araştırmada rapor edilmektedir.

Güneydoğu Anadolu Bölgesinde Yapılmış Bazı Çalışmalar:

Demirhan (2019) tarafından Siirt ili Kurtalan ilçesi Gözpınar Köyü taban merasında 2017 yılında yapılmış olan yüksek lisans çalışmasında, mera vejetasyonunun yapısı ve toprak özellikleri incelenmiştir. Modifiye edilmiş lup yöntemiyle gerçekleştirilen vejetasyon etütlerinde 9 familyaya ait toplam 23 bitki türü belirlenmiştir. Botanik kompozisyonda buğdaygiller %35,3, baklagiller %28,6 ve diğer familyalar %36,1 oranında yer almıştır. Kalite sınıflandırmasına göre türlerin sadece 2'si azalıcı, 2'si çoğalıcı çıkmış; geri kalan 19 tür istilacı olarak kaydedilmiştir. Mera bitkiyle kaplı alan oranı %76,9 olarak ölçülmüş, toprakların orta bünyeli, hafif alkalin ve tuzsuz olduğu tespit edilmiştir. Çalışma sonucunda, istilacı türlerin baskın olması nedeniyle meranın durumunun zayıf olduğu, ancak toprak verilerine dayanarak uygun ıslah önlemleriyle iyileştirilebileceği belirtilmiştir.

Seydoşoğlu ve Kökten (2018) tarafından Batman ili Beşiri ilçesine bağlı 14 köy merasında 2018 vejetasyon döneminde yürütülen çalışmada, mera durumu, mera sağlığı ve botonik kompozisyonu değerlendirilmiştir. Tekerlekli lup yöntemi ile her merada 400 nokta gözlemi yapılmıştır. Araştırma alanlarında 117 farklı bitki türü tespit edilmiş; bunların 17'si buğdaygil (%30,9), 32'si baklagil (%34,7) ve 68'i diğer familyalara (%34,4) ait türler olarak bildirilmiştir. Türlerin kalite derecelerine göre dağılımında ise 7 tür azalıcı (%2,6), 8 tür çoğalıcı (%6,8) ve 102 tür istilacı (%90,6) olarak belirlenmiştir. Mera florasının büyük ölçüde istenmeyen istilacı türlerden oluşması nedeniyle çalışma alanlarının "zayıf mera" durumda, ancak bitki örtüsü devamlılığı açısından "sağlıklı mera" sınıfında olduğu rapor edilmiştir. Araştırmacılar, bölgede aşırı, erken ve düzensiz otlatmanın mera tahribatındaki rolünü vurgulayarak, sürdürülebilirlik için otlatma planı uygulanması, gübreleme ve yabancı ot kontrolü gibi ıslah tedbirlerinin alınması gerektiğini önermektedir.

Seydoşoğlu vd. (2015) tarafından Diyarbakır ili Silvan ilçesinin taban kesimindeki 6 köy merasında nokta çerçeve metodu ile yapılan vejetasyon etütlerinde 11 familyadan 43 bitki türü belirlenmiştir. Mera alanlarına göre bitki ile kaplılık oranları %46,2 ile %72,0 arasında tespit edilmiştir. Botanik kompozisyon analizinde, meralardaki buğdaygil oranlarının %30,8–72,9, baklagil oranlarının %16,9–48,3, diğer familyalara ait bitkilerin oranlarının ise %10,2–39,7 arasında değişim gösterdiği rapor edilmiştir. Çalışma bulguları, hemen tüm meralarda istilacı türlerin baskın olduğunu, özellikle değerli buğdaygil ve baklagil yem bitkilerinin düşük oranlarda kaldığını göstermiştir. Sonuç olarak Silvan ilçesindeki taban meraların yoğun otlatma baskısı altında kompozisyon bakımından bozulduğu, mera iyileştirmeleri (gübreleme, dinlendirme, yabani ot kontrolü ve benzeri) ile verimin artırılmasının gerekli olduğu belirtilmiştir.

Aydın vd. (2014) tarafında Mardin ili Derik ilçesindeki mera alanında 2012-2013 yıllarında yürütülen çalışmada sekiz hat üzerinde nokta yöntemi ile meranın botanik kompozisyonu iki yıl boyunca izlenmiştir. 16 farklı familyadan 53 bitki türü tespit edilmiştir. Araştırma sonuçlarına göre mera alanının ortalama %53,3'ü bitki ile kaplı bulunmuştur. Kaplama alanına göre botanik kompozisyonda buğdaygiller %4,0, baklagiller %23,2 ve diğer familyalar %72,8 pay almıştır. Merada en yaygın türlerin *trifolium* (*Trifolium campestre*, %16,95), güneşgülü (*Helianthemum sp.*, %13,75), *brom* (*Bromus spp.,* %9,83) ve peygamber çiçeği (*Achillea sp.,* %8,48) olduğu rapor edilmiştir. Ortalama bitki boyu 7,6 cm olarak ölçülmüş, vejetasyonun büyük kısmının cüce formlu yıllık otlardan ibaret olduğu gözlenmiştir. İki yıllık veriler karşılaştırıldığında yağışlı yılın sonunda bitki örtüsünde belirgin artış görülmüş, ilk yıl %39 olan kaplılık ikinci yıl %67'ye yükselmiştir. Kalite bakımından, belirlenen 53 türün 2'si azalıcı, 1'i çoğalıcı, geri kalan 50'si istilacı kategorisinde yer almıştır. Sonuç olarak, meradaki bitki örtüsünün çoğunlukla hayvanların yemediği yabancı otlardan oluştuğu, mera durumunun zayıf olduğu belirtilerek bu meranın ıslahı için ek tedbirler alınması önerilmiştir.

1.9. İç Anadolu Bölgesi

İç Anadolu Bölgesi'nde farklı meralarda yapılan vejetasyon çalışmalarına göre meraların bitki örtüsü kompozisyonu büyük ölçüde bozulmuştur. Kaliteli yem bitkileri olan buğdaygil ve baklagillerin oranı azalırken, yoğun otlatmaya dayanıklı değersiz otların (diğer familyalar) payı birçok yerde yarıdan fazladır. Bitki ile kaplı alan oranı düşüktür; bazı meralarda toprağın ancak %15'i bitkiyle kaplıyken geniş alanlar çıplak kalmıştır. Bu durum mera verimini olumsuz etkilemiş, yıllık kuru ot üretimi dekar başına 100 Kg'ın altına düşmüştür. İyi durumdaki bazı meralarda bile bitki örtüsü ancak arazinin yarısını kaplamaktadır. İncelenen meraların çoğu "orta" veya "zayıf" durumda olup sadece çok azı iyi durumda bulunmuştur. Yoğun ve kontrolsüz otlatma sonucunda mera kalitesi düşmüş, taşıma kapasitesi çok azalmıştır.

Bölgedeki meraların zayıf durumu, yarı kurak iklim koşulları ile yıllardır süren aşırı otlatmanın bir sonucudur. Düşük yağış ve kuraklık, bitki büyümesini sınırlandırırken, erken ve yoğun otlatma bitkilerin yenilenmesine fırsat vermemiştir. Bunun sonucunda, verimli türler yerini yabancı otlara bırakmış, toprak örtüsü incelmiş ve erozyon artmıştır. Eğimli ve sığ topraklı arazilerde bu bozulma daha da şiddetlidir. Sonuç olarak, İç Anadolu meralarının büyük kısmı verim ve kalite açısından optimumun altındadır. Bu meraların sürdürülebilir yönetim ilkeleriyle yeniden düzenlenmesi, aşırı otlatmanın kontrol altına alınması ve gerekli ıslah çalışmalarının yapılması bölge meralarının sağlığını ve verimini artırmak için zorunludur.

İç Anadolu Bölgesinde Yapılmış Bazı Çalışmalar:

S Ünal vd. (2012) tarafından Ankara ilindeki meraların durumunu değerlendirmek amacıyla 2009-2010 yıllarında 60 farklı mera noktasında vejetasyon etütleri gerçekleştirmiştir. Tekerlekli nokta yöntemi ile yürütülen bu çalışmada, ortalama bitki ile kaplı alan %60.5, çıplak alan %39.5 olarak ölçülmüştür. Mera bitki örtüsünü oluşturan türlerin %10,2'si otlatmaya hassas azalıcı türler, %25,7'si çoğalıcı türler olup geriye kalan büyük kısım istilacı otsu bitkilerdir. Mera durum sınıflandırmasına göre incelenen 60 meradan 2'si "iyi", 26'sı "orta" ve 32'si "zayıf" durumda bulunmuştur. Mera sağlığı açısından yapılan değerlendirmede noktaların çoğunun riskli ya da problemli kategoride olduğu belirlenmiştir. Sonuç olarak Ankara meralarının genelinde yapısal bir bozulma ve verim düşüşü tespit edilmiş; sürdürülebilir mera yönetimi ve ıslah tedbirlerinin acilen uygulanması gerektiği önerilmiştir.

Sabahaddin Ünal vd. (2012) tarafından 2008 yılında Çankırı ilinde yürütülen çalışma, ilin tümünü temsil edecek şekilde seçilen 41 mera noktasında bitki örtüsü ve mera sağlığı değerlendirmesi yapmıştır. Tekerlekli nokta yöntemi ile yapılan ve toprak özelliklerinden erozyon şiddetine kadar çeşitli parametrelerin kaydedildiği bu araştırmada, meralarda ortalama bitki ile kaplı alan %65,2, çıplak alan %34,8 olarak tespit edilmiştir. Azalıcı türler toplam vejetasyonun %14,7'sini, çoğalıcılar %24,8'ini oluşturmuş; geri kalan bitki örtüsünü istilacı karakterde türler meydana getirmiştir. Mera durumu değerlendirmesinde 41 meradan 1'i "çok iyi", 3'ü "iyi", 23'ü "orta" ve 14'ü "zayıf" kategoride yer almıştır. Mera sağlığı bakımından da 24 durak "riskli" veya "problemli" olarak sınıflandırılmıştır. Bu bulgular, Çankırı yöresi meralarının yapısal olarak bozulmuş olduğunu ve bozulma sürecinin hızlı şekilde sürdüğünü ortaya koymaktadır. Çalışma, tahrip olmuş meralarda uygun mera yönetimi ve ıslah uygulamalarının bir an önce devreye alınması gerektiğini vurgulamaktadır.

Babalık ve Ercan (2018) tarafından Eskişehir ili Seyitgazi ilçesindeki Karaören köyü merasında, 2016 yılı vejetasyon döneminde mera özelliklerini araştırmıştır. Transekt ve kuadrat yöntemleri kullanılarak yapılan çalışmada mera florası ayrıntılı olarak incelenmiş ve bölgedeki biyoçeşitlilik ortaya konmuştur. Araştırma alanında 49 familyaya ait toplam 89 bitki taksonu tespit edilmiştir. En zengin üç familya, 10 tür ile buğdaygiller (*Poaceae*), 8 tür ile baklagiller (*Fabaceae*) ve 7 tür ile papatyagiller (Asteraceae) olup yem açısından önemli familyaların çeşitliliği yüksektir. Meranın bitki ile kaplı alanı %51,2 olarak ölçülmüş, vejetasyonun botanik kompozisyonunda buğdaygiller %44 ile en büyük paya sahipken baklagiller %23, diğer familyalar %33 oranında yer almıştır. Karaören merasının ot verimi topraküstü biyomas olarak 351,6 kg/da toprak altı biyomas olarak 560,7 kg/ da seviyesinde saptanmıştır. Mera durumu değerlendirmesinde bu mera "iyi durumda" olarak sınıflandırılmıştır. Sonuçlar, Karaören merasının İç Anadolu koşullarına rağmen nispeten iyi korunmuş ve çeşitli bitki örtüsüne sahip olduğunu, uygun yönetimle meraların verimli halde tutulabileceğini göstermektedir.

1.10. Karadeniz Bölgesi

Karadeniz Bölgesi'ndeki farklı mera araştırmaları, bölge meralarının bitki örtüsü yoğun fakat kalite açısından sorunlu olduğunu göstermektedir. İncelenen meralarda buğdaygiller ve baklagillerin toplamı genellikle vejetasyonun yarısından azını oluştururken, diğer

familyalardan bitkiler baskın hale gelmiştir. Örneğin bazı meralarda baklagil oranı %5–10 gibi çok düşük değerlere inerken, istilacı türlerin oranı %50–70'e ulaşmaktadır. Yüksek yağış sayesinde meraların toprakları %60–90 oranında bitkiyle kaplı olsa da bu örtünün büyük kısmı hayvanların tercih etmediği düşük kaliteli otlardan oluşmaktadır. Birçok mera alanında yıllarca süren aşırı otlatma nedeniyle lezzetli ve besleyici bitkiler yerlerini dikenli, acı veya çalı formundaki bitkilere bırakmıştır. Nitekim mera durum dereceleri çoğunlukla "zayıf" sınıfta yer almakta, bu da verim ve otlatma kapasitesinin düşüklüğüne işaret etmektedir.

Bölgedeki meraların bu duruma gelmesinde iklim, arazi yapısı ve özellikle otlatma baskısı başlıca rol oynamıştır. Yağışlı iklim ve derin toprak potansiyeli aslında kaliteli mera bitkilerini destekleyebilmesine rağmen, eğimli arazilerde kontrolsüz otlatma ve bakım eksikliği vejetasyonu olumsuz etkilemiştir. Birçok çalışma, mera ıslahı ve planlı otlatma yapılmadıkça mevcut bitki örtüsünün giderek fakirleşeceğini vurgulamıştır. Öte yandan, bazı kuzey yayla kesimlerinde baklagillerin yeniden yükselebildiği, güneyin kurak noktalarında ise iyice azaldığı görülmüştür. Bu da uygun yönetim ve ekosistem koşulları sağlandığında meraların kendini toparlayabileceğine işaret etmektedir.

Sonuç olarak, Karadeniz Bölgesi meralarının çoğu şu anda orta veya zayıf durumda olup acil tedbir gerektirmektedir. Otlatma rejiminin düzenlenmesi, meraların dinlendirilmesi ve gerekli alanlarda üstten tohumlama ile kaliteli türlerin artırılması tavsiye edilmektedir.

Karadeniz Bölgesinde Yapılmış Bazı Çalışmalar:

Yavuz vd. (2012) tarafından Amasya ilindeki meraların vejetasyon özelliklerini belirlemek amacıyla 2012 yılında 106 noktada mera etüdü gerçekleştirmiş olup toplam 186 bitki türü tespit edilmiş ve bunların 42'si baklagil, 40'ı buğdaygil, 104'ü diğer familyalara ait bitki türleri olarak rapor edilmiştir. Ortalama bitki ile kaplı alan oranı %77,8 olarak ölçülmüştür. Botanik kompozisyonda baklagillerin payı %22,84, buğdaygillerin %41,81, diğer familyaların %35,35 olarak hesaplanmıştır. Kalite gruplarına göre ise kompozisyonun %18,07'sini azalıcı değerli türler oluştururken, %53,52'si istilacı türlerden meydana gelmiştir. Sonuçlar Amasya meralarında yabancı otların hâkim, kaliteli otların ise düşük oranda kaldığını göstermiştir. Çalışma, meraların bu durumunun uzun süreli aşırı otlatmaya bağlı olduğunu belirterek mera yönetimi ve ıslahı konularında öneriler sunmuştur.

Uzun vd. (2016) tarafından 2016 yılında Bartın ili Merkez ilçeye bağlı 15 köy merasında vejetasyon çalışmalarını modifiye tekerlekli lup metodu ile yürütülmüştür. İncelenen meralarda toplam 128 bitki türü saptanmış olup türlerin kalite derecelerine göre dağılımı, 18 türün azalıcı, 10 türün çoğalıcı ve 100 türün (89 otsu + 11 çalı/ağaç formunda) istilacı grupta olduğunu göstermiştir. Meraların bitkiyle kaplı alan oranı ortalama %93,57 gibi oldukça yüksek bulunmuştur. Ancak botanik kompozisyonda azalıcı türlerin oranı %15,52, çoğalıcıların %15,59 iken istilacı türler %68,89 gibi baskın bir değere ulaşmıştır. Mera durum değerlendirmesi sonucunda 15 meradan 1'i "Çok iyi", 1'i "İyi", 6'sı "Orta" ve 7'si "Zayıf" sınıfa girmiştir. Mera sağlığı açısından ise 14 mera "Sağlıklı", 1 mera "Sorunlu" olarak belirlenmiştir. Aşırı otlatılan alanlarda toprak sıkışması artmış, kaliteli bitki oranı azalmıştır. Sonuç olarak meraların yaklaşık yarısının acilen ıslaha ihtiyaç duyduğu, diğer yarısının ise dikkatli kullanılmazsa hızla bozulacağı vurgulanmıştır.

Erkovan (2000) tarafından 2000 yılında Bayburt ili Aydıntepe ilçesi Çiğdemlik köyü meralarının vejetasyon yapısını ve mevcut durumu yüksek lisans tezi çalışması kapsamında incelenmiştir. Araştırmada mera üç kesime (I, II, III) ayrılarak her birinin bitki türleri, botanik kompozisyonu ve mera durumu değerlendirilmiştir. İncelenen kesimlerde toplam 63 bitki türü tespit edilmiştir. I. kesim dışında diğer iki kesimde koyun yumağı (*Festuca ovina*) en baskın bitki olurken, I. kesimde mavi ayrık (*Elymus hispidus*) dominant tür olarak belirlenmiştir. Ayrıca buğdaygillerden yumrulu salkımotu (*Poa bulbosa*) ve baklagillerden çok başlı geven

(*Astragalus multiceps*) yaygın türler arasında saptanmıştır. Botanik kompozisyon, ortalama olarak %39,67 buğdaygil, %23,05 baklagil ve %37,28 diğer familyalardan türlerden oluşmuştur. Bitki örtüsünün toprağı kaplama oranı, I. kesimde %60,5, II. kesimde %65,3 ve III. kesimde %70,2 olarak ölçülmüştür. Bu veriler ışığında, Çiğdemlik merasının orta derecede bir kapalılığa sahip ancak bitki bileşiminin kalite bakımından tam dengeli olmadığı görülmüştür. Mera durumunun iyileştirilmesi için otlatma baskısının kontrolü ve uygun ıslah önlemlerinin gerekliliği vurgulanmıştır.

Çatal vd. (2019) tarafından 2019 yılında Rize ili İkizdere ilçesindeki Ovit Yaylası'nda botanik kompozisyon ve mera durumunu belirlemek amacıyla yürütülen çalışmada Lup metodunun kullanılmış ve toplam 45 bitki taksonu belirlenmiştir: Bunların 6'sının buğdaygillere (*Poaceae*), 4'ünün baklagillere (*Fabaceae*), 35'inin ise diğer familyalara ait olduğu tespit edilmiştir. Araştırma alanının bitki ile kaplı alan oranı %63,40 gibi nispeten düşük bir değerde bulunmuştur. Botanik kompozisyonda buğdaygiller %39,35, baklagiller %6,61, diğer familyalar %54,04 oranlarına sahiptir. Merada en yaygın bulunan ilk üç tür; *Festuca woronowii* (17,66%), *Nardus stricta* (13,90%) ve *Sibbaldia parviflora* (12,80%) olarak kaydedilmiştir. Bu türler, yüksek rakımlı ve aşırı otlatılmış alanların karakteristik dayanıklı bitkileridir. Mera durumu, 1,976'lık mera derecesi ile "çok zayıf" olarak belirlenmiştir. Sonuç olarak, Ovit yaylası merasının gerek bitki örtüsü yoğunluğu gerekse kompozisyon kalitesi bakımından ciddi anlamda bozulmuş olduğunu göstermektedir. Çalışma, özellikle kontrollü otlatma rejimi uygulanmasını ve üstten tohumlama başta olmak üzere diğer ıslah yöntemlerinin devreye sokulmasını önermiş; aksi takdirde yayladaki mera ekosisteminin kendini yenileyemeyeceğini vurgulamıştır.

1.11. Marmara Bölgesi

Marmara Bölgesi'nde incelenen dört mera çalışması, bölgedeki doğal meraların bitki kompozisyonu ve verim durumuna ışık tutmaktadır. Genel olarak meraların botanik kompozisyonunda buğdaygiller ve baklagiller önemli yer tutmakla birlikte, aşırı otlatma ve çevresel koşullar nedeniyle birçok alanda istilacı yabancı otlar baskın hale gelmiştir.

Çalışmalarda ölçülen kuru ot verimleri de meraların yetersiz durumda olduğuna işaret etmektedir. Sonuç olarak, Marmara Bölgesi meralarında verim ve kalite sorunları tespit edilmiştir. İklimsel faktörler (yağış rejimi) verimi yıllara göre etkilese de asıl belirleyici etmen, mera yönetimindeki yetersizliklerdir. Aşırı otlatma ve ihmal, meraların bitki çeşitliliğini olumsuz yönde değiştirmiş; kaliteli yem bitkileri yerini büyük ölçüde yabancı otlara bırakmıştır. Bu çalışmalar, bölgedeki meraların ıslaha ve sürdürülebilir otlatma programlarına ihtiyaç duyduğunu vurgulamaktadır. Uygun tedbirlerle (dinlendirme, aşırı yükün azaltılması, baklagil ekimi ve benzeri) meraların üretkenliğinin ve ekolojik dengesinin yeniden tesis edilebileceği raporlanmıştır. Marmara meralarının mevcut durumu zayıf-orta düzeyde olup iyileştirme uygulamaları yapılmadıkça bölgesel hayvancılığı destekleme kapasitesi sınırlı kalacağı bildirilmiştir.

Marmara Bölgesinde Yapılmış Bazı Çalışmalar:

Gür ve Altın (2015) tarafından Tekirdağ ilinin farklı yörelerinde seçilen doğal mera alanlarında yürütülmüş olan çalışma meraların vejetasyon yapısı ve bazı ekolojik özellikleri incelemiştir. Araştırmada çeşitli mera parçalarında bitki türleri saptanmış; botanik kompozisyon, bitkiyle kaplılık, kuru ot verimi ve toprak özellikleri (pH, organik madde ve benzeri) analiz edilmiştir. Tekirdağ meralarında toplam 67 bitki taksonu belirlenmiştir. Ortalama botanik kompozisyon oranları %48,7 buğdaygil (Poaceae), %21,4 baklagil (Fabaceae) ve %29,9 diğer familyalar şeklindedir. Bitki örtüsü kaplılık oranı %60 ile %78 arasında değişmiş, kuru ot verimi 210–340 kg/da aralığında ölçülmüştür. Toprak analizleri meraların genelde orta derecede verimli ve pH'nın nötr civarında olduğunu göstermiştir. Tekirdağ yöresi meralarının mevcut florasında

buğdaygil türlerinin ağırlıkta olduğu, baklagillerin nispeten düşük kaldığı görülmüştür. Mera verimi bölgedeki yağış ve toprak koşullarına göre düşük-orta düzeydedir. Genel olarak, yoğun otlatmanın etkileri Tekirdağ meralarında da gözlenmekte; korunmuş alanlar daha iyi durumda iken, tahrip olmuş alanlarda istilacı tür oranlarının çok yüksek olduğu vurgulanmaktadır.

Şahbaz (2010) tarafından İstanbul ili Silivri ilçesine bağlı Fener köyü doğal merasında 2008-2009 yılları arasında yürütülen yüksek lisans araştırması, meranın verimi, botanik kompozisyonu ve bitki boyları üzerine odaklanmıştır. Toplam 1908 dekarlık köy merası 9 parçaya ayrılarak incelenmiş; 6 tekerrürlü deneme deseniyle farklı biçim zamanlarında yeşil ve kuru ot verimleri ölçülmüş, bitki boyu gelişimi izlenmiştir. Botanik kompozisyon, biçilen örneklerde ağırlık oranları esas alınarak baklagil, buğdaygil ve diğer familyalar olarak hesaplanmıştır. Meranın ortalama kuru ot verimi 2008'de 219 kg/da 2009'da 237 kg/da olarak belirlenmiştir. Kompozisyonda baklagiller her iki yılda da başat konumda bulunmuş(2008'de %53,5, 2009'da %53,45 baklagil); buğdaygiller %34– 35 civarı, diğer familyalar ise %12–13 olarak tespit edilmiştir. Ağırlıkça baklagil hâkimiyetinin, mera florasında *Trifolium spp., Medicago spp.* gibi türlerin bulunmasından kaynaklandığı belirtilmiştir. Mera durumu, hesaplanan kalite derecesine göre zayıf bulunmuş olup aşırı otlatma belirtileri raporlanmıştır. Nitekim meranın taşıma kapasitesi 96.7 BBHB (Büyükbaş Hayvan Birimi) olarak hesaplanmışken, fiilen meradan yararlanan hayvan varlığının 482.5 BBHB'ye karşılık geldiği bildirilmiştir. Bu durum, meranın kapasitesinin yaklaşık 5 katı hayvan otlatıldığı anlamına gelmekte ve yoğun aşırı otlatma sorununu ortaya koymaktadır. Fener köyü merası verim ve kalite bakımından zayıflamış, bitki örtüsü büyük ölçüde düşük boylu ve yıllık otlardan oluşur hale gelmiştir. Mevcut otlatma baskısının azaltılması ve mera ıslahı yapılması önerilmektedir.

Kurt (2016) tarafından Kırklareli Lüleburgaz İlçesi Doğal Merasında 2014-2015 yıllarında koruma altındaki bir askeri mera alanında gerçekleştirilen yüksek lisans tezinde, meranın botanik kompozisyonu ve verim potansiyelleri araştırılmıştır. 6000 m²'lik korunmuş mera sahasında, tesadüf bloklu deneme deseniyle 4 tekerrür halinde çalışılmıştır. 2014 ve 2015 yıllarında Mart-Eylül döneminde belirli aralıklarla biçim yapılarak yeşil ot ve kuru ot verimleri ölçülmüş; ayrıca farklı familyalara ait baskın türlerin gelişim durumları ve bitki boyları izlenmiştir. Botanik kompozisyon, hasat edilen örneklerin yeşil ve kuru ağırlıklarına göre *Poaceae, Fabaceae* ve diğerleri olarak hesaplanmıştır. 2014 yılında ortalama yeşil ot verimi 1245 kg/da 2015 yılında 1172 kg/da olarak belirlenmiştir. Aynı yılların ortalama kuru ot verimleri ise sırasıyla 391 kg/da ve 318 kg/da'dır. 2015 yılındaki düşüş, yağışın daha az olmasından kaynaklanmıştır. 2014'te bitki örtüsü kompozisyonu yeşil ağırlık temelinde %66,0 buğdaygil, %14,2 baklagil, %19,8 diğer iken; 2015'te %59,1 buğdaygil, %14,0 baklagil, %26,9 diğer şeklinde bulunmuştur. Kuru ot ağırlığına göre kompozisyonda da buğdaygiller her iki yılda en yüksek payı almıştır (2014: %70,9; 2015: %61,4), baklagillerin oranı düşük kalmıştır (yaklaşık %12-14). Florada tespit edilen önemli türler arasında *Lolium perenne* (çok yıllık çim), *Bromus spp.* (Brom otları) gibi buğdaygiller ile *Trifolium campestre, Trifolium pratense* (üçgüller) gibi baklagiller ve çeşitli diğer yabani otlar bulunmaktadır. Lüleburgaz'ın korunan mera sahasında bile buğdaygillerin baskın, baklagillerin zayıf olduğu bir vejetasyon yapısı rapor edilmiştir.

SONUÇ

Yapılan literatür taraması, Türkiye'deki çayır-mera alanlarının genel olarak bozulma eğiliminde olduğunu göstermektedir. Ülke mera alanları, 1940'larda yaklaşık 44 milyon hektar iken günümüzde yaklaşık 14,6 milyon hektara gerilemiş; bu azalma sadece alan kaybı değil aynı zamanda mera bitki örtüsünün niteliğinde de ciddi bozulmaya yol açmıştır. Çeşitli çalışmalar, Türkiye meralarında yem değeri yüksek buğdaygil ve baklagil türlerinin oranlarının azalmasına karşın, az değerli ve istilacı türlerin hızla yayıldığını raporlamıştır.

Genel olarak bitki örtüsü çeşitliliği fiziksel olarak yüksek olsa da kaliteli türlerin baskınlığı azaldığından mera kondisyon sınıfı düşmüş durumdadır. Birçok bölgede toprak yüzeyi büyük ölçüde çıplak kalmakta, örtü oranları ideal düzeyin altına düşmekte ve bu da erozyon ile verim kaybını beraberinde getirmektedir. Elde edilen veriler, arazideki degradasyonun temel sebeplerini "azalan yağış miktarı ve uzun kurak mevsimler ile kontrolsüz, yoğun otlatma" olarak işaret etmektedir. Bu bağlamda, meralarda sürdürülebilirliği sağlamak için meraların dinlendirilmesi, ıslah edilmesi (baklagil ekimi, gübreleme ve benzeri) ve otlatma kapasitelerinin planlı şekilde düzenlenmesi gibi önlemler önerilmektedir. Aksi halde mevcut bozulma sürdürülerek mera ekosistemlerinin ot üretme potansiyeli ve toprağı koruma fonksiyonu yitirilme tehlikesiyle karşılaşmaktadır.

Türkiye'nin farklı coğrafi bölgelerinde yapılan etütler, ortak bozulma eğilimine rağmen çeşitli farklılıklar ortaya koymaktadır. Akdeniz ve Ege Bölgeleri gibi yaz kuraklığının belirgin olduğu alanlarda, kuru mevsime dayanıklı çok yıllık buğdaygil türleri halen görece yüksek oranda bulunabilse de aşırı otlatma sonucu istilacı yabancı otlar egemen hale gelmiştir. Örneğin bazı Akdeniz meralarında baklagil oranı %10–20'nin altına inerken, yabancı otlar bitki örtüsünün yarıdan fazlasını kaplamaktadır. Bu durum, meraların yem kalitesini düşürmüş ve genel olarak "zayıf" mera sınıfına sokmuştur. Marmara ve Karadeniz Bölgeleri ise yağışlı iklim sayesinde örtü oranı yüksek (%60–90) karakterlidir; ancak burada da verimli yem bitkilerinin azlığı sorun olarak öne çıkmaktadır. Karadeniz'de çok yıllık otsuların varlığına rağmen eğimli arazilerde kontrolsüz otlatma, bitki örtüsünü bozulmaya itmiştir. Çeşitli çalışmalarda, bu bölgelerde baklagil payının genelde düşük olduğu, istilacı türlerin hakimiyeti nedeniyle mera durum derecelerinin "orta" ya da "zayıf" seviyede olduğu bildirilmiştir. Yüksek rakımlı Marmara meralarında bile verim genellikle 200–700 kg/da aralığında kalmakta (bu da çoğu mera için yetersiz sayılmaktadır) ve mezofil otsuların oranı düşük olduğundan kalite problemleri yaşanmaktadır. Özetle, kuzeybatı bölgeler bol yağış nedeniyle gerek fazlaca bitki örtüsü sunsa da bu örtü büyük oranda hayvanların tercih etmediği türlerden oluştuğu için mera sağlığı sorunu devam etmektedir.

İç Anadolu Bölgesi'ndeki meraların bitki örtüsü kompozisyonu büyük ölçüde bozulmuştur. Yarı kurak iklime uyumlu buğdaygil ve baklagil türleri yıldan yıla azalarak yerini dikenli, otsu yabancı türlere bırakmıştır. Birçok çalışma, İç Anadolu meralarında bitkiyle kaplı alan oranının düşük (%15–60 arası değişim) ve kuru ot veriminin dekar başına 100 kg'ın altında olduğunu göstermiştir. Bu meraların büyük kısmı "orta" veya "zayıf" sınıflandırılmış, taşıma kapasiteleri hızla azalmış durumdadır. Bölge ikliminin kuraklığı ile aşırı otlatmanın birleşik etkisi, verimli otsuların gelişimini engellemiş; sonuçta toprak örtüsü incelmiş, erozyon artmıştır.

Doğu ve Güneydoğu Anadolu Bölgeleri ise ülkenin en düşük mera verimliliğine sahip alanları olarak öne çıkmaktadır. Yüksek dağlık kesimler (Doğu Anadolu) hem soğuk iklim koşulları hem yoğun otlatma nedeniyle bitkisel üretimi sınırlı kalan meralar sunmaktadır. Bu meralarda çalışmalar, buğdaygil oranının genellikle %10–60, baklagillerin ise %4–33 arasında değiştiğini göstermiş, kuru ot verimi çok düşük bulunmuş ve mera durumu çoğu alanda "zayıf" kategoride raporlanmıştır. Güneydoğu'da ise mevsimsel iklim stresi ile sürekli otlatma bir araya gelerek meraların kompozisyonunu büyük ölçüde bozmuştur. Birçok Güneydoğu merasında istilacı türler bitki çeşitliliğinin %90'ından fazlasını oluştururken, yem değeri yüksek türlerin hemen hemen yok seviyesinde kaldığı bulunmuştur. Bu durum, bölge hayvancılığında kaba yem açığını derinleştirmektedir. Her iki bölgede de, yağış yetersizliğinin ve yıllık otlatma baskısının azaltılması için acil önlemler alınması gerekliliği vurgulanmaktadır.

İncelenen çalışmaların hemen hepsi standart vejetasyon ölçüm yöntemlerini kullanmıştır. Bitki örtüsü kompozisyonu ve kaplılık oranı belirlemek için transekt, kuadrat, nokta çerçeve veya lup yöntemleri yaygın şekilde tercih edilmiştir. Bu yöntemler farklılık gösterse de, hepsi bitki

topluluğu yapısını nicel olarak ortaya koymaktadır. Yöntem tercihlerinden kaynaklanan farklar, örneğin örtü oranının hesaplanma biçimi (bitki boyu ya da bireysel nokta sayımı gibi) sonuçlarda küçük değişikliklere yol açabilmektedir. Ancak mevcut araştırmalarda ki sonuçlar, kullanılan metotlara bakılmaksızın, Türkiye meralarının genel bozulma trendleri konusunda tutarlılık göstermektedir. Sonuç olarak, çayır-mera yönetiminde uyulması gereken sürdürülebilir uygulamalar (dinlendirerek otlatma, tarım dışı kullanımın sınırlandırılması, ıslah çalışmaları vb.) üzerinde de önemli bir temel oluşturacaktır.

ÖZET

Bitki ıslahında ıslah hatlarının verimini ve ürün kalitesini artırırken değişen biyotik ve abiyotik stres faktörlerine dayanıklı bitki çeşitleri ve melezleri geliştirmeye yönelik sürekli ihtiyaç göz önüne alındığında, dünya çapında bitki ıslahçıları uzun zamandır saf hatlar elde etmek için gereken süreyi kısaltmanın yöntemlerini aramaktadır. Saf hatların hızlı üretimi için en son geliştirilen yaklaşım hızlı ıslahtır. Bu teknolojinin basit, uygun maliyetli ve oldukça uyarlanabilir olduğu kanıtlanmıştır. Hızlı ıslah, dünya çapında çeşitli yetiştirme ve araştırma programlarına aktif olarak entegre edilmiş ve farklı yetiştirme bölgelerinde evrensel uygulanabilirliğini göstermiştir.

Hızlı ıslah şunları teşvik eden koşullar oluşturarak her neslin vejetatif dönemini en aza indirir: 1) hızlandırılmış çiçeklenme, 2) hızlı tohum olgunlaşması ve 3) ardışık ıslah döngülerini sağlamak için hasat sonrası dormansinin üstesinden gelinmesi. Bu yaklaşımın uzun gün mahsullerinde büyümeyi hızlandırmadaki uygulanabilirliği ilk olarak 2018'de gösterilmiştir. Yazlık buğday, arpa, nohut ve bezelye için yılda altı nesil, kolza tohumu için ise yılda dört nesil elde etmek başarılmıştır. Uzun gün mahsullerindeki başarısının ardından soya fasulyesi, kinoa, kenevir ve diğerleri dahil olmak üzere kısa gün türleri için optimize edilmiş protokoller geliştirilmiştir. Hızlı ıslah protokolleri çok çeşitli bitki türleri için oluşturulmuştur.

Bu derlemenin amacı, yöntemin bitki vejetasyon periyodunun kısalmasını etkileyen faktörlerin bir araya getirilmesini sağlamak, yayınlanmış hızlandırılmış ıslah protokollerini özetlemek ve hızlı ıslah uygulamasını tanımlamaktır.

Anahtar kelimeler: Hızlı ıslah, bitki ıslahı, ıslah döngüleri

SPEED BREEDING: A CURRENT STATUS REVIEW

ABSTRACT

Plant breeders throughout the world have been searching for ways to shorten the time needed to obtain pure lines, given the continuous need for breeding plant varieties and hybrids that are resistant to shifting biotic and abiotic stress factors while enhancing yield and product quality.Speed breeding is the most modern method for producing pure lines rapidly. This technology has shown itself to be easy to use, reasonably priced, and very flexible. Speed breeding has proven to be universally applicable in a variety of growing environments and has been actively incorporated into numerous breeding and research projects across the globe.

In order to assure further breeding cycles, speed breeding reduces the vegetative period of each generation by fostering 1) early flowering, 2) rapid seed development, and 3) overcoming post-harvest dormancy. In 2018, the viability of this strategy for enhancing long-day crop growth was initially shown. For spring wheat, barley, chickpeas, and peas, six generations annually have been attained, whereas for rapeseed, four generations annually. Optimized procedures have been constructed for short-day species, including as hemp, quinoa, soybeans, and others, in response to the success of long-day crops. Speed breeding methods have been developed for many different types of plants.

This review's objectives are to give a summary of published speed breeding protocols, explain how speed breeding is applied, and give an overview of the elements influencing the method's capacity to shorten the plant vegetation period.

Keywords: Speed breeding, plant breeding, breeding cycles

GİRİŞ

Islah ve genetik araştırmalardaki sınırlayıcı faktörlerden biri, saf hatlar geliştirmek için gereken zamandır. Bu, bir yandan tek bir neslin uzun vejetatif döneminden, diğer yandan da genellikle bitki materyalinde ardışık 4-6 nesil kendi kendine tozlaşma gerektiren kendileme özelliklerinden kaynaklanmaktadır. Birçok araştırmacı homozigot bitki hatlarının hızlı gelişimini sağlayan yaklaşımlar aramıştır. Bu araştırmaların sonucunda, sonbahar-kış döneminde sera yetiştiriciliği, tek tohumlu iniş, mekik ıslahı (shuttle breeding), embriyo kültürü ve çift haploid teknolojisi gibi yöntemler uygulamaya konulmuştur. Tüm bu yöntemlerin hem avantajları hem de sınırlamaları vardır. Bitkilerin vejetatif döneminde önemli bir kısalma sağlayan en son yaklaşımlardan biri hızlı ıslahtır. Bu yöntem, ekimden çiçeklenmeye kadar geçen süreyi kısaltan faktörlerin uygulanmasına ve ayrıca, gelişmenin generatif evresini hızlandıran ve hasat sonrası dormansiyi gideren tekniklere dayanmaktadır (Blinkov ve ark., 2025).

Işık ve sıcaklık manipülasyonuna ve fiziksel sınırlamaya dayanan hızlı ıslah, ıslah döngüsünü hızlandırarak bitki ıslahının farklı aşamalarını etkilemektedir. Hızlı ıslah, kullanıma sunulmasından bu yana ekonomik açıdan önemli birçok türün ıslah programlarını hızlandırmıştır. Hızlı ıslah, homozigotluğa hızlı bir ilerleme ve halihazırda gelişmiş veya dönüştürülmüş hatların, yani gen düzenlemeli mahsullerin ve transgenik mahsullerin değerlendirilmesini sağlar. Hızlı ıslah teknikleri ayrıca kaynak açısından verimli genotipleme ve fenotiplemeyi de kolaylaştırır; ancak hızlı ıslah koşullarının bitki büyümesi ve gelişimi üzerindeki olumsuz etkilerini değerlendirmek ve azaltmak için daha fazla araştırmaya ihtiyaç vardır. Hızlı ıslah protokolleri artık küçük veya geniş ölçekli benimseme ve yerel ihtiyaçlara/yeniliklere dayalı daha fazla değişiklik için mevcuttur. Bu nedenle hızlı ıslah protokolleri, ürün dayanıklılığı ve adaptasyonu için kritik olan genlerin tanımlanması ve aktarılması potansiyellerini gerçekleştirmek için aşamalı olarak iyileştirilebilir ve modern ıslah teknikleriyle birleştirilebilir (Varshney ve ark., 2021).

Islahta döngü devir hızını artırma teknikleri yaygın olarak hızlı ıslah terimi altında gruplandırılmaktadır (Ghosh ve ark., 2018). Bunlar,

1) Hızlandırılmış tek tohumlu nesil eldesi için homozigot hatların hızlı gelişimi,
2) DNA işaretleyici teknolojisi kullanılarak bir yılda daha fazla ıslah döngüsü,
3) Stresli koşullar ve olgunlaşmamış embriyoların in vitro kültürü kullanılarak bir yılda daha fazla nesil,
4) Olgunlaşmamış tohum hasadı ve fotoperiyot tepkisi kullanılarak gen atlatma uygulamalarını içermektedir (Samantara ve ark., 2022).

Hızlı döngü teknikleri, bitki büyüme ortamının (örneğin bitki yoğunluğu, fotoperiyot ve sıcaklık) optimize edilmesi, çiçeklenme metabolik yolağını hedefleyen genetik mühendisliği, genç bitkilerin olgun anaçlara aşılanması, bitki büyüme düzenleyicilerinin uygulanması ve olgunlaşmamış tohumların hasat edilmesi gibi herhangi bir kombinasyonu içerebilir (Chiurugwi ve ark., 2019).

1. HIZLI ISLAHIN KULLANIM ALANLARI

Hızlı ıslahın uygulamaları arasında çift ebeveynli ve daha karmaşık haritalama popülasyonlarının geliştirilmesi, özellik piramiti oluşturma, geri melezlemelerin hızlandırılması, yetişkin bitki özelliklerinin fenotiplenmesi, mutant çalışmaları ve genetik dönüşüm deneyleri yer almaktadır (Watson ve ark., 2018). Son araştırmalar, gen düzenleme, yüksek verimli fenotipleme ve genotipleme, genomik seçilim ve MAS gibi yeni ortaya çıkan tekniklerin hızlı ıslah ile birleştirilerek mahsül iyileştirmenin hızlandırılmasındaki gücünü göstermiştir (Gosal ve ark., 2020). Ayrıca, çok sayıda akraba hattı üretmenin maliyeti ve alan

gereksinimleri, bu hatların yüksek bitki yoğunluklarında ekilmesiyle en aza indirilebilir (Yao ve ark., 2017). Hızlı ıslah, düşük çimlenme oranı, zayıf canlılık ve bazen çarpık büyüme gibi çift haploid teknolojisiyle ilişkili zorlukların üstesinden gelinmesine de yardımcı olmaktadır (Ferrie, 2007). Genetik haritalama amaçları açısından, birden fazla nesil kendi kendine döllenmeden sonra geliştirilen rekombinant saf hatlar (RIL'ler), tekrarlanan döllenme sırasında meydana gelen çoklu mayoz olayları ve bunun sonucunda ortaya çıkan daha yüksek rekombinasyon sıklığı nedeniyle çift haploide göre avantajlı olabilir. Benzer şekilde, ayrılan nesillerin ilerlemesi ve değerlendirilmesi, hızlı ıslah koşulları altında kısa sürede tek tohum nesli ile yapılabilir; bu da geleneksel soyağacı yetiştirme yöntemine kıyasla zaman tasarrufu ve maliyet açısından verimlidir (Jahne ve ark., 2020). Bu teknik, ıslah süresini kısaltmada etkili olmuş ve klasik ıslaha kıyasla üç kat daha yüksek generasyon atlatma sağlamıştır (Samantara ve ark., 2022).

Hızlı ıslah, haritalama popülasyonlarının oluşturulmasında oyunun kurallarını değiştiren bir unsur olarak ortaya çıkmıştır. Geleneksel olarak, genetik haritalama için çeşitli ayrışan popülasyonlar oluşturmak zaman alıcı bir süreçti. Ancak, hızlı ıslahın nesiller arasında hızla geçiş yapabilme yeteneği bu alanı dönüştürmüştür. Araştırmacılar artık büyük ve genetik olarak çeşitli haritalama popülasyonlarını verimli bir şekilde üretebilmekte ve bu da onlara temel özelliklerle ilişkili genleri saptamak için gerekli kaynakları sağlamaktadır (Gaba ve ark., 2021). Bu atılım, nicel özellik lokusu (QTL) analizi ve MAS alanını önemli ölçüde hızlandırmıştır (Chiurugwi ve ark., 2019). Çalışmalar, pirinçte tuzluluk stres toleransını artırmak için bir biotron hızlı ıslah sistemi aracılığıyla geliştirilen bir haritalama popülasyonunun kullanımını göstermiştir (Sharma ve ark., 2023).

Tek bir ürün çeşidine birden fazla istenen özelliğin dahil edilmesi uygulaması olan özellik istifleme (Trait stacking), modern tarımda önem kazanmıştır (Voss-Fels ve ark., 2019). Hızlı ıslah, bu sürecin hızlandırılmasında önemli bir rol oynamaktadır. Birden fazla bitki neslini hızla üretme ve değerlendirme yeteneği sayesinde, ıslahçılar çok özellikli kombinasyonları verimli bir şekilde oluşturabilir ve değerlendirebilirler (Bermejove ark., 2016). Bu verimlilik yalnızca zamandan tasarruf sağlamakla kalmaz, aynı zamanda kaynakları da korumaktadır. Sonuç olarak, ürün ıslahçıları son derece uyumlu ve dayanıklı çeşitleri daha etkili bir şekilde geliştirebilirler. Bu çok özellikli ürünler, değişen iklim koşullarından gelişen zararlı baskılarına kadar çeşitli zorluklara dayanabilir. Hızlı ıslah tarafından mümkün kılınan hızlandırılmış özellik istifleme, dinamik olarak değişen bir dünyanın taleplerini karşılayabilen ürün çeşitlerinin geliştirilmesine katkıda bulunur. Bu, kuraklık ve tuzluluk gibi abiyotik streslere karşı toleransı artırmak için hücresel detoksifikasyon, ozmolit birikimi, antioksidan mekanizmalar ve sinyal yollarıyla ilişkili genlerin istiflenmesine odaklanan pirinç çalışmalarını içeriyordu (Shailani ve ark., 2021). Avrupa iki sıralı arpa çeşidi Scarlett örneğinde, hastalık direncini artırmak için hızlı özellik introgresyonu ve hızlı ıslah gibi yenilikçi tekniklerin kullanımı gerçekleştirilmiştir. Bu, dört donör hattan birden fazla hastalık direnci geninin değiştirilmiş bir geri melezleme yaklaşımıyla entegre edilmesiyle sağlanmış ve bu da iki yıl gibi oldukça kısa bir sürede 87 introgresyon hattının oluşturulmasına yol açmıştır (Hickey ve ark., 2017). Buğday ıslahında çoklu özellikler için istenen alelik kombinasyonlarına sahip popülasyonu geliştirmek için erken nesil seleksiyon kullanıldı. Bu yenilikçi çok özellikli fenotipleme yöntemi, uygun alelik kombinasyonlarının hızlı bir şekilde seçilmesi için kök sistemi mimarisi, yaprak pası direnci ve bitki boyunu bir araya getirmektedir. Bu yaklaşım, hızlı ıslahla kusursuz bir şekilde uyum sağlayarak her yıl dört ardışık tarama yapılmasına olanak tanımakta ve ıslah verimliliğini önemli ölçüde artırmaktadır (Alahmad ve ark., 2018).

2. HIZLI ISLAHA YARDIMCI UYGULAMALAR

Araştırmacılar, çiçeklenme başlangıcına kadar geçen süreyi kısaltmak ve embriyo gelişimi ile tohum olgunluğunu hızlandırmak için gece/gündüz sıcaklığını, mevcut ışık spektrumunu ve yoğunluğunu ve fotoperiyot süresini değiştirirler (Hickey ve ark., 2017). Bitkilerin ışık süresi ve kalitesindeki değişikliklere çiçeklenme sürelerini kısaltarak yanıt vermesiyle, ışığa özellikle önem verilir. Bitki büyümesini ve gelişimini hızlandırmak için yapay elektrik lambalarının kullanımı uzun zamandır yaygın olarak kullanılmaktadır (Wheeler, 2008). Fotoperiyot uzatma, o zamandan beri uzun gün türlerinde çiçeklenme süresini değiştirmek için yaygın olarak kullanılmaktadır. Gelişmiş LED aydınlatma sistemlerinin ortaya çıkışı, yaşam döngüsünü hızlandırma çabalarını tamamlayarak, gölgeden kaçınma gibi ışık tepkilerini tetiklemek ve çiçeklenmeye hızlı ilerlemeyi teşvik etmek için dalga boyu bileşiminin değiştirilmesini mümkün kılmıştır (Christopher ve ark., 2015).

2.1. GÜN UZUNLUĞU

Gün uzunluğu, bitkiler için mevsimsel değişiklikleri gösteren önemli bir çevresel sinyal görevi görmektedir. Bitkiler, üreme organlarının oluşumunun başlaması, yumru oluşumu, uykuda kalmaya geçiş ve diğer fizyolojik tepkiler dahil olmak üzere çeşitli gelişimsel süreçlerle fenotipik olarak ortaya çıkan, gün/gece süresindeki değişikliklere genetik olarak programlanmış tepkilere sahiptir. Fotoperiyodik tepkilerine göre bitkiler üç gruba ayrılabilir: i) kısa gün bitkileri, gün uzunluğu kritik bir eşiğin altına düştüğünde çiçeklenmeye başlar (genotipe bağlı olarak tipik olarak 8-15 saat ışık); ii) uzun gün bitkileri, çiçek açmak için kritik bir eşiği aşan gün uzunluklarına ihtiyaç duyar (genotipe bağlı olarak tipik olarak 9-18 saatten fazla ışık); iii) nötr-gün bitkileri, fotoperiyodik değişikliklere hiçbir çiçeklenme tepkisi göstermez. Kritik gün uzunluğu, aşıldığında (uzun gün bitkileri için) veya altında kalındığında (kısa gün bitkileri için) çiçeklenmeyi tetikleyen belirli fotoperiyot eşiğini temsil eder. Bu eşik, türler arasında ve hatta aynı tür içindeki çeşitler arasında önemli ölçüde değişiklik göstermektedir (Jackson, 2009). Hızlı ıslahta, hızlı çiçeklenmeyi teşvik etmek için optimum gün uzunlukları, mahsulün fotoperiyodik hassasiyetine göre dikkatlice seçilmektedir (Kigoni ve ark., 2023).

Uzun gün ve nötr gün bitkileri için 22 saat ışık/2 saat karanlık fotoperiyodu önerilir. Çok sayıda çalışma, bu uzatılmış gün uzunluğunun *Triticeae* tahıllarında (Ficht ve ark., 2023), bezelyede (Cazzola ve ark., 2020), kolzada ve daha kısa fotoperiyotlara kıyasla birçok başka türde çiçeklenme başlangıcını önemli ölçüde hızlandırdığını göstermiştir (Song ve ark., 2021). Sürekli aydınlatma uzun gün mahsulleri için kullanılabilirken, karanlık bir dönemin dahil edilmesi gece-gündüz döngüsünde gen ifadesinin korunmasına yardımcı olur ve büyüyen bitkilerin fizyolojik durumunu iyileştirir (Mitache ve ark., 2023). Yapay aydınlatmanın 22 saatlik sürenin tamamı boyunca kullanılması gerekmez; sera koşullarında en ekonomik yaklaşım, karanlık dönemlerde yapay aydınlatma ile desteklenen 10 saat doğal gün ışığından yararlanmayı içerir. Doğal ve yapay aydınlatmanın bu kombinasyonu, uzun süreli yapay aydınlatma rejimlerine kıyasla bitki başına eşdeğer gelişim oranları ve tohum üretimiyle sonuçlanır (Cha ve ark., 2023).

Kısa gün bitkileri, evrensel bir optimum fotoperiyottan yoksundur ve bu da çiçeklenmenin hızlandırılmasını destekleyen gün uzunluğu koşullarının önceden değerlendirilmesini gerektirir. Aşırı kısa fotoperiyotlar, bu türlerde çiçeklenmeyi geciktiren stres tepkilerine neden olabilir (Schilling ve ark., 2023). Türlere özgü gereksinimler belirlenmiştir: Pirinç, soya ve börülce 10/14 saat gece/gündüz uygulamasında maksimum çiçeklenme hızlanmasına ulaşır (Jahne ve ark., 2020). Başarılı çiçeklenme ve tohum tutumunun ardından, fotoperiyodun uzatılması tohum olgunlaşmasını daha da hızlandırabilir (Schilling ve ark., 2023).

2.2. IŞIK KAYNAKLARI VE SPEKTRAL KOMPOZİSYON

Kontrollü büyüme koşulları altında, yapay aydınlatma güneş radyasyonunun yerine geçerek fotosentezi kolaylaştırırken fotomorfogenez, fotoperiyodizm ve fototropizmi etkiler. Bitki aydınlatma sistemleri akkor lambaları, floresan tüpleri, yüksek basınçlı cıva lambalarını, yüksek basınçlı sodyum lambalarını, metal halojenür lambalarını ve ışık yayan diyotları (LED'ler) kapsar. Bu ışık kaynakları spektral özellikleri, ışık verimliliği, güç tüketimi, çalışma ömrü, ısı emisyonu, güvenilirlik ve bertaraf gereksinimleri açısından önemli ölçüde farklılık gösterir (Dutta Gupta ve Agarwal, 2017). Hızlı ıslah uygulamaları için, 400-700 nm spektrum aralığında fotosentetik olarak aktif radyasyon (PAR) sağlayabilen tüm aydınlatma sistemleri uygundur (Ghosh ve ark., 2018). Hızlandırılmış bitki büyümesi için en sık kullanılan aydınlatma teknolojileri arasında metal halojenür (Kigoni ve ark., 2023), yüksek basınçlı sodyum (Marenkova ve ark., 2024), floresan (Cazzola ve ark., 2020) ve LED aydınlatma sistemleri yer almaktadır (Cha ve ark., 2023). Farklı lamba tiplerini birleştiren hibrit aydınlatma sistemleri, optimum spektral kompozisyonu elde etmek için uygulanabilir (Ghosh ve ark., 2018).

Uzun gün bitkileri için LED armatürler, sürekli aydınlatma sırasında enerji verimliliği sağlaması nedeniyle belirli avantajlar sunar (Watson ve ark., 2018) ve hassas spektral ayarlama yetenekleri gibi ek avantajlar da sağlar (Choi ve ark., 2023). Bitkiler, ışık spektral kompozisyonu konusunda farklı tercihler sergiler ve bu da çeşitli bitkiler için farklı ışık kaynaklarının kullanılmasını gerektirir (Ghosh ve ark., 2018). Örneğin, hızlı ıslahta börülce üzerinde yapılan çalışmalar, metal halojenür lambalara kıyasla LED aydınlatma altında önemli ölçüde daha başarılı tozlaşma olduğunu göstermiştir (Edet ve Ishii, 2022).

Işık spektral kompozisyonunun manipüle edilmesi, temel bitki büyüme ve gelişim parametrelerinin değiştirilmesini sağlar (Ouzounis ve ark., 2015). Uzak kırmızı ışık, vejetatif büyüme hızını etkileyen en güçlü morfogenetik faktörlerden birini temsil eder. Bitki fizyolojik tepkileri yalnızca uzak-kırmızı ışığın varlığıyla değil, aynı zamanda kırmızı ışığa oranıyla da belirlenir (Demotes-Mainard ve ark., 2016). Hızlı ıslahta uzak-kırmızı ışığın kolza tohumunda (Song ve ark., 2021), tritikalede (Blinkov ve ark., 2025), pirinçte generatif evreye geçişi önemli ölçüde hızlandırmada oldukça etkili olduğu kanıtlanmıştır (Jahne ve ark., 2020). Mahsul türüne bağlı olarak, uzak-kırmızı ışık çiçeklenme süresini 3-20 gün azaltabilir (Blinkov ve ark., 2025). Ancak, çeşitli kırmızı-uzak-kırmızı oranları da dahil olmak üzere, tüm bitkiler hızlı ıslahta uzak-kırmızı ışık altında hızlandırılmış çiçeklenme göstermez. Bezelye (Mobini ve Warkentin, 2016) ve soya gibi ürünler bu spektruma hiçbir tepki göstermez (Jahne ve ark., 2020). Ayrıca, uzak-kırmızı ışık, boğum arası uzama, bitki yatması ve başak başına tane sayısında azalma gibi istenmeyen etkilere yol açabilir (Choi ve ark., 2023). Kırmızı ve mavi ışık spektrumları ayrıca hızlı ıslah koşulları altında hızlandırılmış bitki büyümesinde önemli roller oynar (Ghosh ve ark., 2018). Daha erken çiçeklenmeyi ve olgunlaşmayı teşvik etmenin ötesinde, bu spektrumlar bitki boyunun kısalmasına ve daha kompakt büyüme alışkanlıklarına katkıda bulunur; bunlar özellikle büyüme odası yetiştiriciliği için avantajlıdır (Blinkov ve ark., 2025). Tüm dalga boyları bitki örtüsü süresinin kısalmasını desteklemez; UV-A ve yakın kızılötesi radyasyonun ışık spektrumuna eklenmesinin, aspir bitkisinde vejetatif büyümeyi yavaşlattığı gözlemlenmiştir (Gaoua ve ark., 2025).

2.3. IŞIK YOĞUNLUĞU

Işık yoğunluğu, spektral kompozisyonla birlikte en kritik ışık kalitesi parametrelerinden birini temsil eder. Işık yoğunluğundaki değişiklikler fotosentez verimliliğini etkileyebilir ve bitki morfolojik, anatomik, fizyolojik ve biyokimyasal özelliklerinde değişikliklere neden olabilir (Shafiq ve ark., 2021). Çok sayıda çalışma, ışık yoğunluğunun hızlı ıslah koşulları altında fenolojik faz ilerleme hızını da etkilediğini göstermiştir (Kabade ve ark., 2024). Optimum ışık

yoğunluğu yalnızca generatif faza hızlı geçişi kolaylaştırmakla kalmaz, aynı zamanda bitkilerin iyi bir fizyolojik durumda kalmasına da yardımcı olur (Mitache ve ark., 2024). Bitki türleri değişken ışık yoğunluğu gereksinimleri gösterse de, hızlı ıslahta evrensel olarak en çok uygulanabilir yoğunluk, yetişkin bitki taç yüksekliğinde 450-500 mmol/m²/s arasında değişmektedir (Ghosh ve ark., 2018). Buğday üzerinde yapılan çalışmalar, 400 mmol/m²/s'nin altındaki ışık yoğunluklarının daha yavaş bitki gelişim hızlarına yol açtığını göstermektedir (Ficht ve ark., 2023). Işık yoğunluğunun 800-1000 mmol/m²/s'ye çıkarılması, soya (Jahne ve ark., 2020) ve pirinç gibi bazı ürünlerde çiçeklenmeyi ve olgunlaşmayı hızlandırabilir (Kabade ve ark., 2024). Daha yüksek ışık yoğunlukları, kontrollü büyüme ortamlarında önemli avantajlar sağlayan daha kompakt bitki mimarisini de destekleyebilir (Jahne ve ark., 2020). Bununla birlikte, aşırı yüksek ışık yoğunlukları fotosentetik fotoinhibisyona, oksidatif hasara ve hücresel bileşenlerin bozulmasına neden olabilir ve sonuçta gelişimsel gecikmelere yol açabilir (Shafiq ve ark., 2021). Yüksek ışık yoğunluklarının olumsuz etkileri nohut ve mercimek için hızlı ıslahta deneysel olarak gösterilmiş olup, düşük büyüme oranları, yaprak kavrulması, bitki solması ve zayıf tohum üretimi olarak ortaya çıkmıştır (Mitache ve ark., 2024).

2.4. SICAKLIK

Sıcaklık, bitki gelişimini etkileyen temel bir faktörü temsil eder ve tohum çimlenme hızı, vejetatif ve generatif evrelerdeki ilerleme, uygun mayoz bölünme, gamet canlılığı, tozlaşma başarısı ve nihayetinde nihai verim dahil olmak üzere kritik süreçleri yönetir (Fu ve ark., 2022). Hızlı ıslah protokolleri, gelişim oranlarını en üst düzeye çıkarmak için her bir bitkiye göre uyarlanmış dikkatli bir sıcaklık rejimi seçimi gerektirir (Ghosh ve ark., 2018). Hızlı ıslah koşullarında bitki yetiştirmek için en yaygın gündüz sıcaklıkları 22-25°C'dir. Bu gündüz sıcaklık aralığı çoğu uzun gün tahıl (Watson ve ark., 2018), *Brassica* üyeleri (Ghosh ve ark., 2018) ve diğerleri için uygundur (Mitache ve ark., 2024). Pirinç (Kabade ve ark., 2024), pamuk, soya ve diğer sıcak mevsim mahsulleri için gündüz sıcaklıkları 28-32°C'ye çıkarılabilir (Blinkov ve ark., 2025). Hızlı ıslahta hassas sıcaklık kontrolünün sağlanması kritik bir gerekliliktir, çünkü önemli sıcaklık dalgalanmaları stres tepkilerini tetikleyebilir ve vejetatif büyüme oranlarını azaltabilir (Watson ve ark., 2018). Bazı soğuk stresi uygulamaları hızlı ıslahta faydalı olabilir. Örneğin, kotiledon aşamasında soğuk sertleştirme domateste çiçeklenmeyi hızlandırır (Gimeno-Páez ve ark., 2025), baklada çiçeklenme başlangıcından sonra kısa süreli sıcaklık düşüşü ise ilk alt çiçeklerde tohum oluşumunu iyileştirir (Mobini ve ark., 2020).

3. ÖRNEKLER

Öncü çalışmalar, mahsul yetiştirme döngülerinin hızlandırılması için zemin hazırlamıştır. Bu çalışmalar, 22 saat ışık ve 22/17 °C sıcaklıkların bir kombinasyonunu ve olgunlaşmamış tohum hasat tekniklerini kullanarak buğday, arpa ve kanolaya odaklanmıştır. Bu müdahaleler, nesil sürelerini buğday için 65 güne, arpa için 68 güne ve kanola için 98 güne düşürerek yılda yaklaşık 4 ila 6 nesil elde edilmesini sağlamıştır (Watson ve ark., 2018). Tarla bitkilerinde hızlı ıslah alanında yapılmış birçok çalışmanın bazıları şunlardır:

Çil, (2023) tarafından yürütülmüş çalışmada, çiçeklenmeden 13 gün sonra olgunlaşan ayçiçeği (*Helianthus annuus*) embriyoları izole edilmiş ve 22/2 saat gündüz/gece fotoperiyodu, 24/18°C gündüz/gece, LED aydınlatmada, %70 hava neminde yetiştirilen petri kaplarında nesil değişimi için kültüre alınmıştır. Bitkiler 52-67 günde çiçeklenmiş, embriyo izolasyonu 65-80 günde tekrar edilebilmiş ve yılda 4-5 nesil elde edilmiştir.

Gaoua ve ark., (2025), dört LED uygulaması (beyaz, tam spektrum, kırmızı + mavi + beyaz ve kontrol) ile aspir (*Carthamus tinctorius*) bitkisinin etkili hızlı ıslahını araştırmışlar ve hasat süresini kırmızı + mavi + beyaz LED kombinasyonu altında en kısa elde etmişlerdir. Bitki boyu,

bitki başına tohum sayısı ve başak başına tohum sayısı, sırasıyla tam spektrum LED, kontrol ve kırmızı + mavi + beyaz LED kombinasyonları altında en yüksek olmuştur. Tozlaşmadan 10 gün sonra kurtarılan olgunlaşmamış embriyolar %57 çimlenme oranı göstermiş ve tozlaşmadan sonraki gün sayısı arttıkça çimlenmede artış eğilimi görülmüştür. Çimlenme oranları, çeşitler veya hormon uygulamaları arasında önemli ölçüde farklılık göstermemiştir.

Watson et al., (2018) yetiştirmeyi 1 saat gün doğumu/gün batımı simülasyonu ile 22 saat gündüz/2 saat gece fotoperiyodu koşullarında; yetişkin bitki seviyesinde ışık yoğunluğunu 440-650 µmol/m²/s, 22/17°C gündüz/gece, gün doğumu/gün batımı sırasında kademeli sıcaklık değişimleri ve %70 neme ayarlayarak gerçekleştirmişlerdir. Baklalar ekimden 6 hafta sonra toplanmış ve 35°C'de 5 gün kurutulmuş, tohumlar oda sıcaklığında nemli filtre kağıdına ve agar plakalarına yerleştirilmiş, 4 gün boyunca 4°C'de tutulmuş ve ardından 5 gün oda sıcaklığında bekletilmiştir. Çiçeklenme 44-49 gün sonra gerçekleşmiştir. Her biri 75-80 gün süren, yılda 4 jenerasyon elde etmişlerdir.

Samineni ve ark., (2020) nohutta (*Cicer arietinum*), yarı kontrollü sera koşullarında, fotoperiyodu uzatmak için ek gece aydınlatması altında, çiçeklenmeyi 23-56 gün arasında sürede, 1 generasyonu 43-79 gün arası sürede elde etmişler, toplamda yılda 6-7 jenerasyon üretebilmişlerdir.

Ghosh ve ark., (2018), Mürdümük'te (*Lathyrus sativus*) büyümeyi 1 saatlik gündoğumu/günbatımı simülasyonuyla 22/2 saatlik gündüz/gece fotoperiyodunda, yetişkin bitki seviyesinde ışık yoğunluğunu 440-650 µmol/m²/s uygulayarak, gündoğumu/günbatımı sırasında kademeli değişikliklerle 22/17°C gündüz/gece sıcaklıklarında, nemi %70 olacak şekilde 31 günde çiçeklendirmiş, bir yılda her biri 80 gün süren 4.5 jenerasyon sağlayabilmişlerdir.

Mitache et al., (2024), mercimekte (*Lens culinaris*), yetiştirme sürecinde ekim yoğunluğunu >300 tohum/m² ayarlamış, 18/6 saat gündüz/gece fotoperiyodu, LED aydınlatma, 410-730 nm spektrum, 74-93 µmol/m²/s (4000-5000 lüks) ışık yoğunluğu ve 23-25/14-16°C gündüz/gece sıcaklığı ayarlamışlar ve çiçeklenmeyi 27 günde sağlamışlardır. Her biri 62-76 gün olan 6 jenerasyon elde etmişlerdir.

4. ZORLUKLAR VE SINIRLAMALAR

Hızlı ıslah farklı bitki türlerinde genetik kazanım oranını artırmak için güçlü bir araçtır; ancak sınırlamaları vardır. Hızlı ıslah kurulduktan sonra, türler yoğun büyüme koşullarına yanıt olarak genotiple farklılıklar gösterebilir (Tanaka ve ark., 2016). Yoğun büyüme koşulları genellikle sınırlı tohum verimiyle sonuçlanır ve bu da sonraki saha değerlendirmelerini kısıtlayabilir (Gonzalez-Barrios ve ark., 2021). Yeni nesil seyrek fenotiplemeli saha deneme tasarımlarının kullanımı, düşük tohum sayılarının üstesinden gelinmesine yardımcı olabilir (Watson ve ark., 2018).

Agronomik özellikler için fenotipleme, hızlı ıslah ile birlikte gerçekleştirilebilir; ancak fenotipik ifade kontrollü ortam koşulları altında önyargılı olabileceğinden dikkatli olunması gerekir. Sonuç olarak, hızlı ıslah koşullarındaki tarla bitkilerinin fenotiplemesi, özellik ifadesinin tarla ortamıyla ilişkili olduğunu doğrulamak için tarlada doğrulanmalıdır. Örneğin, bor toleransı, hızlı ıslah koşullarıyla bütünleşmek üzere hidroponik olarak yetiştirilen bezelyede güvenilirlik açısından ayırt edilmiş ve buğdayda hızlı ıslah teknikleri, hastalık direnci gibi fenotip taramalarıyla birleştirilmiştir (Bennett ve ark., 2017). Çiçeklenme süresi ve bitki boyu gibi çeşitli agronomik karakterler, hızlı ıslah koşullarında kaydedildiğinde, tarla bazlı belirleme ve üretimle ilişkilidir ve bu nedenle dolaylı seçilimi kolaylaştırabilir (Watson ve ark., 2018). Bununla birlikte, yulafta bitki boyu ve çiçeklenme zamanında gözlemlendiği gibi, genotipler ve büyüme sistemleri arasındaki çapraz etkileşim nedeniyle bazı karakterler tutarlı bir şekilde

fenotiplenmeyebilir (Gonzalez-Barrios ve ark., 2021). Hızlı ıslah koşullarında bitki yetiştirirken karşılaşılan diğer büyük zorluklar arasında, bu kadar yoğun koşullar altında zararlı ve hastalık yönetimi ve gen keşfi amacıyla haritalama popülasyonları geliştirilirken bireylerin izlenmesi gerekliliği yer almaktadır (Samantara ve ark., 2022).

Hız için çabalarken bitkiler fizyolojik kapasitelerinin sınırında yetiştirilir ve hızlı döngü değişimine elverişli koşullar genellikle bitkinin kendini savunma yeteneğine zarar verir ve dikkatli bir yönetim olmadan değerli üreme materyalinin felaket düzeyinde kaybına yol açabilir. Azaltma, her tür için ve bazı durumlarda tür içindeki genotipler için fotoperiyot doygunluğunu ve sıcaklık sınırlarını belirlemek üzere koşulların uyarlanmasından kaynaklanır. Her nesilde her bireyden yedek tohum tutulması, kontrollü ortam veya benzeri durumlarda bir neslin hastalık, zararlı veya güç kaybından etkilenmesi durumunda genetik kayba karşı da sigorta sağlamaktadır (Samantara ve ark., 2022).

Temel sınırlamalardan biri, hedef türlerin hızlı döngüsüne uygun kontrollü ortam koşullarına erişimdir. Gelişmiş kontrollü ortam tesisleri kolayca bulunamıyorsa hızlı ıslah ortamları pahalı hale gelir ve hızlı ıslahı embriyo kurtarma ve MAS gibi diğer tekniklerle birleştirmek ek kaynaklar ve uzmanlık gerektirir. Diğer zorluklar arasında, örneğin kış aylarında sürekli elektrik temini ve sıcaklık koruması yer alır (O'connor ve ark., 2013). Gelişmiş ülkelerde bu kadar sorunlu olmasa da, sınırlı altyapı, yetersiz uzmanlık ve uluslararası kuruluşlarla sınırlı iş birlikleri nedeniyle kaynak bakımından fakir ülkelerde araştırma ve ıslah için hızlı ıslahın rutin kullanımı bir zorluk olmaya devam etmektedir (Wanga ve ark., 2021).

Saf hat, tekrarlayan seleksiyon, toplu seleksiyon, kitle seleksiyon ve soyağacı seçimi de dahil olmak üzere geleneksel seçilim tekniklerinde bulunan uzun ve genişletilmiş seçilim ve kendileme döngüleri nedeniyle hızlı ıslahta uygulamaya uygun görülmemektedir. Bu geleneksel yöntemler, modern tarımsal bağlamlarda hızlı ıslahın gerektirdiği ıslah talepleri ve hassasiyetle uyuşmamaktadır (Jagadish ve ark., 2016). Buna karşılık, tek bitki seçimi (SPS, single plant selection) ve tek tohum nesli (SSD, single seed descent) gibi belirli ıslah yöntemlerinin hızlı ıslah ilkeleriyle olağanüstü derecede uyumlu olduğunu belirtmekte fayda vardır (Jahne ve ark., 2020).

Çalışmalar, ışık kalitesinin, özellikle kırmızı ve uzak kırmızı oranının, bezelye, nohut, bakla, mercimek ve acı bakla gibi serin mevsim baklagillerinin çiçeklenme süresini önemli ölçüde etkilediğini ortaya koymuştur. Bu bulgular, baklagil yetiştiriciliğinde tek tohum neslini hızlandırmak için çok önemlidir ve baklagil mahsullerini geliştirmeye yönelik biyoteknolojik araçlarda pratik uygulamalar sunmaktadır (Croser ve ark., 2016).

İlk çaprazlamalardan sonra homozigot hatları hızla oluşturmak için hızlı ıslah yaklaşımları, fotoperiyot, sıcaklık, toprak nemi, popülasyon yoğunluğu ve karbondioksit seviyeleri gibi büyüme değişkenlerinin değiştirilmesini gerektirir (Potts ve ark., 2023). Bu ayarlamalar, her yıl birden fazla üreme döngüsünün oluşturulmasını kolaylaştırarak, çeşitli ortamlardaki üreme süreçlerini hızlandırmak ve çeşitli seçim teknikleri kullanarak popülasyonları değerlendirmek için uygun hale getirir. Sonuç olarak, bu adaptasyonlar gelişmiş genetik kazanıma katkıda bulunur (Shamshiri ve ark., 2018). Birçok ürün türü ve genotipinde büyümeyi, gelişmeyi, çiçeklenmeyi ve tohum oluşumunu artırmak, fotoperiyot rejiminin manipüle edilmesini gerektirir. Raporlara göre, belirli fotoperiyot rejimleri buğday, arpa, nohut ve yer fıstığı gibi ürünlerde erken çiçeklenmeye neden olabilir. Elektrik kaynaklarının istikrarsız olduğu ülkelerde iç mekan hızlı ıslah için, fotoperiyodu ayarlamak amacıyla düşük enerjili LED'ler ve güneş enerjisi sistemleri kullanılabilir (Potts ve ark., 2023).

Toprak neminin modülasyonu, bitki biyometrik gelişimi üzerindeki doğrudan ve dolaylı etkisi nedeniyle mahsul gelişiminde hayati önem taşır. Çiçeklenmeden sonra, toprak nem içeriğinin azaltılmasının buğday, arpa, kanola ve nohutta hızlı tane dolumunu ve olgunlaşmasını

kolaylaştırdığı gösterilmiştir (Gilland, 2002). Etkili toprak nem yönetimi stratejileri çok yönlüdür ve açık alanlar veya kontrollü iç mekan ortamları olsun, çeşitli ortamlarda kullanıma uyarlanabilir. Hem su kıtlığının hem de aşırı suyun buğday, inci darısı, bezelye ve arpada erken çiçeklenmeyi ve olgunlaşmayı tetiklediği gözlemlenmiştir (Gudi ve ark., 2022). Bu yaklaşımlar, daha akıcı ve verimli bir nesil devir sürecine yol açarak optimizasyon için muazzam bir potansiyel taşır. Dahası, iç mekan yetiştiriciliği, toprak nem kontrolü açısından benzersiz bir avantaj sunar. İç mekan tesislerinin kontrollü parametreleri dahilinde, yetiştiriciler, mahsullerin özel ihtiyaçlarını karşılamak için nem seviyelerini yönetmede daha fazla hassasiyete ve esnekliğe sahiptir (Sinha ve ark., 2021).

5. SONUÇ

Yapay aydınlatma ile ilgili ilk deneylerden LED ışıklar ve güneş enerjisi gibi son teknolojilerin kullanımına kadar uzanan hızlı ıslahın yolculuğu, bitki ıslahında devrim yapma potansiyelini ortaya koymaktadır. Fotoperiyot, sıcaklık, toprak nemi ve popülasyon yoğunluğu gibi çevresel değişkenleri hassas bir şekilde ayarlayarak, hızlı ıslah, geleneksel ıslah döngülerini önemli ölçüde kısaltarak hızlı ürün üretimini mümkün kılar ve faydaları oldukça çoktur.

ÖZET

Artan enerji talebi, fosil yakıtların sınırlı rezervleri ve çevresel etkileri sürdürülebilir enerji kaynaklarının geliştirilmesini zorunlu hale getirmiştir. Bu bağlamda, organik atıkların oksijensiz koşullarda mikroorganizmalar tarafından parçalanarak biyogaz ve biyometana dönüştürülmesini sağlayan anaerobik fermantasyon, teknik ve ekonomik açıdan uygulanabilirliği kanıtlanmış bir yöntem olarak öne çıkmaktadır. Biyogaz üretimi sonrasında anaerobik fermantasyon hem enerji üretimi hem de atık yönetiminde çevresel etkilerin azaltılmasına katkı sunmaktadır. Hidroliz, asidojenez, asetojenez ve metanojenez aşamalarından oluşan bu biyokimyasal süreç, yenilenebilir enerji teknolojileri arasında önemli avantajlara sahiptir. Bu çerçevede, düşük Δ-9-tetrahidrokanabinol (THC) içeriği, yüksek biyokütle verimi ve farklı iklim koşullarına uyum sağlayabilmesi ile dikkat çeken endüstriyel kenevir, enerji üretiminde potansiyel bir hammadde olarak öne çıkmaktadır. Literatürde, yüksek lignin içeriğine rağmen kenevir biyokütlesinin umut verici biyometan potansiyeli sunduğu ve uygulanan mekanik ya da kimyasal ön işlemlerle metan veriminin belirgin şekilde artırılabildiği raporlanmıştır. Ayrıca, kenevir atıklarının hayvansal gübre gibi diğer organik substratlarla ko-fermantasyonu sinerjik etkiler yaratarak biyogaz üretiminde performans artışı sağlayabilmektedir. Bu çalışmada, endüstriyel kenevir işleme atıklarının anaerobik fermantasyon yoluyla biyogaz ve biyometan üretim potansiyeli değerlendirilecek, mevcut literatürdeki çalışmalarda kenevirin biyogaz üretimindeki rolüne ilişkin araştırmalara yer verilecek ve bu hammaddenin yenilenebilir enerji üretimindeki stratejik önemi ortaya konacaktır. Böylece elde edilecek bulgular sürdürülebilir enerji üretimi, çevre dostu atık yönetimi ve iklim değişikliğiyle mücadele politikalarına katkı sağlaması öngörülmektedir.

Anahtar Kelimeler: Kenevir, Biyogaz, Biyometan potansiyeli (BMP), anaerobik fermantasyon, yenilenebilir enerji

ENERGY CONVERSION OF HEMP BIOMASS THROUGH ANAEROBIC FERMENTATION: PERSPECTIVES ON BIOGAS AND BIOMETHANE

ABSTRACT

The growing global demand for energy, limited fossil fuel reserves and the adverse environmental impact of fossil fuels have made the development of sustainable energy sources imperative. In this context, anaerobic fermentation — the decomposition of organic waste by microorganisms in an oxygen-free environment, resulting in the production of biogas and biomethane — has emerged as a technically and economically viable method. This process contributes to energy generation and mitigating the environmental impact of waste management. Consisting of four biochemical stages — hydrolysis, acidogenesis, acetogenesis and methanogenesis — anaerobic fermentation offers several advantages over other renewable energy technologies. Within this framework, industrial hemp, characterized by its low THC content, high biomass yield and adaptability to diverse climatic conditions, stands out as a promising energy production feedstock. Despite its relatively high lignin content, the literature reports that hemp biomass exhibits notable biomethane potential and that mechanical or chemical pretreatments can significantly enhance methane yields. Furthermore, co-fermenting hemp residues with other organic substrates, such as animal manure, has been shown to produce synergistic effects and improve biogas production efficiency. This study will evaluate the potential of industrial hemp processing residues for biogas and biomethane production through anaerobic fermentation. Findings from existing literature will be discussed to elucidate hemp's role in biogas generation and highlight its strategic importance as a renewable energy resource. The results obtained are expected to contribute to sustainable energy production, eco-friendly waste management and climate change mitigation policies.

Keywords: Hemp, Biogas, Biomethane Potential (BMP), Renewable Energy.

GİRİŞ

İnsan yaşamını sürdürebilmek ve üretim faaliyetlerini devam ettirebilmek için enerjiye ihtiyaç duyar. Ancak mevcut küresel enerji yapısı hâlâ büyük ölçüde yenilenemeyen fosil yakıtlara dayanmaktadır. Bu durum, hem enerji arz güvenliği hem de çevresel sürdürülebilirlik açısından ciddi bir tehdit oluşturmaktadır (Abraham vd., 2020). Fosil yakıt rezervlerinin sınırlı olması, enerji fiyatlarında yaşanan dalgalanmalar ve bu kaynakların yanması sonucu ortaya çıkan yüksek miktardaki sera gazı (GHG) emisyonları, günümüzde enerji krizinin ve iklim değişikliğinin temel nedenleri arasında yer almaktadır (Millati vd., 2020; Paudel vd., 2017).

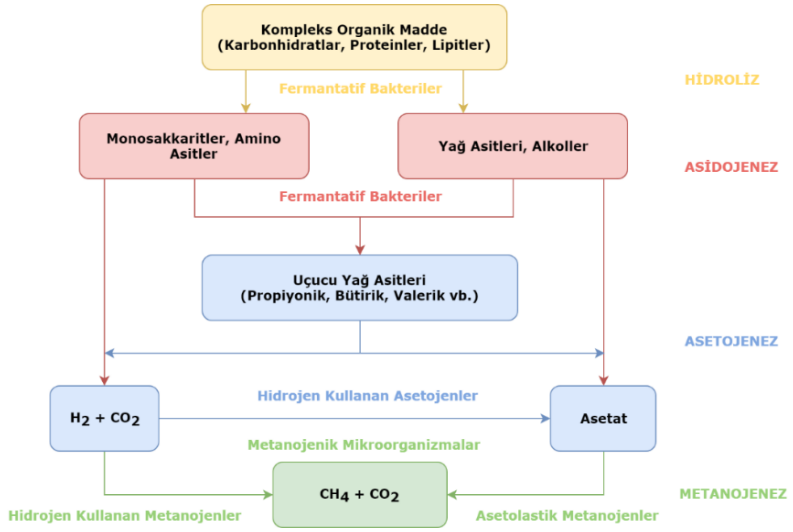
Artan enerji talebi, nüfus artışı ve ekonomik büyüme gibi faktörler, yenilenebilir enerji kaynaklarını ekonomik olarak cazip ve çevresel açıdan sürdürülebilir bir alternatif haline getirmiştir (Paudel vd., 2017). Yenilenebilir enerji; güneş, rüzgâr, jeotermal, hidroelektrik ve biyokütle gibi doğal kaynaklardan elde edilmekte, böylece fosil yakıtlara olan bağımlılığı azaltarak enerji arz güvenliğini güçlendirmektedir.

Bu kaynaklar içinde biyokütle enerjisi, hem çevre dostu olması hem de doğrudan bitkisel ve organik atıklardan enerji üretimine olanak tanıması nedeniyle özel bir öneme sahiptir. Biyokütle, fotosentez yoluyla atmosferden aldığı karbondioksiti enerji üretimi sırasında yeniden atmosfere saldığı için karbon nötr bir döngü oluşturur (Millati vd., 2020). Bu özelliği, onu iklim değişikliğiyle mücadelede stratejik bir yenilenebilir enerji kaynağı haline getirmektedir.

Biyokütle kaynakları arasında lignoselülozik biyokütle, dünyadaki en verimli karbon depolarından biri olarak öne çıkmaktadır. Yıllık küresel üretimi yaklaşık 12×10^{10} ton düzeyindedir ve karasal bitkiler tarafından yakalanan biyoenerji, insanlığın toplam enerji talebinin yaklaşık 3–4 katı kadardır (Guo vd., 2015). Bu, lignoselülozik biyokütlenin gelecekteki enerji güvenliğini sağlamada önemli bir potansiyele sahip olduğunu göstermektedir. Bununla birlikte, bu potansiyelin verimli şekilde kullanılmaması hâlinde çevresel riskler ortaya çıkabilmektedir. Örneğin, bitki samanının yakılması gibi geleneksel uygulamalar; arazi israfına, hava kirliliğine ve karbon salımına neden olmaktadır (Cheng & Zhong, 2014; Zhang vd., 2018). Dolayısıyla biyokütlenin sürdürülebilir şekilde değerlendirilmesi, çevresel faydanın en üst düzeye çıkarılması açısından kritik öneme sahiptir.

Enerji talebinin karşılanmasında fosil kaynakların uzun vadede güvenilir bir çözüm sunamayacağı açıktır. Bu nedenle araştırmalar, biyokütle tabanlı biyoyakıtlar üzerine yoğunlaşmıştır. Günümüzde mısır, buğday, pirinç, soya fasulyesi ve şeker kamışı gibi çeşitli tarımsal ürünler biyoyakıt üretiminde kullanılmaktadır (Abraham vd., 2020; Prade vd., 2011). Ancak bu hammaddeler genellikle gıda kaynaklarıyla rekabet ettiği için, yeni nesil biyoyakıt çalışmaları gıda dışı lignoselülozik materyallere yönelmiştir. Bu tür biyokütleler, yüksek karbon içeriği ve düşük maliyetleriyle sürdürülebilir enerji üretimi açısından büyük avantaj sağlamaktadır.

Bu kapsamda anaerobik fermantasyon, lignoselülozik biyokütlenin enerjiye dönüştürülmesinde en etkili teknolojilerden biridir. Bu biyokimyasal süreçte organik maddeler, oksijensiz ortamda mikroorganizmalar tarafından parçalanarak biyogaz üretir (Angelidaki vd., 2018; Appels vd., 2011). Elde edilen biyogazın temel bileşeni metan (CH_4) olup, hem elektrik ve ısı üretiminde hem de biyometan saflaştırması yoluyla doğalgaz yerine kullanılabilmektedir. Böylece, hem enerji üretiminde fosil kaynaklara bağımlılık azalmakta hem de karbon salımı minimize edilmektedir (Kumar vd., 2017).



Sonuç olarak, fosil yakıtların çevresel zararları ve sınırlı rezervleri göz önüne alındığında, biyokütle tabanlı biyogaz üretimi, enerji arz güvenliği ve iklim değişikliğiyle mücadele açısından geleceğin en sürdürülebilir çözümlerinden biri olarak değerlendirilmektedir.

1. ANAEROBİK FERMANTASYON

Anaerobik koşullarda organik atıkların ayrıştırılması, tarihsel olarak atık yönetimi ve enerji geri kazanımı alanlarında kullanılan en eski biyoteknolojik süreçlerden biridir. Günümüzde ise anaerobik fermantasyon sürdürülebilir enerji üretimi ve çevresel etkilerin azaltılması açısından en yaygın tercih edilen biyolojik dönüşüm yöntemlerinden biri hâline gelmiştir. Biyogaz teknolojisi, dünya genelinde gelişmiş/gelişmekte olan ülkelerde ekonomik uygulanabilirliği, enerji geri kazanım verimliliği ve çevresel sürdürülebilirliği ile etkinliğini kanıtlamıştır (Angelidaki vd., 2018).

Anaerobik fermantasyon, oksijensiz koşullar altında organik maddelerin mikroorganizmalar tarafından biyokimyasal reaksiyonlarla stabilize edilmesi ve biyogaza dönüştürülmesi sürecidir (Chen vd., 1980; Safley Jr & Westerman, 1990). Bu biyogaz genellikle %50–70 CH_4 ve %30–50 karbondioksit (CO_2) içerirken, az miktarda hidrojen sülfür (H_2S), amonyak (NH_3) ve hidrojen (H_2) gibi bileşenler de bulunabilir. Böylece anaerobik fermantasyon hem enerji üretimi sağlar hem de atığın çevresel etkilerini azaltarak sürdürülebilir bir döngü oluşturur.

Bu süreç, biyokimyasal olarak dört temel aşamada gerçekleşir: hidroliz, asidojenez, asetojenez ve metanojenez (Dichtl, 1997). Her aşamada farklı mikrobiyal topluluklar aktif rol oynar ve sistemin genel verimliliği bu topluluklar arasındaki simbiyotik dengeye bağlıdır (Şekil 1; (Chernicharo, 2007).

Şekil 1. Anaerobik ayrışmanın metabolik aşamaları (Chernicharo, 2007).

Anaerobik fermantasyonun birinci aşaması olan "hidroliz" esnasında hammaddenin kompleks yapıları (örneğin karbonhidratlar, yağlar gibi) daha basit organik yapılara (örneğin aminoasitler, şeker, yağ asitleri) dönüştürülür. Bu aşamada kompleks maddeler fermentatif bakteriler tarafından üretilen enzimlerin yardımı ile ayrışır ve çözünmüş hale geçer, böylece fermantatif bakterilerin hücre duvarlarından geçebilecek bir yapıya dönüşürler (Henze vd., 2008). Hidroliz sırasında katı partiküller suda çözünür bir hale geçtikleri için bu aşamaya sıvılaştırma (likifikasyon) da denilmektedir (Avcıoğlu Onurbaş, 2011).

Mikroorganizmalarca gerçekleştirilen ikinci temel adım asidojenezdir. Asidojenez fazında fermantatif bakteriler enerji ihtiyaçlarını karşılamak için çözünmüş bileşikleri hücre içerine alırlar. Daha sonra mikroorganizmalarca ayrışan bu bileşikler daha basit bileşenlere dönüştürülür ve hücre dışına atılır (Henze vd., 2008). Fermantasyon işleminde, substratlar hem elektron verici hem de alıcı olarak hizmet eder (Eddy vd., 2014). Bu aşamada üretilen en bilinen bileşikler uçucu yağ asitleri (valerik, propiyonik ve bütirik asitler), alkoller (etanol), laktik asit, CO_2, H_2, NH_3 ve H_2S'dür (Henze vd., 2008). Bu aşamada çözünmüş karbonhidratlar; etanol,

hidrojen ve karbondioksite, aminoasitler; süksinik asit ve hidrojene ve yağ asitleri ise asetat ve hidrojene dönüşür. Asetat, sadece çözünebilir organik bileşiklerin fermantasyonu yoluyla değil, aynı zamanda asetojenez yoluyla da üretilebilir (Gerardi, 2003). Asidojenez fazı anaerobik arıtmada gerçekleşen en hızlı fazdır ve metan üretimi asit üretimine göre daha yavaş gerçekleştiğinden dolayı çözünmüş organik madde konsantrasyonunda oluşan ani artışlar asit üretimini tetikleyerek sistemde aşırı yüklemeye sebep olabilir. Bu durumda metan üretimi yavaşlar ve üretilen asit sonucu sistemde ani pH düşmesine yol açarak prosesi inhibe eder (Henze vd., 2008).

Asetojenez fazında asetojenik mikroorganizmalarca fermantasyon devam eder ve asidojenez aşamasında oluşan uçucu yağ asitleri metan üretiminin öncüsü olan asetat, hidrojen ve karbondioksite dönüşür (Eddy vd., 2014). Burada asetat üretimi asidojenezden farklı olarak, asetojenik mikroorganizmaların aktivitesi ile gerçekleştirilir (Gerardi, 2003). Bu aşamada en önemli besin maddeleri anaerobik fermantasyonda kilit rol oynayan propiyonik ve bütirik asitlerdir (Henze vd., 2008). Hidrojene dönüşümü yeterli hızda gerçekleşmeyen uçucu yağ asitleri asidojenez aşamasında olduğu gibi sistemde birikerek pH'nın ani şekilde değişmesine yol açabilir. Bunun yanı sıra hidrojen üreten asetojenik mikroorganizmalar ile hidrojen tüketen metanojenik mikroorganizmalar arasında hassas bir denge de mevcuttur (Christensen, 2011; Eddy vd., 2014). Bu hassas dengeye rağmen hidrojenin kısmi basıncı çok düşük bir seviyede seyreder. Bunun sebebi üretilen hidrojenin metanojenler ve sülfat indirgeyen mikroorganizmalar tarafından hızlı şekilde tüketilmesiyle alakalıdır (Henze vd., 2008).

Anaerobik fermantasyonun dördüncü ve son aşaması olan metanojenez, metanojenik mikroorganizmalarca önceki aşamalarda üretilen asetat, hidrojen ve karbondioksitin metana çevrildiği aşamadır. Metan üretimi için iki grup metanojenik mikroorganizma görev alır; asetolastik metanojenler, asetatı metan ve karbondioksite dönüştürürler, hidrojen kullanan metanojenler ise elektron vericisi olarak hidrojen ve elektron alıcısı olarak karbondioksiti kullanarak metan üretirler (Eddy vd., 2014; Henze vd., 2008). Metanojenik mikroorganizmalar, asetat, karbondioksit, hidrojen, formate, metanol, etanol ve bazı durumlarda methylamine gibi organik molekülleri de metabolize etmektedirler (Balch vd., 1979; Weimer, 1998; Zinder vd., 1984). Kompleks organik bileşiklerin metana dönüşmesi, hammaddenin metanojenik mikroorganizmalar tarafından kullanılabilen substratlara dönüştürülmesiyle sağlanabilir. Bu aşamaya kadar en kritik nokta asetat üretimidir çünkü anaerobik fermantasyonda üretilen metanın yaklaşık %70'si asetattan sağlanmaktadır. Bu durumda asetat üretimi biyogaz veya metan üretimi açısından bir "darboğaz" olarak adlandırılabilir (Avcıoğlu Onurbaş, 2011; Eddy vd., 2014; Gerardi, 2003). Asetolastik metanojenlerin büyüme oranı oldukça düşüktür. Bu durum anaerobik reaktörlerin uzun adaptasyon süresine olan ihtiyacı açıklamaktadır. Hidrojen kullanan metanojenler, 4 ila 12 saatlik iki katına çıkma zamanları ile asetolastik metanojenlerden çok daha yüksek büyüme oranına sahiptir (Henze vd., 2008). Asidojenik, asetojenik ve metanojenik mikroorganizmaların çalışma hızı kabaca aynı olduğu sürece, metanojenez aşamasının metabolik aktivitesi korunur (Gerardi, 2003).

Bu dört aşamanın dengeli ilerlemesi hem metan üretiminde maksimum verim hem de proses stabilitesi için zorunludur. Ancak bu denge yalnızca mikrobiyal etkileşimlerle değil, aynı zamanda çevresel ve mühendislik parametrelerinin dikkatle optimize edilmesiyle sürdürülebilir (Angelidaki vd., 2018; Appels vd., 2011).

Anaerobik sistemlerin performansını belirleyen çevresel faktörler arasında **pH, sıcaklık, karbon/azot oranı (C/N), organik yükleme hızı (OLR)** ve **karıştırma** koşulları öne çıkar. Metanojenlerin optimum pH aralığı 6.8–7.4'tür; bu aralığın dışına çıkılması mikrobiyal aktiviteyi baskılar ve gaz üretimini düşürür (Gerardi, 2003). Sıcaklık açısından mezofilik (35-37 °C) sistemler kararlı mikrobiyal yapılar sağlarken, termofilik (50-55 °C) koşullar daha hızlı

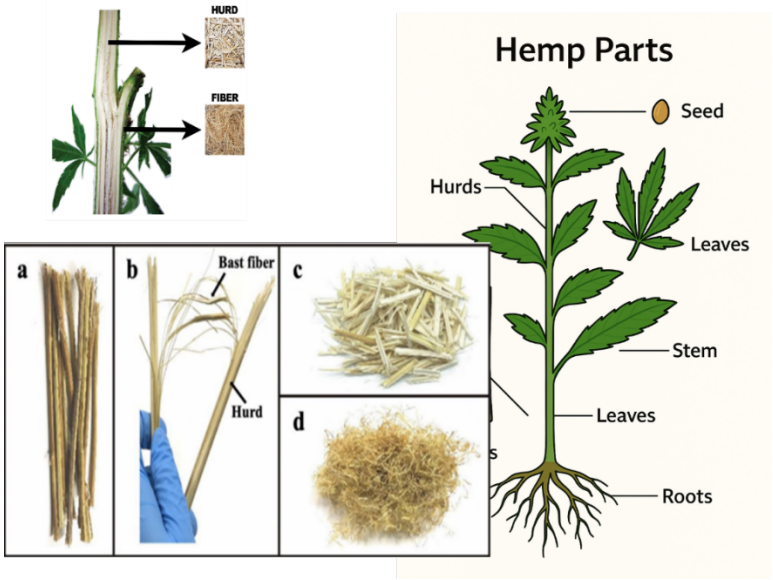
reaksiyonlar sunar fakat stabilite riskini artırır (Eddy vd., 2014). Uygun C/N oranı (20-30), mikroorganizmaların beslenme dengesini korur; düşük oranlar amonyak toksisitesine, yüksek oranlar ise besin eksikliğine neden olur (Henze vd., 2008). OLR'nin kontrolü, pH dengesini koruyarak uçucu yağ asidi birikimini engeller; karıştırma ise sıcaklık homojenliği ve substrat-mikroorganizma teması açısından sürecin verimliliğini artırır (Christensen, 2011).

Anaerobik fermantasyonun başarısı, yalnızca süreç parametrelerinin kontrolüne değil, aynı zamanda kullanılan **biyokütlenin kimyasal bileşimine** de bağlıdır. Günümüzde tarımsal artıklar, hayvansal gübreler, gıda endüstrisi atıkları ve lignoselülozik materyaller, biyogaz üretiminde yaygın olarak değerlendirilmektedir (Mao vd., 2015; Weiland, 2010). Lignoselülozik biyokütleler, yüksek selüloz ve hemiselüloz içerikleri sayesinde iyi bir karbon kaynağıdır; ancak lignin varlığı, mikrobiyal parçalanmaya karşı direnç göstererek biyogaz üretimini sınırlar (Kumar vd., 2017). Bu nedenle, selüloz ve hemiselülozun erişilebilirliğini artırmak için fiziksel, kimyasal veya biyolojik **ön işlem teknikleri** uygulanması gereklidir.

Farklı organik atıkların birlikte sindirildiği **anaerobik ko-fermantasyon** yaklaşımı, substratlar arasındaki besin dengesini iyileştirerek sinerjik etkiler yaratabilir. Ancak bazı durumlarda kimyasal uyumsuzluklar antagonistik etkilere yol açabilir (Bıtrak, 2021). Bu nedenle, farklı substratların birlikte kullanım potansiyelinin değerlendirilmesinde **biyokimyasal metan potansiyeli (BMP)** testleri büyük önem taşır. BMP, belirli bir substrattan elde edilebilecek maksimum metan miktarını belirleyen temel göstergedir ve sistem tasarımı, kütle dengesi hesapları ve enerji verimliliği analizlerinde kritik rol oynar (Angelidaki vd., 2009; Labatut vd., 2011; Weinrich vd., 2018). Ancak laboratuvar koşullarında belirlenen bu potansiyelin tam ölçekli sistemlerde sürdürülebilir şekilde gerçekleşebilmesi, substrat bileşimi kadar çevresel koşulların ve işletme stratejilerinin de optimize edilmesine bağlıdır.

Son yıllarda yapılan araştırmalar, sürdürülebilir enerji üretimi ve çevresel rehabilitasyon hedefleri doğrultusunda, yeni nesil lignoselülozik biyokütle türlerine yönelmiştir. Bu bağlamda **endüstriyel kenevir (*Cannabis sativa L.)***, yüksek biyokütle verimi, düşük pestisit gereksinimi, kısa büyüme süresi ve farklı iklim koşullarına adaptasyon yeteneği ile ön plana çıkmaktadır (Barta vd., 2013; Ingrao vd., 2018). Lignoselülozik yapısı nedeniyle belirli teknik zorluklar barındırsa da, uygun ön işlem uygulamalarıyla kenevir biyokütlesinin yüksek metan verimi sağladığı bildirilmektedir (Nges vd., 2012; Schroyen vd., 2018).

2. ENDÜSTRIYEL KENEVİR



Endüstriyel kenevir (*Cannabis sativa L.*), son yıllarda yalnızca geleneksel lif ve tohum üretiminde değil, aynı zamanda sürdürülebilir biyokütle kaynaklarının geliştirilmesi bağlamında da dikkat çeken stratejik bir bitki türü olarak öne çıkmaktadır. Bu bitkinin çok yönlü kullanım potansiyeli, çevresel, ekonomik ve endüstriyel açıdan geniş bir etki alanı yaratmaktadır. Endüstriyel kenevirin bu denli istisnai bir konuma sahip olmasının temel nedenlerinden biri, psikoaktif türlerden genetik olarak ayrışmış olmasıdır. Endüstriyel kenevir türleri, Δ-9-tetrahidrokanabinol (THC) oranı bakımından %0,3'ün altında değerlere sahiptir ve bu yönüyle narkotik amaçlı türlerden net biçimde ayrılmaktadır (Desanlis vd., 2013). Bu fark, yalnızca yasal açıdan güvenli bir hammadde değil, aynı zamanda sürdürülebilir endüstriler için etik ve ekonomik bir alternatif haline getirmiştir.

Agronomik açıdan değerlendirildiğinde, kenevirin biyolojik yapısı yüksek verimliliğiyle dikkat çeker. C_3 fotosentetik yapıya sahip bu yıllık bitki, lignoselülozik biyokütle üretiminde son derece etkilidir. Literatürde, kenevirin ayda yaklaşık 50 cm büyüyebildiği, 4 m'ye kadar ulaşabildiği ve kuru madde veriminin 7,6–15 Mg ha^{-1} $yıl^{-1}$ arasında değiştiği raporlanmaktadır (Burczyk vd., 2008; Jankauskiene vd., 2015; Strzelczyk vd., 2022). Bu yüksek biyokütle üretimi, enerji yoğunluğu açısından da son derece avantajlıdır; enerji değeri 124–223 GJ ha^{-1} $yıl^{-1}$ aralığında bildirilmektedir. Düşük pestisit gereksinimi, geniş iklim aralığında yetişebilme

kapasitesi ve kuraklığa karşı dayanıklılığı, keneviri çevresel olarak sürdürülebilir tarım sistemleri için ideal bir tür haline getirmektedir (Finnan & Styles, 2013). Böylece kenevir üretimi yalnızca ekonomik kazanç değil, aynı zamanda toprak verimliliği, biyoçeşitlilik ve karbon döngüsünün desteklenmesi bakımından da önemli ekosistem hizmetleri sağlar.

Endüstriyel kenevirin çevresel katkıları, üretim potansiyeli kadar önemlidir. Derin ve yaygın kök sistemi, toprakta biriken ağır metallerin ve kirleticilerin uzaklaştırılmasını sağlayarak fitoremedasyon uygulamalarında etkili bir araç haline getirmektedir (Akkaya vd., 2025; Visković vd., 2024). Bu özelliği sayesinde kenevir, kirlenmiş toprakların rehabilitasyonunda "çift işlevli" bir bitki olarak değerlendirilmektedir; bir yandan çevresel iyileştirme sağlarken, diğer yandan ekonomik değeri yüksek biyokütle üretimi gerçekleştirmektedir. Ayrıca, yüksek karbon tutma kapasitesiyle iklim değişikliğinin etkilerinin azaltılmasına da katkıda bulunur. Yapılan çalışmalar, bir hektarlık kenevir tarlasında yılda önemli miktarda CO_2'nin sabitlenebildiğini ortaya koymuştur (Kaur & Kander, 2023; Visković vd., 2024). Bu yönüyle kenevir hem karbon yutağı işlevi gören hem de karbon-nötr üretim sistemlerine entegre edilebilen nadir tarımsal türlerden biridir.

Endüstriyel kenevirin endüstriyel değerlendirme potansiyeli oldukça geniştir. Bitkinin sap kısmı, lif ve hurd (odunsu iç kısım) olmak üzere iki temel fraksiyona ayrılır (Şekil 2). Lif, sapın yaklaşık %25'ini, hurd ise %75'ini oluşturur (Schluttenhofer & Yuan, 2017). Kenevirin lignoselülozik yapısı, selüloz (%40–48), hemiselüloz (%20–25) ve lignin (%15–20) oranlarıyla tipik enerji bitkilerinden biri olan miscanthus ile benzerlik göstermektedir (Jankauskiene vd., 2015). Lif fraksiyonu yüksek selüloz içeriği (%70–75) sayesinde tekstil ipliği, kâğıt hamuru, biyokompozit ve ısı yalıtım malzemeleri gibi katma değeri yüksek sektörlerde kullanılmaktadır. Buna karşın hurd fraksiyonu, daha yüksek lignin ve mineral içeriğiyle özellikle yapı sektöründe "hempcrete" (kenevir betonu) üretiminde, ayrıca hayvan yataklığı, sunta ve biyokütle yakıtı üretiminde değerlendirilmektedir (Jami vd., 2019; Stevulova vd., 2018).

Şekil 2. Endüstriyel kenevir ve kısımları (Tyagi vd., 2022)

Kenevirin bu kimyasal yapısı, biyoyakıt üretimi açısından da önemli fırsatlar sunar. Lignoselülozik fraksiyon, biyogaz, biyoetanol ve biyodizel üretimi için uygun bir substrat niteliği taşımaktadır. Yapılan araştırmalar, özellikle hurd ve lif fraksiyonlarının, ön işlem uygulanmadan dahi yüksek BMP'ye sahip olduğunu göstermiştir (Heiermann vd., 2009; Jankauskiene vd., 2015). Bu durum, kenevirin hem enerji üretiminde hem de karbon nötrlüğü hedefleriyle uyumlu döngüsel ekonomi uygulamalarında güçlü bir alternatif olduğunu

kanıtlamaktadır. Ayrıca, kenevir tohum yağı biyoetanol ve biyodizel üretiminde önemli bir hammadde niteliği taşırken, yağ çıkarımı sonrasında elde edilen küspe de %50'ye varan protein içeriğiyle yem olarak değerlendirilmektedir (Capcanari vd., 2023; Süzerer vd., 2023).

Bu kapsamda, endüstriyel kenevir yalnızca lif ve tohum üretimiyle sınırlı bir tarım ürünü değil, aynı zamanda çevresel rehabilitasyon, yenilenebilir enerji üretimi ve sürdürülebilir endüstriyel dönüşüm açısından stratejik bir biyoresürstür. Lif, hurd, tohum ve yağ fraksiyonları üzerinden farklı değer zincirlerine entegre olabilen bu bitki, hem toprak kalitesinin artırılması hem de karbon sekestrasyonu, enerji üretimi ve atık geri kazanımı hedefleriyle uyumlu bir biyodöngü modelinin temel bileşenini oluşturmaktadır.

3. ENDÜSTRİYEL KENEVİRİN ANAEROBİK FERMANTASYON POTANSİYELİ

Endüstriyel kenevir, lignoselülozik yapısı, yüksek büyüme hızı ve farklı bitki fraksiyonlarının (yaprak, sap, lif, hurd, tohum) kimyasal çeşitliliği sayesinde anaerobik fermantasyon süreçlerinde yenilenebilir enerji üretimi için önemli bir biyokütle kaynağıdır. Lifli dokuların yüksek lignin içeriği hidroliz hızını azaltırken, fenolik bileşiklerin belirli bir eşiğin üzerinde bulunması metan üretimini geçici olarak baskılayabilmektedir. Schroyen vd. (2017, 2015), fenolik konsantrasyonun 100 mg L^{-1}'den 2000 mg L^{-1}'ye yükselmesinin metan oluşumunda belirgin bir inhibisyona yol açtığını, ancak mikrobiyal toplulukların zamanla bu koşullara adapte olarak inhibitör etkinin kısmen ortadan kalktığını bildirmiştir. Lignin miktarı, BMP'nin en belirleyici bileşenlerinden biridir ve bu nedenle lignin bariyerinin enzimatik veya termo-kimyasal ön işlemlerle zayıflatılması metan üretim verimini önemli ölçüde artırmaktadır (Schroyen vd., 2018).

Kenevirin farklı fraksiyonlarındaki selüloz, hemiselüloz ve lignin oranları biyobozunabilirlik üzerinde doğrudan etkilidir. Özellikle selüloz/hemiselüloz oranı yüksek, lignin oranı düşük olan yaprak fraksiyonları, birim kuru madde başına daha yüksek metan verimi sağlar (Adamovi vd., 2014). Bununla birlikte kenevirin çeşidi, yetiştirme koşulları, hasat zamanı ve partikül boyutu gibi faktörler biyogaz verimini büyük ölçüde etkiler. Mikroorganizmaların optimum aktivitesi için C/N oranının 16–20 arasında tutulması önerilmekte; azot, fosfor ve kükürt eksiklikleri ise metanojenik faaliyetleri sınırlandırmaktadır (Álvarez vd., 2010; Hinken vd., 2008; Mshandete vd., 2004; Nges vd., 2012). Dolayısıyla uygun besin dengesi, özellikle karışık substratlı sistemlerde sürecin kararlılığını ve metan verimini artıran temel bir faktör olarak öne çıkmaktadır.

Tarla denemeleri, ön işlem uygulanmamış kenevir biyokütlesinin enerji üretiminde pek çok klasik enerji bitkisiyle rekabet edebildiğini göstermiştir. Prade vd. (2011), İsveç'in güneyinde yürüttükleri çalışmada biyogaz üretimi için en uygun hasat döneminin Eylül–Kasım, katı biyoyakıt üretimi için ise Şubat–Nisan olduğunu bildirmiştir. Biyogaz için hektar başına enerji getirisi 296 GJ ha^{-1}, katı yakıt için ise 201 GJ ha^{-1} olarak hesaplanmıştır. Takip eden çalışmalar, sonbaharda hasat edilen taze biyokütlenin biyogaz üretimi açısından, ilkbaharda hasat edilen kuru biyokütlenin ise ısı ve kojenerasyon sistemleri için daha avantajlı olduğunu göstermiştir (Kreuger, Prade, vd., 2011; Prade vd., 2012). Kenevirin farklı fenolojik evrelerinde yürütülen deneysel çalışmalarda, en yüksek metan verimi erken gelişim aşamasında (309–316 L CH_4 kg^{-1} ODM) gözlenmiş; olgunlaşmayla birlikte bu değer 289–302 L CH_4 kg^{-1} ODM'ye düşse de artan biyokütle üretimi hektar başına metan verimini 142–175 m^3 ha^{-1}'den 2780–3230 m^3 ha^{-1}'e yükseltmiştir. Ortalama metan oranı %60 civarında saptanmış, farklı gübreleme stratejileri arasında anlamlı fark bulunmamıştır. Bu sonuçlar, biyogaz tesislerinden elde edilen sindirim ürünlerinin (katı ve sıvı faz) kenevir yetiştiriciliğinde etkili bir geri besin kaynağı olarak değerlendirilebileceğini göstermektedir (Michal vd., 2023; Velechovský vd., 2021).

Balodis vd. (2011), Letonya koşullarında kenevirin 12.6 t DM ha^{-1} verimle mısır ve kolzayla rekabet edebildiğini ve 116 GJ ha^{-1} düzeyinde metan enerji verimi sağladığını bildirmiştir. Adamovičs vd. (2014), Futura 75 ve Uso 31 çeşitlerinde ince öğütülmüş fraksiyonların 208 GJ ha^{-1}, kaba fraksiyonların ise 148 GJ ha^{-1} enerji verimi ürettiğini raporlamıştır. Benzer şekilde, Pakarinen vd. (2011), Finlandiya koşullarında kenevirin 14 t DM ha^{-1} biyokütle ve 108 GJ ha^{-1} metan enerji verimiyle mısırla eşdeğer performans sergilediğini ortaya koymuştur. Bu bulgular Gissén vd. (2014) tarafından yapılan yaşam döngüsü analizleriyle desteklenmiş ve kenevirin arazi kullanımı ve çevresel etki açısından sürdürülebilir enerji bitkileri arasında güçlü bir alternatif olduğu gösterilmiştir. Bu sonuçlar birlikte değerlendirildiğinde, ön işlemsiz kenevir biyokütlesinin, doğru hasat zamanlaması ve parçacık boyutu kontrolüyle, pek çok geleneksel enerji bitkisine benzer metan verimi sağlayabildiği görülmektedir.

Bununla birlikte, kenevirin lignin içeriği ve fenolik bileşiklerinin mikrobiyal bozunmayı sınırlaması nedeniyle, son yıllarda araştırmalar biyobozunabilirliğin artırılmasına yönelik ön işlem stratejilerine yönelmiştir. Kreuger vd. (2011b), buhar ön işleminin yalnızca mekanik öğütmeye kıyasla metan verimini belirgin biçimde artırdığını ve aynı biyokütlenin etanol–metan eş üretiminde kullanılmasının enerji çıktısını iki katına kadar yükselttiğini bildirmiştir. Schroyen vd. (2017, 2015), veratril alkol ve lakaz enzimleriyle yapılan biyokimyasal ön işlemlerin fenolik bileşiklerin yaklaşık %80'ini uzaklaştırarak inhibitör etkileri azalttığını, ancak toplam biyogaz üretimindeki farkın sınırlı kaldığını göstermiştir. Schroyen vd. (2018) ise lignin içeriği ile BMP arasındaki ilişkiyi modelleyerek kenevirin BMP değerini 238 L CH_4 kg^{-1} VS olarak belirlemiş; bu değerin buğday samanına yakın, ancak miscanthus'tan daha yüksek olduğunu rapor etmiştir.

Son dönemde yapılan çalışmalar, enerji dönüşüm zincirinin optimizasyonu amacıyla biyokimyasal ve termokimyasal süreçlerin entegrasyonuna odaklanmıştır (Daglioglu vd., 2024). Özellikle hidrotermal karbonizasyon ve buhar gazlaştırma süreçleri, lignoselülozik kenevir biyokütlesinin çok aşamalı enerji dönüşümüne olanak tanımaktadır. NaOH ön işleminin kenevir hurdasından biyometan üretimini %164 oranında artırdığı, 200 °C'de elde edilen hidrokömürün 1278 mL g^{-1} H_2 verimiyle en yüksek biyohidrojen performansını sağladığı bildirilmiştir. Bununla birlikte, sindirim ürünlerinden elde edilen hidrokömürlerin yüksek kül içeriği nedeniyle gazlaştırma aktivitesi düşük bulunmuştur. Ancak aynı koşullarda (200 °C) elde edilen sıvı faz, 213 mL CH_4 g^{-1} KOİ değerine ulaşarak en yüksek BMP'yi vermiştir. Bu bulgular, kenevir biyokütlesinin biyogaz, biyohidrojen ve hidrokömür üretim rotalarının ardışık biçimde değerlendirilmesinin enerji dönüşüm verimini önemli ölçüde artırabileceğini göstermektedir.

Kenevirin diğer biyokütlelerle birlikte sindirimi, yani ko-fermantasyon yaklaşımı, sürecin hem kararlılığını hem de besin dengesini iyileştirmektedir. Nges vd. (2012), domuz ve kümes hayvanı gübresi ile gıda ve mezbaha atıklarının temel substratına kenevir, mısır ve tritikale ilavesinin metan verimini %30 oranında artırdığını bildirmiştir. Böske vd. (2014) ise at gübresiyle birlikte kenevir, keten, buğday samanı ve ladin talaşı kullanılan yukarı akışlı katı durum reaktörlerinde kenevirin 168 L CH_4 kg^{-1} VS değeriyle keten ve odun yongalarına kıyasla daha yüksek performans sergilediğini ve termofilik koşullarda metan oranının %59,8'e ulaştığını rapor etmiştir (Tablo 1). Bu çalışmalar, kenevirin karışık substratlı sistemlerde C/N oranını dengeleyerek inhibitör etkileri azalttığını ve biyogaz üretiminde sinerjik bir katkı sunduğunu göstermektedir.

Tablo 1. Endüstriyel kenevir ve farklı biyokütlelerin BMP değerlerinin karşılaştırılması

Bitki / Hammadde	BMP (L_{CH_4}/kgVS)	Açıklama	Kaynak
Kenevir (genel, sap-ağırlıklı fraksiyonlar)	≈ 230–250	Ortalama metan verimi, hasat zamanına göre sınırlı değişim gösterir	(Adamovi vd., 2014)
Kenevir (yaprak fraksiyonu)	≈ 330–370	Yapraklar düşük lignin içeriği nedeniyle en yüksek CH4 verimi sağlar.	(Adamovi vd., 2014)
Mısır silajı	≈ 280–360	En yaygın referans enerji bitkisi: yüksek hektar verimi sayesinde toplam üretim yüksektir.	(Weiland, 2010)
Şeker pancarı (posası/silajı)	≈ 320–450	Kolay parçalanabilir karbonhidrat içeriği sayesinde yüksek biyogaz verimi	(Szwarc & Szwarc, 2020)
Çim / Grass silaj	≈ 290–320	Orta- yüksek metan verimi; ancak protein oranı değişkendir.	(Weiland, 2010)
Buğday sapı	≈ 230 (ön işlemsiz) → ≈ 280–300 (ön işlemli)	Yüksek lignin oranı nedeniyle ön işlem gerektirir.	(Weiland, 2010)

Öte yandan yaşam döngüsü değerlendirmeleri, kenevirin yalnızca enerji üretiminde değil, aynı zamanda çevresel rehabilitasyonda da ikili bir işlev üstlendiğini ortaya koymuştur (Todde vd., 2022). Ağır metallerle kirlenmiş topraklarda yetiştirilen kenevirin değerlendirilmesine yönelik dört farklı tedarik zinciri senaryosunda, kirlenmiş biyokütlenin anaerobik sindirim veya yakma yoluyla işlenmesi en yüksek enerji tasarrufu (25.3–36.8 GJ ha^{-1}) ve emisyon azaltımı (579–641 kg CO_2e ha^{-1}) sağlamıştır. Monte Carlo simülasyonlarıyla doğrulanan bu bulgular, kirlenmiş arazilerin kenevir temelli biyoenerji üretimiyle yeniden işlevsel hale getirilebileceğini göstermektedir (Todde vd., 2022). Ekonomik açıdan değerlendirildiğinde, Barta vd. (2013), buhar ön işlem, etanol fermantasyonu, anaerobik fermantasyon ve kojenerasyonun entegre biçimde uygulanmasının yüksek enerji çıktısı sağladığını, ancak biyokütle tedarik maliyetleri ve biyogaz fiyatları nedeniyle ekonomik sürdürülebilirliğin sınırlı kaldığını belirtmiştir. Bununla birlikte kenevirin düşük pestisit gereksinimi, hastalıklara dayanıklılığı ve organik tarımla uyumu, onu gıda, yem ve enerji üretimi arasında dönüşümlü kullanılabilecek sürdürülebilir bir enerji bitkisi haline getirmektedir (Gissén vd., 2014; Kreuger, Sipos, vd., 2011; Prade vd., 2012).

Sonuç olarak, kenevirin anaerobik fermantasyon süreçlerindeki potansiyeli, hem ön işlemsiz uygulamalarda rekabetçi BMP değerleri hem de lignin yapısının çözülmesiyle elde edilen yüksek verimli ön işlemli sistemlerle güçlenmiştir. Termo-kimyasal süreçlerin entegrasyonu ve ko-fermantasyon stratejileri ise enerji dönüşüm verimini daha da artırarak, kenevirin biyogaz tabanlı biyorafineri sistemlerinde merkezi bir hammadde olarak değerlendirilebileceğini göstermektedir.

Tablo 2. Literatürde endüstriyel kenevir biyokütlesinin biyogaz üretimine ilişkin seçilmiş çalışmalar

Kaynak	Araştırma	Yer	Biyokütle	Diğer Biyokütlelerle Karşılaştırma	Kuru Madde (Dm) Verimi (T/Ha)	Enerji İçeriği (Gj/Ha) veya Metan Verimi	Başlıca Bulgular
(Schroyen vd., 2015)	Fenolik bileşiklerin metan üretimi üzerindeki inhibitör etkisinin değerlendirilmesi	Belçika	Kenevir	X	n.a.	100–2000 mg/L fenolik derişiminde CH_4 üretiminde azalma	Fenolik bileşiklerin yüksek konsantrasyonlarda metan oluşumunu baskıladığı, mikrobiyal adaptasyonla etkilerin zamanla azaldığı gösterildi.
(Schroyen vd., 2017)	Lignin bozunumu ve detoksifikasyon enzimlerinin etkisi	Belçika	Kenevir	X	n.a.	%80 fenolik uzaklaştırma, toplam CH_4 üretiminde sınırlı artış	Veratril alkol ve lakaz enzimiyle fenoliklerin azaltılması, süreç başlangıcındaki toksisiteyi azalttı.
(Schroyen vd., 2018)	BMP tahmininde lignin içeriğinin belirleyici rolü	Belçika	Kenevir, Buğday, Miscanthus, Keten	✓	n.a.	BMP: 238 L CH_4/kg VS	Lignin miktarının BMP'nin en güçlü belirleyicisi olduğu, kenevirin orta düzeyde potansiyel sunduğu gösterildi.
(Michal vd., 2023)	Farklı büyüme evresi ve gübreleme rejimlerinin biyogaz ve metan üretimi üzerine etkisi	Çekya	Kenevir	X	12 tDM/ha, %32 KM	309–316 L CH_4/kg ODM; MHY: 2780–3230 m^3/ha	Erken evrede en yüksek metan verimi; BGP sindirim ürünlerinin etkili bir gübre alternatifi olduğu gösterildi.
(Daglioglu vd., 2024)	NaOH ön işlemi, HTC ve buhar gazlaştırma entegrasyonu ile	Türkiye	Kenevir hurdası	X	n.a.	1278 mL H_2/g, 213 mL CH_4/g KOİ	NaOH ön işlemi biyometanı %164 artırdı; 200 °C'deki

	biyometan ve biyohidrojen üretimi					hidrokömür en yüksek H_2 verimini sağladı.
(Todde vd., 2022)	Kirlenmiş topraklarda yetiştirilen kenevirin fitoremediasyon ve enerji geri kazanımı	İtalya	Kenevir (kirlenmiş toprak)	X	n.a.	25.3–36.8 GJ ha^{-1} enerji tasarrufu	Kirlenmiş biyokütlenin anaerobik fermantasyonu ve yakma ile işlenmesi, 579–641 kg CO_2e/ha azaltımı sağladı; fitoremediasyonla enerji geri kazanımı önerildi.

4. SONUÇ VE ÖNERİLER

Endüstriyel kenevir (*Cannabis sativa L.*), yüksek biyokütle üretim kapasitesi, kısa büyüme süresi, düşük pestisit gereksinimi ve çok yönlü kullanım alanlarıyla döngüsel ekonomi vizyonunun merkezinde konumlanabilecek stratejik bir tarım ürünüdür. Bitkinin tüm fraksiyonlar-lif, hurd, tohum ve yaprak-enerji, malzeme ve çevre yönetimi açısından farklı değer zincirlerine entegre edilebilmekte, böylece "atık üretmeyen üretim" ilkesine dayalı bütüncül bir biyorafineri modeli oluşturulabilmektedir. Anaerobik fermantasyon süreci, bu sistemin enerji yönelimli dönüşümünde temel bir teknoloji olup hem biyogaz üretimi hem de sindirim artıklarının tarımsal döngüye geri kazandırılması sayesinde çevresel sürdürülebilirliğin sağlanmasında kilit rol üstlenmektedir.

Biyorafineri yaklaşımının yaygınlaştırılması, kenevirin yalnızca biyogaz üretiminde değil, aynı zamanda biyohidrojen, biyokömür, biyoplastik ve biyogübre üretim hatlarında eş zamanlı olarak değerlendirilmesine olanak tanımaktadır. Bu entegre dönüşüm yaklaşımı, kaynak verimliliğini en üst düzeye çıkarırken atık yönetimi ve enerji tüketim maliyetlerini azaltmakta; dolayısıyla "döngüsel değer zinciri" konseptinin tarımsal uygulamalarda somutlaşmasını sağlamaktadır. Son yıllarda yapılan çalışmalar, NaOH veya buhar ön işlemiyle desteklenen fermantasyon hatlarının biyogaz verimini %150'nin üzerinde artırabildiğini ve lignin bariyerinin parçalanmasıyla biyobozunabilirliğin anlamlı biçimde iyileştirildiğini göstermektedir. Ayrıca, bu tür sistemlerin hidrotermal karbonizasyon ve kojenerasyon süreçleriyle entegrasyonu, enerji dönüşüm zincirinde sıfır atık hedefini teknik olarak erişilebilir kılmaktadır. Böylelikle kenevir temelli biyorafineri sistemleri, enerji üretimi, karbon döngüsü ve atık yönetimini bütünleştiren bir sürdürülebilirlik modeli haline gelmiştir.

Gelecekteki araştırmaların, kenevirin enerji dönüşümündeki potansiyelini daha etkin kullanabilmek adına üç temel eksende yoğunlaşması gerekmektedir. İlk olarak, ön işlem optimizasyonu, farklı kenevir fraksiyonlarının (lif, hurd, yaprak) kimyasal ve enzimatik ön işlem kombinasyonlarıyla biyokimyasal metan potansiyelinin artırılmasını ve sürecin enerji girdisi–çıktısı dengesiyle birlikte modellenmesini içermelidir. İkinci olarak, hibrit enerji sistemleri üzerine çalışmalar derinleştirilmelidir. Anaerobik fermantasyonun fotobiyolojik, elektrokimyasal veya termokimyasal süreçlerle entegrasyonu, aynı biyokütleden çoklu enerji ürünlerinin (CH_4, H_2, biyokömür) eş zamanlı olarak elde edilmesini mümkün kılacak ve bu sayede enerji verimliliği yeni bir boyut kazanacaktır. Üçüncü olarak ise, karbon nötrlüğü ve yaşam döngüsü değerlendirmesi odaklı modelleme çalışmaları ön plana çıkmalıdır. Kenevir tabanlı biyogaz üretiminin karbon ayak izi, toprak karbon sekestrasyonu ve karbondioksit emisyon dengelemesi parametreleriyle birlikte değerlendirilmesi, sistemin iklim politikalarıyla entegrasyonunu güçlendirecektir.

Sonuç olarak, kenevir temelli biyorafineri sistemleri yalnızca yenilenebilir enerji üretimini değil, aynı zamanda toprak sağlığını, atık yönetimini ve karbon dengesini birlikte hedefleyen yeni nesil döngüsel ekonomi uygulamaları için güçlü bir fırsat sunmaktadır. Bu vizyonun hayata geçirilebilmesi, kenevirin ulusal enerji ve çevre politikalarında "karbonsuz büyüme" hedeflerine entegre edilmesiyle mümkün olacaktır. Böyle bir yaklaşım, yalnızca biyokütle temelli enerji güvenliğini güçlendirmekle kalmayacak, aynı zamanda tarımsal kalkınmayı ve iklim değişikliğiyle mücadeleyi destekleyen yenilikçi bir yeşil dönüşüm stratejisine öncülük edecektir.

TEŞEKKÜR

Bu çalışma, Necmettin Erbakan Üniversitesi Bilimsel Araştırma Projeleri Koordinatörlüğü tarafından desteklenen 23GAP19001 No'lu proje kapsamında edinilen bilimsel perspektif ve kavramsal çerçeveden yararlanılarak hazırlanmıştır.

ÖZET

Bu araştırma, Konya Bahri Dağdaş Uluslararası Tarımsal Araştırma Enstitüsü Müdürlüğünde tesis edilen mera arazisinde yürütülmüştür. Araştırmada enstitümüzde bulunan 4 farklı koyun ırkının (AKK, OAM, Hasmer ve Hasak) sütten kesilmiş kuzularının (2,5 – 3 aylık) meradaki büyüme performansları ve otlatmanın meranın verim ve botanik kompozisyonlarına olan etkileri incelenmiştir. Bu amaçla mera parselleri Nisan - Temmuz ayları arasında 84 gün süre ile kuzularla otlatılıp büyüme performansları belirlenmiş ve daha sonra mera parselleri 24 Eylül'e kadar otlatılmaya devam edilmiştir. Tesadüf blokları deneme deseninde 3 tekerrürlü olarak yürütülen denemede sütten kesilmiş kuzular meraların kapasitesine göre rastgele olarak deneme alanlarına alınmıştır. Otlatma denemesi boyunca hayvanların canlı ağırlık değişimi, meranın ot verimi, meranın besin madde içeriği ve botanik kompozisyonu gibi veriler ölçülmüştür.

Anahtar Kelimeler: Kuzu, yapay mera, otlatma, ot verimi, botanik kompozisyon

ABSTRACT

This project was conducted on the pastural land which established in Bahri Dagdas International Agricultural Research Institute. In the research, the performance of weaned lambs(two and a half- three mounths) of 4 different sheep breeds (AKK, OAM, Hasmer and Hasak) was monitored and the effect of grazing on pasture production and botanical composition was measured. Pasture was grazed with lambs for eighty four day between April and July and growth performance of lambs was monitored and than Pastures was continued to graze until 24 September. The grazing trial in which weaned lambs is allocated to paddocks randomly depending on the pasture capacity was conducted on a completely randomized block design with three replicates. The measurements of animal liveweight gain changes, herbage production, nutritive value and botanical composition was taken during the grazing trial.

Key Words : Lamb, artificial pasture, grazing, herbage yield, botanical composition

1.GİRİŞ

İhtiyaç duyulan kaliteli ve ucuz kaba yemlerin üretilememesi hayvancılık sektörünün gelişmesini sınırlandıran en önemli engellerden biri olduğu bilinmektedir. Kaliteli kaba yemler esas olarak çayır ve meralar ile yem bitkileri yetiştiriciliğinden sağlanmaktadır. Tarla bitkilerinin artıkları kullanılarak bir miktar kaba yem üretilse de bunun miktarı oldukça sınırlıdır. Doğal çayır ve meralarımızın aşırı ölçüde tahrip edilmelerinden dolayı verim güçlerini yitirmişlerdir. Bunun sonucu olarak, ihtiyaç duyulan kaliteli kaba yem yeterli miktarda üretilememektedir.

Modern hayvancılık işletmelerin de yemin önemli bir girdi olduğu bilinmektedir. Yemin en ucuz elde edildiği kaynak mera alanları olup yapay meralar bu tip işletmeler için büyük önem taşımaktadır. Son yıllarda da uygulanan tarım politikaları ile hayvancılığa ve yem bitkileri ekimine verilen desteklerden dolayı bölgede modern hayvancılık işletmelerinin sayısının artması, ekstansif şartlarda beslenen hayvanların yapay mera ihtiyacını artırmaktadır.

Hayvancılık işletmelerinin sayısının artmasına rağmen, doğal meralardan faydalanma her geçen gün azalmaktadır. Meraların kullanımı konusunda yaşanan genel sorunlar içerisinde yer alan aşırı ve zamansız otlatma, meraların kapasitesinin çok üzerinde hayvan otlatılması gibi faktörler buralarda da kendisini yoğun bir şekilde hissettirmektedir. Ayrıca yetersiz yağış ve yağışların yıl içerisindeki dağılımındaki düzensizlikler buna eklenince yapılan çalışmalar başarısızlıkla sonuçlanmaktadır.

Doğal meraların verim potansiyellerinin azalması, Gıda, Tarım ve Hayvancılık Bakanlığının çiftçi desteklemeleri kapsamında yapay mera alanlarını desteklemesi ve artan et fiyatları neticesinde koyun üretimi yapan çiftçilerin yapay meralar oluşturması gerekliliğini ortaya çıkarmaktadır.

Bu şekilde doğal meralara olan baskılar azaltılabilecek ve kaliteli kaba yem ihtiyacı karşılanabilecektir. Bu aynı zamanda doğal meraların sürdürülebilir nitelik kazanmalarına yardımcı olacaktır.

Temelde bu çalışmada yağlı kuyruklu olan AKK ile ince kuyruklu olan OAM ve et verimi yönünde melezleme çalışmaları ile enstitümüzde elde edilmiş Hasmer ve Hasak koyun ırklarının sütten kesilmiş kuzularının meradaki büyüme performansına bakılmış ve bu kuzuların meranın ot verimi ve botanik kompozisyonuna olan etkileri ölçülmüştür. Mevcut şartlarda bölgemizde çiftçilerin elinde bu meralardan faydalanabilecek farklı morfoloji (kuyruk yapısı vb.) ve verim yönünde (et, yün vb.) koyun ırkları (Dağlıç gibi) bulunmaktadır. Bu koyun ırklarının entansif şartlardaki verimleri ortaya konmuş olmasına rağmen mera üzerindeki verimleri bilinmemekte olup meradaki performansları ve meranın verimine olan etkileri farklı olması muhtemeldir.

2.LİTERATÜR ÖZETİ

Yapay mera tesisine yönelik buğdaygil yem bitkileri ile baklagil yem bitkilerinin karışımlarının ekimi ile ilgili bazı araştırmalara ait sonuçlar aşağıda özetlenmiştir.

Ateş ve ark.(2008b), tarafından Yeni Zelanda kurak meralarında farklı otlatma yoğunluklarında yaklaşık 3 ay süre ile yapılan kuzu besisinde ortalama kuzu başı günlük canlı ağırlık artışı 300 g olarak kaydedilmiş olup besi sonu kuzulardaki ortalama canlı ağırlık değişimi 29-41 kg arasında olmuştur.

İşliel ve ark. (1962), 1957 ve 1961 yılları arasında Orta Anadolu şartlarında bölgeye uygun karışımların tespiti çalışmalarını yapmışlardır. Kılçıksız brom+domuz ayrığı+çayır üçgülü karışımından ortalama 3904 kg/da, kılçıksız brom+domuz ayrığı+çayır üçgülü+ yonca

karışımından ortalama 3350 kg/da, kılçıksız brom+domuz ayrığı+çayır üçgülü+adi otlak ayrığı+yonca karışımından ise ortalama 4222 kg/da ot aldıklarını belirtmişlerdir.

Tekeli (1977), Kurak bölge şartlarında yapay mera kurmak için en uygun ekim yönteminin tespiti çalışmalarında yonca, kılçıksız brom ve mavi ayrık kullanmış, tohumların karışık veya ayrı ayrı olarak sıraya ekimlerinin elverişli ekim yöntemi olduğunu belirtmiştir.

Tosun ve ark. (1977), yapay meralardan elde edilen kuru ot miktarının doğal meralara göre yaklaşık 3 katı daha fazla olduğunu belirtmişlerdir. Erzurum kıraç şartlarında en uygun mera ıslah metodunun mevcut bitki örtüsünün tamamen öldürmek sureti ile hazırlanan iyi bir tohum yatağı olduğunu ve buraya bölgeye adapte olmuş yem bitkileri tohumu karışımlarının ekilmesi gerektiğini belirtmişlerdir.

Sheaffer ve ark. (1984) ile Kleczek (1990), karışımlardan sözü edilen faydaların sağlanabilmesi için uygun türlerin seçimine bağlı olduğunu belirtmişlerdir. Otlatma amacıyla seçilen yatık ve yarı yatık türler tesisteki diğer türden zarar görebileceğini vurgulamışlardır. Bu yüzden karışımlardan uzun yıllar faydalanabilmek amacıyla uyumlu ve rekabet gücü birbirlerine yakın türleri bir araya getirmek gerektiğini söylemişlerdir. Bu konuda yaptıkları çalışmada taban arazilerdeki yapay mera tesisleri için ak üçgül ve gazal boynuzu ile birlikte çok yıllık çim, kelp kuyruğu, çayır yumağı, çayır salkım otu ve kılçıksız brom gibi buğdaygilleri sıkça kullanmışlardır.

Haris(1987), sulu ve kurak meralarda ki botanik kompozisyondaki farklılığın nedeni olarak türler arasında su için yapılan rekabetin olduğunu bildirmiştir. Örnek olarak yağışlı geçen yıllarda özellikle yağışlı yaz aylarında ve sulanan meralarda ak üçgül artış göstermektedir

Tosun ve ark. (1989), Erzurum'da kıraç şartlarda karışımda %25 oranında baklagil kullanarak, yonca+buğdaygil ve korunga+buğdaygil ile tesis ettikleri iki ayrı suni merada yürütmüşlerdir. Araştırıcılar hafif, orta ve ağır olmak üzere 3 otlatma yoğunluğunu esas alarak karışımların çeşitli yönlerden performansını değerlendirmişlerdir. Karışımda buğdaygil olarak; otlak ayrığı, kılçıksız brom ve koyun yumağı olmak üzere 3 tür kullanılmıştır. Tabii merada dekarda 3, 4 ve 5 koyun otlatılırken, suni meralarda, 6, 10 ve 14 koyun otlatılmıştır. Suni meralarda doğal meradan iki kat fazla kuru ot verimi sağlanmıştır. Yine dekara canlı ağırlık artışı en fazla yonca+buğdaygil merasında 38,7 kg ile gerçekleşirken, doğal merada bu değer 2.12 kg'da kalmıştır. Meralarda yenen ot miktarı, kuru ot verimi ve botanik kompozisyon, otlatma yoğunluğuna bağlı olarak önemli ölçüde değişmemiştir. Araştırıcılar, klimaks durumdan tamamen uzaklaşmış kıraç meraların otlatma sistemlerine uyulması ile ıslahının mümkün olabileceğini, ancak bunun için çok uzun bir zamana ihtiyaç duyulduğunu, böyle alanlarda sürüm yapıldıktan sonra yapay mera kurulması işleminin en başarılı ve ekonomik sonuçları verdiğini belirtmişlerdir.

Vallentine (1989), tabii meraların çok sayıda türden meydana gelmesine karşın genellikle yapay meralarda buğdaygil ve baklagillerden oluşan birkaç türe yer verildiğini vurgulamış, karışımlardan oluşan bitkilerin mevcut şartları iyi değerlendirip daha yüksek verim sağladığını, baklagilin fikse ettiği azottan buğdaygillerin istifade ettiğini, karışımdaki buğdaygiller baklagillerden kaynaklanan şişme gibi problemleri hafiflettiğini, farklı türlerin karışımlarından temin edilen yemin hayvanlar için daha dengeli ve besleyici olduğunu vurgulamıştır.

Serin ve ark. (1997), yaptıkları araştırmada taban arazilerde yapay mera tesisi için kullanılabilecek yem bitkileri ile bunların karışımlarını belirlemişlerdir. Sulu şartlarda yetişen ve otlatmaya dayanıklı olan baklagillerden ak üçgül ve gazal boynuzu ile buğdaygillerden kelp kuyruğu, kırmızı yumak, çok yıllık çim, çayır yumağı, çayır salkım otu ve kılçıksız bromu yalnız veya karışım halinde yetiştirmişlerdir. Üç yıllık ortalama sonuçlarına göre, karışımlar kuru ot (1096.0 kg/da) ve ham protein verimi (155.1 kg/da) yönünden yalnız ekimlerden (730.7

ve 87.0 kg/da) üstün olmuştur. Ak üçgül ile kırmızı yumak (Nova Rubra) çayır yumağı ve kılçıksız brom; gazal boynuzu ile kırmızı yumak (Nova Rubra ve Victor) çok yıllık çim (diploid), çayır yumağı ve kılçıksız brom karışımları yüksek kuru ot verimi sağlamışlardır. Bunlar arasında ak üçgül+kırmızı yumak (Nova Rubra), gazal boynuzu+kırmızı yumak (Nova Rubra ve Victor), gazal boynuzu+çok yıllık çim (diploid) ve gazal boynuzu+çayır yumağı karışımlarının ham protein verimlerini de yüksek bulmuşlardır. En yüksek ham protein oranı (%8.93) yalnız ekilen ak üçgülde belirlenirken, gazal boynuzu+çok yıllık çim (diploid)'de baklagil oranı (%60.9), gazal boynuzu+kırmızı yumak (Nova Rubra) karışımında ise karışım etkinliği (1.68) en yüksek olduğunu tespit etmişlerdir.

Bakoğlu ve ark. (1999) Erzurum meralarında yaygın bitki türlerinin ham protein, ham selüloz oranları ile mineral madde içeriklerini inceledikleri çalışmalarında, 92 bitki türünde ortalama %16,2 oranında ham protein bulmuşlardır. Baklagiller en yüksek (%21,1), buğdaygiller en düşük (%11,8), diğer familyalara ait türler (%15,7) ise bu iki değer arasında yer almıştır. Bitkilerin ortalama ham selüloz oranı %29,8 olarak bulunmuştur. Buğdaygiller ortalamanın üzerinde (%33,3), baklagiller (%28,0) ve diğer familyalar (%28,0) ise ortalamanın altında ve birbirine yakın değerlerde ham selüloz oranına sahip olmuşlardır.

Brand (2000), farklı koyun ırklarının meralarda ot seçiminin farklı olduğunu, Dorper koyun ırkının merinoslara göre daha az seçici olduğundan dolayı daha fazla mera bitkisinden yararlandığını bildirmiştir.

Yerli koyun ırklarımızın entansif şartlarda yoğun kuzu besisi performansına ait değerlerin 270-320 g/baş/g arasında değiştiği bildirilmiştir (Aktaş ve ark 2001) Ancak bu koyun ırklarımızın merada besi performanslarına ait veriler bulunmamaktadır.

Steinheim ve ark (2008), farklı koyun ırklarının meradaki ot seçme davranışlarının farklı olduğu bildirmektedirler. Soder ve ark (2009), ruminantların kompleks karışımlardan oluşan meralardaki ot tercihleri farklılıklar olduğunu, bu farklılıkların hayvanin tüketeceği ot miktarını, meranın kompozisyonunu ve besin madde muhtevasını da etkilediğini bildirmiştir.

3.MATERYAL VE METOT

3.1.MATERYAL

3.1.1.Araştırma Alanının Yeri, İklim ve Toprak Özellikleri

Araştırma, Bahri Dağdaş Uluslararası Tarımsal Araştırma Enstitü Müdürlüğü'ne ait sulanabilen arazide yapılmıştır.

Araştırmanın yapıldığı ve uzun yıllara ait bazı iklim değerleri mukayese bakımından Çizelge 1'de verilmiştir. Otlatma yılına rastlayan aylarda 2013 yılı sıcaklık ortalaması 14 C° ve toplam yağış miktarı 158.6 mm, 2014 yılı sıcaklık ortalaması 15.9 C° ve toplam yağış miktarı 212.2 mm olarak gerçekleşmiştir. Uzun yıllar ortalamasına göre sıcaklık 14.2 C° ve toplam yağış miktarı 188.8 mm olarak gerçekleşmiştir.

Çizelge 1. Araştırma yerinin otlatma dönemindeki 2013-2014 ve uzun yıllara ait sıcaklık ve yağış değerleri.

Aylar	Sıcaklık(C°)			Yağış(mm)		
	2013	2014	UYO	2013	2014	UYO
Ocak	1.5	3.8	3.0	26.6	58.8	44.2
Şubat	4.4	4.8	-8.5	33.6	17.4	28.1

UYO(uzun yıllar ortalaması)

Araştırmanın yürütüldüğü deneme parsellerinin bazı fiziksel ve kimyasal özelliklerini tespit etmek amacıyla ekimden önce 0-30 cm'lik katmanından toprak örnekleri alınmıştır. Alınan örnekler Toprak ve Su Kaynakları Araştırma Enstitüsü Müdürlüğü laboratuvarında analiz edilmiştir. Analiz sonuçlarına göre Çizelge 2'de görüldüğü gibi deneme yerine ait topraklar %2.38 organik madde, %18.60 kireç içermektedir. Tuzsuz, killi ve hafif alkali (pH7.91) yapıdadır.

Çizelge 2. Araştırma yeri topraklarının bazı fiziksel ve kimyasal özellikleri.

Toprak derinliği (cm)	Toplam Tuz (%)	Organik Madde (%)	Kireç(%)	Fosfor P_2O_5 (kg/da)	Potasyum K_2O (kg/da)	Bünye	pH
0-30	0.046	2.38	18.60	7.97	107.05	Killi	7.91

3.1.2.Bitki Materyali

Bitki Materyali olarak Konya ekolojik koşullarında önceki yıllarda denemeye alınan çok sayıda karışımdan en iyi sonucu veren, hayvanlar için lezzetli olan, verimi yüksek, otlatmaya dayanıklı yapay mera karışımında kullanılan türler ve oranları Çizelge 3'te belirtilmiştir.

Çizelge 3. Karışımda kullanılan bitkilerin oranları ve miktarları

Bitki Adı	%	gr/da	Karışım miktarı(gr)
1.*Lotus corniculatus* (Gazal boynuzu)	10	2500	250
2.*Trifolium repens* L. (Ak üçgül)	20	2500	450
3.*Lolium perenne* L. (İngiliz çimi)	20	3750	750
4.*Dactylis glomerata* L. (Domuz ayrığı)	30	1000	300
5.*Festuca arundinacea* (Kamışsı Yumak)	20	3750	750
Toplam ekilecek tohum miktarı			2500

Şekil 1. Denemede kullanılan buğdaygil ve baklagil karışımlarından genel görünüm.

3.1.3.Hayvan Materyali

Denemede; hayvan materyali olarak Bahri Dağdaş Uluslararası Tarımsal araştırma Enstitüsünde bulunan koyunculuk ünitesinde yetiştirilen her yıl, aynı yaş ve canlı ağırlıkta Akkaraman, Orta Anadolu Merinosu, Hasmer ve Hasak ırkları koyunların 2,5-3 aylık yaşta sütten kesilmiş kuzuları kullanılmıştır.

Şekil 2. Otlatılacak kuzuların tartım ve seçimi

3.2. METOT

Araştırmada ele alınan konular bazında, birinci yıl yapay mera tesis edilmiş, ikinci ve üçüncü yıllarda ise otlatma ile birlikte 21 gün aralıklarla ölçüm ve gözlemler yapılmıştır.

Deneme Deseni ve Süresi: Araştırma, tesadüf blokları deneme deseninde 3 tekerrürlü olarak 33 ay süreli olarak yürütülmüştür.

Çizelge 4. Denemenin kurulması (otlatma planı ve tekerrür (blok) dağılımı)

Meranın Parsel Alanı, Toprak Hazırlığı, Ekim Şekli ve Zamanı: Tesis edilen mera parsellerinin her biri 25 m x 40 m = 1000 m^2 boyutlarında olup toplam 12000 m^2'dir. Çalışmada kullanılan tohumların küçük olması, çimlenme ve çıkış zorluğu nedeniyle tohum yatağı hazırlığı özenle yapılmıştır. Arazi nadas-buğday ekim nöbetinden sonra Eylül 2011 tarihinde kulaklı pullukla sürülmüştür. 2012 yılı İlkbaharın kazayağı-tırmık ile ikilenerek uygun tesviye ile tohum yatağı hazır hale getirilmiştir. Deneme parsellerine, dekara 2500 gr tohum karışımı gelecek şekilde ekim mibzeriyle 15 cm sıra aralığında, 4-5 cm derinliğe 10 Nisan 2012 tarihinde ekilmiştir.

Şekil 3. Ekimi yapılan parsellerin tohum ve toprak hazırlığı çalışmalarından genel görüntü.

Mera Alanının Çitle Çevrilmesi

Deneme alanının etrafı beton tel çitle çevrilmiştir.

Şekil 4. Yapay mera çit çalışmalarından görüntüler.

Bakım: Tesis yılında karışımdaki bitkilerin yıl boyunca çıkıştan otlatma periyoduna ve kışa giriş, kıştan çıkışa kadar geçen sürede bitkilerin gelişme durumları izlenerek gerekli bakımlar yapılmıştır. Deneme dönemi içerisinde arzu edilmeyen yabancı otlarla makine ve elle mekanik mücadele yapılmıştır.

Barınak ve Gölgeliklerin Yapımı: Meranın ikinci yılı olan 2012 yılında mera parsellerinin köşelerine 12'şer m^2'lik barınak ve gölgelikler yapılmıştır.

Sulukların Yapımı: Mevcut Enstitü deki koyunculuk ünitesinde bulunan çeşmeden yere gömülerek borularla getirilen su borusu ile her bir barınakların içerisine otomatik şamandıralı suluk tasları monte edilmiştir. Kuzuların su ihtiyaçlarını otomatik su taslarından giderilmiştir.

Şekil 5. Hayvan barınak ve suluk yapımından görüntüler.

Gübreleme: Toprak analizlerine bağlı olarak, tohum yatağı hazırlanırken dekara saf madde hesabı ile 10 kg azot ve 10 kg fosfor verilmiştir. Denemenin ileriki aşamalarında ise toprak analizleri sonuçlarına göre 2013 yılı Ekim ayında dekara 5 kg fosfor (P_2O_5) hesabıyla diamonyum fosfat, 2013-2014 Nisan aylarında ise 5 kg saf N hesabıyla amonyum nitrat(%33 N) gübresi uygulanmıştır.

Yapay Meranın Sulanması: Sulama suyu sondaj kuyusundan temin edilmiştir. Kuyudan çıkan su, deneme tarlasına borularla getirilerek yağmurlama ile sulama yapılmıştır.

Birinci yıl hava sıcaklığındaki değişmeler ve topraktaki nem miktarı dikkate alınarak sulama yapılmıştır. İkinci yıl ve sonrası için her 21 günde bir toprak nemini ölçmek suretiyle eksik nemi tarla kapasitesine tamamlayarak sulama yapılmıştır. 2013 yılında toplam 768 mm, 2014 yılında ise 600 mm su uygulanmıştır. İki yıllık ortalama 684 mm su uygulanmıştır.

Şekil 6. Sulama ve gübrelemeden genel görüntüler.

Kuzuların Tartılması ve Meraya Yerleştirilmesi: Kuzular meraya alınacakları gün aç karna tartılmış ve başlangıç ağırlıkları tespit edilmiştir. Kuzuların ortalama canlı ağırlıkları, yaşı ve cinsiyeti eşit olacak şekilde gruplandırılmıştır. Kuzu grupları deneme parsellerine ilk yıl 17 Nisan 2013 tarihinde, ikinci yıl ise 24 Nisan 2014 tarihinde tesadüfi olarak dağıtılmıştır. Meraya yerleştirilen kuzular otlatma periyodu boyunca 21 gün aralıkla aç karna tartılarak canlı ağırlık artışları belirlenmiştir. Bu uygulama her iki yılda da Eylül ayının son haftasına kadar devam etmiştir.

Şekil 7. 2013 yılı otlatmadan görüntüler.

Şekil 8. 2014 yılı otlatmadan görüntüler.

Meradan Örnek Alınması: Otlatma başlangıcında ve 21 gün aralıklarla devam eden örnek alma işlemlerinde otlatılmayan alanlardaki tel kafeslerin içerisinden ve otlatılan alanlardan el ile örnekler alınmıştır. Bu örneklerden verim ve botanik kompozisyon değerleri tespit edilmiştir. Örnek alma işlemi her iki yılda da Nisan ayında başlayıp Eylül ayının son haftasına kadar devam etmiştir.

Şekil 9. Botanik kompozisyondan görüntüler.

Otlatma Planı ve Zamanı: Otlatma 12 dekarlık bir alanda yürütülmüştür. Bitkilerin gelişme ve verimlerine göre birinci yıl tesis yılı ikinci yıl ve üçüncü yılda ise otlatma yılı olarak değerlendirilmiştir. Kuzular meraya sokulmadan önce deneme dışı diğer meralarda 15 gün süre ile alıştırma yapılmıştır. Söz konusu denme parselleri tel çit ile çevrilerek parsellerin her biri 1dekar olacak şekilde dizayn edilmiştir. Otlatma işlemi sürekli otlatma sistemine göre parsellerde yapılan incelemeler ve gözlemler sonucunda bir plan dahilinde 4 grup hayvan ırkları ile karışımların otlatma olgunluğuna geldiği Nisan - Temmuz ayları arasında 84 gün otlatma kapasitelerine uygun şekilde otlatma yapılarak besi performansları belirlenmiştir. Daha sonra mera parselleri bir ay süre zarfında dinlendirilerek tekrar 24 Eylül'e kadar otlatılmaya devam edilmiştir. Otlatma denemesi boyunca yirmi bir gün aralıklarla hayvanların canlı ağırlık değişimi, meranın ot verimi, meranın besin madde içeriği ve botanik kompozisyonu gibi veriler ölçülmüştür.

Çalışmada Yapılan Gözlem ve Ölçümler: Bitkilerin çimlenme ve çıkış zamanları büyüme ritimleri, botanik kompozisyonları değişimi (kışa girişte, kıştan çıkışta, otlatma öncesi ve otlatma sonrası), kışa giriş, kıştan çıkış ve otlatma sonrası gelişme durumları verim ve kalite özellikleri gibi bazı gözlemler yapılmıştır. Bu amaçla; Otlatma parsellerinde her otlatma periyodu başında ve otlatma sonuna kadar 21 gün aralıklarla ot verimi ölçülmüştür. Ayrıca otlatma esnasındaki bitki gelişmesini ve parsellerin toplam ot üretimini değerlendirmek için otlatma başlangıcında parsellere 3'er adet 1.10'ar metrekarelik tel kafes yerleştirilmiştir. Otlatma periyodu başından itibaren otlatma sonuna kadar 21 gün aralıklarla yeşil ve kuru ot verimini ölçmek için her parsele yerleştirilen bu kafeslerden 2- 3 cm yükseklikten biçim yapılmıştır. Otlatma başlangıcında parsellere konulan kafesler vasıtasıyla otlatma periyodu boyunca hayvanların tüketimine sunulan toplam ot miktarı tespit edilmiştir. Ayrıca otlatma periyodu ve yoğunluğuna bağlı olarak bitki kompozisyonunda meydana gelecek değişimleri izlemek üzere her 21 günde bir parsellerdeki kafes ve otlatılan alanlardan alınan örneklerden bitki kompozisyonu ağırlıkça tespit edilmiştir. Her iki yılda da kafeslerden Nisan ayından Eylül ayının son haftasına kadar 8 biçim alınmıştır.

1.Yeşil Ot Verimi(kg/da): Her parsele meranın bütününü temsil edecek şekilde tesadüfi olarak 1.2 m^2(1.1x1.1m) büyüklükte 3 adet kafes yerleştirilmiştir. Otlatma başlangıcında ve otlatma periyodu içerisinde her 21 günde 1 m^2'lik alan içerisindeki otlar toprak seviyesinden 2-3 cm yükseklikten biçilmiştir. Kafesler daha sonra rastgele seçilip toprak seviyesinden 2-3 cm yükseklikten biçimi yapılmış olan yeni alanlara konulmuştur. Her parseldeki kafeslerden elde edilen yeşil otlar tartılarak parsel verimi gram olarak tespit edilmiş ve parselin yeşil ot verimi dekara kg olarak çevrilmiştir.

2.Kuru Ot Verimi(kg/da): Tespit edilen yeşil ot ağırlıkları 70 Cº' de sabit ağırlığa gelene kadar kurutulmuş ve oranlanmak suretiyle kuru ot verimleri tespit edilmiştir.

3.Kuru Madde, Oranları (%) ve Verimleri(kg/da): Kuru madde oranları her bölmeden biçilerek (otlanan alanlardan) 21 günde bir alınan karışım örneklerinden rastgele örnekleme metoduna göre alınan örneklerden 70 ^{0}C 'de 24 saat kurutulduktan sonra tartılıp taze ağırlığa oranlanmıştır. Kuru madde verimleri ise kuru ot verimi ile kuru madde oranının çarpılması ile kg/da olarak hesap edilmiştir (Buğdaycıgil ve ark. 1996).

4. Botanik Kompozisyon(%): Otlatmanın etkilerini belirlemek amacıyla 21 günde bir kuru ağırlığa göre botanik kompozisyon tespiti yapılmıştır. Bunun için alınan ot örnekleri türlere göre ayrılarak kurutulup tartılmış, her türün ağırlığı toplam ağırlığa oranlanmak suretiyle botanik kompozisyon hesaplanmıştır.

5.Ham Protein Oranları (%) ve Verimleri (Kg/Da): Ham protein, oranları otlatılan kısımlardan tesadüf olarak elle biçilen bitki örnekleri 70 Cº' de sabit ağırlığa gelene kadar kurutulmuş ve değirmende homojen şekilde öğütüldükten sonra toplam N miktarı, 6.25 katsayısı ile çarpılarak (azot oranı * 6.25) azot tayin cihazı LECO FP 528 ile belirlenmiştir. Ham protein verimleri ise ham protein oranları ile dekara kuru ot verimleri çarpılarak karışımların dekara protein verimleri bulunmuştur (Anonymous, 2009).

6. Asit Deterjanda Çözünmeyen Lif (Adf) İçeriği (%): Örneklerin ADF içerikleri Van Soest vd. (1991) metoduna göre Gerhard–Fibretern marka cihazla tespit edilerek elde edilen tartım değerlerinin oranlanması suretiyle ADF değerleri tespit edilmiştir.

7. Nötr Deterjanda Çözünmeyen Lif (Ndf) İçeriği (%): Örneklerin NDF içerikleri Van Soest vd. (1991) metoduna göre Gerhard–Fibretern marka cihazla tespit edilerek elde edilen tartım değerlerinin oranlanması suretiyle NDF değerleri tespit edilmiştir.

8. Ham Kül İçeriği (%): Örnekler kül fırınında 550 C^0'de rengi beyaz ya da açık gri renk olana kadar yakılarak kül oranı tespit edilmiştir (Karabulut ve Canbolat 2005).

9. Ham Selüloz(%): Van Soest vd. (1991) metoduna göre Gerhard–Fibretern marka cihazla tespit edilmiştir. Elde edilen tartım değerlerinin oranlanması suretiyle selüloz değerleri tespit edilmiştir.

Şekil 10. Laboratuvar analizinden görüntüler

10. Hayvan Performansı: Otlatma süresi boyunca hayvanlara ek yem verilmemiştir. Mera örneklemesine paralel olarak 21 günde bir hayvanlar tartılmış ve canlı ağırlıklar belirlenmiştir. Hayvan performanslarına ait veriler, kuzuların günlük canlı ağırlık artışları (gr/gün) ve kuzuların hektar alanda et verimleri(kg/gün/ha) üzerinden değerlendirilmiştir.

3.3. VERİLERİN DEĞERLENDİRİLMESİ

Denemeden elde edilen 2013, 2014 yılları ve iki yıllık ortalamalara ait veriler Tesadüf bloklarında İki Faktörlü (Yıl, Irk) Deneme desenine göre varyans analizi uygulanmıştır. İncelenen özelliklere ait ortalamalar ise "Tukey" önem testine göre gruplandırılmıştır. Buna göre aynı gruba giren ortalamalar aynı harflerle, birbirinden farklı ortalamalar ise farklı harflerle gösterilmiştir. İstatistik analizlerde Jump 15 istatistik paket programından yararlanılmıştır.

4. BULGULAR

4.1.Yeşil Ot Verimi (kg/da)

Denemenin iki yıllık bulguları sonucunda; Konya şartlarında oluşturulmuş sulanan meradan elde edilen toplam iki yıllık ortalama yeşil ot verimleri; hayvan ırklarının bulunduğu parseller arasında istatistikî olarak (P>0.05) önemsiz bulunmuştur (Çizelge 5). Çalışmada, AKK, OAM, Hasmer ve Hasak ırklarının bulunduğu parsellerin yeşil ot verimleri sırası ile; 2013 yılında 3615,3659,3675ve 3616 kg/da, 2014 yılında ise 3206, 3248, 3232 ve 3256 kg/da yıllar ortalaması ise 3410, 3454, 3456, 3434 kg/da elde edilmiştir.

Çizelge 5. 2013-2014 yılları ortalama yeşil ot verimleri (kg/da)

Kuzu ırkları	Yıllar(kg/da)		Ortalama
	2013	2014

Kuzuların tartımına paralel olarak 21 günde bir biçim yapılarak yılda 8 biçim yapılmıştır (Çizelge 6). En yüksek biçimi otlatma başlangıcında; 2013 yılında otlatma başlangıcı 1.biçimde 1096-1062 kg/da arasında alınırken en düşük biçimi otlatma sonunda; 2013 yılında 8.biçimde 179 -169 kg/da alınmıştır. 2014 yılında ise yine en yüksek biçimi otlatma başlangıcında1.biçimde 946-907 kg/da arasında alınırken en düşük biçimi 5.biçimde 202-189 kg/da alınmıştır. Denemenin genelinde iklim ve otlatma yoğunluğuna bağlı olarak otlatma başından otlatma sonuna kadar yeşil ot veriminde azalma görülmüştür.

4.2. Kuru Ot Verimi (kg/da)

Denemenin iki yıllık bulguları sonucunda; Konya şartlarında oluşturulmuş sulanan meradan elde edilen iki yıllık toplam ortalama yaş ot verimleri; hayvan ırklarının bulunduğu parseller arasında istatistikî olarak (P>0.05) önemsiz bulunmuştur (Çizelge 7). Çalışmada; AKK, OAM, Hasmer ve Hasak ırklarının bulunduğu parsellerin kuru ot verimleri sırası ile 2013 yılında 900, 907, 880 ve 908 kg/da, 2014 yılında, kg/da 765, 766, 766 ve 786 kg/da, yıllar ortalaması ise 833, 836, 823 ve 847 kg/da elde edilmiştir.

Çizelge 7. 2013-2014 yılları ortalama kuru ot verimleri (kg/da)

Kuzu ırkları	Yıllar(kg/da)		Ortalama

F değeri	ÖD	ÖD	ÖD	ÖD	ÖD	ÖD

Çalışmada, AKK, OAM, Hasmer ve Hasak ırklarının bulunduğu parsellerin kuru madde oranları ve kuru madde verimleri sırası ile 2013 yılında % 93.7, 93.8, 93.4, 93.9 ; 842, 850, 819, 850, 2014 yılında ise % 92.3, 92.2, 92.1, 92.3; 702, 703, 704, 722 kg/da yıllar ortalaması ise % 93.1, 93.0, 93.0, 93.8 ;772, 777, 762, 786 kg/da elde edilmiştir.

4.4. Karışımların Ağırlıkça Botanik Kompozisyonu (%)

Karışımı oluşturan bitki türlerini ağırlıkça botanik kompozisyonu bulmak için, her parseldeki otlanılan alanlardan tesadüfi elle örnek alınarak bitkiler türlerine göre ayrılmıştır. Bu türler ayrı ayrı tartılarak toplam ağırlığa oranlanıp her bitki türlerin botanik kompozisyonundaki ağırlıkça yüzdesi bulunmuştur. Otlatma yoğunluğu ve yaz sıcaklığına bağlı olarak İngiliz çiminin birinci ve ikinci yılda karışımdaki oranı yaz aylarında düşmüştür. Yıllar ortalaması olarak denemede kullanılan karışımdaki bitki türlerine göre % oranları İngiliz çimi 9.1-8.9, domuz ayrığı 22.0-21.2, kamışsı yumak 19.9-18.7, gazal boynuzu 33.1-32.4, ak üçgül 6.3-5.4 yabancı ot ve diğerleri11.0- 10.5 arasında değişmektedir. Karışımda en yüksek değerler gazal boynuzu, domuz ayrığı ve kamışsı yumak bitki türlerinden alınmış, İngiliz çimi ile yabancı ot birbirine yakın değerler alırken en düşük oran ak üçgülden elde edilmiştir (Çizelge 10).

4.5.Ham Protein Oranı(%) ve Verimi (kg/da)

2013-2014 yıllarında kuzu ırklarına bağlı olarak karışımların ham protein oranı ve ham protein verimlerine ait değerler Çizelge 11'de verilmiştir. Araştırmada ham protein oranı ve protein verimi bakımından karışımlar arasında fark istatistikî olarak (P>0.05) önemsiz bulunmuştur. Çalışmada, AKK, OAM, Hasmer ve Hasak ırklarının bulunduğu parsellerin protein oranı ve protein verimleri sırası ile 2013 yılında % 18.6, 18.4, 18.6, 18.7; 147.2, 156.0, 149.6, 160.8 kg/da 2014 yılında ise % 18.1, 18.3, 18.0, 18.1; 145.6, 147.2, 146.4, 148.8 kg/da yıllar ortalaması ise % 18.3, 18.4, 18.3, 18.4; 146.4, 151.2, 147.2, 154.4 kg/da elde edilmiştir.

Çizelge 11. Ortalama ham protein oranı (HPO) (%) ve kuru otta ham protein verimi (HPV) (kg/da)

Kuzu ırkları	**HPO (%)**		**HPV (kg/da)**		**Yıllar Ortalama**	
	2013	**2014**	**2013**	**2014**	**HPO (%)**	**HPV (kg/da)**
AKK	18.6	18.1	147.2	145.6	18.3	146.4
OAM	18.4	18.3	156.0	147.2	18.4	151.2
Hasmer	18.6	18.0	149.6	146.4	18.3	147.2
Hasak	18.7	18.1	160.8	148.8a	18.4	154.4

4.6.ADF ve NDF Oranları (%)

2013-2014 yıllarında kuzu ırklarına bağlı olarak karışımların ADF oranı ve NDF oranlarına ait değerler Çizelge 12'de verilmiştir. Araştırmada ADF oranı ve NDF oranı bakımından karışımlar arasındaki ortalamada fark istatistikî olarak (P>0.05) önemsiz bulunmuştur. Çalışmada, AKK, OAM, Hasmer ve Hasak ırklarının bulunduğu parsellerin ADF oranı ve NDF oranları sırası ile 2013 yılında % 31.3, 31.3, 31.4,31.5; % 47.4, 47.4, 47.6,47.5 2014 yılında ise % 33.4, 33.3, 33.3, 33,3; % 51.2, 51.5, 51.4, 51.5 yıllar ortalaması ise % 32.2, 32.3, 32.3, 32.4; 49.3, 49.6, 49.5, 49.5 elde edilmiştir.

Çizelge 12. Ortalama ADF(%) ve NDF(%) oranları

Kuzu ırkları	ADF (%)		NDF (%)		Yıllar Ortalama	
	2013	2014	2013	2014	ADF (%)	NDF (%)
AKK	31.3	33.4	47.4	51.2	32.2	49.3

Hasmer	31.4	33.3	47.6	51.4	32.3	49.5
Hasak	31.5	33.3	47.5	51.5	32.4	49.5
F değeri	ÖD	ÖD	ÖD	ÖD	ÖD	ÖD

4.7. Ham Kül ve Selüloz Oranları(%)

2013-2014 yıllarında kuzu ırklarına bağlı olarak karışımların ham kül ve selüloz oranlarına ait değerler Çizelge 13'de verilmiştir. Araştırmada ham kül oranı ve selüloz oranı bakımından karışımlar arasındaki ortalamada fark istatistikî olarak (P>0.05) önemsiz bulunmuştur. Çalışmada, AKK, OAM, Hasmer ve Hasak ırklarının bulunduğu parsellerin ham kül oranı ve selüloz oranları sırası ile 2013 yılında % 12.4, 12.3, 12.5, 12.3; % 25.3, 25.1, 25.6, 25.6 2014 yılında ise % 11.7, 11.6, 11.7, 11.7; % 29.3, 29.2, 29.4, 29.3 yıllar ortalaması ise % 12.0, 12.0, 12.1, 12.0 ;% 27.3, 27.2, 27.4, 27.5 elde edilmiştir.

Çizelge 13.Yıllar ortalama ham kül(%) ve selüloz(%) oranları

Kuzu ırkları	Ham kül(%)		Selüloz (%)		Yıllar Ortalaması	
	2013	2014	2013	2014	Ham kül(%)	Selüloz(kg/da)
AKK	12.4	11.7	25.3	29.3	12.0	27.3
OAM	12.3	11.6	25.1	29.2	12.0	27.2

4.8. Hayvan Performansı

Kuzuların Günlük Canlı Ağırlık Artışları (gr/gün)

Toplam otlatma periyodu boyunca kuzuların iki yıllık günlük canlı ağırlık artışları Çizelge 14'de verilmiştir. 2013 yılında kuzuların günlük ortalama canlı ağırlık artışları 71.0 - 99.6 gr/gün arasında değişmiştir. 2014 yılında ise kuzuların günlük ortalama canlı ağırlık artışları 84.2 - 106.8 gr/gün arasında değişmiştir. 2013 ve 2014 yılları ortalaması ise 80.3 - 93.8 gr/gün arasında değişmiştir.

Günlük canlı ağırlık artışlarını ırklar arasında karşılaştırdığımızda her iki yılda da en yüksek AKK ırkından (2013 yılı 99.6 gr/gün, 2014 yılı 106.8 gr/gün iki yıl ortalaması ise 103.2 gr/gün) elde edilmiştir. Denemedeki diğer Hasak, Hasmer ve OAM ırklarının sırasıyla ortalama günlük canlı ağırlık artışları 2013 yılında 70.7, 79.8 ve 71.0 gr/gün; 2014 yılında 84.2, 97.8 ve 86.5 gr/gün, iki yıl ortalaması ise 77.4, 88.8 ve 78.7 gr/gün olarak tespit edilmiştir. Otlatma periyodu boyunca günlük canlı ağırlık artışı bakımından ırkların ortalamaları arası fark istatistik olarak önemli bulunmuştur (P<0.001).

Kuzuların Et Verimi (kg/ha/gün)

Toplam otlatma periyodu boyunca kuzuların iki yıllık et verimleri Çizelge 15'de verilmiştir. 2013 yılında kuzuların Hektar alanda ortalama et verimi günlük 4.2 - 7.1 kg, 2014 yılında ise 5.1 - 6.4 kg arasında değişmiştir. 2013 ve 2014 yılları ortalaması sırasıyla 5.1 ve 5.6 kg olarak tespit edilmiş ve yıllar arası farklılık istatistik olarak önemli bulunmuştur ($P<0.001$).

Hektar alanda günlük et verimi (kg/gün/ha) artışlarını ırklar arasında karşılaştırdığımızda ortalama her iki yılda da en yüksek AKK ırkından (2013 yılı 7.1 kg, 2014 yılı 6.4 kg iki yıl ortalaması ise 6.7 kg) elde edilmiştir. Diğer ırklar olan Hasak, Hasmer ve OAM ırklarında sırasıyla 2013 yılında 4.2, 4.8 ve 4.3 kg; 2014 yılında 5.1, 5.9 ve 5.2 kg; iki yıl ortalaması olarak ise 4.6 kg, 5.3 kg ve 4.7 kg olarak tespit edilmiştir. Otlatma periyodu boyunca hektar alanda et verimi bakımından ırkların ortalamaları arasındaki fark istatistik olarak önemli bulunmuştur ($P<0.001$).

Çizelge 14. 2013 ve 2014 yılları otlatma periyodu boyunca kuzuların dönemlere ait günlük canlı ağırlık değişimleri (g/gün)

4.9. Ekonomik Analiz

Bu çalışmada, 2013 ve 2014 yılı ortalaması olarak kuzu ırklarına göre hayvan başına AKK ırkında 15,48 kg, OAM 10,65 kg, Hasmer ırkında 12 kg, Hasak ırkında 11,61 kg canlı ağırlık artışları gerçekleşmiştir. Irklara göre bu canlı ağırlık artışının brüt üretim değeri en yüksek 170,28 TL ile AKK olurken bunu 132 TL ile Hasmer, 127,71 TL ile Hasak ve 117,15 TL ile OAM takip etmektedir.(Çizelge 16.)

Çizelge 16. Kuzu gruplarına göre hayvanların ortalama canlı ağırlık artışlarının ekonomik analizi

Kuzu ırkları	HB Toplam Canlı Ağırlık Artış Miktarı (kg)	Birim fiyatı (TL/kg)	HB Toplam CA Artışının Brüt Üretim Değeri (TL)	Kısmi Bütçe Analizi	
				Hayvan Başına (TL)	Hektara (TL)
AKK	15,48	11	170,28	53,13	3.187,80
OAM	10,65	11	117,15	0,00	0,00
Hasmer	12,00	11	132,00	14,85	891,00
Hasak	11,61	11	127,71	10,56	633,60

5.TARTIŞMA VE SONUÇ:

Araştırmada, elde edilen kuru ot verimi değerleri ortalama 783.0-827.5 kg/da arasında yeşil ot verimleri ise 3299.5-3421.5 kg/da arasında değişim göstermiştir. Bu değerler, İşliel ve ark. (1962)'nın bildirdiği gibi, yeşil ot verimi(3350-4222 kg/da), Serin ve ark. (1997)'nın bildirdiği gibi, kuru ot verimi (1096-731 kg/da), tespit etmişlerdir. Işık ve ark.(2011) bildirdiği araştırmada elde edilen yeşil ot verimi (3894-1856 kg/da) ve kuru ot verimi (973-459 kg/da) elde etmişlerdir. Bu değerlerle araştırmamızda elde edilen değerler kıyaslandığında kimi yukarıdaki değerlerden yüksek, kimi değerlerden paralel ve kimi değerlerden düşük çıkmıştır.

Araştırmada elde edilen ham protein oranı ve ham protein verimleri ortalama sırası ile %18.3-%18.4 ve 146.4-154.4 arasında değişim göstermiştir. Bu değerler; Çukurova ve Konya taban koşullarında buğdaygil yem bitkisi türleri ile bazı çok yıllık baklagil yem bitkisi türlerinin karışımlarında; Çukurova koşullarında (Çınar S.,2012) protein oranlarının % 9.9 - % 20.6, protein verimlerinin ise 80.9-232.4 kg/da arasında değişen ve Konya koşullarında ise (Işık ve Ark.2012) protein oranlarının % 16.8 - % 17.5, protein verimlerinin ise 78.5-164.6 kg/da elde etmişlerdir. Bu değerlerle araştırmamızda elde edilen değerler kıyaslandığında kimi yukarıdaki değerlerden yüksek, kimi değerlerden paralel ve kimi değerlerden düşük çıkmıştır.

Araştırmada elde edilen ADF ve NDF oranları ortalamaları sırası ile % 32.2-32.4; % 49.3-49.6 arasında değişim göstermiştir. Çukurova ve Konya taban koşullarında buğdaygil yem bitkisi türleri ile bazı çok yıllık baklagil yem bitkisi türlerinin karışımlarında ADF ve NDF oranlarının Çukurova koşullarında (Çınar S.,2012) ADF oranlarının % 26.7 - % 40.2, NDF oranlarını ise % 38.5-%70.9 arasında değişen ve Konya koşullarında (Işık ve Ark.2012) ADF oranlarının % 37.9 - % 41.0, NDF oranlarını ise % 56.2- %59.4 arasında değişen değerlerde elde ettiği verilerle paralellik ve uyum göstermektedir.

Araştırmada elde edilen ham kül (%) ve selüloz (%) oranları ortalamaları sırası ile %12.0-%12.1; % 27.2- % 27.5 arasında değişim göstermiştir. Bu değerler; Çukurova ve Konya taban koşullarında buğdaygil yem bitkisi türleri ile bazı çok yıllık baklagil yem bitkisi türlerinin

karışımlarında ham kül (%) ve selüloz (%) oranlarının Çukurova koşullarında (Çınar S.,2012) Ak üçgülde ham selüloz oranı biçim zamanına bağlı olarak % 23.7 - % 27.4, Çayır kelp kuyruğunda ise % 24.7 - % 29.4 olarak tespit etmiştir. Yoncada ham kül oranı ve ham selüloz oranı biçim zamanına bağlı olarak sırası ile % 12.80 - % 15.56 ; % 26.44 - % 35.13 arasında değiştiğini tespit etmiştir. Konya koşullarında (Işık ve Ark.2012) ham kül (%) ve selüloz (%) oranlarının sırası ile % 10.6 - % 10.9; 22.7 kg - 24.6 kg arasında değişen değerler elde etmişlerdir. Bu değerlerle araştırmamızda elde edilen değerler kıyaslandığında kimi yukarıdaki değerlerden yüksek, kimi değerlerden paralel ve kimi değerlerden düşük çıkmıştır.

Sonuç olarak yapay mera karışımında otlatma periyoduna bağlı olarak, meranın ot verimi ve kalitesindeki değişim ile bu değişimin merada otlayan kuzuların performansı üzerine etkilerinin incelenmesi amacıyla yürütülen bu projeden iki yıllık elde edilen verilerden yola çıkarak;

Merada elde edilen botanik kompozisyon değerlerine göre otlatılan kısımlarda ilk baharda buğdaygil oranları artarken yaz mevsimine doğru gittikçe doğrusal bir azalma olmaktadır. Özellikle İngiliz çiminin oranları ilkbaharda hızla artmasına karşın yaz mevsimine doğru ilerledikçe hızla düşüş yaşanmıştır. Yaz sıcaklarında domuz ayrığı daha iyi gelişme göstermiştir. Karışımda baklagil oranları ilkbahardan itibaren yaza doğru iyi gelişme gösterdiği yaz aylarında oranlarının daha çok arttığı görülmüştür. Genel olarak değerlendirildiğinde hayvanlar tarafından en az tercih edilen tür kamışsı yumak olmuştur. Nedeni ise sert yapılı olmasından kaynaklanmaktadır.

Günlük canlı ağırlık artışlarını ırklar arasında karşılaştırdığımızda her iki yılda da en yüksek AKK ırkından (2013 yılı 99.6 gr/gün, 2014 yılı 106.8 gr/gün iki yıl ortalaması ise 103.2gr/gün) elde edilmiştir. Denemedeki diğer ırklardan Hasak, Hasmer ve OAM ırklarında günlük canlı ağırlık artışı sırasıyla 2013 yılında 70.7, 79.8 ve 71.0 gr/gün, 2014 yılında 84.2, 97.8 ve 86.5 gr/gün, iki yıl ortalaması ise 77.4, 88.8 ve 78.7 gr/gün olarak tespit edilmiştir. Otlatma periyodu boyunca ırkların günlük canlı ağırlık değişimleri ortalamaları arası fark istatistik olarak önemli bulunmuştur ($P<0.001$). GCAA'nın en yüksek olduğu dönemin 2014 deneme yılının 2. Döneminde olduğu tespit edilmiştir. 1. Dönem GCAA'ları bakımından yıl ve ırk faktörlerinin etkisi önemsiz bulunmuştur. 2. Dönemden itibaren yıl ve ırk faktörleri arasındaki farklılık önemli seviyede bulunmuştur. 2 yıllık deneme boyunca otlatma periyodunun her döneminde AKK ırkı kuzular diğer ırklara göre daha yüksek performans göstermişlerdir. Mera şartlarında Hasmer ve Hasak ırkı kuzuların pnömoniye yakalanma ihtimalinin daha yüksek olduğu bu sebeple mera şartlarındaki dinlenme barınaklarının kuzey yönünün mutlak suretle kapatılması gerektiği tespit edilmiştir. Bu amaçla 2013 yılının Mayıs ayından itibaren denemedeki bütün dinleme barınaklarının kuzey yönü branda ile kapatılmıştır. Ayrıca mera şartlarında beslenme programının Hasak, Hasmer ve OAM kuzularının gluteal bölgesinin (anüs ile meme arası) sürekli ıslak kalmasına ve özellikle yaz aylarında sinek zararlısına bağlı olarak kurtlanmalara sebebiyet verdiği gözlenmiştir. Bu amaçla 2013 yılında meradaki bütün kuzulara dış parazit mücadelesi yapılmıştır. 2014 yılında ise dış parazit mücadelesi ile beraber kuyruk bölgesinde yıkama işlemi gerçekleştirilmiştir. Bu amaçla dış parazit ilacı olarak ivermectin gurubu (Mektizan), yıkama ilacı olarak ta Biyotoks F kullanılmıştır. Uygulama uygun dozda her 21 günde bir tekrarlanmıştır. 2 yıllık deneme boyunca AKK rkının pnömoni ve kurt zararlısına karşı daha dayanıklı olduğu gözlenmiştir.

Hektar alanda günlük et verimi (kg/gün/ha) artışlarını ırklar arasında karşılaştırdığımızda her iki yılda da en yüksek AKK (2013 yılı 6.0 kg, 2014 yılı 6.4 kg iki yıl ortalaması ise 6.7 kg) elde edilmiştir. Denemedeki diğer ırklardan Hasak, Hasmer ve OAM ırklarında hektar alanda günlük et verimi sırasıyla 2013 yılında 4.2, 4.8 ve 4.3 kg; 2014 yılında 5.1, 5.9 ve 5.2 kg, iki yıl ortalaması ise 4.6 kg, 5.3 kg ve 4.7 kg olarak tespit edilmiştir. Otlatma periyodu boyunca denemedeki ırkların hektar alanda günlük et verimi ortalamaları arası fark istatistik olarak

önemli bulunmuştur (P<0.001). Et verimi üzerine yıl faktörünün etkisi önemli olup 2014 yılında daha yüksek et verimi elde edilmiştir (5.6 kg/gün/ha). 2013 ve 2014 yıllarında 1. otlatma dönemine ait ortalama GCAA arasında fark bulunmaz iken, aynı döneme ait hektar alanda günlük et verimi bakımından önemli olarak bulunan farklılık birim alandaki hayvan sayısından (2013 yılında 10 baş/da; 2014 yılında 6 baş/da) kaynaklanmaktadır.

Denemenin iki yıllık sonucunda sıcaklık, sürekli otlatma sisteminin etkisine bağlı olarak merada ot veriminin azaldığı dönemlerde AKK kuzuları OAM, Hasmer, Hasak kuzulara göre daha iyi gelişme göstermiştir.

OAM, Hasmer ve Hasak kuzularının ise mera şartlarında büyüme performanslarının benzerlik gösterdiği tespit edilmiştir.

OAM ırkına göre hayvan başına ve hektara canlı ağırlık artışı değerinin kısmi bütçe analizi sonucuna göre AKK, Hasmer ve Hasak ırklarında daha fazla gelir elde edilmektedir (Çizelge 16).

Aynı dönemde mera parselleri arasındaki kuru ot verimi, ham protein, ham kül, selüloz, NDF, ADF oranları üzerine ırkın etkisi önemsiz bulunmuştur. Ancak bahse konu verim özellikleri üzerine otlatma döneminin etkisi önemli bulunmuştur.

Bitki örtüsü zayıf ve botanik kompozisyonunda yeterli oranda iyi cins yem bitkileri bulundurmayan vejetasyonlarda, diğer ıslah yöntemleriyle başarıya ulaşmanın mümkün olmadığı yerlerde yapay mera tesisi yoluna gidilmelidir. Yapay mera tesis edilirken, karışıma giren türlerin birbirleri ile uyum sağlamaları hatta birbirlerinin olumsuz yönlerini gidermeleri gerekir (Altın, 1987).

Yüksek üretim ve otlatma için sürülerek tarla arazisine dönüştürülen alanlarda yapay mera kurulması akılcı bir çözümdür. Ancak otlatmanın mutlaka mera yönetim ilkelerine uygun yapılması gerekmektedir. Yapay meralarda otlatma amenajman ilkesine uyulması, Konya bölgesinde özellikle otlatma sistemlerinden sürekli otlatmadan kaçınıp münavebeli otlatma yoluna gidilmesinin uygun olacağı sonucuna varılmıştır. Aksi halde bu araştırmada da görüldüğü gibi, hayvanların otladığı kısımlarda bitkilerin kendini toparlamalarına fırsat verilmemekte ve meranın yoğun otlatılması, ekilen türlerde ve verimde kayıplara yol açarak merada daha az hayvan otlatılmasına, daha az üretimin gerçekleşmesine yol açmaktadır. Sıcaklığın en yüksek, ot verimin en düşük olduğu yaz aylarında, sürekli otlatma sistemine göre düzenlenen mera alanının muhafazası için dinlendirilmesinin uygun olacağı, dinlendirme şansı olmayan işletmelerde bu dönemde hayvanlara kaliteli kuru ot gibi ek yem verilmesinin gerektiği düşünülmektedir.

ÖZET

Bu araştırma, ABD pamuk germplazm koleksiyonundan temin edilen iki farklı türe (*G. hirsutum ve G. barbadense*) ait bazı genotiplerin Çukurova koşullarında tarımsal performans ve lif kalite özelliklerinin belirlenmesi ve yürütülecek ıslah programlarına aktarılabilirliğinin araştırılması amacıyla yürütülmüştür. Araştırmada materyal olarak farklı tarımsal özelliklere sahip 10 genotip (SA 74, SA 263, SA 333, SA 345, SA 405, SA 408, SA 907, SA 1479, SA 1484 ve SA 1535) ile bölgede yaygın olarak yetiştirilen 2 ticari çeşit (Lazer ve May 455) kullanılmıştır. Deneme, 2024 yılında Çukurova Üniversitesi Ziraat Fakültesi Tarla Bitkileri Bölümü Araştırma ve Uygulama Alanı'nda tesadüf blokları deneme desenine göre 3 tekrarlamalı olarak kurulmuştur. Çalışmada, genotiplerin tarımsal özellikleri (bitki boyu, bitkideki boğum sayısı, odun dalı sayısı, meyve dalı sayısı, koza sayısı, tek kozada kütlü ağırlığı, çırçır randımanı ve kütlü pamuk verimi) ile lif kalite özellikleri (lif inceliği, lif uzunluğu, lif mukavemeti, kopma anında lif uzaması, iplik olabilirlik indeksi, yansıma ve sarılık dereceleri) incelenmiştir. Sonuçlar, test edilen pamuk genotiplerinin incelenen tarımsal ve lif kalite özellikleri bakımından önemli derecede farklılık gösterdiğini ortaya koymuştur. Kütlü pamuk verimi 2699–4995 kg/ha arasında değişmiş, en yüksek değer SA 1484 genotipinden elde edilmiştir. Lif uzunluğu, lif mukavemeti, kopma anında lif uzaması ve iplik olabilirlik indeksi bakımından ise SA 1479 genotipi ön plana çıkmıştır. Ancak *G. barbadense* L. türüne ait olan bu genotip, en düşük kütlü pamuk verimine (2699 kg/ha) sahip olmuştur. Tekstil lifinin iplik yapılabilirliğini ve pamuğun fiyatını önemli ölçüde belirleyici özellik olan lif inceliği 4.4-5.4 arasında değişim göstermiş, en ince liflere SA 333 genotipinde ulaşılmıştır. Genotipler arasında SA 405, 32.2 mm lif uzunluğu ile *G. barbadense* genotipine SA 1479 (32.5 mm) benzer uzunlukta lifleri oluşturmuştur. Saptanan lif mukavemeti değerleri 28.0-38.2 (g/tex) arasında değişkenlik göstermiştir. Sonuç olarak, genotiplerin tarımsal ve lif kalite özellikleri birlikte değerlendirildiğinde, bunların bölgesel pamuk ıslah programlarında ebeveyn olarak kullanılmasıyla hem yüksek verimli hem de üstün lif kalitesine sahip pamuk çeşitlerinin geliştirilmesine katkı sağlayabileceği belirlenmiştir.

Anahtar kelimeler: Pamuk, Tarımsal özellikler, Lif kalitesi, Genetik kaynak, Kütlü pamuk verimi

EVALUATION OF AGRONOMIC AND FIBER TRAITS OF COTTON (*gossypium spp.*) GENOTYPES FOR BREEDING POTENTIAL IN THE CUKUROVA REGION

ABSRACT

This study was conducted to determine the agronomic performance and fiber quality characteristics of some genotypes belonging to two different species (*G. hirsutum* L. and *G. Barbadense* L.) obtained from the U.S. cotton germplasm collection under Çukurova conditions, and to investigate their potential transferability to breeding programs. As research material, 10 genotypes with different agronomic traits (SA 74, SA 263, SA 333, SA 345, SA 405, SA 408, SA 907, SA 1479, SA 1484, and SA 1535) and 2 commercial cultivars commonly grown in the region (Lazer and May 455) were used. The experiment was established in 2024 at the Research and Experimental Area of Çukurova University, Faculty of Agriculture, Department of Field Crops, according to a randomized complete block design with 3 replications. In the study, agronomic traits of the genotypes (plant height, number of nodes, number of monopodial branches, number of sympodial branches, number of bolls, seed cotton weight, ginning turnout, and seed cotton yield) as well as fiber technological properties (fiber fineness, fiber length, fiber strength, fiber elongation, spinning consistency index, reflectance, and yellowness) were examined. The results revealed that the tested cotton genotypes showed significant differences in the studied traits. Seed cotton yield ranged between 2699–4995 kg/ha, with the highest value obtained from genotype SA 1484. In terms of fiber length, fiber strength, fiber elongation, and spinning consistency index, genotype SA 1479 stood out. However, this genotype, belonging to the species *G. barbadense* L., had the lowest seed cotton yield (2699 kg/ha). Fiber fineness, which is a highly decisive trait for spinnability and the price of cotton, ranged between 4.4 and 5.4, with the finest fibers obtained in genotype SA 333. Among the genotypes, SA 405 produced fibers with a length of 32.2 mm, similar to the *G. Barbadense* L. genotype SA 1479 (32.5 mm). The determined fiber strength values ranged between 28.0 and 38.2 (g/tex). As a result, when the agronomic and fiber quality traits of the genotypes were evaluated together, it was determined that their use as parents in regional cotton breeding programs could contribute to the development of cotton cultivars with both high yield and superior fiber quality.

Keywords: Cotton, Agronomic traits, Fiber quality, Germplazm, Seed cotton yield

1. GİRİŞ

Pamuk (Gossypium spp.), yalnızca ekonomik değeri yüksek bir lif bitkisi değil; aynı zamanda yağ, yem ve biyoenerji hammaddesi potansiyeli ile stratejik öneme sahip bir endüstri bitkisidir (Saleem ve ark., 2024). Pamuğun ve yan ürünlerinin ekonomik değerinin korunması amacıyla son 100 yıldır pamuk genetik kaynaklarının toplanması ve korunmasına yönelik uluslararası çabalar artmıştır (Campbell ve ark., 2010; Hinze ve ark., 2025). Kökenini 20. yüzyılın başlarında yürütülen toplama girişimlerinden alan modern ABD pamuk germplazm koleksiyonunda, günümüzde yetiştirilen kültür çeşitleri ile yabani pamuk türlerine ait sekiz yerel ırk belirlenmiştir (Percy ve ark., 2014). Bitki genetik kaynakları ve germplazm koleksiyonları, tarımsal üretimi biyotik ve abiyotik stres faktörlerinin zararlı etkilerinden koruyarak, hem günümüz hem de gelecek kuşakların gıda ve lif ihtiyacını güvence altına alan stratejik rezervlerdir. Bu rezervler özellikle kültür çeşitleri, yerel genotipler ve yabani akrabaların korunması ile sürdürülebilir tarımın ve ıslah çalışmalarının vazgeçilmez bir altyapısını oluşturur (Hinze ve ark., 2025). Ayrıca germplazm koleksiyonları tarımsal üretim haricinde ilaç, biyoteknoloji ve ekosistem hizmetleri açısından da stratejik bir öneme sahiptir. Tüm önemli tarla bitkilerinde modern çeşitlerden sürekli artan verim beklentisi, gen bankalarında bulunan genetik varyasyonun gelecekteki ıslah faaliyetleri için çok daha kritik bir rol oynayacağını göstermektedir. Koleksiyonlardan elde edilen genetik materyaller, özellikle kalite özelliklerinin iyileştirilmesi ve biyotik-abiotik streslere dayanıklı çeşitlerin geliştirilmesinde önemli rol oynar. Örneğin, son yıllarda yeni DNA dizileme teknolojileri, moleküler belirteçler ve genomik seçim teknikleri ile birlikte koleksiyonların taranması, spesifik genlerin hızlı şekilde ıslah programlarına aktarılmasına olanak sunmakta (McCouch ve ark., 2016; Cortés ve Barnaby, 2023), bu da pamuk verimi ve lif kalitesinin daha da geliştirilmesine katkı sağlamaktadır.

Tekstil endüstrisinde üretim verimliliği ve pamuklu dokuma kumaşların kalitesi, büyük ölçüde liflerinin sahip olduğu kalite özelliklerine bağlıdır. Lif uzunluğu, lif mukavemeti, lif inceliği (mikroner değeri), parlaklık ve renk derecesi gibi parametreler; iplik üretiminde eğirme verimliliğini, dokuma/örme performansını ve kumaşın kullanım özelliklerini etkilemektedir. Örneğin uzun ve ince lifler, daha dayanıklı ve düzgün yüzeyli ipliklerin üretilmesini sağlarken, düşük mukavemet veya yüksek varyasyon gösteren lifler üretim sırasında iplik kopuşlarını artırarak maliyetleri yükseltebilmektedir (Bradow ve Davidonis, 2000). Ayrıca pamuk lif kalitesi, tekstil ürünlerinin konfor, estetik ve dayanıklılık özellikleri açısından da stratejik öneme sahiptir. Tüketicilerin talep ettiği yüksek kaliteli kumaşlar, özellikle düşük mikroner değerine sahip, parlak ve homojen renkte liflerden elde edilmektedir. Bu nedenle iplik ve tekstil işletmeleri, farklı pamuk çeşitleri arasında kalite parametrelerine dayalı seçim yaparak üretim stratejilerini belirlemektedir. Son yıllarda özellikle genetik iyileştirme ve hassas tarım uygulamaları ile lif kalitesinin artırılmasına yönelik araştırmalar yoğunlaşmıştır (Özgüven ve Türker, 2010; Yang ve ark., 2023; Prince Charles ve Pandiyarajan, 2025).

Küresel ölçekte iklim değişikliğinin pamuk üretim alanlarında yarattığı belirsizlikler, lif kalite özelliklerinin korunmasını daha da kritik hale getirmiştir (Khan et al., 2025). Hasat dönemindeki yağışlar, sıcaklık dalgalanmaları ve kuraklık gibi faktörler, lif inceliği ve mukavemeti üzerinde olumsuz etkilere neden olabilmektedir (Saini ve ark., 2023). Bu bağlamda hem üreticiler hem de tekstil sanayi, kalite kayıplarını azaltacak yeni çeşitlerin geliştirilmesine ve hasat sonrası kalite koruma yöntemlerine yönelmektedir .

Bu çalışma, ABD Pamuk Germplazm Koleksiyonundan temin edilen bazı genotiplerin Çukurova koşullarında tarımsal performans ve lif kalite özelliklerinin değerlendirilmesini amaçlamaktadır. Elde edilecek sonuçlar, bölgesel ıslah programlarında ebeveyn olarak

kullanılabilecek genotiplerin seçilmesine katkı sağlayarak, hem yüksek verimli hem de üstün lif kalitesine sahip pamuk çeşitlerinin geliştirilmesine zemin oluşturacaktır.

2. MATERYAL ve YÖNTEM

Bu çalışma, Çukurova Üniversitesi Tarla Bitkileri Araştırma ve Uygulama alanında 2024 yılında yürütülmüştür. Çalışmanın yürütüldüğü Adana ilinin uzun yıllar ve 2024 yılına ait sıcaklık, yağış ve nem değerleri Çizelge 1'de verilmiştir.

Çizelge 1. Adana ili uzun yıllar ve 2024 yılına ait meteorolojik veriler.

Aylar	Ort. Sıcaklık (°C)		Ort nem (%)		Toplam Yağış (mm)	
	Uzun Yıllar	2024	Uzun yıllar	2024	Uzun Yıllar	2024
Ocak	9.6	12.3	66.4	71.9	112.1	74.1

Çizelge 1 incelendiğinde, denemenin yürütüldüğü 2024 yılında uzun yıllar ortalamasına göre 93.3 mm daha az yağış gerçekleştiği, ortalama sıcaklık ve ortalama nem değerlerinin ise uzun yıllara göre birbirlerine yakın olduğu görülmektedir.

Denemenin yürütüldüğü tarlaya ait toprak analizleri Çukurova Üniversitesi Toprak ve Bitki Besleme Bölümü Analiz Laboratuvarında gerçekleştirilmiş olup, değerler Çizelge 2'de verilmiştir. Çizelge 2'de görüldüğü gibi denemenin kurulduğu toprağın pH'sı 8.2 olup hafif alkali bir özellik göstermektedir. Organik madde içeriği (%1.34) bakımından fakir bir toprak olup, yararlanılabilir fosfor ve potasyum düzeyleri sırasıyla 10.9 ppm ve 323 ppm'dir. Toprağın kireç oranı %31.63, tuz içeriği ise 0.2 Mmhos/cm olarak belirlenmiştir.

Çizelge 2. Deneme yeri toprağının bazı fiziksel ve kimyasal özellikleri

Derinlik (cm)	Tekstür	pH	Tuz (Mmhos/cm)	Kireç (%)	Org. Madde (%)	Yarayışlı P (ppm)	Yarayışlı K (ppm)

Denemede, ABD pamuk germplazm koleksiyonundan sağlanan 10 adet genotip (SA 74, SA 263, SA 333, SA 345, SA 405, SA 408, SA 907, SA 1479, SA 1484 ve SA1535) ile bölgede yaygın olarak yetiştiriciliği yapılan Lazer ve May 455 çeşitleri kullanılmıştır (Çizelge 3). Deneme, Tesadüf blokları deneme desenine göre 3 tekrarlamalı olarak kurulmuştur. Araştırmada kullanılacak materyaller 2023 yılında tohum çoğaltma çalışmalarına alınarak, çok farklı morfolojik özellikteki bitki tiplerine sahip genotipler, büyümenin her aşamasında izlenmiş ve bu çalışma amacına uygun olanlar seçilmiştir. Deneme ekim işlemleri, hava koşulları ve toprak sıcaklıklarının uygun olduğu 19 Nisan 2024 tarihinde sıra arası 70 cm, sıra üzeri ise 10 cm olacak şekilde gerçekleştirilmiştir. Denemeye ait parsellerin hasat işlemleri 10 Ekim 2024 tarihinde gerçekleştirilmiştir.

Çizelge 3. Çalışmada kullanılan materyallere ait bazı bilgiler.

2.1. Kütlü pamuk verimi (kg/da), morfolojik ve lif kalite özelliklerin ölçümü

Çalışmada, bitki boyu, boğum sayısı, koza sayısı, odun dalı ve meyve dalı sayıları her parselden kenar tesiri çıkarıldıktan sonra ortadaki iki sıradan rastgele seçilen 10 bitkiden ortalamaları alınarak belirlenmiştir. Bitki boyu toprak yüzeyinden bitkinin tepe noktasına kadar olan mesafenin ölçülmesiyle, boğum, odun dalı, meyve dalı ve koza sayıları ise ana gövde üzerinde oluşan yapıların sayılmasıyla saptanmıştır. Hektara kütlü pamuk verimi ise 10 m^2'lik her parselde 2. ve 3. sırada bulunan tüm bitkilerin hasat sonrası tartılarak elde edilen değerlerin

hektara çevrilmesiyle saptanmıştır. Her parselden toplanan 30 adet koza örneğinden ise tek koza kütlü ağırlığı ve çırçır randımanı değerleri hesaplanmıştır. Tek kozadan çıkan kütlü ağırlığı hassas terazide tartılarak belirlenmiştir. Çırçır randımanı ise laboratuvar tipi rollergin çırçır makinesi kullanılarak, aşağıdaki eşitlik yardımıyla belirlenmiştir.

Çırçır Randımanı (%) =[LA / KPA] x100

Burada; LA= Lif ağırlığını (g), KPA= Kütlü pamuk ağırlığını (g) ifade etmektedir.

30 adet koza örneğinden elde edilen lifler ise kalite özelliklerinin analiz edilmesi amacıyla Pamuk Araştırma Enstitüsü (Aydın/Nazilli) Lif Kalite Laboratuvarına gönderilmiştir. Burada HVI 1000 cihazı kullanılarak, lif inceliği, lif uzunluğu, lif mukavemeti, kopma anında lif uzaması, iplik olabilirlik indeksi, yansıma ve sarılık derecesi ölçümleri yapılmıştır.

Araştırmadan elde edilen veriler R programında "agricoale" paketi kullanılarak varyans analizi, "ggplot2" paketi ile biplot analizleri gerçekleştirilmiştir. İstatistiksel olarak önemli çıkan özellik ortalamaları en küçük güvenilir fark (EGF) testi ile %5 önem düzeyinde karşılaştırılmıştır. CV katsayıları yüksek olan odun dalı ve meyve dalı sayısı verilerine karekök transformasyonu gerçekleştirilmiştir. Transformasyon sonrası verilere normallik testi yapılmıştır.

3. BULGULAR ve TARTIŞMA

Araştırma sonuçları, pamuk genotiplerinde incelenen özelliklerin, bitki boyu, koza sayısı, tek koza kütlü ağırlığı, çırçır randımanı ve kütlü pamuk verimi yönünden istatistiki olarak önemli derecede fark yarattığını (P<0.01) ortaya koymuştur (Çizelge 4).

Çizelge 4. Genotiplerin tarımsal özellikler açısından varyans analiz sonuçları.

3.1. Bitki Boyu (cm)

Çalışmada ortalama bitki boyu değerleri 78.1-116.8 cm aralığında değişim göstermiş olup en düşük değer SA 408 genotipinde görülürken, en yüksek değer SA 1479 genotipinde belirlenmiştir (Çizelge 6). ABD germplazm kaynaklarında SA 1479 genotipine ilişkin bitki boyunun 152-183 cm, diğer genotiplerin ise 91-122 cm aralığında değerlere sahip olduğu bildirilirken, bizim çalışmamızda da benzer şekilde SA 1479 genotipi diğer genotiplere göre daha uzun boylu olmuştur (USDA, 2025). Bitki boyu, pamukta bitki mimarisi kavramını etkileyen önemli bir özelliktir (Shang ve ark., 2015). Bitki boyu ana gövde üzerinde bulunan boğumların uzamasının bir fonksiyonu olup, pamuk bitkisinin biyolojik veriminin oluşumunda önemli bir rol oynar. Ayrıca, bitkilerin yatmaya karşı direnci de esas olarak bitki boyundan etkilenir. Bu nedenle, pamuk bitkisinde besin dağılımının optimum düzeyde olması, başka bir deyişle vejetatif-generatif dengenin sağlanması ve yüksek verim elde edilebilmesi için uygun bir bitki boyu geliştirme süreci gereklidir (Liu ve ark., 2013).

Çizelge 6. Pamuk genotiplerinin tarımsal özelliklerinin ortalama değerleri

Genotip	Bitki boyu (cm)	Boğum sayısı (adet)	ODS (adet)	MDS (adet)	Koza Sayısı (adet)	Tek Koza Kütlü Ağırlığı (g)	ÇR (%)	Kütlü Pamuk Verimi (kg/ha)

ODS: Odun dalı sayısı, MDS: Meyve dalı sayısı, ÇR: Çırçır randımanı

EGF: En küçük güvenilir fark.

3.2. Boğum Sayısı (adet)

Çalışmada ortalama boğum sayısı değerleri genotipler arasında istatistiksel olarak önemli fark oluşturmamakla birlikte 19-22.4 adet arasında değişim göstermiş olup, en düşük değer Lazer çeşidinde gerçekleşirken, en yüksek değer SA 74 genotipinde bulunmuştur (Çizelge 6). Pamuk bitkisinde boğum sayısı; verim potansiyeli, bitki yapısı, olgunlaşma süresi ve lif kalitesi üzerinde doğrudan etkilidir. Fazla veya az boğum, hem verimi hem de lif kalitesini olumsuz etkileyebilir, bu nedenle optimum boğum sayısı pamuk ıslahında kritik bir parametredir (Bourland ve ark., 1992). Bitki büyümesinin kontrolünde dört dönemin önemli olduğu bilinmektedir. Bu dönemler; taraklanma öncesi, taraklanma, çiçeklenme ve çiçeklenme doruğu dönemleridir. Tüm bu dönemlerde ana gövdede oluşan boğum sayılarının bilinmesi, erkencilik ve bitki büyüme düzenleyicilerinin kullanım zamanının belirlenmesi gibi konularda kritik öneme sahiptir (Bölek ve ark., 2007). Önceki çalışmalar incelendiğinde, boğum sayısı değerlerinin yetişme koşulları ve çeşide bağlı olarak 16-24 adet arasında gerçekleştiği görülmektedir (Ören ve Basal, 2006; Tarhan ve Karademir, 2019; Sağır ve ark., 2021).

3.3. Odun Dalı ve Meyve Dalı Sayısı (adet)

Çalışmada, genotipler arasında ortalama odun dalı sayısı değerleri açısından istatistiksel olarak önemli farklılık oluşmadığı, değerlerin 0.6-1.6 adet arasında gerçekleştiği, en düşük değerin SA 907 genotipinde, en yüksek değerin ise SA 1479 genotipinde oluştuğu görülmektedir (Çizelge 6). Önceki çalışmalar incelendiğinde, odun dalı sayısı değerlerinin bizim çalışmamıza benzer aralıkta olduğu görülmektedir (Sadık ve Kaynak, 2017; Haliloğlu ve Çoklu, 2024; Kaya ve Karayağlı, 2024). Çalışmada ortalama meyve dalı sayısı değerleri de istatistiksel olarak önemli fark oluşturmadığı, genotipler arasında 9.0-14.2 adet arasında değişim gösterdiği, en düşük değerin Lazer çeşidinde, en yüksek değerin ise SA 1479 genotipinde gerçekleştiği bulunmuştur (Çizelge 6). Pamuk bitkisinde verim değerini doğrudan etkileyen bir parametre olduğundan meyve dalı sayısının yüksek olması istenilen bir durumdur.

3.4. Koza sayısı (adet)

Çalışmada ortalama koza sayısı değerlerinin 15.7-24.9 adet arasında değişim gösterdiği, en düşük değerin SA 263, en yüksek değerin ise SA 907 genotipinde gerçekleştiği görülmektedir (Çizelge 6). Bu genotiplere ait ABD germplazm kaynaklarında belirtilen veriler incelendiğinde, bizim bulgularımızla paralellik gösterdiği anlaşılmaktadır (USDA, 2025). Koza sayısı, pamuk bitkisinde verim bileşenlerini oluşturan önemli bir bulgudur. Bitkinin verimliliğini oluşturan esas konulardan biri olan koza sayısının fazla olmasının yanında hasat edilebilir olması da önem arz etmektedir. Elde edilen sonuçlar göstermektedir ki tüm genotipler kabul edilebilir seviyede koza sayısına sahip olmuştur. Koza sayısını etkileyen faktörler içinde bakım işlemleri ve ekim normu optimum değerler içerisinde olmalıdır. Bu çalışmada bitkinin üretmiş olduğu toplam koza sayıları (açmış+açmamış kozalar) dikkate alınmıştır.

3.5. Tek Koza Kütlü Ağırlığı (g)

Çalışmada, tek kozadan elde edilen ortalama kütlü ağırlıkları 3.4-6.5 g arasında değişim göstermiş olup, en düşük değer SA 1479 genotipinde, en yüksek değer ise SA 74 genotipinde bulunmuştur. ABD germplazm kaynaklarında da belirtildiği gibi *G. barbadense* L. türüne ait olan SA 1479 genotipi daha fazla koza sayısına sahip ancak daha küçük yapıda kozalar oluşturmuştur (USDA, 2025). Pamuk bitkisi indeterminent büyüme özelliği gösterdiğinden koza sayısının tahmin edilmesinde sadece çiçek sayısına ya da yeni açmış kozalara bakmak doğru değildir. Pamuk, generatif döneminde dahi uygun şartları buldukça vejetatif büyüme eğilimi gösterecektir. Hasat edilebilir kozalar dikkate alınarak tek koza kütlü ağırlıkları belirlenmiştir.

3.6. Çırçır Randımanı (%)

Çalışmada, çırçır randımanı değerleri %31-43 değerleri arasında değişim göstermiş olup, en düşük değer SA 405 genotipinde görülürken, en yüksek değer May 455 ve Lazer çeşitlerinde saptanmıştır. ABD germplazm kaynaklarında genotiplere ait veriler incelendiğinde, bu çalışmada tüm genotipler bir miktar daha yüksek çırçır randımanı değerlerine sahip olmuştur (USDA, 2025). Lif ağırlığının kütlü pamuk ağırlığına oranlanması ile elde edilen çırçır randımanı, özellikle pamuk fiyatının belirlenmesinde önemli bir parametre olup, ıslah edilen çeşitlerde yüksek değerlerde olması istenir. Bu çalışmada genotipler arasındaki çırçır randımanı değerleri incelendiğinde özellikle *G. hirsutum* L. türüne ait olan SA 408 ile *G. barbadense* L. türüne ait SA 1479 genotipleri yüksek lif oranı değerleri ile ön plana çıkmaktadır.

3.7. Kütlü Pamuk Verimi

Çalışmada, ortalama kütlü pamuk verim değerleri 2699-4995 kg/ha değerleri arasında değişim göstermiş olup, en düşük değer *G barbadense* L. türüne ait olan SA 1479 genotipinde oluşurken, en yüksek değer *G. hirsutum* L. türüne ait SA 1484 genotipinde belirlenmiştir. SA 1479 genotipi düşük kütlü pamuk verimi gerçekleştirmesine rağmen yüksek kaliteli lifler oluşturmuştur. Kütlü pamuk verimi, birim alandaki bitki sayısı, bir bitkide ortalama koza sayısı ve tek koza kütlü ağırlığı olmak üzere üç verim bileşeninin çarpılmasıyla hesaplanır. Daha önceki çalışmalar, özellikle koza ağırlığının daha fazla iyileşmesiyle pamuk veriminde artışla sonuçlandığını göstermektedir (Tang ve ark., 1993; Iqbal ve ark., 2013; Shakeel ve ark., 2015). Bu nedenle, verim bileşenlerinin kütlü pamuk verimini nasıl değiştirdiğinin bilinmesi, pamuk ıslahında yeni çeşitlerin seçimi için oldukça önemlidir. Pamuk veriminin iyileştirilmesi, özellikle ilk konum kozaları ve fizyolojik olarak sağlıklı bitkide gelişecek olan diğer konum kozaların daha fazla oluşumuyla gerçekleştirilebilir (Dong ve ark., 2014). Genel olarak en fazla koza ağırlığı ve en iyi lif kalitesi için bitkinin orta bölümünde (5-9. boğum arası oluşan kozalar) yer alan birinci ve ikinci konum kozalarıdır(Tan, 1992). Bu kozalar pamuk veriminin sırasıyla %60 ve %30'nu oluşturmaktadır (Oosterhuis, 2001). Bu çalışmada, özellikle SA 1484 genotipi, yüksek koza sayısı ve tek koza kütlü ağırlığı değerleri ile yüksek verim özelliği göstermesinden dolayı ıslah çalışmalarında ebeveyn olarak kullanılmasında önem kazanmıştır.

3.8. Lif İnceliği

Çalışmada, genotipler arasında ortalama lif inceliği değerleri açısından istatistiksel olarak önemli farklılık oluşmadığı, değerlerin 4.4-5.4 arasında gerçekleştiği, en düşük değerin SA 333 genotipinde, en yüksek değerin ise SA 408 genotipinde oluştuğu görülmektedir (Çizelge 7). Lif inceliği büyük oranda çeşidin genetik yapısı tarafından belirlenen bir özellik olmakla birlikte, kozanın bitki üzerindeki konumu, ekim zamanı, yetiştirme sezonundaki çevresel faktörler ve kültürel uygulamalar tarafından da önemli derecede etkilenmektedir. Çok yüksek lif inceliği değerleri (>4.5) lifin kaba olduğu anlamına gelip, tekstil endüstrisi için istenilen bir durum değildir. Çok düşük lif inceliği değerleri (<3.8) ise liflerin olgun olmadığı ve iplik yapımında

kopmaların yüksek olacağı anlamına gelir (Bange ve Constable, 2009). Islah açısından bakıldığında mikroner genellikle lif uzunluğu ve mukavemeti gibi diğer kalite parametreleriyle negatif korelasyon gösterdiğinden, kabul edilebilir bir mikroner değerine ulaşmak ıslahçılar için önemli bir zorluktur (Song ve ark., 2021). Genellikle 3.8–4.5 aralığındaki mikroner değerleri iplik üretiminin verimliliği yönünden ideal kabul edilmektedir (Bange ve ark., 2010). Ülkemizde ve dünya genelinde, tekstil sektöründe ciddi bir sorun olan ve lif fiyat düşüşlerine yol açan kaba lif (yüksek mikroner) sorununa yönelik genetik kaynaklardan yararlanılarak çözüm stratejileri geliştirilebilir. Çalışmamızda bu bağlamda SA 333 genotipi ülkemiz pamuk ıslahçılarına önemli bir materyal olarak sunulabilir.

3.9. Lif Uzunluğu (mm)

Çalışmada, ortalama lif uzunluğu değerleri 27.4-32.5 mm arasında değişim gösterdiği, en düşük değerin SA 263 genotipinde, en yüksek değerin ise *G. barbadense* L. türüne ait olan SA 1479 genotipinde bulunmuştur. ABD germplazm kayıtlarında belirtilen lif uzunluğu değerlerine göre bizim bulgularımız daha düşük olmuştur (Çizelge 3). Bu durumun genel olarak çevre koşulları, nem ve sıcaklık stresleri gibi faktörlerden etkilenmesiyle gerçekleştiği düşünülmektedir. Lif uzunluğu en önemli kalite özelliği olarak kabul edilmekte olup, tekstil endüstrisi ve iplik teknolojisi için büyük önem taşımaktadır. Ticari üretim için daha uzun lifli pamuk çeşitleri tercih edilmektedir. Lif uzunluğu değerleri "25.15-27.94 mm arası orta; 27.94-32.00 mm arası uzun" olarak sınıflandırılmaktadır (Dağdelen ve ark., 2009). Çalışmada genotiplere göre saptanan lif uzunluğu değerleri incelendiğinde, SA 345, SA 405, SA 907, SA1479, SA 1484, May 455 ve Lazer genotipleri 28.85-32.65 mm ile "uzun" kategorisinde yer almış ve pamuk ıslah programlarında ebeveyn seçiminde önemli görülmüşlerdir.

3.10. Lif Mukavemeti (g/tex)

Çalışmada ortalama lif mukavemeti değerleri 28.0-38.2 g/tex arasında değişim gösterdiği, en düşük değerin SA 263, en yüksek değerin ise *G. barbadense* L. türüne ait olan SA 1479 genotipinde oluştuğu görülmektedir (Çizelge 7). Lif mukavemeti kavramı, belirli bir hacimdeki lif demetinin kopması için gereken güç olarak ifade edilmektedir. Çoğunlukla genetik yapıdan belirlenen bu lif özelliği, çevre koşullarından çok etkilenmemekle beraber özellikle hasat zamanı oluşacak olumsuz koşullarda önemli azalmalar ile sonuçlanabilmektedir (Cevheri, 2022). Ülkemizde yetiştirilen pamukların lif mukavemeti değerleri 25-38 g/tex arasında değiştiği, ortalama olarak 30.9 g/tex olduğu rapor edilmiştir (Özbek, 2009). Lif mukavemeti değerleri "<21 çok zayıf, 22-24 zayıf, 25-27 orta, 28-30 kuvvetli ve >31 çok kuvvetli" olmak üzere sınıflandırılmaktadır (Uster, 2008). Bu çalışmamızda da genotiplerin USTER HVI 1000 skalasına göre saptanan lif mukavemeti değerleri incelendiğinde SA 263, SA 408, SA 74 ve SA 1535 genotipleri "kuvvetli" sınıfında yer alırken, SA 345, SA 1479, SA 333, SA 405, SA 907 ve SA 1484 genotipleri ise "çok kuvvetli" sınıfında yer almıştır. Bu durum ıslah amacıyla seçilecek genotiplerin lif mukavemeti yönünden önemini artırmıştır.

3.11. Kopma Anında Lif Uzaması (%)

Çalışmada, ortalama kopma anındaki lif uzaması değerlerinin %7.0-7.9 arasında değişim gösterdiği, en düşük değerin SA 1535 genotipinde, en yüksek değerin ise May 455 çeşidinde oluştuğu görülmektedir (Çizelge 7). Elde edilen sonuçlar incelendiğinde, SA 345 genotipi, USDA kayıtlarında belirtilen değerden 1.5 birim daha esnek oluşuyla dikkat çekmektedir. Kopma anında lif uzaması değerleri "<5 çok düşük, 5.1-5.8 düşük, 5.9-6.7 orta, 6.8-7.6 yüksek ve >7.7 çok yüksek" olarak sınıflandırılmaktadır (Uster, 2008). Bu çalışmada genotiplerin USTER HVI 1000 skalasına göre belirlenen kopma anındaki lif uzaması değerleri incelendiğinde, SA 263, SA 345, SA 408, SA 333, SA 1535, SA 405, SA 907 ve SA 1484 genotipleri "yüksek" sınıfında yer alırken, SA 74 ve SA 1479 genotipleri çok yüksek sınıfında

yer almıştır. Bu durum pamuk ıslahında ebeveyn seçiminde kopma anında lif uzaması değeri bakımından SA 74 ve SA 1479 genotiplerinin önemini arttırmıştır.

Çizelge 7. Pamuk genotiplerinin lif kalitesi özelliklerinin ortalama değerleri.

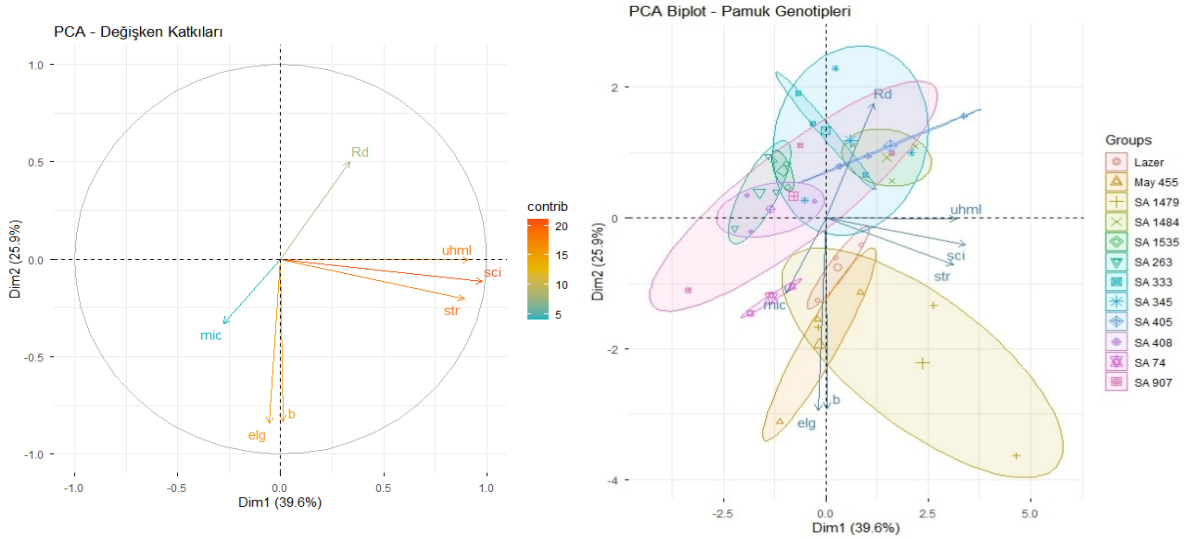
EGF: En küçük güvenilir fark.

3.12. İplik Olabilirlik İndeksi (%)

Çalışmada, ortalama iplik olabilirlik indeksi değerleri %121.6-180.3 arasında değişim göstermiş, en düşük değerin SA 408 genotipinde, en yüksek değerin ise *G. barbadense* L türüne ait SA 1479 genotipinde oluştuğu görülmektedir (Çizelge 7). İplik olabilirlik indeksi, liflerin eğrilebilirliğini tahmin etmek için kullanılan bir hesaplamadır. Bu indeksin belirlenmesinde lif mukavemeti, lif inceliği, lif uzunluğu, lif üniformite indeksi, yansıma ve sarılık dereceleri birlikte değerlendirilir. Genel olarak iplik olabilirlik indeksi ne kadar yüksekse, iplik mukavemeti o kadar yüksektir (Uster, 2008). Tekstil endüstrisinde %120 ve üzerindeki değerler yüksek kabul edilir. Elde edilen sonuçlar incelendiğinde, genotiplerin tümünde %120'den daha yüksek iplik olabilirlik indeksi değerlerine ulaşılmıştır.



3.13. Yansıma ve Sarılık Dereceleri (%)

Çalışmada, pamuk genotiplerinin ortalama yansıma değerleri %73.3-79.3 aralığında değişmiş olup, en düşük değer SA 907 genotipinde, en yüksek değer ise SA 333 genotipinde gerçekleşmiştir. Ülkemiz pamuklarının lif yansıma değerlerinin %56-82 arasında değiştiği, ortalama değerin ise %70 olduğu bilinmektedir (Özbek, 2009). Bu çalışmadan elde edilen

sonuçlar incelendiğinde, genotipler arasında gerçekleşen lif yansıma değerlerinin ülkemiz ortalama değerlerinden daha yüksek olduğu anlaşılmaktadır.

Çalışmada, lif sarılık değerleri ise 8.2-10.0 değerleri arasında değişim göstermiş olup, en düşük değer SA 405 genotipinde, en yüksek değer ise May 455 çeşidinde gerçekleşmiştir. Çalışmada sarılık (+b) değerinin 4-8 arasında olduğu durumlarda lif sarılık yüzdesinin standart değere yakın olduğu kabul edilmiştir (Uster, 2008). Bu çalışmadan elde edilen sarılık derecesi değerlerine bakıldığında, tüm genotiplerin "iyi" sınıfında yer aldıkları görülmektedir (Uster, 2008).

3.14. Çalışmada Kullanılan Genotiplerin PCA-Biplot ve Değişken Katkıları Analizleri

Şekil 1. Çalışmada kullanılan pamuk genotiplerinde lif kalite özelliklerine ait değişken katkıları ve biplot grafiği.

Şekil 1'de pamuk genotiplerinin lif kalite özellikleri bakımından dağılımını gösteren temel bileşen analizi (Principal Component Analysis, PCA) sonuçları verilmiştir. Analiz sonucunda birinci (Dim1) ve ikinci (Dim2) temel bileşenler toplam varyansın yaklaşık %65.1'ini (%39.6 + %25.5) açıklamıştır. Bu yüksek varyans oranı, grafikteki genotipler arasındaki farklılıkların güvenilir biçimde temsil edildiğini göstermektedir. Biplot'ta genotipler farklı sembollerle gösterilmiş, her grubun etrafındaki elipsler %95 güven aralığını yansıtmıştır. Elipslerin konumu ve örtüşme düzeyi, gruplar arası benzerlik veya ayrışma derecesini ortaya koymaktadır. Örneğin, Lazer ve May 455 çeşitlerinin (sarı renkle gösterilen grup) PCA düzleminde lif kalite değerleri açısından diğerlerinden belirgin biçimde ayrıştığı görülmektedir. Bu durum, söz konusu genotiplerin özellikle lif inceliği ve kopma anında lif uzaması bakımından farklı değerlere sahip olduğunu göstermektedir. Buna karşın SA 408, SA 74 ve SA 907 genotiplerinin kümelerinin kısmen örtüşmesi, bu grupların benzer lif kalite profillerine sahip olduklarına işaret etmektedir. Değişkenleri temsil eden vektörlerin yönü ve uzunluğu, her bir özelliğin varyansa katkı düzeyini yansıtmaktadır. Grafikte lif uzunluğu ve lif mukavemeti vektörlerinin aynı doğrultuda uzanması, bu iki özelliğin pozitif korelasyon gösterdiğini ortaya koymaktadır. Buna karşılık, lif inceliği vektörünün zıt yönde yer alması, lif inceliği yüksek genotiplerde genellikle daha kısa boylu veya düşük mukavemetli liflerin bulunduğunu göstermektedir. Bu bulgu, literatürde sıklıkla vurgulanan incelik–mukavemet arasındaki ters ilişkiyi doğrulamaktadır (Song ve ark., 2021; Prasad ve ark., 2022). Genel olarak PCA biplot analizi, pamuk genotiplerinin lif kalite parametreleri bakımından hem grup içi benzerliği hem de gruplar arası farklılıkları açık biçimde ortaya koymuştur. Özellikle SA 1484, SA 1535, SA 263, SA 333 ve SA 345 genotipleri, lif uzunluğu ve mukavemet parametreleriyle yüksek korelasyon göstermiş ve üstün kalite potansiyeli taşımıştır. Bu genotipler, yüksek kaliteli ve dayanıklı lif üretimi

hedefleyen ıslah programlarında değerli ebeveyn adayları olarak öne çıkmaktadır. Buna karşılık, Lazer ve May 455 genotipleri kopma anında lif uzama oranı değerleri bakımından avantajlı olsa da, lif inceliği yönünden sınırlı kalmıştır. Bu nedenle, söz konusu genotiplerin yüksek dayanıklılık potansiyeli taşıyan SA 333 veya SA 1535 gibi genotiplerle melezlenmesi, lif kalitesi bakımından dengeli kombinasyonlar oluşturabilir. Sonuç olarak, SA 1484 × Lazer, May 455 × SA 345 ve SA 1535 × SA 408 kombinasyonları, lif uzunluğu, dayanıklılık ve esneklik özelliklerini bir araya getirebilecek potansiyel melezler olarak önerilmektedir.

4. SONUÇ

ABD pamuk germplazm koleksiyonundan elde edilen on genotip ile iki ticari çeşidin Çukurova koşullarında tarımsal performans ve lif kalite özelliklerinin belirlenmesi amacıyla yürütülen çalışmada, genotipler arasında hem verim hem de lif kalite özellikleri bakımından istatistiksel olarak anlamlı farklılıklar oluşmuştur. Kütlü pamuk verimi 2699–4995 kg/ha arasında değişmiş, en yüksek değer SA 1484 (*G. hirsutum* L.), en düşük değer ise SA 1479 (*G. barbadense* L.) genotipinde belirlenmiştir. Lif uzunluğu (32.5 mm), mukavemeti (38.2 g/tex) ve iplik olabilirlik indeksi (%180.3) bakımından SA 1479 genotipi ön plana çıkarken, en ince lifler SA 333 genotipinde saptanmıştır. Lif kalite özellikleri incelendiğinde, lif uzunluğu ile lif mukavemeti arasında pozitif, lif inceliğinde ise negatif korelasyon gerçekleştiği görülmüştür. Ayrıca, SA 1484, SA 405, SA 333 ve SA 1535 genotipleri lif kalite parametreleri açısından yüksek korelasyon sergileyerek üstün kalite potansiyeli taşımıştır. Sonuç olarak, SA 1484 ve SA 405 genotipleri yüksek verim özellikleriyle; SA 1479 ve SA 333 genotipleri ise üstün lif kalitesiyle öne çıkmıştır. Bu genotiplerin bölgesel pamuk ıslah programlarında ebeveyn olarak kullanılması, Çukurova koşullarına uyumlu, hem yüksek verimli hem de yüksek lif kalitesine sahip yeni pamuk çeşitlerinin geliştirilmesine önemli katkı sağlayacaktır.

ÖZET

İklim değişikliği, özellikle artan ortalama sıcaklıklar ve aşırı hava olaylarının sıklığındaki artışlar, koyun yetiştiriciliği üzerinde çok yönlü olumsuz etkiler yaratmaktadır. Bu çalışmanın amacı, iklim değişikliğinin koyun yetiştiriciliği üzerindeki etkilerini, özellikle ısı stresi, hayvan performansı ve adaptasyon stratejileri bağlamında kapsamlı bir şekilde inceleyerek, sürdürülebilir üretim için etkili önlemler ve yönetim yaklaşımlarını ortaya koymaktır. Isı stresi, koyunların homeostazını bozarak metabolik dengelerini etkiler ve yem tüketimi ile besin madde kullanımını azaltır. Bu durum, büyüme performansında gerileme, üreme başarısında düşüş ve bağışıklık sisteminde zayıflama gibi sonuçlar doğurur. Ayrıca, oksidatif stresin artması, hücresel hasarları tetikleyerek hayvan sağlığını olumsuz etkiler. Isı stresi, özellikle yaz aylarında ve sıcak iklim bölgelerinde koyunlarda önemli verim kayıplarına yol açmaktadır. Hayvan refahının sağlanması ve sürdürülmesi, iklim değişikliğinin olumsuz etkilerini hafifletmede temel bir stratejidir. Koyunların çevresel, beslenme ve sağlık gereksinimlerine uygun koşullarda tutulması, stres faktörlerinin azaltılması ve refahın artırılması performansın korunmasını sağlar. Refahın iyileştirilmesi, et kalitesi ve karkas özellikleri üzerinde de olumlu etkiler doğurarak hem üreticilerin hem de tüketicilerin beklentilerini karşılamaktadır. Adaptasyon stratejileri, genetik dayanıklılığın artırılmasından modern yönetim tekniklerine ve teknolojik yeniliklere kadar geniş bir yelpazede ele alınmaktadır. Isı stresine dayanıklı koyun ırklarının genetik seleksiyon yoluyla geliştirilmesi, adaptasyonun biyolojik temelini oluşturur. Barınaklarda mikroiklim kontrolü, serinletme sistemleri ve uygun havalandırma gibi çevresel düzenlemeler, ısı stresinin etkilerini azaltmada etkilidir. Ayrıca, yapay zekâ destekli giyilebilir teknolojiler ve izleme sistemleri, hayvanların fizyolojik durumları, davranışları ve çevresel stres faktörleri hakkında gerçek zamanlı veri sağlayarak erken müdahale imkanı sunmaktadır. Sonuç olarak, iklim değişikliğinin koyun yetiştiriciliğine etkileri multidisipliner bir yaklaşımla ele alınmalıdır. Isı stresi ve performans kayıplarını minimize etmek için genetik, çevresel ve teknolojik adaptasyon stratejilerinin entegre edilmesi gerekmektedir. Bu yaklaşımlar, hayvan refahını artırırken sürdürülebilir koyun yetiştiriciliğinin geleceğini güvence altına alacaktır.

Anahtar Kelimeler: Isı Stresi Yönetimi, Hayvan Refahı, Genetik Adaptasyon, Sürdürülebilir Hayvancılık, Giyilebilir Teknolojiler

IMPACT OF CLIMATE CHANGE ON SHEEP FARMING: HEAT STRESS, PERFORMANCE, ADAPTATION STRATEGIES

ABSTRACT

Climate change, especially increasing average temperatures and increasing frequency of extreme weather events, has multifaceted negative effects on sheep breeding. The aim of this study is to comprehensively examine the effects of climate change on sheep breeding, especially in the context of heat stress, animal performance and adaptation strategies, and to present effective measures and management approaches for sustainable production. Heat stress disrupts homeostasis of sheep, affects their metabolic balance and reduces feed consumption and nutrient use. This results in a decline in growth performance, decreased reproductive success and weakened immune system. In addition, increased oxidative stress triggers cellular damage and negatively affects animal health. Heat stress causes significant yield losses in sheep, especially in summer months and in hot climate regions. Ensuring and maintaining animal welfare is a basic strategy in mitigating the negative effects of climate change. Keeping sheep in conditions suitable for their environmental, nutritional and health requirements, reducing stress factors and increasing welfare ensures performance is maintained. Improving welfare also has positive effects on meat quality and carcass characteristics, meeting the expectations of both producers and consumers. Adaptation strategies cover a wide range of topics, from increasing genetic resistance to modern management techniques and technological innovations. The development of heat stress-resistant sheep breeds through genetic selection forms the biological basis of adaptation. Environmental regulations such as microclimate control, cooling systems and appropriate ventilation in shelters are effective in reducing the effects of heat stress. In addition, artificial intelligence-supported wearable technologies and monitoring systems provide real-time data on the physiological status, behavior and environmental stress factors of animals, allowing early intervention. In conclusion, the effects of climate change on sheep farming should be addressed with a multidisciplinary approach. In order to minimize heat stress and performance losses, genetic, environmental and technological adaptation strategies need to be integrated. These approaches will increase animal welfare and secure the future of sustainable sheep farming.

Keywords: Heat Stress Management, Animal Welfare, Genetic Adaptation, Sustainable Livestock, Wearable Technologies

1. GİRİŞ

Küresel iklim değişikliği, dünya genelinde ekosistem dengesini bozarak tarımsal üretim sistemlerinin sürdürülebilirliğini tehdit eden en kritik çevresel sorunlardan biri haline gelmiştir. Atmosfere salınan sera gazlarının (karbondioksit [CO_2], metan [CH_4], diazot monoksit [N_2O] vb.) birikimi sonucunda küresel sıcaklık artışı meydana gelmekte ve bu durum özellikle geviş getiren hayvanların yoğun bulunduğu bölgelerde hayvansal üretimi çok yönlü etkilemektedir (Koyuncu ve Akgün, 2018). Hayvancılık sektörü, hem iklim değişikliğinin başlıca nedenlerinden biri olan sera gazı salımına kaynaklık etmekte hem de artan sıcaklıklar, kuraklık, su kıtlığı ve ekstrem hava olayları gibi olumsuzluklardan doğrudan etkilenmektedir (Sarıözkan ve Küçükoflaz, 2020). Hayvansal üretimin küresel sera gazı emisyonuna katkısı özellikle enterik fermantasyon, yem üretimi, gübre yönetimi ve enerji kullanımı üzerinden şekillenmektedir. Geviş getiren hayvanlarda selülozun mikrobiyal fermantasyonu sonucu ortaya çıkan metan gazı, hayvancılık kaynaklı CH_4 salımının en önemli kaynağıdır ve küresel ısınma potansiyeli bakımından CO_2'ye göre 21 kat daha etkilidir (Koyuncu ve Akgün, 2018). Küçükbaş hayvanlar arasında koyunlar, sığırlara göre daha az emisyon üretse de, yaygın yetiştiricilik pratikleri ve yem kalitesi düşüklüğü nedeniyle enterik fermantasyon kaynaklı metan salımı bakımından dikkate değer bir katkı sunmaktadır (Sarıözkan ve Küçükoflaz, 2020). Bununla birlikte, iklim değişikliği sadece emisyon yönüyle değil, hayvan refahı, fizyolojik denge, bağışıklık sistemi, üretim performansı ve üreme parametreleri üzerinde de yıkıcı etkiler yaratmaktadır. Sıcaklık-Nem İndeksi (THI) değerinin artmasıyla birlikte koyunlarda rektal sıcaklık, solunum ve nabız hızı artmakta, yem alımı ve canlı ağırlık kazanımı azalmakta, kortizol seviyeleri yükselmekte ve oksidatif stres belirteçleri aktive olmaktadır (Slimen vd., 2019). Sıcaklık stresi, özellikle gebelik ve laktasyon gibi fizyolojik olarak hassas dönemlerde, hayvanların enerji dengesini bozmakta, embriyonik kayıpları artırmakta ve doğurganlık üzerinde baskı oluşturmaktadır (Romo-Barron vd., 2019; Arero ve Özmen, 2025). Koyunlar, evrimsel süreç içerisinde gelişmiş bazı morfolojik (açık tüy rengi, yağlı kuyruk yapısı), fizyolojik (terleme, solunum artışı), davranışsal (gölge arama, gece otlama) ve genetik (HSP70, MC1R, ENOX2 vb. gen ekspresyonları) adaptasyon mekanizmaları sayesinde sıcaklık stresine karşı diğer türlere göre daha dirençli olsa da, 21. yüzyılın ortalarından itibaren bu doğal dayanıklılığın yetersiz kalabileceğini ortaya koymaktadır (Joy vd., 2020; Berihulay vd., 2019; Thornton vd., 2021). Bu nedenle, iklim değişikliğine karşı koyun yetiştiriciliğinde hem genetik ıslah temelli adaptif stratejiler hem de yönetimsel ve çevresel uyarlamalar bütüncül biçimde değerlendirilmelidir (Aboul-Naga vd., 2022; Henry vd., 2018).

Bu derlemenin amacı, iklim değişikliğinin koyun yetiştiriciliği üzerindeki etkilerini çok boyutlu bir yaklaşımla ele almak; özellikle ısı stresinin koyunların fizyolojisi, üretimi ve refahı üzerindeki etkilerini güncel araştırmalar ışığında incelemek, adaptasyon stratejilerini morfolojik, davranışsal, genetik ve yönetimsel düzeylerde değerlendirmek ve sürdürülebilir hayvancılık için yol gösterici öneriler sunmaktır.

2. İKLİM DEĞİŞİKLİĞİNİN KOYUN YETİŞTİRİCİLİĞİ ÜZERİNDEKİ ETKİLERİ

İklim değişikliği, koyun yetiştiriciliğini doğrudan ve dolaylı yollarla etkileyen çok katmanlı bir kriz dinamiği yaratmaktadır. Artan sıcaklıklar, değişen yağış rejimleri, uzayan kuraklık periyotları, yem kalitesindeki azalma ve su kaynaklarına erişimdeki kısıtlamalar, özellikle dış ortamda yetiştirilen koyun sürülerini ciddi şekilde tehdit etmektedir (Koyuncu ve Nageye, 2020; Ghahramani vd., 2019). Küresel ölçekte yapılan modellemelere göre, 2090 yılına kadar koyunların maruz kalacağı aşırı ısı stresli gün sayısında %60'tan fazla artış beklenmektedir (Thornton vd., 2021). Bu durum, özellikle tropikal ve yarı kurak bölgelerde hayvansal üretimin sürdürülebilirliğini riske atmaktadır. Isı stresinin doğrudan etkileri arasında yem tüketiminde azalma, su ihtiyacının artışı, vücut sıcaklığında yükselme, solunum ve terleme hızının artması

gibi fizyolojik tepkiler yer almaktadır. Bu durum, enerji metabolizmasının bozulmasına, bağışıklık sisteminin zayıflamasına ve üretim performansında düşüşe neden olmaktadır (Slimen vd., 2019; Morgado vd., 2023). Aynı zamanda, sıcaklık artışı süt veriminde %35–40 oranında düşüşe ve et üretiminde canlı ağırlık artışının yavaşlamasına neden olabilmektedir (Koyuncu ve Nageye, 2020). Bu etkiler, özellikle Sıcaklık-Nem İndeksi (THI) değerinin 78'in üzerine çıktığı durumlarda ciddi hale gelmektedir (Berihulay vd., 2019). İklim değişikliğinin bir diğer önemli etkisi yem ve ot kaynaklarının kalitesinde azalma yoluyla gerçekleşmektedir. Artan sıcaklık ve CO_2 seviyeleri, yem bitkilerinde ham protein içeriğini düşürmekte, sindirilebilirliği azaltmakta ve lif oranlarını artırarak hayvan beslenmesini olumsuz etkilemektedir (Henry vd., 2018; Ghahramani vd., 2019). Ayrıca kuraklık koşulları altında otlatma alanlarının biyoçeşitliliği azalarak besleme maliyetlerini yükseltmektedir (Koyuncu ve Akgün, 2018). İklim değişikliği sadece üretim parametrelerini değil, hayvan sağlığı ve refahını da kapsamlı biçimde etkilemektedir. Artan sıcaklıklar, dış parazitlerin ve hastalıkların yayılım alanını genişletmekte; bu durum koyunlarda hem bulaşıcı hastalık sıklığını artırmakta hem de tedavi maliyetlerini yükseltmektedir (Sarıözkan ve Küçükoflaz, 2020). Isı stresine bağlı olarak bağışıklık sisteminin baskılanması, koyunları sekonder enfeksiyonlara karşı daha savunmasız hale getirmektedir (Morgado vd., 2023). Ek olarak, iklimsel stresin sosyal davranışlar üzerinde de etkili olduğu gösterilmiştir. Borthwick vd., (2024), serbest gezen Merinos koyunlarında sıcaklık arttıkça gölgelik bölgelerde daha uzun süre kalındığını ve bu davranışın sürü içindeki sosyal ağ yapısını değiştirdiğini ortaya koymuştur. Bu durumun bilgi veya hastalık yayılımı gibi popülasyon düzeyinde sonuçları olabileceği vurgulanmaktadır. Su kaynaklarının azalması da iklim değişikliğinin önemli bir çıktısıdır. Hayvansal üretimde özellikle yaz aylarında artan su ihtiyacı karşılanamazsa, dehidrasyon, hipertermi ve ölümlerle sonuçlanabilecek ciddi fizyolojik stresler ortaya çıkabilmektedir (Koyuncu ve Nageye, 2020; Henry vd., 2018). Ojango vd., (2023) Kuzey Kenya'daki çoban topluluklarında koyun ve keçi üretimini artırmak amacıyla iklim dirençli hayvan yönetim uygulamalarının benimsenmesini ve bu uygulamaların etkilerini yaptıkları bu çalışmayla incelemiş olup ,serbest otlatmadan mevsimsel göç sistemine geçişin daha iyi olduğunu, bunun yanı sıra bulundukları bölgenin aralıklı ve öngörülemez yağış alan yarı kurak bir alan olduğunun da göze alınması gerektiğini belirtmiştir. Türkiye gibi Akdeniz iklim kuşağında yer alan ülkelerde, sıcaklık artışına bağlı olarak hayvancılık işletmelerinin maliyetlerinde %50'ye varan yükselişler beklenmektedir (Koyuncu ve Nageye, 2020). Son olarak, iklim değişikliği hayvan ırklarının genetik sürdürülebilirliğini de tehdit etmektedir. Sıcaklık ve çevresel baskılar nedeniyle düşük adaptasyon kabiliyetine sahip bazı ırkların üretimden düşmesi, genetik çeşitliliğin azalmasına ve yerel ırkların yok olmasına neden olabilir (Joy vd., 2020; Tsartsianidou vd., 2021). Sánchez-Molano vd., (2020) yaptıkları çalışmada 1991-2018 yılları arasında 4469 kuzudan alınan büyüme dönemi verileri toplayarak rastgele regresyon modelleri aracılığıyla bireysel "reaksiyon normları" oluşturmuşlardır. İklim değişikliğinin, çiftlik hayvanlarının verimliliğini olumsuz etkileyebileceğini öne ssürmüşlerdir. Hava durumu verilerini 10 günlük ortalama olarak almışlardır. Sonuç olarak iklim değişikliğinin etkilerini azaltmak için genetik ıslah stratejilerinin uygulanabilir olduğunu, yeni tanımlanan dayanıklılık fenotipleri, seleksiyon programlarına entegre edilerek gelecekteki üretim kayıplarının minimize edilmesine katkı sağlayabileceğini vurgulamışlardır. Bu durum, sadece biyolojik çeşitliliği değil aynı zamanda kültürel mirası da etkilemektedir. Tüm bu etkiler bir araya geldiğinde, iklim değişikliğinin koyun yetiştiriciliği üzerinde hem kısa vadeli ekonomik hem de uzun vadeli ekolojik ve genetik düzeyde sürdürülemez sonuçlar doğurduğu açıkça görülmektedir. Bu nedenle, sıcaklık stresine karşı hem bireysel hem sistem düzeyinde koruyucu ve uyarlanabilir çözümlerin geliştirilmesi bir zorunluluk haline gelmiştir.

3. ISI STRESİNİN FİZYOLOJİK VE ÜREME ÜZERİNE ETKİLERİ

Isı stresi, koyunların homeostatik dengesini bozan ve sistemik düzeyde çok yönlü etkiler yaratan çevresel bir stres faktörüdür (Pulido-Rodríguez vd., 2025). Sıcaklık stresi, sıcakkanlı hayvanların vücut ısısını regüle eden sistemlerinin bozulması sonucu ortaya çıkan fizyolojik bir durumdur. Küçükbaş hayvanların sıcaklık stresine maruziyeti hem hayvan refahını hem de ekonomik verimliliği olumsuz etkiler. Hayvanların sıcaklığa dayanıklılığı; genetik, morfolojik ve fizyolojik özelliklerine bağlı olarak değişkenlik gösterir. "Konfor sıcaklık aralığı" terimi, hayvanın minimum enerji harcayarak vücut sıcaklığını sabit tutabildiği sıcaklık dilimini ifade eder. Bu aralık koyunlar için 12–32 °C, keçiler için 12–24 °C'dir (Yılmaz ve Çam, 2023). Sıcaklık-Nem İndeksi (THI) değerinin yükselmesiyle birlikte koyunlarda temel yaşam fonksiyonlarında belirgin fizyolojik tepkiler ortaya çıkmaktadır. Bu tepkiler arasında rektal sıcaklık artışı, solunum ve kalp atım hızında yükselme, su tüketiminde artış ve yem tüketiminde azalma gibi termoregülasyon odaklı yanıtlar öne çıkmaktadır (Slimen vd., 2019; Morgado vd., 2023; Pulido-Rodríguez vd., 2025). Sıcaklık stresi, hipotalamus-hipofiz-adrenal (HHA) yolu üzerinden endokrin sistemin işleyişini bozarak stres hormonlarında artışa neden olur. Kortizol seviyelerindeki yükselme, bağışıklık sisteminin baskılanmasına, enerji metabolizmasının olumsuz etkilenmesine ve oksidatif stres belirteçlerinin aktivasyonuna yol açmaktadır (Slimen vd., 2019). Aynı zamanda triodotironin (T3) ve tiroksin (T4) gibi tiroid hormonlarında da ısı stresine bağlı olarak azalma gözlenmekte, bu da bazal metabolizma hızının düşmesine neden olmaktadır (Joy vd., 2020). Isı stresinin hematolojik ve biyokimyasal parametreler üzerinde de belirgin etkileri vardır. Rektal sıcaklık ve solunum hızında artış görülmekte; buna karşın toplam protein, albumin ve antioksidan aktivitede baskılanma gözlenmektedir (Slimen vd., 2019). Ayrıca, serumda nitrik oksit (NO) ve malondialdehit (MDA) düzeylerinin artması, oksidatif hasarın önemli göstergeleri arasında yer almaktadır (Slimen vd., 2019). Üreme sistemi, ısı stresine karşı oldukça hassas bir yapıya sahiptir. Dişi koyunlarda kızgınlık süresi kısalmakta, ovulasyon oranı düşmekte, embriyo kayıpları artmakta ve gebelik oranlarında önemli ölçüde azalma meydana gelmektedir (Romo-Barron vd., 2019). Özellikle gebeliğin erken dönemlerinde meydana gelen ısı stresi, plasental büyümeyi ve fetal gelişimi olumsuz etkileyerek düşük doğum ağırlığına ve neonatal kayıplara yol açabilmektedir (Slimen vd., 2019). Erkek koyunlarda ise testiküler termoregülasyonun bozulması, spermatogenez sürecini olumsuz etkileyerek sperm motilitesi, morfolojisi ve yoğunluğunda düşüşe neden olmaktadır (Arero ve Özmen, 2025). Artan testis sıcaklığı, germ hücrelerinde apoptozise ve sperm DNA hasarına yol açabilmekte; bu da fertilite oranlarının düşmesine neden olmaktadır (Arero ve Özmen, 2025). Üreme hormonları üzerindeki etkiler de dikkat çekicidir. Isı stresine maruz kalan koyunlarda folikül stimüle edici hormon (FSH), luteinize edici hormon (LH), östrojen ve progesteron seviyelerinde düzensizlikler görülmekte, bu da ovaryum fonksiyonlarının baskılanmasına yol açmaktadır (Romo-Barron vd., 2019). Özetle, ısı stresi koyunlarda temel vücut sistemleri üzerinde hem akut hem de kronik etkiler yaratarak üretim ve üreme verimliliğini düşürmektedir. Fizyolojik dengedeki bozulmalar, yalnızca kısa vadeli üretim kayıplarına değil, aynı zamanda sürü sağlığının ve genetik verimliliğin sürdürülebilirliğini tehdit eden uzun vadeli sonuçlara da yol açmaktadır. Bu nedenle, ısı stresinin etkileri sadece biyolojik değil, aynı zamanda ekonomik ve genetik açılardan da stratejik öneme sahiptir.

4. DAVRANIŞSAL VE MORFOLOJİK ADAPTASYONLAR

Koyunlar, evrimsel süreç boyunca farklı ekolojik koşullara uyum sağlayarak geliştirdikleri davranışsal ve morfolojik özellikler sayesinde sıcaklık stresi gibi çevresel baskılara karşı belirli düzeyde direnç geliştirmiştir. Bu adaptasyonlar, hayvanların termal yükü minimize etmesine, su ve enerji kaybını azaltmasına ve hayatta kalma olasılığını artırmasına olanak tanımaktadır (Berihulay vd., 2019; Joy vd., 2020).

4.1. DAVRANIŞSAL YANITLAR

Isı stresine maruz kalan koyunlar, çevresel koşullara karşı bir dizi davranışsal strateji geliştirir. Bunlar arasında gölgede dinlenme süresinin artması, otlatma saatlerinin sabah erken ve akşam geç saatlere kaydırılması, su tüketiminin artışı ve grupsal hareketlerde değişimler yer alır (Henry vd., 2018). Borthwick vd., (2024), sıcaklığın arttığı dönemlerde koyunların daha sık ve uzun süreli gölgelik alanlarda kaldığını, bunun da sürü içi sosyal etkileşimleri yoğunlaştırarak davranışsal ağ yapısını değiştirdiğini belirtmiştir. Bu durum, sürü içinde bilgi yayılımı, sosyal stres ve patojen iletim oranları üzerinde etkili olabilir. Sıcaklık stresi ayrıca hayvanların otlama davranışlarını da değiştirir. Aşırı sıcak koşullarda koyunlar daha az hareket eder, otlama süresi ve sıklığı azalır; bu da yem tüketimini dolaylı olarak düşürerek canlı ağırlık artışı ve süt verimini olumsuz etkiler (Koyuncu ve Nageye, 2020). Bununla birlikte, bazı sürülerde gece otlaması gibi davranışsal esneklikler gelişerek çevresel stresin etkileri kısmen dengelenebilir.

4.2. MORFOLOJİK ADAPTASYONLAR

Koyunlarda sıcak ortama uyum sağlamada etkili olan bir diğer önemli faktör, morfolojik özelliklerdir. Tüy rengi, deri kalınlığı, kulak yapısı, kuyruk morfolojisi ve vücut yüzey alanı gibi özellikler, ısı değişimlerinin yönetilmesinde kritik rol oynar (Berihulay vd., 2019). Açık renkli yapağıya sahip koyunlar, güneş ışığını daha fazla yansıtarak vücut ısısının artmasını sınırlar. İnce ve seyrek yapağı yapısı ise hava sirkülasyonunu artırarak termal yükün azaltılmasına yardımcı olur (Arero ve Özmen, 2025). Yağlı kuyruk yapısına sahip yerli ırklar, enerji depolamasını vücudun periferik bölgesinde yoğunlaştırarak iç organların ısı dengesini koruma avantajı sunar (Arero ve Özmen, 2025). Bu yapı, ısıya karşı pasif bir savunma mekanizması olarak da işlev görür (Aboul-Naga vd., 2022). Yüksek sıcaklıkta yetiştirilen koyunlarda daha küçük vücut yapısının yaygın olduğu, bunun da yüzey alanı/kütle oranını artırarak ısı kaybını kolaylaştırdığı belirlenmiştir (Joy vd., 2020). Bu fizyolojik avantaj, özellikle Sahra altı Afrika ve Orta Doğu'daki yerel koyun ırklarında sıklıkla gözlenmektedir. Ayrıca, koyunların postüral (duruşsal) davranışlarında da iklimsel koşullara göre değişim görülmektedir. Isı stresine maruz kalan hayvanlar, gölgeye yönelme dışında, vücutlarını toprağa daha yakın tutarak ısı kaybını artıran yatış pozisyonları benimseyebilirler (Thornton vd., 2021). Genel olarak, davranışsal ve morfolojik adaptasyonlar, sıcaklık stresinin kısa vadeli etkilerine karşı koyunların hayatta kalmasını sağlayan ilk savunma hatlarıdır. Ancak bu yanıtların uzun süreli ve kronik iklim değişikliği koşullarında yetersiz kalabileceği ve üretim verimliliğini tam anlamıyla koruyamayacağı dikkate alınmalıdır. Bu nedenle, bu adaptif özelliklerin genetik temelleriyle ve uygulamalarla desteklenmesi büyük önem taşımaktadır.

5. GENETİK VE EPİGENETİK YANITLAR

İklim değişikliğinin koyunlar üzerindeki etkilerine karşı yalnızca davranışsal ve fizyolojik tepkiler yeterli olmamakta; uzun vadede kalıcı adaptasyon sağlanabilmesi için genetik dayanıklılık büyük önem taşımaktadır. Bu bağlamda, sıcaklık stresine karşı geliştirilen genetik ve epigenetik yanıtlar, koyunların seleksiyon, ıslah ve sürdürülebilir üretim stratejileri açısından temel bir belirleyici hâline gelmiştir (Berihulay vd., 2019; Aboul-Naga vd., 2022).

5.1. GENETİK ADAPTASYON MEKANİZMALARI

Koyunların sıcak ortamlara adaptasyonu, birçok genetik lokusun ekspresyon seviyeleriyle ilişkilidir. Özellikle "heat shock proteins" (HSP), sıcaklık stresine karşı hücresel düzeyde koruma sağlayan önemli gen ailesidir. HSP70, HSP90 ve HSP60 genleri, hücresel proteinlerin denatürasyonunu engelleyerek hücre bütünlüğünün korunmasına yardımcı olur (Berihulay vd., 2019). Bu genlerin sıcaklık stresi altında yüksek düzeyde ifade edildiği ve termotoleransla pozitif ilişkili olduğu birçok çalışmada gösterilmiştir. Tsartsianidou vd., (2021), Chios koyunlarında yürüttükleri genom çapında ilişkilendirme çalışmasında, sıcaklık stresine

dayanıklılığı etkileyen çeşitli genom bölgelerini (QTL) tanımlamış ve HSP ile ilişkili bazı aday genleri belirlemiştir. Özellikle TRPM8, ATP1A1, ENOX2 ve MC1R gibi genlerin sıcak ortam adaptasyonunda etkili olduğu vurgulanmıştır. Bu genlerin düzenleyici bölgeleri, hücre membran stabilitesi, iyon kanalı denetimi ve pigmentasyon ile ilişkili fizyolojik süreçlerde rol oynamaktadır. Buna ek olarak, Ren vd., (2024) sıcak çöl koşullarına adapte olmuş Mısır Hu koyunlarında, genetik çeşitliliğin ısıya adaptasyon kapasitesiyle yakından ilişkili olduğunu göstermiştir. Isı toleransı yüksek bireylerde, HSP70 ve BCL2 gibi stresle ilişkili genlerin ekspresyon düzeylerinin anlamlı biçimde yüksek olduğu, bu bireylerin ise daha yüksek canlı ağırlık kazancı ve rektal sıcaklık stabilitesi gösterdiği bildirilmiştir.

5.2. EPİGENETİK DÜZENLEMELER

Genetik varyasyonların ötesinde, epigenetik mekanizmalar da çevresel streslere karşı hızlı ve geri dönüşlü adaptasyon süreçlerinde önemli rol oynamaktadır. Epigenetik değişimler, genetik dizide bir değişiklik olmadan gen ekspresyonunun çevresel sinyallerle düzenlenmesini sağlar. Özellikle DNA metilasyonu, histon modifikasyonları ve mikroRNA'lar, ısı stresine karşı geliştirilen epigenetik yanıtlar arasında yer almaktadır (Ren vd., 2024). Mısır'da yapılan çalışmalarda, sıcak ortamlarda yetiştirilen Hu koyunlarında, özellikle HPA aksı üzerinden işleyen CRH-ACTH-kortizol yolundaki epigenetik değişimlerin adaptasyonda önemli rol oynadığı bildirilmiştir (Ren vd., 2024). Bu sistemin metilasyon profillerinde görülen farklılıklar, kortizol salınım düzeylerini ve dolayısıyla hayvanın stresle başa çıkma kapasitesini doğrudan etkileyebilmektedir. Ayrıca, DNA metilasyonundaki bu farklılıkların kuşaklar boyunca aktarılabileceği, yani epigenetik kalıtımla termotoleransın artırılabileceği düşünülmektedir. Epigenetik profilleme yöntemlerinin gelişmesiyle birlikte, koyunlarda ısı stresine duyarlı gen bölgelerinin tanımlanması ve bu bilgilerin seleksiyon programlarına entegre edilmesi mümkün hâle gelmiştir (Ren vd., 2024). Bu da klasik fenotip temelli seleksiyonun ötesine geçilerek, moleküler düzeyde daha hedefli ve etkili bir ıslah stratejisi geliştirilmesine olanak tanımaktadır (Berihulay vd., 2019).

5.3. GENOMİK SELEKSİYON VE SÜRDÜRÜLEBİLİRLİK

Isıya dayanıklı bireylerin erken yaşta tanımlanabilmesi, genetik ilerlemenin hızlandırılması açısından büyük avantaj sağlar. Bu amaçla, SNP (single nucleotide polymorphism) bazlı genotipleme teknikleriyle ısı stresine dayanıklı fenotiplerin genomik belirteçlerle eşleştirilmesi yönünde önemli ilerlemeler kaydedilmiştir (Tsartsianidou vd., 2021). Bu sayede, sadece üretim performansı değil aynı zamanda çevresel streslere karşı direnç de ıslah hedefi hâline gelmektedir. Genetik ve epigenetik dayanıklılık, koyunların uzun vadeli iklimsel değişikliklere karşı korunmasında anahtar rol oynamakta; bu bilgiler sürdürülebilir hayvancılık politikalarının oluşturulmasında da temel veri kaynağı olarak değerlendirilmektedir.

6. YÖNETİMSEL VE BESLENME STRATEJİLERİ

İklim değişikliğinin koyun yetiştiriciliği üzerindeki etkilerini azaltmak ve ısı stresinin üretim üzerindeki olumsuz sonuçlarını hafifletmek amacıyla uygulanan yönetimsel ve beslenme stratejileri, hayvan refahı ve verimliliği açısından kritik öneme sahiptir. Özellikle sıcaklık-nem indeksinin (THI) yüksek olduğu dönemlerde, uygun barınak koşulları, çevresel düzenlemeler, rasyonel sulama sistemleri ve takviye edici besin destekleri ile koyunların stres düzeyi azaltılabilir (Berihulay vd., 2019; Thornton vd., 2021).

6.1. BARINAK VE ÇEVRESEL DÜZENLEMELER

Isı stresine karşı ilk savunma hattı, hayvanların barınma ve çevre koşullarının iyileştirilmesidir. Gölgelik alanların artırılması, barınaklarda doğal havalandırma sistemlerinin kullanılması, zeminin ısıyı yansıtan ve absorbe etmeyen malzemelerle düzenlenmesi ve gerektiğinde fan ya da püskürtmeli soğutma sistemlerinin uygulanması ısı stresini azaltıcı etkiler göstermektedir

(Slimen vd., 2019). Özellikle açık arazide otlayan sürülerde, ağaç altı gölgelik sistemlerin hayvanların vücut sıcaklığını düşürmede etkili olduğu bildirilmiştir (Borthwick vd., 2024). Bazı ülkelerde, tarım ve hayvancılığı birleştiren entegre sistemlerde güneş panelleri gölgelik olarak kullanılarak hem elektrik üretimi sağlanmakta hem de hayvan refahı korunmaktadır (Tüfekçi vd., 2022). Bu tür sürdürülebilir uygulamalar, sıcaklık stresine karşı çift yönlü çözüm sunmaktadır.

6.2. SU TEMİNİ VE YÖNETİMİ

Sıcaklık arttıkça koyunların suya olan ihtiyacı da artar. Isı stresinin etkilerini azaltmak için yeterli ve sürekli temiz su temini sağlanmalıdır. Dehidrasyon, termoregülasyonun bozulmasına, yem tüketiminde azalmaya ve verim kayıplarına neden olur. Özellikle laktasyon dönemindeki dişiler ve gelişme çağındaki kuzu ve toklularda su tüketimi, metabolik ihtiyaçların karşılanması açısından yaşamsaldır (Slimen vd., 2019; Pulido-Rodríguez vd., 2025). Su kaynaklarının doğru yerleştirilmesi, hayvanların suya kolay erişmesini sağlayarak stres düzeylerini azaltabilir (Henry vd., 2018). Ayrıca yaz aylarında suyun aşırı ısınmaması için gölgede tutulması, su kalitesinin korunması açısından önemlidir.

6.3. BESLENME STRATEJİLERİ

Isı stresi altında yem tüketimi azalırken enerji ihtiyacı artar. Bu durum, besleme stratejilerinde değişiklik yapılmasını gerekli kılar. Rasyonlara yüksek sindirilebilirliğe sahip yemlerin eklenmesi, selüloz içeriği düşük fakat enerji yoğunluğu yüksek yemlerin tercih edilmesi önemlidir (Henry vd., 2018). Ayrıca, yemleme saatlerinin serin dönemlere kaydırılması (örneğin sabah erken ve akşam geç saatler) yem alımını artırabilir (Koyuncu ve Nageye, 2020). Beslenme takviyeleri yoluyla hayvanların fizyolojik stresle başa çıkması desteklenebilir. Özellikle E vitamini, C vitamini, betain, selenyum, çinko gibi antioksidan ve ozmoregülator bileşikler; oksidatif stresi azaltarak bağışıklık sistemini desteklemekte, hormon dengelerini düzenlemekte ve genel performansı artırmaktadır (Joy vd., 2020). Betaine, özellikle hücre içi su dengesini koruyarak ısı stresine karşı hücresel düzeyde dayanıklılık sağlar (Joy vd., 2020). Protein metabolizmasının desteklenmesi için metiyonin, lizin gibi esansiyel amino asitlerin rasyona dahil edilmesi önerilmektedir. Bu sayede, protein katabolizması sınırlandırılarak vücut dokularının yıkımı önlenebilir ve performans korunabilir (Henry vd., 2018).

6.4. YÖNETİM UYGULAMALARI

Yetiştirici düzeyinde alınabilecek bazı düşük maliyetli önlemler de ısı stresinin etkilerini azaltmada etkilidir. Bunlar arasında sıcak saatlerde otlatmadan kaçınma, hayvanların erken kırkımı (shearing), aşırı kalabalık barınaklardan kaçınma, stres faktörlerini minimize eden taşıma ve manipülasyon prosedürleri gibi uygulamalar yer alır (Joy vd., 2020; Pulido-Rodríguez vd., 2025). Ayrıca, sürü yönetimi sırasında yüksek riskli hayvan gruplarının (örneğin gebe dişiler, yaşlı bireyler) öncelikli olarak korunması ve takip edilmesi önerilmektedir. Özellikle gebelik ve laktasyon dönemlerinde ısı stresine karşı alınacak önlemler, sürü genelindeki üretkenlik ve hayatta kalma oranlarını doğrudan etkiler.

7. İKLİME DAYANIKLI ISLAH VE SÜRDÜRÜLEBİLİRLİK PERSPEKTİFİ

Küresel ısınmanın koyun yetiştiriciliği üzerindeki çok yönlü etkileri, sadece kısa vadeli yönetim önlemleriyle değil; aynı zamanda uzun vadeli stratejik ıslah yaklaşımları ve sürdürülebilir sistem tasarımlarıyla ele alınmalıdır. Bu bağlamda, iklim değişikliğine dayanıklı hayvan ırklarının geliştirilmesi, genetik kaynakların korunması, ekosistem temelli hayvancılık modellerinin benimsenmesi ve üretici düzeyinde adaptasyon kapasitesinin artırılması hayati önemdedir (Berihulay vd., 2019; Aboul-Naga vd., 2022; Henry vd., 2018). Fenotipik ve genetik göstergelerin bir araya getirilmesiyle iklim değişikliğine daha dirençli hayvan ırkları geliştirilebilir. İklim değişikliğinin etkileriyle başa çıkmak için multidisipliner yaklaşımlara

ihtiyaç vardır: hayvan ıslahı, besleme, barınak koşulları ve sağlık hizmetleri birlikte düşünülmelidir (Gaughan vd., 2019).

7.1. TERMOTOLERANT IRKLARIN ÖNEMİ

Isıya dayanıklı yerli ve bölgesel ırklar, iklim değişikliğine uyumda doğal bir avantaj sağlamaktadır. Bu ırklar genellikle daha küçük vücut yapısına, açık tüy rengine, yağlı kuyruk morfolojisine ve daha iyi su/ısı metabolizmasına sahiptir. Örneğin, Mısır'daki Hu koyunları sıcak çöl koşullarına yüksek düzeyde adaptasyon göstermekte, bu özellikleriyle genetik kaynak olarak büyük potansiyel taşımaktadır (Ren vd., 2024). Türkiye'de yerli ırkların üretim verimleri genellikle daha düşük olduğu için, termotolerans ile verim özellikleri arasında bir denge kuracak selektif ıslah programlarına ihtiyaç vardır (Tsartsianidou vd., 2021).

7.2. GENOMİK VE EPİGENETİK SELEKSİYON STRATEJİLERİ

Geleneksel fenotipe dayalı seleksiyon yöntemleri, çevresel stres koşullarında yeterli başarıyı sağlayamayabilir. Bu nedenle genetik seleksiyon süreçlerinde genomik marker'ların ve epigenetik profilleme tekniklerinin kullanımı giderek yaygınlaşmaktadır. SNP tabanlı genotipleme, ısı stresine karşı dayanıklı fenotiplerle ilişkilendirilmiş genetik bölgelerin tanımlanmasını ve selektif çiftlik içi uygulamalara entegre edilmesini sağlamaktadır (Tsartsianidou vd., 2021). Özellikle HSP70, MC1R, ENOX2 gibi stresle ilişkili genlerin ekspresyon düzeylerinin yüksek olduğu bireylerin tercih edilmesi, sadece stres toleransını değil aynı zamanda yaşam süresi ve genel performansı da olumlu etkileyebilmektedir (Berihulay vd., 2019). Epigenetik regülasyonla aktarılan stres toleransı özelliklerinin nesiller arası sürdürülebilirliği desteklemesi, bu stratejileri daha da değerli kılmaktadır (Aboul-Naga vd., 2022).

7.3. EKOSİSTEM TEMELLİ SÜRDÜRÜLEBİLİRLİK

İklime dirençli hayvancılık sistemlerinin tasarımında, hayvan–bitki–çevre etkileşimini göz önünde bulunduran ekosistem temelli yaklaşımlar öne çıkmaktadır. Bu sistemler, biyoçeşitliliği koruyarak hem hayvan refahını hem de otlatma alanlarının sürdürülebilirliğini artırmaktadır (Ghahramani vd., 2019; Darcan ve Daşkıran, 2010). Bu tür sistemlerde, hem mikroiklim koşullarının iyileştirilmesi hem de üretim çeşitlendirmesi sağlanarak, çiftçilerin iklim değişikliğine karşı dirençleri artırılmaktadır. Aynı zamanda karbon ayak izinin azaltılması ve sera gazı emisyonlarının düşürülmesi açısından da önemli katkılar sunmaktadır.

7.4. EĞİTİM VE POLİTİKA DESTEĞİ

Küçükbaş hayvan yetiştiriciliği yapan üreticilerin iklim değişikliğine karşı uyum kapasitelerinin artırılması için bilgiye erişim, eğitim ve finansal destek mekanizmalarının sağlanması gereklidir. Özellikle düşük ve orta gelirli bölgelerde, iklime dayanıklı ıslah uygulamalarının benimsenmesi için devlet destekli programlara, yerel bilgi sistemlerine ihtiyaç duyulmaktadır (Henry vd., 2018; Gaughan vd., 2019). Buna ek olarak, yerli ırkların korunması ve genetik kaynakların ticarileşmeden uzak uzun vadeli ıslah programlarıyla güvence altına alınması, hayvancılık sektörünün geleceği açısından stratejik bir adımdır. Bu hedef hem biyolojik çeşitliliğin korunmasına hem de tarımsal sistemlerin iklim krizine dirençli hale getirilmesine katkı sağlar.

8. SONUÇ VE ÖNERİLER

İklim değişikliği, koyun yetiştiriciliğini çok boyutlu bir kriz alanı hâline getirmekte; hem çevresel koşulların zorlaşması hem de üretim sistemlerinin bu değişime uyum sağlamakta zorlanması, sürdürülebilir hayvancılığı tehdit etmektedir. Artan sıcaklıklar, değişen yağış desenleri ve ekstrem iklim olayları, koyunların fizyolojik, üreme, davranışsal ve genetik kapasitelerini zorlamakta; üretim kayıpları, bağışıklık baskılanması, fertilite sorunları ve refah

düzeyinde düşüş gibi sonuçlara yol açmaktadır. Koyunlar, tarihsel süreçte bazı davranışsal (gölgelik arama, gece otlama), morfolojik (açık tüy rengi, yağlı kuyruk yapısı), fizyolojik (terleme, solunum artışı) ve genetik (HSP70, MC1R vb. gen ekspresyonu) adaptasyon mekanizmaları geliştirmiştir. Ancak günümüzde küresel iklim değişikliği bu doğal tolerans eşiğini aşmakta ve adaptasyonun kalıcı, verimli ve sürdürülebilir şekilde desteklenmesini zorunlu kılmaktadır. Bu kapsamda alınması gereken önlemler çok katmanlıdır. Yönetimsel düzeyde; barınak tasarımı, gölgelik alan oluşturulması, soğutma sistemleri, doğru otlatma ve yemleme zamanlaması, stres azaltıcı uygulamalar gibi pratik çözümler önem arz etmektedir. Beslenme stratejilerinde ise antioksidanlar, vitamin destekleri (C, E), metiyonin gibi amino asitler ve betain gibi osmoregülatör bileşiklerin kullanımı ile fizyolojik dengenin korunması sağlanabilir. Uzun vadeli sürdürülebilirlik için ise genetik ve epigenetik seleksiyon sistemlerinin entegrasyonu büyük önem taşımaktadır. Isı stresine dayanıklı bireylerin SNP analizleriyle belirlenmesi, HSP gen ailesi gibi aday genlerin ekspresyon düzeylerinin izlenmesi ve termotolerant yerli ırkların korunarak üretime kazandırılması, iklim değişikliğine karşı genetik direnç inşası açısından stratejik değer taşımaktadır. Ekosistem temelli üretim modelleri (silvopastoral sistemler, agrivoltaik uygulamalar) ve karbon ayak izi düşük sürdürülebilir hayvancılık politikaları ile hem çevresel hem de ekonomik direnç artırılabilir. Yerli ırkların korunması, üreticilerin eğitimi ve teşvik mekanizmalarının yaygınlaştırılması da bu sürecin toplumsal ve uygulamalı boyutlarını destekleyecektir.

Sonuç olarak, iklim değişikliğine karşı koyun yetiştiriciliğini korumanın yolu, sadece hayvanların değil, tüm üretim sistemlerinin dayanıklılığını artırmaktan geçmektedir. Bu bağlamda, multidisipliner bir yaklaşımla; genetik, fizyolojik, çevresel ve yönetimsel tüm bileşenleri kapsayan entegre stratejilerin geliştirilmesi kaçınılmazdır. Bu stratejiler, yalnızca üretim verimliliğini değil, aynı zamanda hayvan refahını, çevresel sürdürülebilirliği ve gıda güvenliğini de güvence altına alacaktır.

ÖZET

Artan enerji talebi, fosil yakıtların sınırlı rezervleri ve çevresel etkileri sürdürülebilir enerji kaynaklarının geliştirilmesini zorunlu hale getirmiştir. Bu bağlamda, organik atıkların oksijensiz koşullarda mikroorganizmalar tarafından parçalanarak biyogaz ve biyometana dönüştürülmesini sağlayan anaerobik fermantasyon, teknik ve ekonomik açıdan uygulanabilirliği kanıtlanmış bir yöntem olarak öne çıkmaktadır. Biyogaz üretimi sonrasında anaerobik fermantasyon hem enerji üretimi hem de atık yönetiminde çevresel etkilerin azaltılmasına katkı sunmaktadır. Hidroliz, asidojenez, asetojenez ve metanojenez aşamalarından oluşan bu biyokimyasal süreç, yenilenebilir enerji teknolojileri arasında önemli avantajlara sahiptir. Bu çerçevede, düşük Δ-9-tetrahidrokanabinol (THC) içeriği, yüksek biyokütle verimi ve farklı iklim koşullarına uyum sağlayabilmesi ile dikkat çeken endüstriyel kenevir, enerji üretiminde potansiyel bir hammadde olarak öne çıkmaktadır. Literatürde, yüksek lignin içeriğine rağmen kenevir biyokütlesinin umut verici biyometan potansiyeli sunduğu ve uygulanan mekanik ya da kimyasal ön işlemlerle metan veriminin belirgin şekilde artırılabildiği raporlanmıştır. Ayrıca, kenevir atıklarının hayvansal gübre gibi diğer organik substratlarla ko-fermantasyonu sinerjik etkiler yaratarak biyogaz üretiminde performans artışı sağlayabilmektedir. Bu çalışmada, endüstriyel kenevir işleme atıklarının anaerobik fermantasyon yoluyla biyogaz ve biyometan üretim potansiyeli değerlendirilecek, mevcut literatürdeki çalışmalarda kenevirin biyogaz üretimindeki rolüne ilişkin araştırmalara yer verilecek ve bu hammaddenin yenilenebilir enerji üretimindeki stratejik önemi ortaya konacaktır. Böylece elde edilecek bulgular sürdürülebilir enerji üretimi, çevre dostu atık yönetimi ve iklim değişikliğiyle mücadele politikalarına katkı sağlaması öngörülmektedir.

Anahtar Kelimeler: Kenevir, Biyogaz, Biyometan potansiyeli (BMP), anaerobik fermantasyon, yenilenebilir enerji

ENERGY CONVERSION OF HEMP BIOMASS THROUGH ANAEROBIC FERMENTATION: PERSPECTIVES ON BIOGAS AND BIOMETHANE

ABSTRACT

The growing global demand for energy, limited fossil fuel reserves and the adverse environmental impact of fossil fuels have made the development of sustainable energy sources imperative. In this context, anaerobic fermentation — the decomposition of organic waste by microorganisms in an oxygen-free environment, resulting in the production of biogas and biomethane — has emerged as a technically and economically viable method. This process contributes to energy generation and mitigating the environmental impact of waste management. Consisting of four biochemical stages — hydrolysis, acidogenesis, acetogenesis and methanogenesis — anaerobic fermentation offers several advantages over other renewable energy technologies. Within this framework, industrial hemp, characterized by its low THC content, high biomass yield and adaptability to diverse climatic conditions, stands out as a promising energy production feedstock. Despite its relatively high lignin content, the literature reports that hemp biomass exhibits notable biomethane potential and that mechanical or chemical pretreatments can significantly enhance methane yields. Furthermore, co-fermenting hemp residues with other organic substrates, such as animal manure, has been shown to produce synergistic effects and improve biogas production efficiency. This study will evaluate the potential of industrial hemp processing residues for biogas and biomethane production through anaerobic fermentation. Findings from existing literature will be discussed to elucidate hemp's role in biogas generation and highlight its strategic importance as a renewable energy resource. The results obtained are expected to contribute to sustainable energy production, eco-friendly waste management and climate change mitigation policies.

Keywords: Hemp, Biogas, Biomethane Potential (BMP), Renewable Energy.

1. GİRİŞ

İnsan yaşamını sürdürebilmek ve üretim faaliyetlerini devam ettirebilmek için enerjiye ihtiyaç duyar. Ancak mevcut küresel enerji yapısı hâlâ büyük ölçüde yenilenemeyen fosil yakıtlara dayanmaktadır. Bu durum, hem enerji arz güvenliği hem de çevresel sürdürülebilirlik açısından ciddi bir tehdit oluşturmaktadır (Abraham vd., 2020). Fosil yakıt rezervlerinin sınırlı olması, enerji fiyatlarında yaşanan dalgalanmalar ve bu kaynakların yanması sonucu ortaya çıkan yüksek miktardaki sera gazı (GHG) emisyonları, günümüzde enerji krizinin ve iklim değişikliğinin temel nedenleri arasında yer almaktadır (Millati vd., 2020; Paudel vd., 2017).

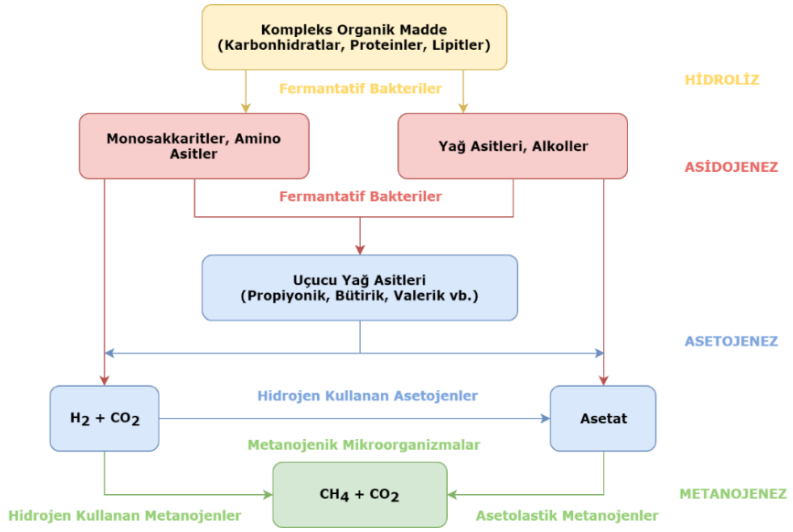
Artan enerji talebi, nüfus artışı ve ekonomik büyüme gibi faktörler, yenilenebilir enerji kaynaklarını ekonomik olarak cazip ve çevresel açıdan sürdürülebilir bir alternatif haline getirmiştir (Paudel vd., 2017). Yenilenebilir enerji; güneş, rüzgâr, jeotermal, hidroelektrik ve biyokütle gibi doğal kaynaklardan elde edilmekte, böylece fosil yakıtlara olan bağımlılığı azaltarak enerji arz güvenliğini güçlendirmektedir.

Bu kaynaklar içinde biyokütle enerjisi, hem çevre dostu olması hem de doğrudan bitkisel ve organik atıklardan enerji üretimine olanak tanıması nedeniyle özel bir öneme sahiptir. Biyokütle, fotosentez yoluyla atmosferden aldığı karbondioksiti enerji üretimi sırasında yeniden atmosfere saldığı için karbon nötr bir döngü oluşturur (Millati vd., 2020). Bu özelliği, onu iklim değişikliğiyle mücadelede stratejik bir yenilenebilir enerji kaynağı haline getirmektedir.

Biyokütle kaynakları arasında lignoselülozik biyokütle, dünyadaki en verimli karbon depolarından biri olarak öne çıkmaktadır. Yıllık küresel üretimi yaklaşık 12×10^{10} ton düzeyindedir ve karasal bitkiler tarafından yakalanan biyoenerji, insanlığın toplam enerji talebinin yaklaşık 3–4 katı kadardır (Guo vd., 2015). Bu, lignoselülozik biyokütlenin gelecekteki enerji güvenliğini sağlamada önemli bir potansiyele sahip olduğunu göstermektedir. Bununla birlikte, bu potansiyelin verimli şekilde kullanılmaması hâlinde çevresel riskler ortaya çıkabilmektedir. Örneğin, bitki samanının yakılması gibi geleneksel uygulamalar; arazi israfına, hava kirliliğine ve karbon salımına neden olmaktadır (Cheng & Zhong, 2014; Zhang vd., 2018). Dolayısıyla biyokütlenin sürdürülebilir şekilde değerlendirilmesi, çevresel faydanın en üst düzeye çıkarılması açısından kritik öneme sahiptir.

Enerji talebinin karşılanmasında fosil kaynakların uzun vadede güvenilir bir çözüm sunamayacağı açıktır. Bu nedenle araştırmalar, biyokütle tabanlı biyoyakıtlar üzerine yoğunlaşmıştır. Günümüzde mısır, buğday, pirinç, soya fasulyesi ve şeker kamışı gibi çeşitli tarımsal ürünler biyoyakıt üretiminde kullanılmaktadır (Abraham vd., 2020; Prade vd., 2011). Ancak bu hammaddeler genellikle gıda kaynaklarıyla rekabet ettiği için, yeni nesil biyoyakıt çalışmaları gıda dışı lignoselülozik materyallere yönelmiştir. Bu tür biyokütleler, yüksek karbon içeriği ve düşük maliyetleriyle sürdürülebilir enerji üretimi açısından büyük avantaj sağlamaktadır.

Bu kapsamda anaerobik fermantasyon, lignoselülozik biyokütlenin enerjiye dönüştürülmesinde en etkili teknolojilerden biridir. Bu biyokimyasal süreçte organik maddeler, oksijensiz ortamda mikroorganizmalar tarafından parçalanarak biyogaz üretir (Angelidaki vd., 2018; Appels vd., 2011). Elde edilen biyogazın temel bileşeni metan (CH_4) olup, hem elektrik ve ısı üretiminde hem de biyometan saflaştırması yoluyla doğalgaz yerine kullanılabilmektedir. Böylece, hem enerji üretiminde fosil kaynaklara bağımlılık azalmakta hem de karbon salımı minimize edilmektedir (Kumar vd., 2017).



Sonuç olarak, fosil yakıtların çevresel zararları ve sınırlı rezervleri göz önüne alındığında, biyokütle tabanlı biyogaz üretimi, enerji arz güvenliği ve iklim değişikliğiyle mücadele açısından geleceğin en sürdürülebilir çözümlerinden biri olarak değerlendirilmektedir.

2. ANAEROBİK FERMANTASYON

Anaerobik koşullarda organik atıkların ayrıştırılması, tarihsel olarak atık yönetimi ve enerji geri kazanımı alanlarında kullanılan en eski biyoteknolojik süreçlerden biridir. Günümüzde ise anaerobik fermantasyon sürdürülebilir enerji üretimi ve çevresel etkilerin azaltılması açısından en yaygın tercih edilen biyolojik dönüşüm yöntemlerinden biri hâline gelmiştir. Biyogaz teknolojisi, dünya genelinde gelişmiş/gelişmekte olan ülkelerde ekonomik uygulanabilirliği, enerji geri kazanım verimliliği ve çevresel sürdürülebilirliği ile etkinliğini kanıtlamıştır (Angelidaki vd., 2018).

Anaerobik fermantasyon, oksijensiz koşullar altında organik maddelerin mikroorganizmalar tarafından biyokimyasal reaksiyonlarla stabilize edilmesi ve biyogaza dönüştürülmesi sürecidir (Chen vd., 1980; Safley Jr & Westerman, 1990). Bu biyogaz genellikle %50–70 CH_4 ve %30–50 karbondioksit (CO_2) içerirken, az miktarda hidrojen sülfür (H_2S), amonyak (NH_3) ve hidrojen (H_2) gibi bileşenler de bulunabilir. Böylece anaerobik fermantasyon hem enerji üretimi sağlar hem de atığın çevresel etkilerini azaltarak sürdürülebilir bir döngü oluşturur.

Bu süreç, biyokimyasal olarak dört temel aşamada gerçekleşir: hidroliz, asidojenez, asetojenez ve metanojenez (Dichtl, 1997). Her aşamada farklı mikrobiyal topluluklar aktif rol oynar ve sistemin genel verimliliği bu topluluklar arasındaki simbiyotik dengeye bağlıdır (Şekil 1; (Chernicharo, 2007).

Şekil 1. Anaerobik ayrışmanın metabolik aşamaları (Chernicharo, 2007).

Anaerobik fermantasyonun birinci aşaması olan "hidroliz" esnasında hammaddenin kompleks yapıları (örneğin karbonhidratlar, yağlar gibi) daha basit organik yapılara (örneğin aminoasitler, şeker, yağ asitleri) dönüştürülür. Bu aşamada kompleks maddeler fermentatif bakteriler tarafından üretilen enzimlerin yardımı ile ayrışır ve çözünmüş hale geçer, böylece fermantatif bakterilerin hücre duvarlarından geçebilecek bir yapıya dönüşürler (Henze vd., 2008). Hidroliz sırasında katı partiküller suda çözünür bir hale geçtikleri için bu aşamaya sıvılaştırma (likifikasyon) da denilmektedir (Avcıoğlu Onurbaş, 2011).

Mikroorganizmalarca gerçekleştirilen ikinci temel adım asidojenezdir. Asidojenez fazında fermantatif bakteriler enerji ihtiyaçlarını karşılamak için çözünmüş bileşikleri hücre içerine alırlar. Daha sonra mikroorganizmalarca ayrışan bu bileşikler daha basit bileşenlere dönüştürülür ve hücre dışına atılır (Henze vd., 2008). Fermantasyon işleminde, substratlar hem elektron verici hem de alıcı olarak hizmet eder (Eddy vd., 2014). Bu aşamada üretilen en bilinen bileşikler uçucu yağ asitleri (valerik, propiyonik ve bütirik asitler), alkoller (etanol), laktik asit, CO_2, H_2, NH_3 ve H_2S'dür (Henze vd., 2008). Bu aşamada çözünmüş karbonhidratlar; etanol,

hidrojen ve karbondioksite, aminoasitler; süksinik asit ve hidrojene ve yağ asitleri ise asetat ve hidrojene dönüşür. Asetat, sadece çözünebilir organik bileşiklerin fermantasyonu yoluyla değil, aynı zamanda asetojenez yoluyla da üretilebilir (Gerardi, 2003). Asidojenez fazı anaerobik arıtmada gerçekleşen en hızlı fazdır ve metan üretimi asit üretimine göre daha yavaş gerçekleştiğinden dolayı çözünmüş organik madde konsantrasyonunda oluşan ani artışlar asit üretimini tetikleyerek sistemde aşırı yüklemeye sebep olabilir. Bu durumda metan üretimi yavaşlar ve üretilen asit sonucu sistemde ani pH düşmesine yol açarak prosesi inhibe eder (Henze vd., 2008).

Asetojenez fazında asetojenik mikroorganizmalarca fermantasyon devam eder ve asidojenez aşamasında oluşan uçucu yağ asitleri metan üretiminin öncüsü olan asetat, hidrojen ve karbondioksite dönüşür (Eddy vd., 2014). Burada asetat üretimi asidojenezden farklı olarak, asetojenik mikroorganizmaların aktivitesi ile gerçekleştirilir (Gerardi, 2003). Bu aşamada en önemli besin maddeleri anaerobik fermantasyonda kilit rol oynayan propiyonik ve bütirik asitlerdir (Henze vd., 2008). Hidrojene dönüşümü yeterli hızda gerçekleşmeyen uçucu yağ asitleri asidojenez aşamasında olduğu gibi sistemde birikerek pH'nın ani şekilde değişmesine yol açabilir. Bunun yanı sıra hidrojen üreten asetojenik mikroorganizmalar ile hidrojen tüketen metanojenik mikroorganizmalar arasında hassas bir denge de mevcuttur (Christensen, 2011; Eddy vd., 2014). Bu hassas dengeye rağmen hidrojenin kısmi basıncı çok düşük bir seviyede seyreder. Bunun sebebi üretilen hidrojenin metanojenler ve sülfat indirgeyen mikroorganizmalar tarafından hızlı şekilde tüketilmesiyle alakalıdır (Henze vd., 2008).

Anaerobik fermantasyonun dördüncü ve son aşaması olan metanojenez, metanojenik mikroorganizmalarca önceki aşamalarda üretilen asetat, hidrojen ve karbondioksitin metana çevrildiği aşamadır. Metan üretimi için iki grup metanojenik mikroorganizma görev alır; asetolastik metanojenler, asetatı metan ve karbondioksite dönüştürürler, hidrojen kullanan metanojenler ise elektron vericisi olarak hidrojen ve elektron alıcısı olarak karbondioksiti kullanarak metan üretirler (Eddy vd., 2014; Henze vd., 2008). Metanojenik mikroorganizmalar, asetat, karbondioksit, hidrojen, formate, metanol, etanol ve bazı durumlarda methylamine gibi organik molekülleri de metabolize etmektedirler (Balch vd., 1979; Weimer, 1998; Zinder vd., 1984). Kompleks organik bileşiklerin metana dönüşmesi, hammaddenin metanojenik mikroorganizmalar tarafından kullanılabilen substratlara dönüştürülmesiyle sağlanabilir. Bu aşamaya kadar en kritik nokta asetat üretimidir çünkü anaerobik fermantasyonda üretilen metanın yaklaşık %70'si asetattan sağlanmaktadır. Bu durumda asetat üretimi biyogaz veya metan üretimi açısından bir "darboğaz" olarak adlandırılabilir (Avcıoğlu Onurbaş, 2011; Eddy vd., 2014; Gerardi, 2003). Asetolastik metanojenlerin büyüme oranı oldukça düşüktür. Bu durum anaerobik reaktörlerin uzun adaptasyon süresine olan ihtiyacı açıklamaktadır. Hidrojen kullanan metanojenler, 4 ila 12 saatlik iki katına çıkma zamanları ile asetolastik metanojenlerden çok daha yüksek büyüme oranına sahiptir (Henze vd., 2008). Asidojenik, asetojenik ve metanojenik mikroorganizmaların çalışma hızı kabaca aynı olduğu sürece, metanojenez aşamasının metabolik aktivitesi korunur (Gerardi, 2003).

Bu dört aşamanın dengeli ilerlemesi hem metan üretiminde maksimum verim hem de proses stabilitesi için zorunludur. Ancak bu denge yalnızca mikrobiyal etkileşimlerle değil, aynı zamanda çevresel ve mühendislik parametrelerinin dikkatle optimize edilmesiyle sürdürülebilir (Angelidaki vd., 2018; Appels vd., 2011).

Anaerobik sistemlerin performansını belirleyen çevresel faktörler arasında **pH, sıcaklık, karbon/azot oranı (C/N), organik yükleme hızı (OLR)** ve **karıştırma** koşulları öne çıkar. Metanojenlerin optimum pH aralığı 6.8–7.4'tür; bu aralığın dışına çıkılması mikrobiyal aktiviteyi baskılar ve gaz üretimini düşürür (Gerardi, 2003). Sıcaklık açısından mezofilik (35-37 °C) sistemler kararlı mikrobiyal yapılar sağlarken, termofilik (50-55 °C) koşullar daha hızlı

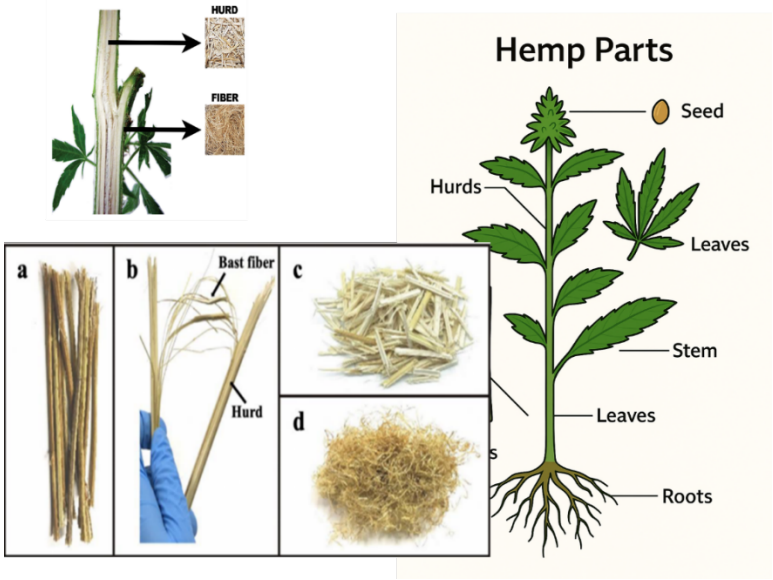
reaksiyonlar sunar fakat stabilite riskini artırır (Eddy vd., 2014). Uygun C/N oranı (20-30), mikroorganizmaların beslenme dengesini korur; düşük oranlar amonyak toksisitesine, yüksek oranlar ise besin eksikliğine neden olur (Henze vd., 2008). OLR'nin kontrolü, pH dengesini koruyarak uçucu yağ asidi birikimini engeller; karıştırma ise sıcaklık homojenliği ve substrat-mikroorganizma teması açısından sürecin verimliliğini artırır (Christensen, 2011).

Anaerobik fermantasyonun başarısı, yalnızca süreç parametrelerinin kontrolüne değil, aynı zamanda kullanılan **biyokütlenin kimyasal bileşimine** de bağlıdır. Günümüzde tarımsal artıklar, hayvansal gübreler, gıda endüstrisi atıkları ve lignoselülozik materyaller, biyogaz üretiminde yaygın olarak değerlendirilmektedir (Mao vd., 2015; Weiland, 2010). Lignoselülozik biyokütleler, yüksek selüloz ve hemiselüloz içerikleri sayesinde iyi bir karbon kaynağıdır; ancak lignin varlığı, mikrobiyal parçalanmaya karşı direnç göstererek biyogaz üretimini sınırlar (Kumar vd., 2017). Bu nedenle, selüloz ve hemiselülozun erişilebilirliğini artırmak için fiziksel, kimyasal veya biyolojik **ön işlem teknikleri** uygulanması gereklidir.

Farklı organik atıkların birlikte sindirildiği **anaerobik ko-fermantasyon** yaklaşımı, substratlar arasındaki besin dengesini iyileştirerek sinerjik etkiler yaratabilir. Ancak bazı durumlarda kimyasal uyumsuzluklar antagonistik etkilere yol açabilir (Bıtrak, 2021). Bu nedenle, farklı substratların birlikte kullanım potansiyelinin değerlendirilmesinde **biyokimyasal metan potansiyeli (BMP)** testleri büyük önem taşır. BMP, belirli bir substrattan elde edilebilecek maksimum metan miktarını belirleyen temel göstergedir ve sistem tasarımı, kütle dengesi hesapları ve enerji verimliliği analizlerinde kritik rol oynar (Angelidaki vd., 2009; Labatut vd., 2011; Weinrich vd., 2018). Ancak laboratuvar koşullarında belirlenen bu potansiyelin tam ölçekli sistemlerde sürdürülebilir şekilde gerçekleşebilmesi, substrat bileşimi kadar çevresel koşulların ve işletme stratejilerinin de optimize edilmesine bağlıdır.

Son yıllarda yapılan araştırmalar, sürdürülebilir enerji üretimi ve çevresel rehabilitasyon hedefleri doğrultusunda, yeni nesil lignoselülozik biyokütle türlerine yönelmiştir. Bu bağlamda **endüstriyel kenevir (*Cannabis sativa L.)***, yüksek biyokütle verimi, düşük pestisit gereksinimi, kısa büyüme süresi ve farklı iklim koşullarına adaptasyon yeteneği ile ön plana çıkmaktadır (Barta vd., 2013; Ingrao vd., 2018). Lignoselülozik yapısı nedeniyle belirli teknik zorluklar barındırsa da, uygun ön işlem uygulamalarıyla kenevir biyokütlesinin yüksek metan verimi sağladığı bildirilmektedir (Nges vd., 2012; Schroyen vd., 2018).

3. ENDÜSTRIYEL KENEVİR



Endüstriyel kenevir (*Cannabis sativa L.*), son yıllarda yalnızca geleneksel lif ve tohum üretiminde değil, aynı zamanda sürdürülebilir biyokütle kaynaklarının geliştirilmesi bağlamında da dikkat çeken stratejik bir bitki türü olarak öne çıkmaktadır. Bu bitkinin çok yönlü kullanım potansiyeli, çevresel, ekonomik ve endüstriyel açıdan geniş bir etki alanı yaratmaktadır. Endüstriyel kenevirin bu denli istisnai bir konuma sahip olmasının temel nedenlerinden biri, psikoaktif türlerden genetik olarak ayrışmış olmasıdır. Endüstriyel kenevir türleri, Δ-9-tetrahidrokanabinol (THC) oranı bakımından %0,3'ün altında değerlere sahiptir ve bu yönüyle narkotik amaçlı türlerden net biçimde ayrılmaktadır (Desanlis vd., 2013). Bu fark, yalnızca yasal açıdan güvenli bir hammadde değil, aynı zamanda sürdürülebilir endüstriler için etik ve ekonomik bir alternatif haline getirmiştir.

Agronomik açıdan değerlendirildiğinde, kenevirin biyolojik yapısı yüksek verimliliğiyle dikkat çeker. C_3 fotosentetik yapıya sahip bu yıllık bitki, lignoselülozik biyokütle üretiminde son derece etkilidir. Literatürde, kenevirin ayda yaklaşık 50 cm büyüyebildiği, 4 m'ye kadar ulaşabildiği ve kuru madde veriminin 7,6–15 Mg ha^{-1} $yıl^{-1}$ arasında değiştiği raporlanmaktadır (Burczyk vd., 2008; Jankauskiene vd., 2015; Strzelczyk vd., 2022). Bu yüksek biyokütle üretimi, enerji yoğunluğu açısından da son derece avantajlıdır; enerji değeri 124–223 GJ ha^{-1} $yıl^{-1}$ aralığında bildirilmektedir. Düşük pestisit gereksinimi, geniş iklim aralığında yetişebilme

kapasitesi ve kuraklığa karşı dayanıklılığı, keneviri çevresel olarak sürdürülebilir tarım sistemleri için ideal bir tür haline getirmektedir (Finnan & Styles, 2013). Böylece kenevir üretimi yalnızca ekonomik kazanç değil, aynı zamanda toprak verimliliği, biyoçeşitlilik ve karbon döngüsünün desteklenmesi bakımından da önemli ekosistem hizmetleri sağlar.

Endüstriyel kenevirin çevresel katkıları, üretim potansiyeli kadar önemlidir. Derin ve yaygın kök sistemi, toprakta biriken ağır metallerin ve kirleticilerin uzaklaştırılmasını sağlayarak fitoremedasyon uygulamalarında etkili bir araç haline getirmektedir (Akkaya vd., 2025; Visković vd., 2024). Bu özelliği sayesinde kenevir, kirlenmiş toprakların rehabilitasyonunda "çift işlevli" bir bitki olarak değerlendirilmektedir; bir yandan çevresel iyileştirme sağlarken, diğer yandan ekonomik değeri yüksek biyokütle üretimi gerçekleştirmektedir. Ayrıca, yüksek karbon tutma kapasitesiyle iklim değişikliğinin etkilerinin azaltılmasına da katkıda bulunur. Yapılan çalışmalar, bir hektarlık kenevir tarlasında yılda önemli miktarda CO_2'nin sabitlenebildiğini ortaya koymuştur (Kaur & Kander, 2023; Visković vd., 2024). Bu yönüyle kenevir hem karbon yutağı işlevi gören hem de karbon-nötr üretim sistemlerine entegre edilebilen nadir tarımsal türlerden biridir.

Endüstriyel kenevirin endüstriyel değerlendirme potansiyeli oldukça geniştir. Bitkinin sap kısmı, lif ve hurd (odunsu iç kısım) olmak üzere iki temel fraksiyona ayrılır (Şekil 2). Lif, sapın yaklaşık %25'ini, hurd ise %75'ini oluşturur (Schluttenhofer & Yuan, 2017). Kenevirin lignoselülozik yapısı, selüloz (%40–48), hemiselüloz (%20–25) ve lignin (%15–20) oranlarıyla tipik enerji bitkilerinden biri olan miscanthus ile benzerlik göstermektedir (Jankauskiene vd., 2015). Lif fraksiyonu yüksek selüloz içeriği (%70–75) sayesinde tekstil ipliği, kâğıt hamuru, biyokompozit ve ısı yalıtım malzemeleri gibi katma değeri yüksek sektörlerde kullanılmaktadır. Buna karşın hurd fraksiyonu, daha yüksek lignin ve mineral içeriğiyle özellikle yapı sektöründe "hempcrete" (kenevir betonu) üretiminde, ayrıca hayvan yataklığı, sunta ve biyokütle yakıtı üretiminde değerlendirilmektedir (Jami vd., 2019; Stevulova vd., 2018).

Şekil 2. Endüstriyel kenevir ve kısımları (Tyagi vd., 2022)

Kenevirin bu kimyasal yapısı, biyoyakıt üretimi açısından da önemli fırsatlar sunar. Lignoselülozik fraksiyon, biyogaz, biyoetanol ve biyodizel üretimi için uygun bir substrat niteliği taşımaktadır. Yapılan araştırmalar, özellikle hurd ve lif fraksiyonlarının, ön işlem uygulanmadan dahi yüksek BMP'ye sahip olduğunu göstermiştir (Heiermann vd., 2009; Jankauskiene vd., 2015). Bu durum, kenevirin hem enerji üretiminde hem de karbon nötrlüğü hedefleriyle uyumlu döngüsel ekonomi uygulamalarında güçlü bir alternatif olduğunu

kanıtlamaktadır. Ayrıca, kenevir tohum yağı biyoetanol ve biyodizel üretiminde önemli bir hammadde niteliği taşırken, yağ çıkarımı sonrasında elde edilen küspe de %50'ye varan protein içeriğiyle yem olarak değerlendirilmektedir (Capcanari vd., 2023; Süzerer vd., 2023).

Bu kapsamda, endüstriyel kenevir yalnızca lif ve tohum üretimiyle sınırlı bir tarım ürünü değil, aynı zamanda çevresel rehabilitasyon, yenilenebilir enerji üretimi ve sürdürülebilir endüstriyel dönüşüm açısından stratejik bir biyoresürstür. Lif, hurd, tohum ve yağ fraksiyonları üzerinden farklı değer zincirlerine entegre olabilen bu bitki, hem toprak kalitesinin artırılması hem de karbon sekestrasyonu, enerji üretimi ve atık geri kazanımı hedefleriyle uyumlu bir biyodöngü modelinin temel bileşenini oluşturmaktadır.

4. ENDÜSTRİYEL KENEVİRİN ANAEROBİK FERMANTASYON POTANSİYELİ

Endüstriyel kenevir, lignoselülozik yapısı, yüksek büyüme hızı ve farklı bitki fraksiyonlarının (yaprak, sap, lif, hurd, tohum) kimyasal çeşitliliği sayesinde anaerobik fermantasyon süreçlerinde yenilenebilir enerji üretimi için önemli bir biyokütle kaynağıdır. Lifli dokuların yüksek lignin içeriği hidroliz hızını azaltırken, fenolik bileşiklerin belirli bir eşiğin üzerinde bulunması metan üretimini geçici olarak baskılayabilmektedir. Schroyen vd. (2017, 2015), fenolik konsantrasyonun 100 mg L^{-1}'den 2000 mg L^{-1}'ye yükselmesinin metan oluşumunda belirgin bir inhibisyona yol açtığını, ancak mikrobiyal toplulukların zamanla bu koşullara adapte olarak inhibitör etkinin kısmen ortadan kalktığını bildirmiştir. Lignin miktarı, BMP'nin en belirleyici bileşenlerinden biridir ve bu nedenle lignin bariyerinin enzimatik veya termo-kimyasal ön işlemlerle zayıflatılması metan üretim verimini önemli ölçüde artırmaktadır (Schroyen vd., 2018).

Kenevirin farklı fraksiyonlarındaki selüloz, hemiselüloz ve lignin oranları biyobozunabilirlik üzerinde doğrudan etkilidir. Özellikle selüloz/hemiselüloz oranı yüksek, lignin oranı düşük olan yaprak fraksiyonları, birim kuru madde başına daha yüksek metan verimi sağlar (Adamovi vd., 2014). Bununla birlikte kenevirin çeşidi, yetiştirme koşulları, hasat zamanı ve partikül boyutu gibi faktörler biyogaz verimini büyük ölçüde etkiler. Mikroorganizmaların optimum aktivitesi için C/N oranının 16–20 arasında tutulması önerilmekte; azot, fosfor ve kükürt eksiklikleri ise metanojenik faaliyetleri sınırlandırmaktadır (Álvarez vd., 2010; Hinken vd., 2008; Mshandete vd., 2004; Nges vd., 2012). Dolayısıyla uygun besin dengesi, özellikle karışık substratlı sistemlerde sürecin kararlılığını ve metan verimini artıran temel bir faktör olarak öne çıkmaktadır.

Tarla denemeleri, ön işlem uygulanmamış kenevir biyokütlesinin enerji üretiminde pek çok klasik enerji bitkisiyle rekabet edebildiğini göstermiştir. Prade vd. (2011), İsveç'in güneyinde yürüttükleri çalışmada biyogaz üretimi için en uygun hasat döneminin Eylül–Kasım, katı biyoyakıt üretimi için ise Şubat–Nisan olduğunu bildirmiştir. Biyogaz için hektar başına enerji getirisi 296 GJ ha^{-1}, katı yakıt için ise 201 GJ ha^{-1} olarak hesaplanmıştır. Takip eden çalışmalar, sonbaharda hasat edilen taze biyokütlenin biyogaz üretimi açısından, ilkbaharda hasat edilen kuru biyokütlenin ise ısı ve kojenerasyon sistemleri için daha avantajlı olduğunu göstermiştir (Kreuger, Prade, vd., 2011; Prade vd., 2012). Kenevirin farklı fenolojik evrelerinde yürütülen deneysel çalışmalarda, en yüksek metan verimi erken gelişim aşamasında (309–316 L CH_4 kg^{-1} ODM) gözlenmiş; olgunlaşmayla birlikte bu değer 289–302 L CH_4 kg^{-1} ODM'ye düşse de artan biyokütle üretimi hektar başına metan verimini 142–175 m^3 ha^{-1}'den 2780–3230 m^3 ha^{-1}'e yükseltmiştir. Ortalama metan oranı %60 civarında saptanmış, farklı gübreleme stratejileri arasında anlamlı fark bulunmamıştır. Bu sonuçlar, biyogaz tesislerinden elde edilen sindirim ürünlerinin (katı ve sıvı faz) kenevir yetiştiriciliğinde etkili bir geri besin kaynağı olarak değerlendirilebileceğini göstermektedir (Michal vd., 2023; Velechovský vd., 2021).

Balodis vd. (2011), Letonya koşullarında kenevirin 12.6 t DM ha^{-1} verimle mısır ve kolzayla rekabet edebildiğini ve 116 GJ ha^{-1} düzeyinde metan enerji verimi sağladığını bildirmiştir. Adamovičs vd. (2014), Futura 75 ve Uso 31 çeşitlerinde ince öğütülmüş fraksiyonların 208 GJ ha^{-1}, kaba fraksiyonların ise 148 GJ ha^{-1} enerji verimi ürettiğini raporlamıştır. Benzer şekilde, Pakarinen vd. (2011), Finlandiya koşullarında kenevirin 14 t DM ha^{-1} biyokütle ve 108 GJ ha^{-1} metan enerji verimiyle mısırla eşdeğer performans sergilediğini ortaya koymuştur. Bu bulgular Gissén vd. (2014) tarafından yapılan yaşam döngüsü analizleriyle desteklenmiş ve kenevirin arazi kullanımı ve çevresel etki açısından sürdürülebilir enerji bitkileri arasında güçlü bir alternatif olduğu gösterilmiştir. Bu sonuçlar birlikte değerlendirildiğinde, ön işlemsiz kenevir biyokütlesinin, doğru hasat zamanlaması ve parçacık boyutu kontrolüyle, pek çok geleneksel enerji bitkisine benzer metan verimi sağlayabildiği görülmektedir.

Bununla birlikte, kenevirin lignin içeriği ve fenolik bileşiklerinin mikrobiyal bozunmayı sınırlaması nedeniyle, son yıllarda araştırmalar biyobozunabilirliğin artırılmasına yönelik ön işlem stratejilerine yönelmiştir. Kreuger vd. (2011b), buhar ön işleminin yalnızca mekanik öğütmeye kıyasla metan verimini belirgin biçimde artırdığını ve aynı biyokütlenin etanol–metan eş üretiminde kullanılmasının enerji çıktısını iki katına kadar yükselttiğini bildirmiştir. Schroyen vd. (2017, 2015), veratril alkol ve lakaz enzimleriyle yapılan biyokimyasal ön işlemlerin fenolik bileşiklerin yaklaşık %80'ini uzaklaştırarak inhibitör etkileri azalttığını, ancak toplam biyogaz üretimindeki farkın sınırlı kaldığını göstermiştir. Schroyen vd. (2018) ise lignin içeriği ile BMP arasındaki ilişkiyi modelleyerek kenevirin BMP değerini 238 L CH_4 kg^{-1} VS olarak belirlemiş; bu değerin buğday samanına yakın, ancak miscanthus'tan daha yüksek olduğunu rapor etmiştir.

Son dönemde yapılan çalışmalar, enerji dönüşüm zincirinin optimizasyonu amacıyla biyokimyasal ve termokimyasal süreçlerin entegrasyonuna odaklanmıştır (Daglioglu vd., 2024). Özellikle hidrotermal karbonizasyon ve buhar gazlaştırma süreçleri, lignoselülozik kenevir biyokütlesinin çok aşamalı enerji dönüşümüne olanak tanımaktadır. NaOH ön işleminin kenevir hurdasından biyometan üretimini %164 oranında artırdığı, 200 °C'de elde edilen hidrokömürün 1278 mL g^{-1} H_2 verimiyle en yüksek biyohidrojen performansını sağladığı bildirilmiştir. Bununla birlikte, sindirim ürünlerinden elde edilen hidrokömürlerin yüksek kül içeriği nedeniyle gazlaştırma aktivitesi düşük bulunmuştur. Ancak aynı koşullarda (200 °C) elde edilen sıvı faz, 213 mL CH_4 g^{-1} KOİ değerine ulaşarak en yüksek BMP'yi vermiştir. Bu bulgular, kenevir biyokütlesinin biyogaz, biyohidrojen ve hidrokömür üretim rotalarının ardışık biçimde değerlendirilmesinin enerji dönüşüm verimini önemli ölçüde artırabileceğini göstermektedir.

Kenevirin diğer biyokütlelerle birlikte sindirimi, yani ko-fermantasyon yaklaşımı, sürecin hem kararlılığını hem de besin dengesini iyileştirmektedir. Nges vd. (2012), domuz ve kümes hayvanı gübresi ile gıda ve mezbaha atıklarının temel substratına kenevir, mısır ve tritikale ilavesinin metan verimini %30 oranında artırdığını bildirmiştir. Böske vd. (2014) ise at gübresiyle birlikte kenevir, keten, buğday samanı ve ladin talaşı kullanılan yukarı akışlı katı durum reaktörlerinde kenevirin 168 L CH_4 kg^{-1} VS değeriyle keten ve odun yongalarına kıyasla daha yüksek performans sergilediğini ve termofilik koşullarda metan oranının %59,8'e ulaştığını rapor etmiştir (Tablo 1). Bu çalışmalar, kenevirin karışık substratlı sistemlerde C/N oranını dengeleyerek inhibitör etkileri azalttığını ve biyogaz üretiminde sinerjik bir katkı sunduğunu göstermektedir.

Tablo 1. Endüstriyel kenevir ve farklı biyokütlelerin BMP değerlerinin karşılaştırılması

Bitki / Hammadde	BMP (L_{CH_4}/kgVS)	Açıklama	Kaynak
Kenevir (genel, sap-ağırlıklı fraksiyonlar)	≈ 230–250	Ortalama metan verimi, hasat zamanına göre sınırlı değişim gösterir	(Adamovi vd., 2014)
Kenevir (yaprak fraksiyonu)	≈ 330–370	Yapraklar düşük lignin içeriği nedeniyle en yüksek CH4 verimi sağlar.	(Adamovi vd., 2014)
Mısır silajı	≈ 280–360	En yaygın referans enerji bitkisi: yüksek hektar verimi sayesinde toplam üretim yüksektir.	(Weiland, 2010)
Şeker pancarı (posası/silajı)	≈ 320–450	Kolay parçalanabilir karbonhidrat içeriği sayesinde yüksek biyogaz verimi	(Szwarc & Szwarc, 2020)
Çim / Grass silaj	≈ 290–320	Orta- yüksek metan verimi; ancak protein oranı değişkendir.	(Weiland, 2010)
Buğday sapı	≈ 230 (ön işlemsiz) → ≈ 280–300 (ön işlemli)	Yüksek lignin oranı nedeniyle ön işlem gerektirir.	(Weiland, 2010)

Öte yandan yaşam döngüsü değerlendirmeleri, kenevirin yalnızca enerji üretiminde değil, aynı zamanda çevresel rehabilitasyonda da ikili bir işlev üstlendiğini ortaya koymuştur (Todde vd., 2022). Ağır metallerle kirlenmiş topraklarda yetiştirilen kenevirin değerlendirilmesine yönelik dört farklı tedarik zinciri senaryosunda, kirlenmiş biyokütlenin anaerobik sindirim veya yakma yoluyla işlenmesi en yüksek enerji tasarrufu (25.3–36.8 GJ ha^{-1}) ve emisyon azaltımı (579–641 kg CO_2e ha^{-1}) sağlamıştır. Monte Carlo simülasyonlarıyla doğrulanan bu bulgular, kirlenmiş arazilerin kenevir temelli biyoenerji üretimiyle yeniden işlevsel hale getirilebileceğini göstermektedir (Todde vd., 2022). Ekonomik açıdan değerlendirildiğinde, Barta vd. (2013), buhar ön işlem, etanol fermantasyonu, anaerobik fermantasyon ve kojenerasyonun entegre biçimde uygulanmasının yüksek enerji çıktısı sağladığını, ancak biyokütle tedarik maliyetleri ve biyogaz fiyatları nedeniyle ekonomik sürdürülebilirliğin sınırlı kaldığını belirtmiştir. Bununla birlikte kenevirin düşük pestisit gereksinimi, hastalıklara dayanıklılığı ve organik tarımla uyumu, onu gıda, yem ve enerji üretimi arasında dönüşümlü kullanılabilecek sürdürülebilir bir enerji bitkisi haline getirmektedir (Gissén vd., 2014; Kreuger, Sipos, vd., 2011; Prade vd., 2012).

Sonuç olarak, kenevirin anaerobik fermantasyon süreçlerindeki potansiyeli, hem ön işlemsiz uygulamalarda rekabetçi BMP değerleri hem de lignin yapısının çözülmesiyle elde edilen yüksek verimli ön işlemli sistemlerle güçlenmiştir. Termo-kimyasal süreçlerin entegrasyonu ve ko-fermantasyon stratejileri ise enerji dönüşüm verimini daha da artırarak, kenevirin biyogaz tabanlı biyorafineri sistemlerinde merkezi bir hammadde olarak değerlendirilebileceğini göstermektedir.

Tablo 2. Literatürde endüstriyel kenevir biyokütlesinin biyogaz üretimine ilişkin seçilmiş çalışmalar

Kaynak	Araştırma	Yer	Biyokütle	Diğer Biyokütlelerle Karşılaştırma	Kuru Madde (Dm) Verimi (T/Ha)	Enerji İçeriği (Gj/Ha) veya Metan Verimi	Başlıca Bulgular
(Schroyen vd., 2015)	Fenolik bileşiklerin metan üretimi üzerindeki inhibitör etkisinin değerlendirilmesi	Belçika	Kenevir	X	n.a.	100–2000 mg/L fenolik derişiminde CH_4 üretiminde azalma	Fenolik bileşiklerin yüksek konsantrasyonlarda metan oluşumunu baskıladığı, mikrobiyal adaptasyonla etkilerin zamanla azaldığı gösterildi.
(Schroyen vd., 2017)	Lignin bozunumu ve detoksifikasyon enzimlerinin etkisi	Belçika	Kenevir	X	n.a.	%80 fenolik uzaklaştırma, toplam CH_4 üretiminde sınırlı artış	Veratril alkol ve lakaz enzimiyle fenoliklerin azaltılması, süreç başlangıcındaki toksisiteyi azalttı.
(Schroyen vd., 2018)	BMP tahmininde lignin içeriğinin belirleyici rolü	Belçika	Kenevir, Buğday, Miscanthus, Keten	✓	n.a.	BMP: 238 L CH_4/kg VS	Lignin miktarının BMP'nin en güçlü belirleyicisi olduğu, kenevirin orta düzeyde potansiyel sunduğu gösterildi.
(Michal vd., 2023)	Farklı büyüme evresi ve gübreleme rejimlerinin biyogaz ve metan üretimi üzerine etkisi	Çekya	Kenevir	X	12 tDM/ha, %32 KM	309–316 L CH_4/kg ODM; MHY: 2780–3230 m^3/ha	Erken evrede en yüksek metan verimi; BGP sindirim ürünlerinin etkili bir gübre alternatifi olduğu gösterildi.
(Daglioglu vd., 2024)	NaOH ön işlemi, HTC ve buhar gazlaştırma entegrasyonu ile	Türkiye	Kenevir hurdası	X	n.a.	1278 mL H_2/g, 213 mL CH_4/g KOİ	NaOH ön işlemi biyometanı %164 artırdı; 200 °C'deki

	biyometan ve biyohidrojen üretimi					hidrokömür en yüksek H_2 verimini sağladı.
(Todde vd., 2022)	Kirlenmiş topraklarda yetiştirilen kenevirin fitoremediasyon ve enerji geri kazanımı	İtalya	Kenevir (kirlenmiş toprak)	X	n.a.	25.3–36.8 GJ ha^{-1} enerji tasarrufu	Kirlenmiş biyokütlenin anaerobik fermantasyonu ve yakma ile işlenmesi, 579–641 kg CO_2e/ha azaltımı sağladı; fitoremediasyonla enerji geri kazanımı önerildi.

5. SONUÇ VE ÖNERİLER

Endüstriyel kenevir (*Cannabis sativa L.*), yüksek biyokütle üretim kapasitesi, kısa büyüme süresi, düşük pestisit gereksinimi ve çok yönlü kullanım alanlarıyla döngüsel ekonomi vizyonunun merkezinde konumlanabilecek stratejik bir tarım ürünüdür. Bitkinin tüm fraksiyonlar-lif, hurd, tohum ve yaprak-enerji, malzeme ve çevre yönetimi açısından farklı değer zincirlerine entegre edilebilmekte, böylece "atık üretmeyen üretim" ilkesine dayalı bütüncül bir biyorafineri modeli oluşturulabilmektedir. Anaerobik fermantasyon süreci, bu sistemin enerji yönelimli dönüşümünde temel bir teknoloji olup hem biyogaz üretimi hem de sindirim artıklarının tarımsal döngüye geri kazandırılması sayesinde çevresel sürdürülebilirliğin sağlanmasında kilit rol üstlenmektedir.

Biyorafineri yaklaşımının yaygınlaştırılması, kenevirin yalnızca biyogaz üretiminde değil, aynı zamanda biyohidrojen, biyokömür, biyoplastik ve biyogübre üretim hatlarında eş zamanlı olarak değerlendirilmesine olanak tanımaktadır. Bu entegre dönüşüm yaklaşımı, kaynak verimliliğini en üst düzeye çıkarırken atık yönetimi ve enerji tüketim maliyetlerini azaltmakta; dolayısıyla "döngüsel değer zinciri" konseptinin tarımsal uygulamalarda somutlaşmasını sağlamaktadır. Son yıllarda yapılan çalışmalar, NaOH veya buhar ön işlemiyle desteklenen fermantasyon hatlarının biyogaz verimini %150'nin üzerinde artırabildiğini ve lignin bariyerinin parçalanmasıyla biyobozunabilirliğin anlamlı biçimde iyileştirildiğini göstermektedir. Ayrıca, bu tür sistemlerin hidrotermal karbonizasyon ve kojenerasyon süreçleriyle entegrasyonu, enerji dönüşüm zincirinde sıfır atık hedefini teknik olarak erişilebilir kılmaktadır. Böylelikle kenevir temelli biyorafineri sistemleri, enerji üretimi, karbon döngüsü ve atık yönetimini bütünleştiren bir sürdürülebilirlik modeli haline gelmiştir.

Gelecekteki araştırmaların, kenevirin enerji dönüşümündeki potansiyelini daha etkin kullanabilmek adına üç temel eksende yoğunlaşması gerekmektedir. İlk olarak, ön işlem optimizasyonu, farklı kenevir fraksiyonlarının (lif, hurd, yaprak) kimyasal ve enzimatik ön işlem kombinasyonlarıyla biyokimyasal metan potansiyelinin artırılmasını ve sürecin enerji girdisi–çıktısı dengesiyle birlikte modellenmesini içermelidir. İkinci olarak, hibrit enerji sistemleri üzerine çalışmalar derinleştirilmelidir. Anaerobik fermantasyonun fotobiyolojik, elektrokimyasal veya termokimyasal süreçlerle entegrasyonu, aynı biyokütleden çoklu enerji ürünlerinin (CH_4, H_2, biyokömür) eş zamanlı olarak elde edilmesini mümkün kılacak ve bu sayede enerji verimliliği yeni bir boyut kazanacaktır. Üçüncü olarak ise, karbon nötrlüğü ve yaşam döngüsü değerlendirmesi odaklı modelleme çalışmaları ön plana çıkmalıdır. Kenevir tabanlı biyogaz üretiminin karbon ayak izi, toprak karbon sekestrasyonu ve karbondioksit emisyon dengelemesi parametreleriyle birlikte değerlendirilmesi, sistemin iklim politikalarıyla entegrasyonunu güçlendirecektir.

Sonuç olarak, kenevir temelli biyorafineri sistemleri yalnızca yenilenebilir enerji üretimini değil, aynı zamanda toprak sağlığını, atık yönetimini ve karbon dengesini birlikte hedefleyen yeni nesil döngüsel ekonomi uygulamaları için güçlü bir fırsat sunmaktadır. Bu vizyonun hayata geçirilebilmesi, kenevirin ulusal enerji ve çevre politikalarında "karbonsuz büyüme" hedeflerine entegre edilmesiyle mümkün olacaktır. Böyle bir yaklaşım, yalnızca biyokütle temelli enerji güvenliğini güçlendirmekle kalmayacak, aynı zamanda tarımsal kalkınmayı ve iklim değişikliğiyle mücadeleyi destekleyen yenilikçi bir yeşil dönüşüm stratejisine öncülük edecektir.

TEŞEKKÜR

Bu çalışma, Necmettin Erbakan Üniversitesi Bilimsel Araştırma Projeleri Koordinatörlüğü tarafından desteklenen 23GAP19001 No'lu proje kapsamında edinilen bilimsel perspektif ve kavramsal çerçeveden yararlanılarak hazırlanmıştır.

ÖZET

Bu çalışmada Hatay ili Altınözü İlçesinde geçim kaynaklarının büyük bir bölümünü zeytinden sağlayan üreticilerinin girdi kullanım düzeyi ve miktarları, girdi temininde kullanılan kaynaklar, yararlanılan tarımsal destekler ve tarımsal kredi ihtiyaçlarının belirlenmesi amaçlanmıştır. Araştırmanın ana materyalini 80 tarım işletmesinden anket yoluyla toplanan birincil veriler oluşturmuştur. Örnek işletmeler, 1-10 da 43 işletme, 11-25 da 20 işletme ve 26 da üstü 17 işletme olarak gruplara ayrılmış ve karşılaştırmalar yapılmıştır. Karşılaştırmalar çapraz tablolar ve yüzde oranlarla yapılmıştır. Üreticilerin yaş ortalaması 51, aile üyesi 5,6 kişi, %55 ilk-orta öğrenim düzeyi eğitim ve 31 yıllık zeytin üretimi deneyimi vardır. Araştırma alanı olan Altınözü ilçesindeki zeytin üreticilerinin %81'inin zeytin bahçesi alanı 20 dekarın altındadır. Üreticilerin ortalama zeytin bahçesi 16,6 da, parsel sayısı 2,3 ve %84 mülk arazilerden oluşmuştur. Bölgedeki zeytin üreticilerinin tarımsal örgütlenme düzeyi çok düşüktür. Bahçelerde toprak işleme, budama, ilaçlama ve hasat işlemlerinde aile işgücü kullanımı yaygın olup bahçelerde kurak koşullarda üretim yapılmaktadır. Üreticilerin %23'ü zeytin bahçesinde tarım sigortası yaptırmıştır. Üreticilerin ortalama zeytin satış fiyatı 4,5 ₺/kg, zeytinyağı satış fiyatı da 18,7 ₺/kg olarak gerçekleşmiştir. Zeytin üreticileri işletme başına ortalama 59,9 bin ₺ kredi kullanmış ve 2,1 bin ₺ kadar tarımsal destekten yararlanılmıştır. Üreticilerin bir üretim döneminde ihtiyaç duyduğu işletme sermayesi miktarı 31,7 bin ₺/işletme olarak hesaplanmıştır. Bunun %73'ü işgücü giderleri, %10 malzeme alımı, %4 çekigücü gideri ve %13 diğer giderlerden oluşmuştur. Küçük ölçekli zeytin işletmeleri için hibe, sübvansiyonlu kredi ve ödeme kolaylıkları sağlanmalıdır. Kooperatifleşme yoluyla bakım, teknoloji ve pazarlama alanlarında gelişim desteklenmeli; kuraklıkla mücadelede modern sulama yatırımları bölgeye kazandırılmalıdır. Üreticilere budama, gübreleme ve depolama konularında eğitim verilmelidir. Gençlerin kırsal üretime katılımı teşvik edilerek göç azaltılmalı; kaliteyi artırmaya yönelik ambalajlama ve işleme gibi uygulamalar tüm paydaşlarla hayata geçirilerek pazarlarda rekabet gücü ve üretici gelirleri yükseltilmelidir.

Anahtar Kelimeler: Zeytin, Girdi Kullanımı, Kredi İhtiyacı, Altınözü-Hatay.

DETERMINATION OF INPUT UTILISATION LEVEL AND AGRICULTURAL CREDIT NEEDS OF OLIVE PRODUCERS IN HATAY-ALTINÖZÜ DISTRICT

ABSTRACT

This study aimed to determine the level and amount of input use, the sources used in input supply, the agricultural supports utilized, and the agricultural credit needs of producers who derive a large part of their livelihood from olives in Altınözü District, Hatay Province. The primary data for the study consisted of questionnaires collected from 80 agricultural enterprises. Sample farms were divided into groups as 43 farms on 1-10 ha, 20 farms on 11-25 ha, and 17 farms on 26 ha, and comparisons were made. Comparisons were made with cross-tables and percentages. The average age of the producers was 51 years, 5.6 family members, 55% had primary and secondary education, and 31 years of olive production experience. The olive orchard area of 81% of the olive producers in Altınözü district, which is the research area, is below 20 decares. The average olive orchard of the producers is 16.6 da, the number of parcels is 2.3, and 84% of the olive groves are composed of property lands. The level of agricultural organization of olive producers in the region is very low. The use of family labor is common in soil cultivation, pruning, spraying and harvesting operations in the groves and production is carried out under arid conditions in the groves. 23% of the producers have agricultural insurance for their olive groves. The average olive sales price of the producers was 4.5 ₺/kg and the average olive oil sales price was 18.7 ₺/kg. Olive producers used an average of 59.9 thousand ₺ of credit per enterprise and benefited from 2.1 thousand ₺ of agricultural support. The amount of working capital needed by producers in a production period was calculated as 31.7 thousand ₺/enterprise. Of this, 73% was composed of labor expenses, 10% of material purchases, 4% of traction power expenses and 13% of other expenses. Grants, subsidized loans, and payment facilities should be provided for small-scale olive enterprises. Development in the fields of maintenance, technology, and marketing should be supported through cooperatives; modern irrigation investments should be brought to the region to combat drought. Producers should be trained in pruning, fertilization, and storage. Migration should be reduced by encouraging young people to participate in rural production; practices such as packaging and processing to increase quality should be implemented with all stakeholders to increase competitiveness in markets and producer incomes.

Keywords: Olive, Input Use, Credit Need, Altınözü-Hatay.

1. GİRİŞ

XX. yüzyılın bitkisi olarak görülen zeytin, Akdeniz havzası ve Ege adalarında yetiştirilmektedir. Doğal coğrafyası Suriye'nin kuzey doğusundan başlamakla birlikte Akdeniz'in kuzey ve güney sahillerinden Atlas Okyanusuna kadar uzanmaktadır. Dünyada yaklaşık 10 milyon hektar alandaki 900 milyon zeytin ağacından yaklaşık 17 milyon ton zeytin elde edilmektedir. Zeytin ve zeytinyağı üretici ülkelerinin başında İspanya, İtalya, Yunanistan, Türkiye, Tunus ve Fas gelmektedir. Dünyada zeytin üretiminde, AB ülkelerinin payı yıllar içinde değişse de ortalama seviyesi %70'dir (Doğaka, 2015).

Türkiye'nin son 5 yıldaki sofralık zeytin üretim ortalaması 431 bin ton, yağlık zeytin üretimi 1 milyon 329 bin ton olup toplamda 1 milyon 760 bin tondur. Bu dönemdeki zeytinyağı üretim ortalaması ise yaklaşık 175 bin tondur. 2017/18 üretim döneminde genç ağaçların meyve vermeye başlamasıyla birlikte üretim rekor bir artışla 2 milyon 100 bin tona ulaşılmıştır. Hatay'da yaklaşık 5.500 ton sofralık ve 85.501 ton yağlık zeytin üretimi vardır (TÜİK, 2024). Zeytin genetik özelliğinin yanında kültürel işlemlerin tam olarak uygulanamaması nedeniyle periyodisite (bir yıl ürün verme-diğer yıl az/yok verme) gösterir. Ayrıca, hastalık ve küresel iklim değişiklikleri rekolteleri ve ürün kalitesini yıllar arasında etkileyen diğer önemli faktörlerdir. Türkiye'de yıllara göre ürün miktarı değişkenlik göstermekte, yani var yılı yok yılı özelliği şiddetli yaşanmaktadır. Üretim var yıllarında 2 milyon ton, yok yıllarında ise 1 milyon 500 bin ton civarında seyretmektedir. Dolayısıyla, üründe yok yıllarında 500 bin ton kadar rekolte kaybı yaşanmaktadır. İspanya'da gibi ülkelerde bu oran çok daha düşük seviyelerinde kalmaktadır. Böylece, üretimde büyük dalgalanmalar önlenerek, sürekli bir ürün arzı sağlanabilmektedir. Türkiye'de periyodisite etkisinin azaltılması için, daha az periyodisite eğilimi gösteren zeytin çeşitlerinin geliştirilmesi yanında, sulama, ilaçlama ve gübreleme vb. bakım işlemlerine dikkat edilmesi ve bu yönde zeytin üreticilerine gerekli desteklerin sağlanması gerekmektedir. Zeytin yetiştiriciliğinde girdi kullanım düzeyi bu yönü ile daha fazla önem taşımaktadır.

Türkiye'de tarım sektöründe faaliyet gösteren işletmelerin sorunlarının başında yeterli girdi kullanamama ve bunların finansmanında yaşanan sorunlar gelmektedir. İşletmeler üretim sırasındaki finansman ihtiyaçlarını kendi tasarruflarından, dış kaynaklardan veya devletin mali yardımlarından karşılamaktadır. Ancak zeytin üreticilerinin tarımsal kredi olanaklarından yeterince faydalanamadığı görülmektedir. Üreticiler zeytin üretimine verilen destekleri yeterli bulmamaktadır (Seçer ve Emeksiz, 2019). Zeytinde ürün miktarını arttırmak, verim kaybını önlemek, kaliteli zeytin ve zeytinyağı üretimi için toprak analizi, sulama, gübreleme, hasat, zirai mücadele vb. kültürel işlemleri zamanında ve tekniğine uygun şekilde yapabilmesi gerekmektedir. Türkiye'de ve dünyada tarım kredileri, günümüzde genellikle devlet tarafından desteklenen ve bu tür kredilerin özelliklerini bilen yerel bankalar ve/veya bu alanda uzmanlaşmış kredi kurumları, kooperatif bankalar tarafından verilmektedir. Organize olmuş kredi kuruluşları tarım sektöründe faaliyette bulunmak, tarım kesiminin kredi ihtiyacını karşılamak amacıyla kanun ve yönetmeliklerle kurulmuş, kredi işlemlerini belirli esaslara göre yürüten kamu ve özel kuruluşlar olup, faiz oranlarını istedikleri gibi değiştirememektedir (Keskin ve Çalışır, 2024). Organize olmuş kredi kaynaklarında genellikle faiz oranları şahıslardan sağlanan kredilere oranla daha düşük olmaktadır. Organize olmuş kredi kuruluşlarının başında Tarım ve Orman Bakanlığı, Tarım Kredi Kooperatifleri, Ziraat Bankası, Halk Bankası, Vakıflar Bankası ve özel bankalar (Denizbank, Şekerbank, İş Bankası vb.) gelmektedir. Alternatif finansman kaynağı olarak ise leasing, faktöring ve vadeli işlemlerden yararlanılmaktadır (KKB, 2021). Tarım işletmelerinde; doğal afetler, çeşitli hastalık, haşere ve hayvanların verdiği zararlar, savaş ve göçler, işletmelerin küçük ölçekli olması,

tarımsal gelirlerinin yetersiz düzeyde olması, üretimin ve kalitenin artırılmasına yönelik yatırımlar, sosyo-ekonomik faktörler kredi ihtiyacı oluşturan etkenlerin başında gelmektedir. Tarımsal krediler; işletmenin finansal açıdan zayıfladığı ve likidite yönünden eksikliğe düştüğü zamanlarda destek olmakta, işletmenin devamlılığının sağlanmasına yardımcı olmaktadır.

Tarımsal potansiyeli oldukça yüksek olan Türkiye, başta küçük ve parçalı işletmeler, eğitim seviyesi düşük çiftçi yapısı ve modern tarımsal girdi, alet ve ekipmanlara ulaşmada yetersiz kalan finansman gibi karşı karşıya kaldığı çeşitli sorunlar nedeniyle bu potansiyelini tam olarak kullanamamaktadır (Doğan ve ark., 2015). Türkiye tarımının en önemli sorunlarından birisi çiftçilerin gerekli zamanda ve ihtiyaç duydukları miktarda krediye erişim imkanlarının zayıf olmasıdır (Özçelik ve ark., 2005). Tarımda kredi kullanımı üretim miktarının, verimliliğin, girdi kullanım etkinliğinin ve nihayetinde tarımsal gelirin artırılması için oldukça önemlidir (Terin ve ark., 2014; Bozoğlu ve Ceyhan, 2007). Her ne kadar iyi motive edilmiş ve eğitimli olursa olsun, yeterli finans kaynağından yoksun olan bir çiftçinin modern tarım yapma olanağı yoktur. Çünkü modern tarım verimli tohum/tohumluk, gübre, tarımsal ilaç, kesif hayvan yemi, belli konularda uzman işgücü gibi girdilerin kullanımını gerektirmektedir. Bunların uygun zaman ve yeterli miktarda temin edilebilmesi ise sürekli bir nakit çıkışına yol açmaktadır. Ancak tarımın yapısı nedeniyle, çiftçiler sürekli bir nakit çıkışı ile karşı karşıya olmalarına rağmen, hasat dönemine bağlı olarak yılda bir ya da birkaç kez gelir elde edebilmektedirler (Özçelik ve ark., 2005). Bu durum çiftçilerin tarımsal destekler, sübvansiyonlar ve kredi gibi çeşitli yollarla finanse edilmelerini zorunlu kılmaktadır. Çiftçilerin gerekli zaman ve yeterli miktarda krediye erişebilmeleri tarımsal aktivitelerini geliştirebilmelerine ve modern teknolojileri uygulayabilmelerine yardımcı olabilir (Bülbül, 2006). Bu denli önemli olmasına rağmen Türkiye'de tarımsal kredilerin öncelikli olarak, tarımsal üretimin geliştirilmesi, uygun toprak hazırlığı, diğer işlemler için modern girdi ve makine/ekipman temini için ihtiyaç duyan ve bu konularda hassas çiftçilere yönlendirilmesi için uygulamalar oldukça yetersizdir. Tarımsal üretim sürecinde gelir elde edilmesi, üretimin doğası gereği çoğu zaman bir yıl sürdüğünden tarım sektöründe sermaye birikimi çok yavaş gerçekleşmektedir. Tüm bu sayılan nedenlerden dolayı sermaye açısından yetersiz olan tarım işletmelerinin faaliyetlerini sürdürebilmeleri ve yapılarını iyileştirebilmeleri dış finansman/kredi temini yoluna gitmeleri ile mümkün görünmektedir. Tarımsal üretimde miktar ve kalite artışları ancak uygun koşullarda sağlanacak finansmanlarla sağlanabilir.

Akdeniz bölgesinde zeytin üretiminde verim ve kalite düşüklüğü yanında bölgeye uygun çeşit seçimindeki yanlışlıklar, sulama suyu kaynakları yetersizlikleri ve budama tekniği konusundaki eksiklikler olmak üzere bir takım teknik ve altyapı sorunları bulunmaktadır (Demirtaş, 2017). Zeytincilik sektöründe ürün ve üretim maliyetinin düşürülmesinde mutlak gerekli görülen ve zeytincilikte kullanılan girdilerden başta gübre, akaryakıt ve enerjinin sağlanmasında finansman destekleri önem taşımaktadır. Akdeniz bölgesindeki 1.395 bin dekarlık zeytin üretim alanında yaklaşık %37 payla Hatay ili ilk sırada gelmektedir. Bu pay Türkiye'deki diğer iller de dikkate alındığında ise %6 civarındadır (TÜİK, 2024). Hatay ilindeki en önemli zeytin üretim alanlarının başında gelen Altınözü ilçesinin bu yönü araştırma alanı olarak seçilmesinde etkili olmuştur. Altınözü ilçesindeki zeytin üretimi ağırlıklı olarak yağlık çeşitlerden oluşmaktadır. Bu çalışma ile Hatay'da geçim kaynaklarının büyük bir bölümünü zeytinden elde eden Altınözü ilçesinde zeytin üreticilerinin girdi kullanım düzeyi ve miktarları, girdi temininde kullanılan kaynaklar (tarımsal desteklemeler) ve tarımsal kredi ihtiyaçlarının belirlenmesi amaçlanmıştır.

2. DÜNYADA ZEYTİN VE ZEYTİNYAĞI ÜRETİMİ

Zeytinin meyvesi yağlık ve sofralık olarak işlenebilen ve bu işleme sonucu oluşan yan ürünleri değerlendirilebilen ve sağlık açısından çok faydalı olduğu için giderek talebi artan bir üründür. Zeytin bitkisinin özel iklim isteği nedeniyle zeytincilik, dünyada daha çok Akdeniz'e kıyısı olan ülkelerde (İspanya, İtalya, Yunanistan, Türkiye, Tunus, Suriye, Fas, Fransa ve Portekiz) yapılmaktadır. Halen dünya zeytin ağaç varlığının yaklaşık %93'ü bu ülkelerde yer almaktadır. 2021 verilerine göre dünyada yaklaşık olarak 10,3 milyon hektar alanda 23 milyon ton zeytin üretimi yapılmaktadır (FAO, 2023). Dünya'da zeytin ağaçlarının %90'ı Akdeniz havzası ikliminin etken olduğu yaklaşık 40 ülkede bulunmakta olup, toplam 103 milyon dekar alanda zeytin yetiştirilmektedir. Zeytin periyodisite gösteren bir bitki olması nedeniyle dünyada üretimde yıllara göre dalgalanmalar görülmektedir. FAO verilerine göre zeytin üretiminde 2021-2022 döneminde İspanya 3,940 bin ton ile ilk sırada yer alırken onu 2,976 bin ton ile Türkiye, 2,160 bin ton ile İtalya, 1,968 bin ton ile Fas ve 1,200 bin ton ile Tunus izlemektedir. Küresel üretimde 2. sırada yer alan Türkiye ise küresel zeytin üretiminin yaklaşık %13,9'unu gerçekleştirmektedir. 2021-2022 üretim döneminde Yunanistan'da olumsuz iklim koşullarına bağlı olarak zeytin üretiminde çok büyük miktarlarda düşüş yaşanmış olması nedeniyle üretim verisi henüz rapor edilmemiştir. Dünya zeytin üretiminde öne çıkan ülkeler aynı zamanda önemli zeytinyağı üreticisi ülkeleridir. Yıllar itibariyle ortalama zeytinyağı üretimi 2,9 milyon ton olarak gerçekleşirken İspanya yaklaşık %44'ünü tek başına üretmiştir. FAO verilerine göre zeytinyağı üretiminde 2021-2022 döneminde İspanya 1,492 bin ton ile ilk sırada yer alırken onu 329 bin ton ile İtalya, 240 bin ton ile Tunus, 235 bin ton ile Türkiye, 232 bin ton ile Yunanistan ve 203 bin ton ile Portekiz izlemektedir. Türkiye küresel zeytinyağı üretiminin yaklaşık %6,9'unu gerçekleştirmektedir (Çizelge 1, 2, 3).

2.1. TÜRKİYE'DE ZEYTİN VE ZEYTİNYAĞI ÜRETİMİ

Türkiye bulunduğu coğrafi konum ve Akdeniz ikliminin etkin görülmesiyle İspanya, İtalya, Fas, Tunus ve Yunanistan gibi diğer Akdeniz ülkeleriyle birlikte dünyanın sayılı zeytin ve zeytinyağı üreticilerindendir. Türkiye'de özellikle Ege, Marmara, Akdeniz ve Güneydoğu Anadolu Bölgesinde zeytin ağaçlarının yoğun olarak yer alır. Zeytin üretiminin önemli bir bölümü Ege Bölgesinde yapılmaktadır. Aydın, İzmir, Muğla, Manisa, Balıkesir, Mersin, Hatay, Çanakkale, Antalya ve Bursa önde gelmektedir. Sofralık zeytin üretiminin yoğun olarak yapıldığı Bursa, Balıkesir, Çanakkale ve Hatay illeri %75'inden fazlasını karşılamaktadır. Üretim miktarlarının yıllar arasında önemli miktarda dalgalanma göstermesinin ana nedeni zeytinlerdeki peryodisite özelliğidir. TÜİK verilerine göre Türkiye'de 2022-2023 döneminde üretim yaklaşık 1,5 milyon ton olarak gerçekleşmiştir bunun 490 bin tonunu sofralık, 1 milyon tonunu da yağlık zeytin üretimi oluşturmuştur. Sofralık zeytin üretiminde Manisa 120 bin tonla ilk sırada yer alırken, Bursa 95 bin ton, Aydın 50 bin ton, Mersin 42 bin ton ve Hatay ise 41 bin tonla 5. Sırada yer almıştır. Aynı üretim döneminde yağlık zeytin üretiminin iller arasındaki dağılımında İzmir 186 bin tonla ilk sırada yer alırken bunu Muğla 163 bin tonla ikinci, Hatay 138 bin tonla üçüncü ve Aydın 123 bin tonla dördüncü sırada yer almıştır (Çizelge 4, 5, 6).

Çizelge 4. Türkiye'nin zeytin ağaç sayısı ve üretimi

	Ağaç sayısı (Bin)			Üretim (Ton)		
Yıl	Toplam	Meyve veren	Meyve vermeyen	Toplam	Sofralık	Yağlık

2.2. TÜRKİYE'DE ZEYTİNE SAĞLANAN DESTEKLER

Destekleme politikaları ile uygun üretim yapısının oluşturulması, üreticinin korunarak uygun gelirin sağlanması ve tarımın ülke ekonomisine olan katkısının arttırılması amaçlanmaktadır. Türkiye'de Ege ve Akdeniz bölgelerindeki birçok ailenin geçimini sofralık zeytin ve zeytinyağı sektöründen sağlanmaktadır. Ürün arzındaki dalgalanmalar, destekleme politikaları ile uygun üretim yapısının oluşturulması, üreticinin gelirinin ve bunun yanında tarımın ülke ekonomisine olan katkısının arttırılması amaçlanmaktadır. Ülkemizin kalkınmasında önemli rolü olan zeytin ve zeytinyağı stratejik öneme sahiptir. Türkiye'nin zeytin ağaç sayısı ve alanı büyük bir hızla büyümektedir. Türkiye'de sofralık zeytin ve zeytinyağı sektörü uzun yıllar birçok ailenin geçim kaynağını oluşturmuştur. Ürün arzındaki dalgalanmalar, yetiştirmesinin belirli bölgelerde yapılması, temel gıda özelliği taşıması, gelecekte önemli bir ihracat ürünü olması ve yurt dışına satış imkânlarının olması sebebiyle sofralık zeytin ve zeytinyağı devlet tarafından çeşitli politika araçlarıyla desteklenmektedir. Sektörün geliştirilmesi amacıyla uygulamalar geniş bir zamana yayılmış ve araçlarda yıldan yıla değişiklikler olmuştur (Seçer ve Emeksiz, 2019). Türkiye'de zeytin ve zeytinyağına yönelik olarak sağlanan desteklemeler arasında; zeytinyağı fark ödemesi desteği ve dane zeytin fark ödemesi desteği havza bazlı olarak kg başına her yıl güncellenen miktarlarda uygulanmaktadır (Anonim, 2023). Geleneksel zeytin bahçelerinin rehabilitasyonu desteği, sertifikalı fidan desteği, organik tarım desteği, iyi tarım uygulamaları desteği, gübre-mazot desteği, küçük aile işletmesi desteği, biyoteknik mücadele desteği, toprak analizi desteği, lisanslı depolarda muhafaza edilen zeytin ve zeytinyağı desteği, TARSİM desteği (poliçe bedelinin %50'sinin devletçe karşılanması) gibi destekler yıllar arasında artan ve değişen miktarlarda sağlanmaktadır. Ayrıca Kırsal Kalkınmayı Destekleme Programları kapsamında projeli olarak tarımsal ürünlerin işlenmesi, kurutulması, dondurulması, paketlenmesi ve depolanmasına yönelik yatırımlara %50 hibe desteği sağlanmaktadır. IPARD Programı kapsamında bitkisel üretimin çeşitlendirilmesi, bitkisel ürünlerin işlenmesi ve paketlenmesi başlığı altında %55-65 arasında değişen hibe oranlarında yatırım desteği sağlanmaktadır (Keskin ve Çalışır, 2024; KKB, 2023).

2.3. HATAY İLİNDE ZEYTİN ÜRETİMİ

Hatay ilinin ekonomisi genel olarak tarım olmakla birlikte topraklarının 2.270.859,2 da alanında tarım yapılmaktadır. Bu alanın içinde Amik ovasının da 119.300 da olduğunu da göz önünde bulundurursak Hatay topraklarının ne kadar verimli olduğunu daha iyi görülebilir. Alüvyon topraklı Amik Ovasında özellikle turfanda sebzecilik ve turunçgil tarımı yapılmaktadır. Hatay ilinin dağlık kesimi olan Altınözü ve Yayladağı ilçelerinde zeytin üretimi başta gelmektedir. Türkiye genelinde Hatay, 147.194 ton (sofralık ve yağlık zeytin) üretimi ile 2017 yılında ilk 5'te yer alarak, Türkiye (1.7 milyon ton) zeytin üretiminin %9'unu gerçekleştirmiştir. Bölgelere göre yağlık zeytin üretiminde Ege bölgesi birinci sırayı alırken 2.sırada %30 ile Akdeniz bölgesi yer almaktadır. Akdeniz bölgesi içerisinde %38 ile Hatay büyük bir paya sahiptir (Anonim, 2017). Hatay ilinde zeytin üretiminde en önemli sorunlarının, zeytin ağacının periyodisite gösteren bir tür olması nedeniyle dönemsel olarak verimde değişiklik yaşanması, zeytin üretimi yapan işletmelerin %90'ına yakını küçük işletmelerden oluşması, tarım alanlarının dağınık ve parçalı oluşu, zeytin yetiştiriciliğinde ağaçların gençleştirme çalışmalarının yapılmadığı ve özellikle bilinçsiz ve yeterli gübreleme ve ilaçlamanın yapılmadığını söyleyebiliriz.

Çalışmanın ana materyalini Hatay ilinde zeytin üretiminin yoğun olduğu Altınözü ilçesinde örneklemeyle belirlenen toplam 80 zeytin üretici ile yüz yüze anket yoluyla elde edilen birincil veriler oluşturmuştur. Konu ile ilgili daha önce yapılmış olan araştırmalar, bölgede yapılan gözlemler ve mülakatlardan da faydalanılmıştır. Araştırma kapsamında gerekli ikincil verileri

Zeytincilik Araştırma Enstitü kayıtları, Hatay Tarım ve Orman İl Müdürlüğü, Altınözü Tarım ve Orman İlçe Müdürlüğü verileri, TÜİK ve FAO'dan sağlanan istatistiki veriler oluşturmuştur. Ayrıca konu ile ilgili ulusal ve uluslararası çalışmalardan elde edilen bulgulardan da yararlanılmıştır.

Hatay ili Altınözü ilçesi zeytin üretici sayısı ve üretim alanı olarak %40 civarında pay sahibidir ve bu özelliği nedeniyle araştırma alanı olarak belirlenmiştir. Araştırma kapsamında Hatay Tarım ve Orman İl Müdürlüğü ve Altınözü Tarım ve Orman İlçe Müdürlüğüne kayıtlı zeytin yetiştiriciliği yapan ve zeytin ile ilgili tarımsal krediden faydalanan çiftçi kayıtlarından yararlanılmıştır. Çiftçi Kayıt Sistemi (ÇKS) verilerine dayanarak, Altınözü ilçesinde zeytin yetiştirilen mahallelerdeki işletmelerin sahip oldukları zeytin alanı varlığı belirlenerek örnek çerçevesi oluşturulmuştur. Araştırma alanı olarak seçilen ilçedeki 48 mahalleden gayeli örnekleme yöntemi ile Alakent, Atayurdu, Boynuyoğun, Büyükburç, Çetenli, Dokuzdal, Fatikli, Kamberli, Karbeyaz, Karsu, Mayadalı, Sivrikavak, Sarıbük, Oymaklı, Türkmenmezraası, Yolağzı, Yunushanı, Ziyaret olmak üzere 18'i seçilmiştir. Bu mahalleler zeytin üretici sayısı ve üretim alanı olarak öne çıkan yerlerden oluşmaktadır.

Altınözü ilçesinde zeytin üretimi yapan üreticilerin zeytin alanı ve seçilen örneklemin işletme büyüklük gruplarına göre dağılımına Çizelge 7'de yer verilmiştir. Araştırmada zeytin üreticilerinin sahip olduğu alana (dekar) göre üç gruba ayrılarak çeşitli özellikleri bakımından incelenmiştir. Küçük olarak gruplandırılan 1-10 dekar arası üreticilerden 43, orta gruptaki 11-25 dekar arası alana sahip üreticilerden 20 ve büyük grupta 26 dekardan büyük zeytin alanı olan 17 üretici olmak üzere toplam 80 üretici araştırma verilerinin toplanacağı örnek olarak belirlenmiştir. Seçilen örneklem Altınözü ilçesindeki toplam zeytin alanı ve üretici sayısının %5'ini oluşturmaktadır.

Çizelge 7. Araştırma kapsamındaki zeytin üreticileri örnekleminin dağılımı (da)

İşletme büyüklüğü (da)	Üretici sayısı	Alan (da)	Örnek sayısı	Oran (%)
1-10 (Küçük)	895	4133,6	43	53,8
11-25 (Orta)	269	4103,3	20	25,0
26-+ (Büyük)	232	10206,7	17	21,2
Toplam	1396	18443,6	80	100,0

Anket uygulama dönemi 2019 yılı üretim dönemi verilerini kapsamış olup, tarımsal kredi başvurularından yararlanmada ise 2020 yılındaki başvuruları alınmıştır. Bu çalışmada kullanılan anket formları daha önceki benzeri çalışmalarda kullanılan anket formları ve konu ile ilgili literatür incelenerek araştırmanın kapsamına uygun olarak düzenlenmiştir. Ankette yer alan sorunların uygunluğu ve yeterliliği için ön- teste tabi tutulmuş ve gerekli düzeltmelerle ankete son şekli verilmiştir. Anket çalışması 2019 üretim döneminde üretici ile birebir sorular sorularak gerçekleştirilmiştir. Ankette üreticilerin özellikleri yanında işletme yapısını ortaya koyabilmek için arazi büyüklüğü, parça sayısı, mülkiyet durumu vb., üretim teknikleri bakım işlemleri, budama, gübreleme, sulama, ilaçlama vb., pazarlama yapısı, yaşadığı sorunlar ve çözüm önerileri üzerine düşüncelerine değinilmiş ve bir üretim döneminde ihtiyaç duyduğu kredi ihtiyacına yönelik sorulara cevap verilmesi istenilmiştir.

2.4. ZEYTİN İŞLETMELERİNİN ÖZELLİKLERİ

Araştırma kapsamında görüşülen zeytin üreticilerinin yaş özellikleri incelendiğinde 47,6 yıl ile 57,6 yıl arasında değişmiş olup ortalama 51 yaşındadırlar. İşletmecilerin aile birey sayıları da 5-6 kişi arasında değişirken ortalama 5,6 kişidir. Üreticilerin zeytin üretimindeki deneyimleri 25-40 yıl arasında değişmiş ve ortalama 31 olduğu belirlenmiştir. Çalışma kapsamında görüşme yapılan zeytin üreticilerinin eğitimleri %55 oranında ilk ve orta öğrenim, %36 oranında da lise seviyesindedir. Buna göre üreticilerin %90'dan fazlası lise ve altında eğitimlidir. Bu durum Türkiye genelinde yapılmış olan araştırma sonuçlarıyla benzerlik göstermektedir. Çok az da olsa işletme büyüklüğü arttıkça eğitim düzeyinde artış görülmektedir. Araştırma alanında özellikle küçük ölçekli işletmeye sahip üreticiler arasında ek gelir amacıyla tarımsal faaliyetlerin dışında başka alanlarda da çalışma durumu söz konusudur. Görüşme yapılan 80 üreticiden 57'si (%71) tarımsal faaliyetlerin yanında başka işlerde yapmaktadır. Çalışmaya dahil olan zeytin üreticilerinin zeytin ve diğer üretim alanları ortalama 18,5 da olup bunun %90'a yakını zeytinliklerden oluşmuştur. I. grup küçük işletmelerde zeytin alanı 4,8 da iken bu miktar III. grup büyük ölçekli işletmelerde 45,2 dekara kadar yükselmiştir. Araştırmaya katılan üreticilerin ortalama zeytin alanları da 16,6 dekardır. İşletmeciler diğer tarım alanlarında sebze, buğdaygiller ve yem bitkisi yetiştirmektedir. Araştırma alanındaki işletmecilerin zeytin dikim alanı parsellerin parçalı olması nedeniyle çeşitlilik göstermektedir. Arazinin mülk olması yanında hazineden kiralamalar ve ortaklık ile işletilen tarım arazileri de bulunmaktadır. Mülk arazilerin oranı ortalama %84 olup kiralanan araziler %6 ve ortakçılıkla işletilenler ise %10 kadardır. İşletmelerin arazi parçalılık durumu 1-5 arasında değişmekte olup ortalama parsel sayısı 2,3'tür. İncelenen işletmelerde zeytin dikili arazilerin meyilli ve kırsal kesimde olması nedeniyle sulama işlemi yapılamadığı görülmüştür. Araştırma alanındaki arazilerin sadece %3,8'i sulanabilmektedir.

2.5. ZEYTİNDE ÜRETİM MASRAFLARI VE GELİRİ

İşletmelerin tamamına yakını zeytin bahçelerinde toprak işlemesi uygulaması yapmaktadır. Toprak işleme amaçlarının başında yabancı ot kontrolü gelmektedir. Ancak meyilli arazilerde toprak işlemesi su ve rüzgar erozyonuna neden olabilir. Bu nedenle toprak işleme zamanının ve tekniğinin erozyona yol açmayacak şekilde yapılması önemlidir. İşletmelerin zeytinde toprak işleme zamanı çoğunlukla kasım ve haziran ayları arasında uygulanmaktadır. Araştırma kapsamında görüşülen işletmeler bir yılda ortalama 2,5 kez toprak işleme uygulaması yapmıştır. Bu işlemler için çoğunlukla bahçe tipi traktörler kullanılmıştır. Toprak işlemede toplam 28,6 ₺/da işlem ücreti ödemesi ve 19,3 ₺/da aile işgücü karşılığı söz konusu olup toplam da ise 47,9 ₺/da harcama yapılmıştır. Araştırma bölgedeki zeytin bahçelerinin su kaynaklarından uzakta olması nedeniyle genellikle sulama yapılmamaktadır. Sadece ikinci grup işletmelerin birinde zeytin bahçesinde damlama sulama uygulaması yapıldığı belirlenmiştir. Bu nedenle araştırma bölgesinde sulama amaçlı bir üretim ve bakım gideri hesaplanamamıştır. Zeytin bahçelerinde gübre uygulamaları çoğunlukla elle yapılırken sadece 7 işletmede gübre dağıtma makinesi kullanımı olduğu belirlenmiştir. Gübreleme zamanı genellikle bölgedeki yağışların başladığı kış aylarında olmaktadır. Üreticilerin zeytin bahçelerindeki gübre ve gübreleme işçiliği giderleri ortaya konulmuştur. İşletmelerin ortalama gübre masrafı 43,4 ₺/da iken gübreleme işçiliği için 22,6 ₺/da harcama hesaplanmış ve toplam gübreleme gideri ise 77,4 ₺/da olmuştur. İşletmelerin budamada birim alandaki ortalama yabancı işgücü gideri 61,1 ₺/da iken aile işgücü karşılığı ise 27,5 ₺/da olarak hesaplanmıştır. Toplam budama giderinin ise ortama 93,2 ₺/da olduğu belirlenmiştir. İşletmelerin ölçeği büyüdükçe aile işgücü kullanımı azalırken yabancı işgücü kullanımı artmaktadır. Bölgedeki zeytin bahçelerinde Dal Kanseri, Halkalı Leke ve Zeytin Sineği hastalık ve

zararlıları daha fazla sorun olarak görülmektedir. Araştırma alanındaki zeytin bahçelerinde bir üretim döneminde ortalama 1.7 kez ilaçlama yapılmıştır. İşletmelerin birim alandaki ortalama ilaç gideri 38 ₺/da iken işgücü harcaması 40.5 ₺/da ve toplam ilaçlama gideri ise 78.5 ₺/da olmuştur. İşletmeler ortalamasına göre hasatta dekara 506,5 ₺ makine gideri, 507,7 ₺ yabancı işgücü gideri ve 333,1 ₺ aile işgücü karşılığı ve toplam olarak ise 1347,4 ₺ masraf söz konusu olmuştur. Araştırma alanında işgücü ödemelerinin bazı durumlarla nakit olarak yapılmayıp toplanan ürün üzerinden ayni olarak da yapılması söz konusu olmaktadır. Yapılan anlaşmaya göre toplanan ürünün 1/3'ü veya ¼'ünün işgücü karşılığı olarak ödenmesi söz konusudur. Aynı şekilde zeytinlerin yağının çıkarılması aşamasında prese tesislerine ödemelerin toplam yağ üzerinden bir bölümü ile yapıldığı durumlar görülmüştür.

Araştırma döneminde işletmelerin ortalama zeytinyağı satış fiyatının 18.7 ₺/kg olduğu belirlenmiştir. Zeytin ve zeytinyağları hasat sonrasında kasım-aralık aylarında satılmıştır. Çok az miktardaki zeytinyağının satışı ise ocak ayında gerçekleşmiştir. Satışların tamamı peşin olarak yapılırken, ürün teslim yerleri işletmecinin evi veya prese tesisleri olmuştur. İncelenen dönemde işletmeler ortalama 1432,9 kg zeytinyağını pazarlamışlardır. Birinci grup işletmelerden üçü hiç zeytinyağı satışı yapmamış, bu işletmeler zeytinlerini sadece sofralık olarak pazarlama yoluna gitmişlerdir. Katılımcı 80 işletmenin geriye kalan 37'si hem zeytin hem de zeytinyağı pazarken, 40 işletme ise üretimini sadece zeytinyağı şeklinde pazarlara arz etmiştir. Araştırma kapsamında görüşme yapılan işletmelerin ortalama zeytin satış fiyatının 4,5 ₺/kg olduğu, işletme başına ortalama satılan zeytin miktarının 468,5 kg ve birim alana elde edilen zeytin gelirinin ise 127 ₺/da olduğu belirlenmiştir. İşletmelerin satışını gerçekleştirdiği zeytinyağı geliri ortalama 1432,9 ₺/da ve zeytin satış geliri de ortalama 127 ₺/da olduğundan toplam satış geliri de 1741,2 ₺/da olarak belirlenmiştir. Bölgedeki zeytin üreticilerinin zeytin ve zeytinyağı pazarlamasında söz konusu olan pazarlama giderleri İşletmeler ortalamasına göre taşıma gideri 25,1 ₺, işgücü gideri 51,8 ₺ ve diğer giderler 66,9 ₺ olmak üzere toplam ortalama pazarlama gideri 143,8 ₺ olarak hesaplanmıştır.

3. ÜRETİCİLERİNİN KREDİ VE DESTEKLERDEN YARARLANMA DURUMU

Tarımsal üretimde kredi ihtiyacı, çiftçilerin üretim süreçlerini sürdürebilmeleri ve geliştirebilmeleri için oldukça önemlidir. Tarım kesimine kamu bankaları ve Tarım Kredi Kooperatiflerince sağlanan tarımsal krediler düşük faizli (sübvansiyonlu kredi) ve uzun vadelidir (Gezer ve Gezer, 2022). Düşük faizli yatırım ve işletme kredisi kullandırılması Ziraat Bankası ve Tarım Kredi Kooperatiflerince "Tarımsal Üretime Dair Düşük Faizli Yatırım ve İşletme Kredisi Kullandırılmasına İlişkin Karar" kapsamında zeytin bahçe tesislerine yönelik olarak (yatırım ve işletme kredisi), ayrıca modern basınçlı sulama sistemi tesislerinde (yatırım kredisi) %75-100 arasında değişen oranlarda faiz indirimli kredi kullandırılmaktadır (Anonim, 2023). Üreticilerin tamamı zeytin üretiminde kullanılmak üzere kurumlaşmamış kredi kaynaklarından (akraba, komşu, komisyoncu, tüccar vb.) kaynak kullanmadığını ifade etmiştir. Kullanılan kredilerin tamamı banka ve kooperatif kredilerinden oluşmuştur. İncelenen üreticilerden II. gruptan 1 ve III. gruptan 2 olmak üzere 3 üreticinin kredi kaynağı kooperatif iken geriye kalan 14 işletmenin kredi kaynağı ziraat bankası olmuştur. Kullanılan kredi miktarı işletme ölçeği artışına göre artmaktadır. İşletme başına göre I. grupta 0,5 bin ₺ olan kredi miktarı II. grupta 42 bin ₺ ve III. grupta kredi kullanan işletme başına 83 bin ₺'ye kadar yükselmiştir. Kredi kullanan işletmelerin ortalama kredi miktarı ise 60 bin ₺ olduğu belirlenmiştir. Bu sonuçlara göre büyük ölçekli işletmelerin tarımsal kredi kullanımında daha iyi durumda oldukları söylenebilir. Küçük ölçekli işletmeye sahip üreticilerin ise kendi kaynakları ile yetindiği görülmüştür.

Tarımda kredi temini, üreticiler için çeşitli zorluklar içerebilir. Bu zorluklar arasında yüksek faiz oranı, teminat eksikliği, bürokratik engeller ve geri ödeme zorlukları gibi konular öne çıkmaktadır. Bu zorluklar özellikle küçük aile işletmeleri için daha fazla olumsuzluk olarak görülmektedir (Akçabey ve Paksoy, 2023; Gezer ve Gezer, 2022). Zeytin üreticilerinin krediye ulaşmada karşılaştığı sorunlar arasında faiz yüksekliği, bürokratik işlemlerdeki zorluklar ve teminat göstermedeki zorluklar %20 civarındaki oranla ilk üç sırada yer almıştır. Üreticilerin kredi kullanımına ilişkin memnuniyetlerinin incelendiği cevapların dağılımında "memnun" seçeneğinin yer aldığı 4. seçenekte işletme büyüklüğü artışına göre %40 civarındaki olumlu görüş %80'in üzerine çıkmıştır. Kullanılan kredi miktarı daha fazla olan II. ve III. grup işletmelerde memnuniyet düzeyinin daha fazla olduğu görülmektedir. Kararsız ve memnun değil seçenekleri I. grup işletmelerde daha yüksek oranda ifade edilmiştir. Bu sonuçlara göre kredi kullanım düzeyinin memnuniyet durumunu doğrudan etkilediği söylenebilir.

Tarımsal destekler, tarım sektörünün sürdürülebilirliğini ve gelişimini sağlamak için hayati öneme sahiptir. Tarımsal destekler hem ekonomik hem de sosyal açıdan tarım sektörünün güçlenmesine katkıda bulunur. Tarımsal destekler sayesinde üretim artışı, gelir güvencesi, kırsal kalkınma, yeniliklere ve teknolojiye ulaşım, gıda güvenliği, çevresel sürdürebilirlik ve pazarlara erişim gibi konularda iyileşme sağlanabilmektedir (Oğul, 2022). İncelenen 80 işletmeden 38'i (%47.5) tarımsal desteklemelerden yararlanırken işletme başına ortalama 2072,6 ₺ destekleme ödemesi almış olup bu destek tutarının işletmelerin ortalama zeytin arazisine oranı ise 74,1 ₺/da olarak bulunmuştur. Bu destek tutarı işletmelerin sadece zeytin alanlarına ait olan miktarlar olup az da olsa diğer tarım arazileri için de destekleme ödemeleri alınması söz konusudur. Yararlanılan destekleme miktarlarının birim alana düşen değerleri incelendiğinde en yüksek değer II. grup işletmelere aittir. Büyük işletmelerin destekleme uygulamalarından yararlanmada, kredi kullanımında olduğu gibi öne çıkamadığı görülmüştür. Araştırmaya katılan zeytin üreticileri gruplarında tarımsal desteklerden memnuniyet seviyesi ortalama %49 civarındadır. Desteklerden memnuniyetsizlik düzeyi ise ortalama %34 kadardır. Diğer üreticiler ise bu konuda kararsız görüş belirtmişlerdir. İşletme grupları arasında memnuniyet düzeyi II. ve III. gruptaki orta ve büyük ölçekteki işletmeler arasında %80'lere kadar yükselirken, küçük ölçekli I. grup işletmelerde kararsız ve memnuniyetsiz üreticilerin oranı %77'ye yaklaşmıştır. Buna göre tarımsal desteklerden yeterince yararlanamayan küçük ölçekli üreticilerin olumsuz görüşe sahip oldukları söylenebilir.

3.1. ZEYTİN ÜRETİCİLERİNİN KREDİ İHTİYACI

Tarım sektöründe nakit ve nakit benzeri sermaye birikim seviyesinin düşük olması, çiftçilerin öz sermayesi (iç finansman) ile sektörün büyümesini sağlamalarını zorlaştırmaktadır. Bu durum, çiftçilerin dış finansman kaynaklarına (kredi, devlet desteklemeleri, hibe) olan ihtiyacını artırmaktadır. Çiftçiler, üretim sürecinin başlangıcından hasat dönemine kadar herhangi bir satış yapmadan sürekli harcama yapmak zorunda kaldıkları için, tarımsal işletmelerin nakit akış dengesi yılın büyük bir bölümünde negatiftir. Gelirler ise genellikle hasat sonrası tahsil edilen alacaklardan oluşmaktadır. Bu nedenle, tarım işletmelerinin sürdürülebilirliği ve büyümesi için etkin bir finansman stratejisi ve nakit akış yönetimi kritik öneme sahiptir.

Günümüz Türkiye'sinde de tarım sektörünün finansmanında en büyük kaynak sağlayıcı konumunda bulunan Ziraat Bankası, tarım işletmelerine yönelik kredilerini indirimli faiz oranlarıyla sunmaktadır. Cari faiz oranı ile indirimli faiz oranı arasındaki fark, hazine tarafından karşılanmaktadır (kredi sübvansiyonu). Ancak, Ziraat Bankası'nın tarımsal amaçlı nakdi kredilerinin toplam nakdi krediler içindeki payı, 1996 yılında %86 iken 2021 yılında %15'e kadar

düşmüştür (TBB, 2023). Bu durum, Ziraat Bankası'nın ticari amaçlı nakdi kredilere toplam nakdi krediler içinde giderek daha fazla ağırlık verdiğini göstermektedir.

Türkiye'de özellikle son yıllarda enflasyonda yaşanan yükseliş eğilimi, faiz oranlarının artmasına neden oluyor. Faiz oranlarının yükselmesiyle birlikte borçlanma maliyeti de arttığı için tarım işletmelerinin tarım kredilerine erişimi olumsuz etkileniyor. Buna ek olarak, tarım kredilerinin kullanılması için çok sayıda teminat istenilmesi ve uzun formalitelerin yerine getirilmesi gerekmektedir. Gereklilikleri yerine getirmekte güçlük çeken tarım işletmelerine yeterli veya hiç tarım kredisi verilmemektedir. Bu durumlar, işletme sermayesi yetersiz ve düşük üretim gelirine sahip tarım işletmelerinin tarım kredisi kullanmasının ve tarım sektöründe verimlilik düzeyinin artırılmasının önünde ciddi bir engel oluşturmaktadır (Keskin ve Çalışır, 2024). Türkiye'de tarım kesiminin farklı nedenlerle ticari banka kredisi kullanımının çok düşük olduğu bilinmektedir. Tarım sektöründe faaliyet gösteren üreticilerin ticari banka kredisi kullanmama nedenleri incelendiğinde krediye ihtiyaç duymayanların (%42) dışındaki nedenler arasında faiz ve kredi masraflarının yüksekliği (%23) en önemli neden olarak belirtilmiştir. Bunu dini inançlarından ve geleneklerinden dolayı faize girmek istemeyenler (%17) ve teminat kapsamında istenen ipotek veya kefaletleri karşılayamamak (%10) izlemektedir (Çizelge 8).

Çizelge 8. Tarım işletmelerinin ticari banka kredisi kullanmama nedenleri

Kredi kullanmama nedenleri	Oran (%)
Krediye ihtiyaç duymuyorum	42,1
Faizler/kredi masrafları yüksek	23,0
Faize girmek istemiyorum/karşıyım	16,7
İpotek, kefil, teminat vb. talepleri karşılayamamak	9,5
Formalitelerdeki uzunluk/zorluk	3,2
Daha önceki kredilere ait borçların geri ödenememesi	2,4
Ticari bankaların kredi vermemeleri	1,6
Diğer nedenler	1,6
Toplam	100,0

Kaynak: KKB, 2021.

Tarım kesiminde üretim ve yatırım harcamalarının finansmanında çiftçilerin başvurdukları kaynakların 2019-2023 yılları arasındaki dağılımı Çizelge 9'da incelenmiştir. Hiç borçlanmadım ve özkaynaklarımla üretim harcamalarını karşılamaktayım cevabını veren üreticilerin oranı 2019 yılında %49 civarında iken bu oran 2023 yılına kadar oransal olarak sürekli azalarak %17'ye kadar gerilemiştir. Buna göre tarım kesiminde özkaynakların yanında kredi veya borç şeklinde yabancı sermaye ihtiyacının sürekli arttığı görülmektedir. Üreticilerin ihtiyaç duyduğu kredi/borç kaynakları arasında banka kredisi veya tarım kart kullanımı yoluyla finansman sağlama oranı incelenen dönemde %27-%41 arasında değişmiş ve ilk sırada yer almıştır. Tarım kesiminde kullanılan girdilerden tohum, ilaç, gübre ve alet-ekipman gibi ürünlerin satıcılarından ihtiyaçların vadeli olarak alınması şeklindeki borçlanmalar 2019 yılında %5 civarında iken bu oran 2023 yılında %20'ye kadar yükselmiştir. Çiftçilerin bir diğer finansman kaynağı Tarım Kredi Kooperatiflerinden alınan kredilerdir ve bunun oranı da yıllar arasında %8,8 ile %18,6 arasında

değişmiştir. Ürünlerin alıcısı olan tüccarlardan veya aile üyeleri, komşu, akraba ve arkadaş çevresinden borçlanma şeklindeki finansman karşılama şekilleri ise önemsiz düzeylerde kalmıştır. Çizelgedeki verilerin genel olarak değerlendirilmesine göre yıllar arasında üreticilerin yabancı sermaye ihtiyacının giderek arttığı, bu ihtiyaçların karşılanmasında banka ve kooperatif kredileri ile girdi satıcılarının öne çıktığı söylenebilir.

Çizelge 9. Tarım kesimi finansman kaynakları dağılımı (2019-2023 dönemi, %)

Kredi/Borç kaynakları	2019	2020	2021	2022	2023
Hiç borçlanmadım (Özkaynak)	48,7	36,9	26,8	17,2	16,7
Bankadan kredi/Tarım kart kullanımı	27,4	28,7	32,0	41,4	39,3
Girdi satıcısından vadeli alım/Borçlanma	5,3	10,7	16,3	16,6	20,0
Tarım Kredi Kooperatifi kredisi	8,8	13,9	16,3	18,6	14,0
Tüccardan avans alımı	2,7	4,9	4,6	3,4	6,0
Aile/Komşu/Arkadaştan borçlanma	7,1	4,1	3,3	2,1	4,0
Diğerleri	0,0	0,8	0,7	0,7	0,0
Toplam	100,0	100,0	100,0	100,0	100,0

Kaynak: KKB, 2023.

Türkiye'de yapılan bir çalışmada çiftçilerin kullanmış oldukları krediler içinde en yüksek oran üretim faaliyetlerinin finansmanını sağlayan işletme (üretim) kredileridir (%44), bunu izleyen yatırım kredileri (%40) içinde traktör ve mekanizasyon yatırımları en yüksek paya sahiptir (Çizelge 10). Arazi alımı ve damızlık hayvan alımlarını inşaat yatırımları (depo, sera vb.) izlemiştir. Üreticilerin diğer yatırım kredisi harcamalarında sulama yatırımları en önemli harcama olarak yer almıştır (KBB, 2021).

Çizelge 10. Çiftçilerin kullandığı kredi türleri

Kredi türleri	Oran (%)
İşletme kredisi	44,4
Yatırım kredisi	39,6
Diğer krediler	16,0
Toplam	100,0

Kaynak: KKB, 2021.

3.2. ZEYTİN İŞLETMELERİNİN SERMAYE İHTİYACI

Bir tarım işletmesinin sermaye ihtiyacını ortaya konulabilmesi için işletme tipinin ve üretim sisteminin belirlenmesi, sermaye unsurlarının tanımlanması, işletmenin yıllık veya bir üretim dönemi içindeki gelir ve giderlerinin hesaplanması, işgücü ve mekanizasyon ihtiyacının ortaya konulması ve finansal analizinin yapılması gerekir. Yani işletmenin kısa ve uzun vadeli borç ödeme gücünün, karlılığının ve sermaye dağılımının bilinmesi gerekir (Tengiz ve ark., 2022). Bir tarım işletmesinin işletme sermayesi unsurları, işletmenin faaliyetlerini sürdürebilmesi için gerekli olan kaynakları içerir. Bunlar, işletmenin günlük faaliyetlerini sürdürebilmesi için gerekli olan nakit ve

kolayca nakde çevrilebilen varlıklar, üretim sürecinde kullanılacak olan hammaddeler, yarı mamuller ve mamuller (stoklar), alacaklar, işletmenin kısa vadede gelir elde etmek amacıyla yaptığı yatırımlar ve işletmenin kısa vadede nakde çevirebileceği diğer varlıklardır (Karakayacı ve ark., 2022). Bu unsurlar, tarım işletmesinin verimli ve sürdürülebilir bir şekilde faaliyet göstermesi için kritik öneme sahiptir.

Araştırma kapsamındaki zeytin işletmelerinin bir üretim dönemine ait işletme sermayesi ihtiyacı Çizelge 11'de verilmektedir. Zeytin üretiminde diğer meyve ve sebze üretiminde olduğu gibi en önemli harcama türü geçici işçilik harcamalarıdır. İşgücü kullanımı toprak işlemeden başlayıp hasat ve pazarlamaya kadar devem eden tüm süreçlerde söz konusudur. Bu nedenle toplam işletme sermayesi tutarının %73'ünü işgücü giderleri oluşturmuştur. Malzeme alımları yaklaşık %10 civarındaki oranla pay almaktadır. Araştırma bölgesinde zeytin üretimindeki malzeme ihtiyaçları arasında gübre ve ilaç alımları başta gelmektedir. Zeytinde hasatta söz konusu olan ambalaj, zeytinlerin işlenmesi ve depolanması gibi harcamalar %4,4 pay almaktadır. Zeytinde makine çekigücü ihtiyacı toprak işleme, gübreleme, ilaçlama, hasat ve taşıma işlemlerinde söz konusu olmaktadır. Diğer işletme giderleri içinde elektrik, su, bakım-onarım gibi harcamalar bulunmaktadır. İncelenen dönemde 1 dekar zeytin bahçesi için işletme sermayesi ihtiyacı 1912 ₺/da olarak hesaplanmıştır. Ancak tarımsal üretimde işletme sermayesi ihtiyacı üretim yapılan arazilerin yapısına, üretim teknolojisine, mekanizasyon düzeyine ve desteklemelerden yararlanma durumuna göre farklılık gösterecektir. Zeytin üreticileri yaptıkları üretim faaliyetlerindeki harcamalarının çoğunluğunu Ziraat Bankası kanalıyla aldıkları düşük faizli tarımsal kredilerden karşılamışlardır. Buna ilave olarak alan bazlı desteklemeler ve telafi edici ödemelerde bu ihtiyacı karşılamada katkı yapmıştır. Araştırma alanında görüşülen üreticiler arasında hasat öncesinde tarımsal girdi satıcı, tüccar veya prese tesisi/fabrika sahiplerinden avans şeklinde kredi/borç alınması söz konusu olmamıştır.

Çizelge 11. İşletmelerin bir üretim dönemindeki ortalama işletme sermayesi ihtiyacı

İşletme sermayesi unsurları	İşletme sermayesi ihtiyacı (₺/da)	Oran (%)
Geçici işgücü harcamaları	1400	73,2
Malzeme alımı	185	9,7
Hasat, ambalaj, işleme ve depolama giderleri	85	4,4
Makine çekigücü harcamaları	80	4,2
Pazarlama giderleri	47	2,5
Diğer işletme giderleri	115	6,0
Toplam	1912	100,0

Araştırmaya dahil olan zeytin işletmelerinin işletme kredisi ihtiyaçları ve kullanmış oldukları kredi miktarları incelendiğinde I. grup işletmelerin ihtiyaç duyulan kredinin çok altında krediyle yetindikleri görülmektedir. II. ve III. gruptaki işletmelerin ise yeterli kredi kullandıkları söylenebilir (Çizelge 12). Küçük ölçekli işletmelerin öz kaynaklarını kullanmaları söz konusu olsa da bu kaynaklarında üretimdeki girdileri karşılamaktan uzak olduğu ortadadır. Bu nedenle üretimde kullanılan gübre ve ilaç gibi uygulamaları yapamadıkları veya çok az yaptıkları anlaşılmaktadır. İşgücü giderlerinin çoğunluğu ise aile işgücü ile karşılanmıştır. Buna ilave olarak

işletmelerin yararlanmış oldukları tarımsal desteklerde finansman ihtiyacını karşılamada katkı sağlamıştır.

Çizelge 12. İşletmelerin bir üretim dönemindeki işletme kredisi ihtiyacı

İşletme grupları	İşletme kredisi ihtiyacı (bin ₺/işletme)	Kullanılan kredi (bin ₺/işletme)	Yararlanılan destek (₺/işletme)
I	9,2	0,5	261,3
II	33,5	42,0	1846,3
III	86,4	82,8	2780,0
Toplam/Ortalama	31,7	59,9	2072,6

4. SONUÇ

Zeytin hem yağlık hem de sofralık olarak işlenebilen bir meyvedir. Bu işlemler sonucunda elde edilen yan ürünler de değerlendirilebilmektedir. Sağlık açısından önemli faydaları nedeniyle zeytine olan talep giderek artmaktadır. Zeytin bitkisi, özel iklim koşulları gerektirdiğinden, zeytin yetiştiriciliği daha çok Akdeniz'e kıyısı olan ülkelerde (İspanya, İtalya, Yunanistan, Türkiye, Tunus, Suriye, Fas, Fransa ve Portekiz) yoğunlaşmıştır. Türkiye'de 2023 yılında toplam 9 milyon dekar zeytinlik alan kaydedilmiştir. 2023 yılı için toplam zeytinlik alanların %73,6'sı yağlık zeytin ve %26,4'ü sofralık zeytin alanlarıdır.

Hatay ili Türkiye'nin önemli zeytin üretim alanlarından biridir. Yaklaşık olarak 50 bin dekar alanda 3600 kadar üretici zeytin tarımı yapmaktadır. 2023 yılı verilerine göre sofralık zeytinde %8,5 yağlık zeytinlerde ise %13,4 pay almıştır. Hatay ilinde zeytin üretim alanı ve üretici sayısı bakımından Altınözü ilçesi ilk sırada yer almaktadır. Zeytin üretimi ve ticareti ilçe ekonomisinde önemli yer tutmaktadır. Ancak bölgedeki zeytin üretim işletmelerinin %90'ı 50 dekarın altındaki küçük ölçekli araziye sahiptir. İlçedeki zeytin işletmelerinin ortama büyüklüğü de 13,2 dekar olup %81'i 20 da ve altındaki işletmelerden oluşmuştur. Araştırma alanındaki küçük ölçekli zeytin işletmeleri yapısal olarak pek çok dezavantaja sahiptir. Bunlar toprak işleme, gübreleme, sulama ve budamadaki bilinçsizlik, yetersiz sermaye, düşük mekanizasyon, yetersiz teknoloji, örgütsüzlük gibi konular en önemlileridir. Bu araştırmada Hatay ilinin en önemli zeytin üretim bölgesi olan Altınözü ilçesinde belirlenen 80 üreticiye ait veriler kullanılarak, bölgede üreticilerin zeytindeki girdi kullanım durumu ve kredi ihtiyaçlarının belirlenmesi amaçlanmıştır.

Araştırma kapsamında verileri toplanan zeytin üreticilerinin ortalama yaşı 51, aile üye sayısı 5,6 kişidir. Üreticilerin 31,3 yıl zeytin tarımı deneyimi vardır. Üreticilerin %55'i ilk ve orta öğrenim seviyesinde eğitimlidir ve bunların %71'i tarımsal faaliyetlerin dışında başka işlerde yapmaktadır. Araştırmaya katılan işletmeler zeytin üretim alanlarına göre 3 ayrı gruba ayrılarak karşılaştırmalar yapılmıştır. Bunlar; I. grupta 43 işletme ve ortalama zeytin alanı 4,8 da, II. grupta 20 işletme ve ortalama alan 17,5 da, III. grupta ise 17 işletme ve ortalama alan 45,2 da şeklindedir. İşletmelerin %90'a yakın orandaki arazi varlığı zeytin bahçelerinden oluşmaktadır. Zeytin bahçeleri ortalama 16,6 da ve parçalılık ortalama 2,3 tür ve %84 oranında mülk arazilerden meydana gelmiştir. Zeytin bahçelerinde yılda ortalama 2,5 kez toprak işlemesi yapmaktadır, zeytin bahçeleri genellikle kurak koşullarda yetiştirilmekte, yılda 1,6 kez gübreleme uygulaması yapılmaktadır, bahçelerde genellikle budama uygulaması tek seferde kasım-aralık aylarında budama makası ve testere kullanılarak yapılmıştır. Bölgede zeytinlerde görülen çeşitli hastalık ve zararlılarla mücadele için

1,7 kez ilaçlama uygulaması yapıldığı belirlenmiştir. Bölgede zeytinlerin hasadı ekim ayında başlayıp kasım ayında yoğunlaşarak aralık ayında sona ermektedir. Hasat genellikle elle toplama şeklinde yapılmaktadır. Araştırma bölgesindeki zeytin çeşitlerinin büyük oranda yağlık olmasından dolayı ürünler zeytinyağına işlenmektedir. Elde edilen yağlar zeytin işleme tesislerine ve bölgedeki tüccara pazarlanmaktadır. Satışlar genel olarak peşin olarak yapılmakta, ürünler işletmede veya prese tesislerinde teslim edilmektedir. İncelenen dönemde bölgedeki zeytinyağı fiyatı ortalama 18,7 ₺/kg olarak gerçekleşirken sofralık olarak pazarlanan zeytin fiyatı 4,5 ₺/kg olmuştur. İşletmelerin zeytin ve zeytinyağı satışından elde ettiği ortalama gelir 1741 ₺/da olarak hesaplanmıştır.

Katılımcı üreticilerin 17'si TKK veya Ziraat Bankasından sübvanse edilmiş tarımsal kredi kullanmıştır. İşletme başına kullanılan kredi miktarı ortalama 59,9 bin ₺ olmuştur. Üreticilerin krediye ulaşmada karşılaştığı en önemli zorluklar arasında yüksek faiz, prosedürlerin zorluğu ve teminatları yerine getirme zorlukları en önemlileridir. Üreticilerin %55'i kredi kullanımından memnun olduğunu belirtmiştir. İncelenen işletmelerin %48'i çeşitli tarımsal destekleme uygulamalarından yararlanmıştır. Yararlanılan destek miktarı ortalama 74,1 ₺/da ve 2072,6 ₺/işletme olmuştur. Üreticilerin %49'u uygulanan tarımsal desteklerden memnun olduğunu ifade etmiştir. Üreticilerin yaklaşık %23'ü zeytin bahçelerinde tarım sigortası yaptırmıştır. Araştırma bölgesinde kadın girişimcilere yönelik zeytin üretim ve işletme kooperatifi bulunmaktadır. Katılımcılar arasında 30 üretici TKK'lerine üye olduğunu, tamamı ise Ziraat Odasına kayıtlı olduğunu belirtmiştir. Bölgedeki zeytin işletmelerinin bir üretim döneminde birim alanda ihtiyaç duyduğu işletme sermayesi ihtiyacı içinde geçici işgücü harcamaları %73, malzeme alımları %10, hasat, ambalaj ve depolama gideri %4,4, çekigücü gideri %4,2, pazarlama ve diğer giderler ise 8,5 oranında paya sahiptir. Bölgedeki işletmelerin bir üretim döneminde ihtiyaç duyulan işletme kredisi ihtiyacı ortalama 31,7 bin ₺/işletme olarak hesaplanmıştır. Bölgedeki işletmelerin kullanmış olduğu tarımsal kredi miktarı ortalama 59,9 ₺/işletme olmuştur. Büyük ve orta ölçekteki işletmeler için kullanılan kredi miktarları işletme ihtiyacını karşılayabilecek düzeyde iken küçük ölçekli işletmelerin kullanmış olduğu kredi miktarı ihtiyacın çok altında kalmıştır. İşletmelerin işletme sermayesi ihtiyacını karşılamada yararlanılan desteklerinde katkı sağladığı görülmüştür.

Araştırma alanında incelenen zeytin işletmelerinin ve Altınözü ilçesindeki diğer üreticilerin küçük ölçekli arazilere sahip olmalarından kaynaklanan sorunlar yaşamakta olduğu görülmüştür. Bu sorunların aşılabilmesi için;

İşletmelerin yeterli finansman kaynağına ulaşımını sağlayabilmek için, kredi ve destekleme uygulamalarında küçük ölçekli (20 dekar ve altındaki zeytinlikler için) işletmeler için bazı ayrıcalıklar uygulanmalıdır. Bu uygulamalar desteklemeler, hibe ve sübvanse edilmiş tarım kredileri için olmalıdır. Desteklemelerden yararlanma düzeylerini artırmaya yönelik tedbirler, kredi alımında teminat göstermede esneklikler, işlem prosedürlerini kolaylaştırma ve ödeme kolaylıkları gibi uygulamalar gündeme gelmelidir. Küçük ölçekli işletmelerin birlikte hareket etmelerine olanak sağlayacak örgütlenme (kooperatif ve üretici birliği) modelleri ile, bahçelerin bakım işlemlerinde işbirliği, mekanizasyon olanaklarını geliştirme, teknoloji kullanımın artışı, pazarlama, ürün işleme, ürünlerde markalaşma gibi konularda ilerlemeler sağlanabilir. Kurak koşullarda yapılan zeytin tarımında görülen periyodisite, düşük verim ve kalite sorunları, modern sulama tesislerinin bölgeye girmesiyle azalacaktır. Bu konuda gereken yatırımların yerel yönetimler, üretici örgütleri ve diğer kamu birimleriyle işbirliği içinde bölgeye kazandırılmalıdır. Zeytin üreticileri arasında üretim tekniği açısından görülen eksikliklerden budama, sulama, gübreleme, hastalık ve zararlılarla mücadele, hasat işlemlerinde modern tekniklerin kullanılması,

depolama gibi konularda bilgi ve bilinç düzeyini artıracak eğitim ve yayım çalışmaları artırılmalı ve yaygınlaştırılmalıdır. Bölgede zeytin tarımında genç nüfusun katılımını artıracak uygulamalar ve teşvikler artmalıdır. Böylece kırsaldan kentlere doğru olan göçlerde genç nüfusun bir bölümünün kırsalda üretime katılımı sağlanmalıdır. Bölgede üretilen zeytin ve zeytinyağında kalite artışını sağlayacak uygulamalar (hasat, işleme, depolama, ambalajlama vb. konularda) üretici, işleme tesisleri, tüccar gibi sektörün tüm paydaşlarının içinde olduğu projelerle hayata geçirilmelidir. Bölgede üretilen zeytin ve zeytinyağında yurt içi ve yurt dışı pazarların taleplerine uygun kalite ve standartların sağlanması yoluyla üretici gelirlerinin artırılması ve sektörün canlanması önemli görülmektedir.

SAĞLIKLI KÖPEKLERDE KALP BOYUTLARININ RADYOGRAFIK DEĞERLENDIRILMESI: VERTEBRAL KALP SKORU (VHS) VE VERTEBRAL SOL ATRIYUM BOYUTU (VLAS)

Doç. Dr. Başak BOZTOK ÖZGERMEN

Aksaray Üniversitesi, Veteriner Fakültesi

Email: basak1607@gmail.com

ORCID: 0000-0001-7039-8956

ÖZET

Bu çalışmanın amacı, klinik olarak sağlıklı köpeklerde vertebral kalp skoru (VHS) ve vertebral sol atriyal boyut (VLAS) için referans değerler belirlemek ve bu radyografik ölçümlerin demografik faktörler ve ekokardiyografik parametrelerle ilişkisini değerlendirmektir.

Farklı ırk, yaş ve cinsiyette toplam 40 sağlıklı köpek çalışmaya dahil edildi. Tüm olgular rutin klinik ve kardiyovasküler muayeneden geçirildi. Sağ lateral ve dorsoventral toraks radyografilerinden VHS ve VLAS değerleri hesaplandı. Ardından, ekokardiyografi ile sol atriyum (LA), aort kökü (Ao) ölçümleri ve LA/Ao oranı belirlendi. Kardiyak patoloji saptanan hayvanlar çalışma dışı bırakıldı. Veriler cinsiyet, yaş ve vücut ağırlığına göre karşılaştırıldı; parametreler arası korelasyon analizleri yapıldı.

Ortalama VHS değeri 9.86, VLAS 1.32 ve LA/Ao oranı 1.17 olarak bulundu. Cinsiyet, yaş grubu ve ırk büyüklüğüne göre yapılan karşılaştırmalarda istatistiksel olarak anlamlı fark saptanmadı ($p>0.05$). VHS, VLAS ve LA/Ao oranları arasında anlamlı korelasyon bulunmadı. Bu parametrelerin birbirinden bağımsız ölçümler sunduğu sonucuna varıldı.

VHS ve VLAS, klinik olarak sağlıklı köpeklerde cinsiyet, yaş ve vücut ağırlığından bağımsız olarak güvenilir kalp ölçüm yöntemleri olarak değerlendirildi. Bu parametrelerin ekokardiyografiye erişimin mümkün olmadığı durumlarda alternatif tanısal araçlar olarak kullanılması önerilmektedir. Ancak, daha geniş örneklem gruplarıyla yapılacak ileri çalışmalar, elde edilen verilerin genellenebilirliğini artıracaktır.

Anahtar Kelimeler: Köpek, Radyografi, Vertebral Kalp Skoru, Vertebral Sol Atriyum Boyutu, Ekokardiyografi, Kalp Ölçümü

RADIOGRAPHIC ASSESSMENT OF CARDIAC DIMENSIONS IN HEALTHY DOGS: VERTEBRAL HEART SCALE (VHS) AND VERTEBRAL LEFT ATRIAL SIZE (VLAS)

ABSTRACT

This study aimed to establish reference values for the Vertebral Heart Scale (VHS) and Vertebral Left Atrial Size (VLAS) in clinically healthy dogs, and to evaluate the relationship between these radiographic parameters and demographic variables, as well as echocardiographic findings.

Forty healthy dogs of various breeds, sexes, and age groups were enrolled after clinical and cardiovascular examination. Thoracic radiographs (right lateral and dorsoventral views) were used to measure VHS and VLAS. Subsequently, echocardiography was performed to measure the left atrium (LA), aortic root (Ao), and to calculate the LA/Ao ratio. Dogs with cardiovascular abnormalities were excluded. Statistical analyses included independent t-tests, ANOVA, and Pearson correlation to assess the effect of age, sex, breed size, and associations among the cardiac indices.

Mean VHS, VLAS, and LA/Ao values were 9.86, 1.32, and 1.17, respectively. There were no statistically significant differences in these values based on sex, age, or breed size ($p > 0.05$). No significant correlations were found between VHS, VLAS, and LA/Ao ratio, indicating these indices are independent of each other in healthy dogs.

VHS and VLAS can be considered reliable and independent radiographic indicators of cardiac size in healthy dogs, unaffected by sex, age, or body size. These parameters may serve as practical diagnostic tools, especially in settings where echocardiography is not readily available. Further studies with larger sample sizes are recommended to validate these findings across different populations.

Keywords: Dog, Radiography, Vertebral Heart Scale, Vertebral Left Atrial Size, Echocardiography, Cardiac Measurement

GİRİŞ

Köpeklerde kardiyovasküler hastalıklar, veteriner hekimlikte önemli morbidite ve mortalite nedenlerinden biridir. Bu hastalıkların erken teşhisi, tedavi başarısını ve yaşam kalitesini artırmak açısından kritik öneme sahiptir. Kardiyak boyutların değerlendirilmesi, kalp hastalıklarının tanısında temel adımlardan biridir. Ekokardiyografi altın standart olarak kabul edilse de, her klinikte mevcut olmayabilir veya bazı durumlarda uygulanması mümkün olmayabilir.

Radyografi, yaygın olarak erişilebilir ve nispeten düşük maliyetli bir tanı yöntemidir. Vertebral Kalp Skoru (VHS) ve Vertebral Sol Atriyum Boyutu (VLAS), köpeklerde kardiyak büyüklüğün radyografik olarak değerlendirilmesinde kullanılan iki önemli metriktir. VHS, Buchanan ve Bücheler (1995) tarafından tanımlanmış olup kalbin uzunluk ve genişlik ölçülerinin torakal omurga uzunluğuna oranlanması esasına dayanır. VLAS ise Malcolm ve ark. (2018) tarafından tanımlanmış, özellikle mitral kapak hastalıklarının erken teşhisinde önemli bir parametredir.

Bu çalışmada, sağlıklı köpeklerde VHS ve VLAS değerleri belirlenmiş ve bu ölçümlerin yaş, cinsiyet, ırk büyüklüğü gibi demografik değişkenlerle ilişkisi değerlendirilmiştir. Ayrıca, bu radyografik ölçümlerin ekokardiyografik parametrelerle olan ilişkisi de incelenmiştir.

1. GEREÇ VE YÖNTEM

Bu çalışma, Aksaray Üniversitesi Veteriner Fakültesi Etik Kurulu onayı ile yürütülmüştür. Çalışmaya, farklı ırk, yaş ve cinsiyetlerde toplam 40 klinik olarak sağlıklı köpek dahil edilmiştir. Hayvanların sağlık durumları, detaylı fiziksel muayene ve kardiyovasküler sistem muayenesi ile doğrulanmıştır. Kardiyak patoloji veya sistemik hastalık bulgusu saptanan hayvanlar çalışma dışında bırakılmıştır.

Radyografik görüntüler, dijital radyografi cihazı kullanılarak sağ lateral ve dorsoventral pozisyonlarda alınmıştır. VHS ölçümleri, Buchanan ve Bücheler (1995) tarafından tanımlanan yönteme uygun olarak yapılmıştır. VLAS ölçümleri ise Malcolm ve ark. (2018) tarafından tanımlanan tekniğe göre sağ lateral görüntü üzerinden gerçekleştirilmiştir. Tüm ölçümler, deneyimli bir radyoloji uzmanı tarafından iki kez yapılarak ortalamaları alınmıştır.

Ekokardiyografik değerlendirme, iki boyutlu, M-mod ve Doppler modları içeren ultrason cihazı ile sağ parasternal uzun ve kısa eksen görüntülerinde yapılmıştır. Sol atriyum (LA) ve aort kökü (Ao) çapları ölçülmüş, LA/Ao oranı hesaplanmıştır.

İstatistiksel analizler için SPSS 25.0 paket programı kullanılmıştır. Cinsiyet, yaş grubu ve ırk büyüklüğüne göre karşılaştırmalarda bağımsız örneklem t-testi ve tek yönlü ANOVA kullanılmıştır. Parametreler arası ilişkiler Pearson korelasyon analizi ile değerlendirilmiş, $p<0.05$ değeri istatistiksel olarak anlamlı kabul edilmiştir (Rishniw & Erb, 2000; Visser et al., 2015).

2. BULGULAR

Çalışmaya dahil edilen 40 köpeğin yaş ortalaması 5,2 ± 2,8 yıl, vücut ağırlığı ortalaması ise 18,4 ± 7,6 kg olarak bulunmuştur. Köpeklerin %55'i erkek, %45'i dişi idi. Irk dağılımı küçük, orta ve büyük ırklar olarak gruplandırıldığında dengeli bir dağılım gözlenmiştir.

Ortalama VHS değeri 9,86 ± 0,41, VLAS değeri 1,32 ± 0,18 ve LA/Ao oranı 1,17 ± 0,09 olarak hesaplanmıştır. Cinsiyet, yaş grubu ve ırk büyüklüğüne göre yapılan karşılaştırmalarda bu parametrelerde anlamlı fark saptanmamıştır ($p>0.05$). Alt grup analizlerinde küçük ırklarda ortalama VHS 9,89, orta ırklarda 9,84 ve büyük ırklarda 9,85 olarak bulundu. VLAS değerleri de benzer şekilde küçük ırklarda 1,33, orta ırklarda 1,31, büyük ırklarda 1,30 olarak ölçüldü. Yaş

grupları arasında 1–4 yaş, 5–8 yaş ve 9 yaş üzeri gruplar karşılaştırıldığında anlamlı fark gözlenmedi. Cinsiyet bazında erkeklerde VHS ortalaması 9,87, dişilerde 9,85 olarak bulunmuştur.

Gözlemci içi güvenilirlik analizi, ölçümlerin tekrarlanabilirliğini doğrulamıştır. Intraclass korelasyon katsayısı (ICC) VHS için 0,93, VLAS için 0,90 olarak bulunmuş, bu da ölçümlerin yüksek derecede güvenilir olduğunu göstermektedir. Ölçümler arasındaki uyum ±0,1 vertebra farkı içinde bulunmuştur.

Dağılım analizleri, VHS değerlerinin normal dağılım gösterdiğini, VLAS değerlerinin ise hafif sağa çarpık bir dağılım eğilimi sergilediğini ortaya koymuştur. Ekokardiyografik LA/Ao oranı ile radyografik parametreler arasında düşük düzeyde korelasyon bulunması, farklı tekniklerin kalp boyutunu farklı açılardan yansıttığını göstermektedir.

3. TARTIŞMA

Bu çalışmada elde edilen bulgular, VHS ve VLAS'ın sağlıklı köpeklerde cinsiyet, yaş ve ırk büyüklüğünden bağımsız olarak stabil kaldığını ortaya koymuştur. Bu sonuçlar, Buchanan ve Bücheler (1995) ile Hansson ve ark. (2005) tarafından bildirilen bulgularla uyumludur. Hansson ve arkadaşlarının çalışmasında da normal ve genişlemiş kalplere sahip köpeklerde VHS ölçümlerinin gözlemci içi ve gözlemciler arası varyasyonunun düşük olduğu bildirilmiştir ki, bu durum çalışmamızdaki yüksek ICC değerleri ile örtüşmektedir.

VLAS üzerine yapılan önceki araştırmalar, özellikle mitral kapak hastalığında eşik değerin 2,3 vertebra civarında olduğunu ve bu değerin üzerinde sol atriyum genişlemesi olasılığının arttığını göstermektedir (Malcolm ve ark., 2018). Bizim çalışmamızda sağlıklı popülasyonda ortalama 1,32 vertebra bulunması, patoloji varlığında bu değerin belirgin şekilde artabileceğini desteklemektedir.

Radyografik ölçümlerin ekokardiyografiye göre avantajları arasında yaygın erişilebilirlik, düşük maliyet, kısa çekim süresi ve sedasyon gerektirmemesi sayılabilir. Bununla birlikte, projeksiyon farklılıkları, inspiryum/ekspiryum fazı, hasta pozisyonlaması, vücut kondisyon skoru ve radyografik cihaz kalitesi gibi faktörler ölçüm sonuçlarını etkileyebilir. Bu nedenle, standardize edilmiş bir çekim protokolü ve deneyimli bir gözlemci ile çalışmak, ölçümlerin doğruluğunu ve tekrarlanabilirliğini artıracaktır.

Çalışmanın sınırlılıkları arasında örneklem büyüklüğünün görece küçük olması, tek merkezli yürütülmesi ve yalnızca sağlıklı köpekler üzerinde yapılmış olması yer almaktadır. İleride yapılacak daha geniş örneklemli, çok merkezli ve kardiyak patolojilere sahip köpekleri de kapsayan çalışmalar, VHS ve VLAS'ın klinik tanıdaki değerini daha net ortaya koyacaktır. Ayrıca, farklı ırklara özgü referans aralıklarının belirlenmesi, klinik yorumlamanın doğruluğunu artırabilir (Keene et al., 2019).

4. SONUÇ

Sağlıklı köpeklerde VHS ve VLAS ölçümleri, cinsiyet, yaş ve vücut ağırlığı gibi demografik faktörlerden bağımsız olarak güvenilir sonuçlar vermektedir. Bu parametreler, özellikle ekokardiyografi gibi ileri görüntüleme yöntemlerine erişimin mümkün olmadığı koşullarda, kardiyak boyutun değerlendirilmesinde kullanılabilecek pratik ve düşük maliyetli tanısal araçlar olarak önerilmektedir. Daha geniş örneklem gruplarıyla ve farklı kardiyak patolojiler üzerinde yapılacak çalışmalar, bu bulguların genellenebilirliğini artıracaktır.

ABSTRACT

This study explores the potential to mitigate the adverse effects of high body weight loss in chicks when access to feed and water is delayed after hatching in modern broiler production. For this purpose, the study examined the potential to mitigate these adverse effects by *in ovo* feeding varying doses of honey into Anadolu-T broiler eggs on day 18 of incubation. A total of 300 fertilised eggs were divided into six treatment groups, each with five replicates and 10 eggs per replicate, and placed in hatching trays. On the 18th day of incubation, no injection was administered to the negative control group (NC), while the positive control group (PC) received 0.5 ml of physiological serum, and the H25, H50, H75, and H100 groups received 0.25 mg, 0.50 mg, 0.75 mg, and 1 mg of honey, respectively, dissolved in 0.5 ml of physiological saline. Access to feed and water was provided for 24 hours after hatching in all groups. No significant effect of *in ovo* honey feeding was observed on hatchability, chick quality, or hatching weight. However, body weight loss at 24 hours post-hatch was significantly lower in the H25, H75, and H100 groups compared to the positive control group. The study's overall findings strongly suggest that *in ovo* honey feeding may be a practical, effective alternative for reducing live weight loss in broiler chicks, particularly when access to feed and water is delayed, without compromising hatchability. This method could significantly improve commercial broiler farming by supporting chick early viability and performance.

Keywords: *in ovo* feeding, honey, hatchability, fasting

In ovo BAL ENJEKSİYONUNUN ANADOLU-T CİVCİVLERİNDE KULUÇKA PERFORMANSI VE ÇIKIŞ SONRASI YEM VE SU ERİŞİMİ GECİKMESİNE YANIT ÜZERİNE ETKİLERİ

ÖZET

Bu çalışma, modern etlik piliç üretiminde yumurtadan çıktıktan sonra yeme ve suya erişimin geciktirilmesi durumunda civcivlerde yüksek vücut ağırlığı kaybının olumsuz etkilerini azaltma potansiyelini araştırmaktadır. Bu amaçla, kuluçka süresinin 18. gününde Anadolu-T etlik piliç yumurtalarına değişen dozlarda *in ovo* bal verilerek bu olumsuz etkilerin azaltılma potansiyeli incelenmiştir. Toplam 300 adet döllü yumurta beş tekerrürlü ve her tekerrürde 10 yumurta olacak şekilde altı muamele grubuna ayrılarak gelişim tablalarına yerleştirilmiştir. Kuluçkanın 18. gününde negatif kontrol grubuna (NK) enjeksiyon uygulanmazken, pozitif kontrol grubuna (PK) 0.5 ml serum fizyolojik ve B25, B50, B75 ile B100 gruplarına sırasıyla 0.25 mg, 0.50 mg, 0.75 mg ve 1 mg bal, 0.5 ml serum fizyolojik içinde çözündürülerek enjekte edilmiştir. Tüm gruplarda çıkış sonrası yem ve suya erişim 24 saat sonra sağlanmıştır. *İn ovo* bal beslemesinin kuluçka randımanı, çıkış gücü, civciv kalitesi ve civciv çıkış ağırlığı üzerinde anlamlı bir etkisi gözlenmemiştir. Ancak, çıkış sonrası 24. saatte canlı ağırlık kaybı B25, B75 ve B100 gruplarında PK grubuna göre anlamlı düzeyde düşük bulunmuştur. Elde edilen bulgular, *in ovo* bal beslemesinin kuluçka performansını etkilemeden, yem ve suya geç erişimin neden olduğu canlı ağırlık kaybını azaltmada potansiyel, pratik ve etkili bir alternatif olduğunu göstermektedir. Bu yöntem, civcivlerin erken yaşama gücünü ve performansını destekleyerek ticari etlik piliç yetiştiriciliğini önemli ölçüde iyileştirebilir.

Anahtar Kelimeler: *in ovo* besleme, bal, kuluçka performans

1. INTRODUCTION

In standard hatchery and rearing practices, chicks are typically deprived of feed and water for about 24 to 36 hours after hatching. This delay occurs due to the hatching window, vaccinations, sexing, and transport to the hen (Careghi et al., 2005). As a result of this nutrient deficiency, chicks rapidly mobilize body reserves to sustain metabolism, leading to weight loss, decreased growth performance, immune deficiencies, and other adverse health outcomes (Kanagaraju and Rathnapraba, 2019; Kop Bozbay and Ocak, 2020).

Honey is a natural and complex food produced by bees from flower nectar. It is rich in proteins, vitamins, minerals, flavonoids, polyphenols, and various bioactive compounds (Lofty et al., 2006). Due to these components, honey exhibits antioxidant, anti-inflammatory, immunomodulatory, and antimicrobial properties (Alvarez-Suarez et al., 2014; Saeed et al., 2017). The existing literature suggests that *in ovo* honey applications can enhance chick immunity and early growth performance (Memon et al., 2019; Kasmani et al., 2023). However, previous studies have not examined changes in chick weight under conditions where access to feed and water is delayed after *in ovo* honey injection. To address this gap, our study aimed to investigate the effects of *in ovo* honey application on hatching performance and chick quality, as well as its influence on body weight loss during the 24-hour post-hatch fasting period.

2. MATERIAL AND METHODS

In this study, 300 fertile Anadolu-T broiler eggs were incubated under standard conditions. The eggs were divided into six treatment groups, each with five replicates of 10 eggs. The injection dosage was determined based on the understanding that hydroxymethylfurfural in honey is considered toxic when its concentration exceeds 60 mg/kg (IAL, 2008).

On day 18 of incubation, egg fertility was assessed using light monitoring. The solutions prepared for *in ovo* injection were injected into the amniotic fluid, using a volume of 0.5 ml under sterile conditions. No injection was administered to the negative control group (NC), while the positive control group (PC) received 0.5 ml of physiological serum, and the H25, H50, H75, and H100 groups received 0.25 mg, 0.50 mg, 0.75 mg, and 1 mg of honey, respectively, dissolved in 0.5 ml of physiological saline.

Hatchability and mortality were calculated immediately upon completion of hatching. The quality of the chicks was assessed using the Tona score on four randomly selected chicks from each replicate, and relative asymmetry (RA) was measured. Live weights of the chicks at hatch and at 24 hours of age (before access to feed and water) were recorded. Access to feed and water was provided following standard commercial procedures, and the chicks were housed in carriers within the experimental facility for the first 24 hours.

The data obtained were analysed using the SPSS software. Differences between groups were assessed using one-way analysis of variance (ANOVA). If significant differences were identified, Duncan's multiple comparison test was applied. Differences between treatments were considered statistically significant at $p < 0.05$.

3. RESULTS AND DISCUSSION

The study found that *in ovo* honey feeding did not result in significant differences between groups regarding hatchability, mortality rates, and chick quality parameters (Tona score, RA) (Table 1; $p>0.05$). Factors such as the egg's internal nutrients, turning frequency, and incubation positioning are known to influence hatchability (Uni and Ferket, 2004). Cardeal et al. (2015) and Ingram et al.

(1997) reported that hatching is an energy-intensive process and that in egg supplements can enhance hatchability by providing additional energy sources for the embryo. However, the honey doses used in this study did not result in a significant improvement in this regard. This may be because, despite honey's carbohydrate, amino acid, vitamin, and mineral content, the amounts applied were insufficient to impact the incubation process critically. Conversely, the lack of adverse effects indicates that *in ovo* honey application is safe for embryo development.

Table 1. Effect of *in ovo* honey feeding on hatchability (%), hatchability (%), mortality rate (%) and chick quality

	NC	PC	H25	H50	H75	H100	SEM	P value
Hatchability of								
Set eggs	76.00	78.00	88.00	72.00	82.00	74.00	2.039	0.230
Fertile eggs	86.70	90.70	91.50	90.56	83.56	80.61	1.569	0.245
Embryonic mortality								
Pipped	9.08	7.07	6.50	6.94	6.22	10.95	1.082	0.819
Non-Pipped	4.22	2.22	2.00	2.50	10.22	8.44	1.095	0.106
Chick quality								
Tona scoru	99.20	98.50	99.30	99.00	99.60	99.10	0.247	0.884
Relative asimetri	1.48	1.95	1.43	2.34	0.84	1.78	0.168	0.170

NC: negative control; PC: positive control; H25: 0.25 mg honey injection; H50: 0.50 mg honey injection; H75: 0.75 mg honey injection; H100: 1.00 mg honey injection; SEM= standard error of the mean. [a,b,c,d]Within a row, means with different superscripts differ significantly ($P<0.05$).

Significant differences were found among the groups in 24-hour body weight and body weight loss (Table 2; $p<0.001$). The highest body weight was observed in the H50 group (44.48 g), while the lowest weight was recorded in the PC group (40.44 g). The PC group also exhibited the most significant weight loss (4.31 g), whereas weight loss was significantly reduced in the honey-administered groups. This suggests that the readily digestible carbohydrates in honey enhance embryo metabolism, enabling a more effective use of energy reserves in the post-hatch period. These findings imply that *in ovo* honey administration may help mitigate weight loss during vulnerable stages. Furthermore, Uni et al. (2005) reported that each gram increase in hatch weight corresponds to an additional 25-30 g of live weight by day 25. In this context, although honey application does not directly increase hatch weight, it reduces weight loss in starvation conditions, suggesting it could be a viable strategy for promoting faster growth to market weight in practical rearing scenarios.

Table 2. Effect of *in ovo* honey feeding on hatch weight, 24-hour chick weight, and chick body weight loss, g

	NC	PC	H25	H50	H75	H100	SEM	P value
Egg weight	65.00	65.00	65.00	65.00	65.00	65.00	0.115	1.000
Chick weight								

At hatch	44.86	44.75	45.26	46.68	45.14	45.50	0.288	0.450
At 24 h	41.29^{cd}	40.44^{d}	43.47^{ab}	44.48^{a}	42.72^{bc}	41.98^{bcd}	0.320	0.000
BWL	3.57^{ab}	4.31^{a}	1.79^{b}	2.20^{b}	2.41^{b}	3.52^{ab}	0.272	0.040

NC: negative control; PC: positive control; H25: 0.25 mg honey injection; H50: 0.50 mg honey injection; H75: 0.75 mg honey injection; H100: 1.00 mg honey injection; BWL: body weight loss; SEM= standard error of the mean. ^{a,b,c,d}Within a row, means with different superscripts differ significantly ($P<0.05$).

4. CONCLUSION

The current findings indicate that *in ovo* feeding of 0.25 mg, 0.50 mg, 0.75 mg, and 1 mg of honey can be a viable alternative. This method helps to reduce weight loss during the late stages of access to feed and water without negatively impacting hatching performance. However, several issues still need to be addressed, including the optimal honey content to use, the efficiency of the feeding method, and its potential benefits for production indices throughout the entire production cycle.

ABSTRACT

In this study, the effects of *in ovo* colostrum powder feeding into fertile Anadolu-T eggs at different doses on the hatching performance and certain blood parameters of chicks were evaluated. Colostrum, the first milk of mammals, contains high levels of immune and nutritional nutrients; this study examined the contribution of this valuable ingredient to chick development. For this purpose, a total of 450 fertilised eggs were divided into six different treatment groups, each consisting of 15 eggs, and placed in hatching trays. On day 18 of incubation, no injection was administered to the negative control group (NC), whereas the positive control group (PC) received 0.5 mL of physiological saline. The treatment groups C1, C2, C3, and C4 were injected with 1 mg, 2 mg, 3 mg, and 4 mg of colostrum powder dissolved in 0.5 mL of physiological saline, respectively. According to the findings, hatchability and chick weight were not affected by *in ovo* colostrum feeding. The blood protein level in chicks in the C4 group was higher than in the PC, C2, and C3 groups. Similarly, the globulin level was significantly higher in the C4 group than in

the NC, PC, C2, and C3 groups. The blood urea nitrogen level was higher in the NC group than in the C1, C3, and C4 groups. In conclusion, this study demonstrated that *in ovo* colostrum powder injection did not affect hatchability but did result in positive changes in critical biochemical parameters in chick blood. These findings suggest that *in ovo* colostrum feeding has the potential to improve chicks' early immune status and may be a valuable strategy for future research.

Keywords: *in ovo* feeding, colostrum, hatchability

ANADOLU-T ETLİK PİLİÇ YUMURTALARINDA FARKLI DOZLARDAKİ *in ovo* TOZ KOLOSTRUM UYGULAMASININ KULUÇKA PERFORMANSI VE CİVCİV KAN PARAMETRELERİ ÜZERİNE ETKİLERİ

ÖZET

Bu çalışmada, döllü Anadolu-T yumurtalarına farklı dozlarda *in ovo* toz kolostrum beslemesinin civcivlerin kuluçka performansı ve bazı kan parametreleri üzerine etkileri değerlendirilmiştir. Memeli hayvanların ilk sütü olan kolostrum, yüksek oranda bağışıklık ve besin öğeleri içermektedir. Bu amaçla, toplam 450 adet döllü yumurta her biri 15 yumurtadan oluşan beş tekerrürlü altı farklı muamele grubuna ayrılarak gelişim tablalarına yerleştirilmiştir. Kuluçkanın 18. gününde, negatif kontrol grubuna herhangi bir enjeksiyon uygulanmazken (NK), pozitif kontrol (PK) grubuna 0,5 ml serum fizyolojik ve K1, K2, K3 ve K4 gruplarına sırasıyla 0,5 ml serum fizyolojik içinde çözündürülmüş 1 mg, 2 mg, 3 mg ve 4 mg toz kolostrum enjeksiyonu yapılmıştır. Elde edilen bulgulara göre, çıkış gücü ve civciv çıkış ağırlığı *in ovo* kolostrum uygulamasından etkilenmemiştir. K4 grubundaki civcivlerin kan protein düzeyi, PK, K2 ve K3 gruplarına kıyasla daha yüksek bulunmuştur. Benzer şekilde, globülin düzeyi de K4 grubunda NK, PK, K2 ve K3 gruplarına göre yüksek tespit edilmiştir. Kan üre azotu düzeyi ise NK grubunda, K1, K3 ve K4 gruplarına kıyasla daha yüksek saptanmıştır. Sonuç olarak, bu çalışma *in ovo* toz kolostrum beslemesinin kuluçka randımanını etkilemediğini ancak kan biyokimyasal parametrelerinde olumlu değişikliklere yol açtığını göstermiştir. Bu bulgular yumurta içi toz kolostrum beslemesinin civcivlerin erken bağışıklık durumunu iyileştirme potansiyeline sahip olduğunu ve gelecekteki araştırmalar için değerli bir strateji olabileceğini düşündürmektedir.

Anahtar Kelimeler: *in ovo* besleme, kolostrum, kuluçka performans

1. INTRODUCTION

Colostrum, the milk secreted in mammals during the first few days after birth, is a highly nutrient-dense liquid. Rich in energy, colostrum contains more protein, fat, minerals (iron, magnesium, sodium), and vitamins than regular milk, while its lactose content is lower (Georgiev, 2008). Furthermore, colostrum has a higher dry matter content than mature milk (Sjaastad et al., 2003). Prominent biological components of colostrum include immunoglobulins, peptides, hormones, growth factors, enzymes, cytokines, acute-phase proteins, nucleotides, and polyamines (Georgiev, 2008). Thanks to its rich content, colostrum contributes significantly to the development of various tissues and organs, including the gastrointestinal system.

The *in ovo* feeding technique used in poultry farming supports intestinal development and the immune system by delivering additional nutrients to chicks during the embryonic period (Das et al., 2021; Kop-Bozbay and Göneci, 2023). This ensures that chicks hatch with higher quality, higher survival rates, and adequate nutritional reserves, which has a positive impact on their future performance. Furthermore, this nutritional support during the embryonic period is crucial for reducing the potential adverse effects of dietary errors during rearing on hatchability and chick quality. The potent immunological and developmental factors in colostrum, combined with the potential of *in ovo* feeding to enhance early-stage performance, offer a promising synergy for delivering colostrum's bioactive ingredients to poultry embryos. In particular, the stable and concentrated bioactive compound content of powdered colostrum provides an ideal medium for delivering targeted benefits to the embryo. However, there is still a gap in the literature regarding the effects of this treatment on poultry embryos and optimal dosages. In this context, the current study aimed to investigate the effects of *in ovo* injection of powdered colostrum at different doses on hatchability and selected blood parameters in chicks.

2. MATERIAL AND METHODS

In this study, a total of 450 fertile Anadolu-T broiler eggs were incubated under standard conditions using Çimuka (Ankara, Turkey) incubation and hatching machines. The eggs were divided into six treatment groups, each consisting of five replicates with 15 eggs each. On the 18th day of incubation, no injection was administered to the negative control group (negative control, NC), the positive control (PC) group received 0.5 ml of physiological serum and the C1, C2, C3, and C4 treatment groups received injections of 1 mg, 2 mg, 3 mg, and 4 mg of colostrum powder dissolved in 0.5 ml of physiological serum, respectively.

Hatchability and mortality were calculated immediately upon completion of hatching. The quality of the chicks was assessed using the Tona score on four randomly selected chicks from each replicate. Chick weights were recorded. On the day of hatching, blood samples taken from the chicks were analyzed in a special laboratory for hemogram, total protein, albumin, globulin, urea, uric acid, creatine, HDL, LDL, cholesterol and triglyceride.

The data obtained were analysed using the SPSS software. Differences between groups were assessed using one-way analysis of variance (ANOVA). If significant differences were identified, Duncan's multiple comparison test was applied. Differences between treatments were considered statistically significant at $p < 0.05$.

3. RESULTS AND DISCUSSION

In our study, the lack of significant effects of *in ovo* colostrum injection at different doses on hatching weight and early performance parameters (Table 1; $p > 0.05$) may be attributed to

colostrum's essential physiological roles. Colostrum is a fluid focused on supporting physiological and, particularly, immunological processes rather than primarily providing a rapid growth substrate, as is the case in mammalian offspring. Colostrum components, particularly immunoglobulins and growth factors, are believed to support the development of the immune system and maintain metabolic stability, rather than directly influencing embryonic growth. The limited energy and growth substrate content of colostrum did not directly facilitate weight gain.

Table 1. Effect of *in ovo* colostrum feeding on hatchability

	NC	PC	C1	C2	C3	C4	SEM	P value
Egg weight, g	64.48	64.50	64.50	64.49	64.49	64.48	0.106	1.000

The findings of our study's hematological analysis (Table 2; $p < 0.05$) revealed that *in ovo* colostrum injection had positive and significant effects on the physiological status of chicks. These effects were particularly evident in indicators of immunity and protein metabolism, suggesting that the bioactive components of colostrum are effectively absorbed during the embryonic period and trigger a functional response. In this context, it is suggested that *in ovo* colostrum administration may benefit chicks by improving their ability to develop resistance and metabolic adaptation to environmental stressors encountered early in life, rather than directly enhancing growth performance. Notably, the use of 2% colostrum, particularly in its fresh form, during the broiler starter period has shown beneficial effects on broiler performance, carcass characteristics, blood biochemical parameters, immunity, and antioxidant status (Arjomand et al., 2022). Additionally, groups fed diets supplemented with colostrum exhibited higher live weights and live weight gains, while feed conversion ratio (FCR) was lower. The group that received diets containing 2% bovine colostrum per kilogram of feed recorded the highest live weight gains and the lowest FCR, although feed intake was not significantly affected. Consequently, it was concluded that 2% bovine colostrum could be integrated into broiler diets to enhance body weight and reduce FCR (Afzal et al., 2017). Furthermore, a study on laying quails discovered that incorporating powdered colostrum into their diet linearly increased feed intake, egg production, egg weight, shell weight, shell thickness, and improved feed utilization (Bayrıl et al., 2017). Therefore, further research is needed to investigate the long-term effects of *in ovo* colostrum feeding in poultry farming.

Table 2. Blood biochemical properties of chicks obtained by *in ovo* colostrum feeding

NC: negative control; PC: positive control; C1: 1 mg colostrum injection; C2: 2 mg colostrum injection; C3: 3 mg colostrum injection; C4:4 mg colostrum injection. SEM= standard error of the mean. ^{a,b,c,d}Within a row, means with different superscripts differ significantly ($P<0.05$).

4. CONCLUSION

In conclusion, while *in ovo* colostrum administration did not have a significant short-term effect on hatchability, it may enhance chicks' physiological resistance and immune responses. Therefore, colostrum can be considered as part of immune-based protective strategies, particularly during early chick development, when exposure to environmental stressors is high.

BEYAZ KABAK TOHUMLARINDA YAŞLANMA ESNASINDA MEYDANA GELEN FİZYOLOJİK DEĞİŞİMLER

Prof. Dr. Mustafa DEMİRKAYA

Kayseri Üniversitesi, Safiye Çıkrıkçıoğlu MYO, Kayseri

Email: mustafademirkaya@kayseri.edu.tr

ORCID: 0000-0001-7725-3952

ÖZET

Bu çalışma 2024 ve 2025 yıllarında Kayseri Üniversitesi Safiye Çıkrıkçıoğlu MYO'na ait laboratuvarda gerçekleştirilmiştir. Tohumlar temin edildikten sonra çimlenme denemelerine kadar + 4 °C'deki buzdolabında kapalı cam kavanozlarda bekletilmiştir. Tohumların nem kapsamı %7.18 olarak ölçülmüştür. Bu çalışmada beyaz kabak tohumlarında, farklı canlılık seviyelerinde ortaya çıkan bazı fizyolojik değişimler incelenmiştir. Bu amaçla bu amaçla Bursa tohumculuğa ait BUR SAKIZ sakız kabağı çeşidi tohumlarda 80, 60, 40, 20, %10 ve %0 canlılık seviyeleri ± 4 oranında, kontrollü yaşlandırma uygulamaları ile elde edilmiştir. Daha sonra bu canlılık seviyelerinde ortalama çimlenme süresi, çimlenme indeksi hesaplamaları yapılmıştır. Kontrol tohumları %82 canlılığa sahipken 24, 38, 42, 45 ve 48 saat yaşlandırma sonuçlarında, 62, 41, 19,10 ve %0 canlılık seviyeleri elde edilmiştir. Canlılığın azalmasıyla ortalama çimlenme süresi kontrol tohumlarında %4.928 olurken, % 60,40, 20 ve %10 larda sırası ile 5.67,7.128, 8.25 ve 9.727 gün olmuştur. Canlılığın azalmasıyla çimlenme indeksi azalmış, kontrol tohumlarında %4.31 olurken, % 60,40, 20 ve %10 larda sırası ile 3.169, 1.415, 0.607 ve 0.314 olmuştur. Yaşlanmayla birlikte, ortalama çimlenme süresi artmış ve çimlenme indeksleri azalmıştır. Canlılık %40 lara düştüğünde ortalama çimlenme süresindeki artış ve çimlenme indeksindeki azalma daha belirgin olmuştur. Tohumların uygun koşullarda muhafaza etmenin önemli olduğu, canlılıktaki azalma ile tohum kalite parametrelerinin de önemli ölçüde olumsuz etkilendiği ortaya konmuştur. Ayrıca, canlılık kaybı ile çimlenme indeksi azalması arasında ve ortalama çimlenme süresi artması arasında yüksek bir korelasyon tespit edilmiştir. En yüksek negatif korelasyon -0.953 ile çimlenme oranı ve ortalama çimlenme süresi arasında tespit edilmiştir. Yani tohum canlılığını kaybederken, ortalama çimlenme süresinin artması, canlılık kaybıyla güç arasında önemli bir ilişki olduğunu gösteriyor.

Anahtar kelimeler: Tohum, kontrollü yaşlandırma, canlılık, ortalama çimlenme süresi

PHYSIOLOGICAL CHANGES OCCUR IN WHITE PUMPKIN SEEDS DURING AGEING.

ABSTRACT

This study was conducted in 2024 and 2025 at the Kayseri University Safiye Çıkrıkçıoğlu Vocational School Laboratory. After the seeds were obtained, they were stored in sealed glass jars at +4°C in a refrigerator until the germination trials. The seed moisture content was measured as 7.18%. The study investigates some physiological changes that occurred at different viability levels in white pumpkin seeds. For this purpose, seeds of the BUR SAKIZ variety from Bursa Seed Company were subjected to controlled aging treatments at ± 4% rates to obtain viability levels of ± 80%, 60%, 40%, 20%, 10%, and 0%. Subsequently, the average germination time and germination index were calculated for these viability levels. The control seeds had a viability of 82%, while after 24, 38, 42, 45, and 48 hours of aging, viability levels of 62%, 41%, 19%, 10%, and 0% were achieved, respectively. As the viability decreased, the average germination time for the control seeds was 4.928 days, while for 60%, 40%, 20%, and 10% viability levels, the times were 5.67, 7.128, 8.25, and 9.727 days, respectively. With decreasing viability, the germination index also declined, with the control seeds showing a value of 4.31, while for the 60%, 40%, 20%, and 10% viability levels, the indices were 3.169, 1.415, 0.607, and 0.314, respectively. With aging, the average germination time increased and the germination indices decreased. The increase in average germination time and the decrease in germination index became more pronounced when viability dropped to 40%. The results indicate the importance of storing seeds under suitable conditions, as the decrease in viability significantly negatively affects seed quality parameters. Furthermore, a strong correlation was found between the loss of viability and the decrease in germination index, as well as the increase in average germination time. The highest negative correlation of -0.953 was detected between germination rate and average germination time, demonstrating that as seed viability declines, the increase in average germination time shows a significant relationship with the loss of viability.

Keywords: Seed, controlled deterioration, viability, mean germination time

1. GİRİŞ

Dünyada tarım alanlarının her geçen gün çeşitli nedenlerle daraldığı, ayrıca toprakların sürekli ekilip dikilmesiyle verim ve kalite kayıpları ortaya çıkmaktadır. Bunun sonucunda, günümüzde yetersiz veya kalitesiz beslenme olarak insanlığın en büyük sorunlarından biri olarak ortaya çıkmaktadır. Bu durum gözönünde bulundurularak kaliteli ve verimli sebze çeşitlerinin tohumlarını kullanmak önemli hale gelmiştir. Yüksek verim ve kalitesi olan tohumların, aynı zamanda farklı toprak ve iklim şartlarında kalitesini göstermesi için tohumların uygun koşullarda saklanması önem kazanmıştır. Sebze yetiştiriciliğinde en önemli materyallerden biri üretimde kullanılan tohumdur. Bu yüzden kaliteli tohum üretimi ve uzun yıllar ekonomik olarak depolanabilmesi üzerine araştırmalar, türler ve çeşitler bazında devam etmelidir.

Tohumların muhafaza ediebilirliği incelendiği zaman, uzun süre muhafaza edilebilen ve basparmak kuralının uygulanabildiği tohumlar grub tohumlara ortodoks grubu tohumlar olarak adlandırılmaktadır. Bu kural, sıcaklık ve tohum nemi arasında ilişkiyi inceleyen ve bilinen kurala göre tohum nemindeki her %1'lik artış ve sıcaklıktaki her 5°C'lik yükselişle tohum depo ömrü yarıya düşer. Bu kural tohum nem kapsamı %5-14 ve sıcaklık 0-50°C aralığında olduğunda geçerlidir (Harrington 1973). Ortodoks grubu tohumlar, düşük nem içerikleri ve düşük sıcaklıklarda herhamngi bir canlılık kaybına uğramadan uzun süre depolanabilmektedir. Ekonomik yönden değerli bahçe ve tarla bitkileri ile süs bitkilerinin tohumları bu grupta yer alır (Roberts 1973).

Bunun aksine hiç depolanamayan yada çok az süre depolabilen ve kurutulamayan ve inatçı(recalcitrant) olarak adlandırılan bir grub tohum bulunmaktadır. Recalcitrant tohumlar, fizyolojik olgunlukta yüksek tohum nemine (%30-70) sahip, düşük sıcaklık ve kurutmaya hassas, dormansinin görülmediği tohumlardır. Daha çok tropik ve subtropik orijinli bitkilerin tohumlarını kapsar (Arın 2018). Diğer bir grub olan, ara tohumlar olarak adlandırılan intermediat grubu bulunmaktadır. Bu grubtaki tohumlar tropik ve subtropik bölgelerin çok yıllık bitkilerinin kahve turunçgiller ve sert kabuklu meyve ağaçlarının tohumlarıdır. Bu grub tohumlar %40-60 hava nemi, yani tohum nem oranı %9-13 tohum nem kapsamında saklanabilir (Karaçalı 2006).

Tohumlar yaşam sürelerini uzatmak için uygun koşullarda depolansalar bile, serbest radikal içeriğinin artması, protein yapılarının değişimi, besin rezervlerinin bozulumu, yağ asidi içeriği ve enzimatik aktivitelerinin değişimi, membran zararı, kromozom değişimleri ve solunum artması nedeniyle belirli süreler sonucunda zarar görmekte ve canlılıklarını kaybetmektedir (Justice ve Bass 1979). Burada tohum kabukları geçirgen ve yağlı tohumlardan olan kabak tohumlarında tohumlarda suyun çıktığı yerlerere oksijen girerek, yağlar oksitlenerek tohumlar canlılığını daha çabuk kaybedebilir.

Bu çalışmada kontrollü bozulmaya tabii tutulan beyaz kabak tohumlarında, tohum canlılığı azalırken, fizyolojik parametrelerde meydana gelen değişimler arasındaki ilişkiler incelenmiştir.

2. MATERYAL YÖNTEM

2.1. Materyal

Çalışma da Bursa tohumculuğa ait olan BUR SAKIZ çeşidine ait tohumlar kullanılmıştır. BUR SAKIZ çeşidi açık bitki yapısına sahip, silindirik meyve yapısına sahip, genelde 15-17 cm meyve uzunluğu olan ve krem renginde standart bir çeşittir.

2.2. Tohum nem kapsamı

Tohum nem kipsie kabakgillerde önnerilen (Şehirali, 1997) yüksek sıcaklık sabit fırın yöntemine göre 130 °C'de bir saat süreyle aşağıdaki şekilde yapılmış ve hesaplanmıştır. Tohum örnekleri kapakları ile tartılmış ve numaralanmış petri kapları içine iyice yayılmıştır. Petri kapları örnekle birlikte tekrar tartılmıştır. Daha sonra kapakları açık olacak şekilde, 130 ±1°C'deki fırında 1 saat tutulmuştur. Bu sürenin sonunda, fırından çıkarılan petri kaplarının kapakları kapatılarak, içinde silika jel bulunan bir desikatörde 30 dakika soğumaya bırakılmıştır. Soğutulan petri kapları, içindeki örnek ile tartılmıştır. Tartımlar sırasında laboratuarda oransal nem %50±5 civarında olmuştur. Tohum nem kapsamı tayini her grup için iki tekerrürlü olarak yapılmıştır. Tohum nem kapsamları ölçülürken her tekerrürde Mavi (2009)'a göre 2 gram örnek kullnılmıştır. İki tekerrür arasındaki maksimum farkın %0.2'den küçük olmasına dikkat edilmiştir. Aksi takdirde tohum nem kapsamı tayini tekrarlanmıştır.

2.3. Çimlenme testleri

Çimlendirme sıcaklığı (Şehirali 1997)'ye göre 25 °C derece olarak alınmıştır. Burada çimlendirmenin 20-30 arasında yapılabileceği belirtilmiştir. Çimlenme oranları temin edilen kontrol tohumarında ve kontrollü bozulmalardan sonra tespit edilmiştir. Tohum örnekleri (25 tohumdan oluşan 4 tekrar), 25±1 °C'de nemli rulo dispenser kağıt havlular arasında 12 gün boyunca test edildi (Şehirali 1997, Demir ve Ellis 2003). Çimlenme testleri yapılırken lieretürde belirtilen aşağıdaki durumlar dikkate alınmıştır. Tohumlardan sağlıklı olmayan, primer kök ve kotildonu gelişmeyen, zayıf, hastalıklı ve anormal çimlenmiş tohumlar sayıma dahil edilmemiştir. Sayımlar tohumların ortamdan çıkarılması suretiyle yapılmıştır. Tohum canlılığı sayım sonunda yüzde çimlenme olarak belirlenmiştir. (Bekendam ve Grob 1979).

2.4. Ortalama Çimlenme Süresi

Tohum gücünün bir göstegesi olan ortlama çimlenme süresi literatüre göre hesaplanmıştır (Demir et al. 2008).

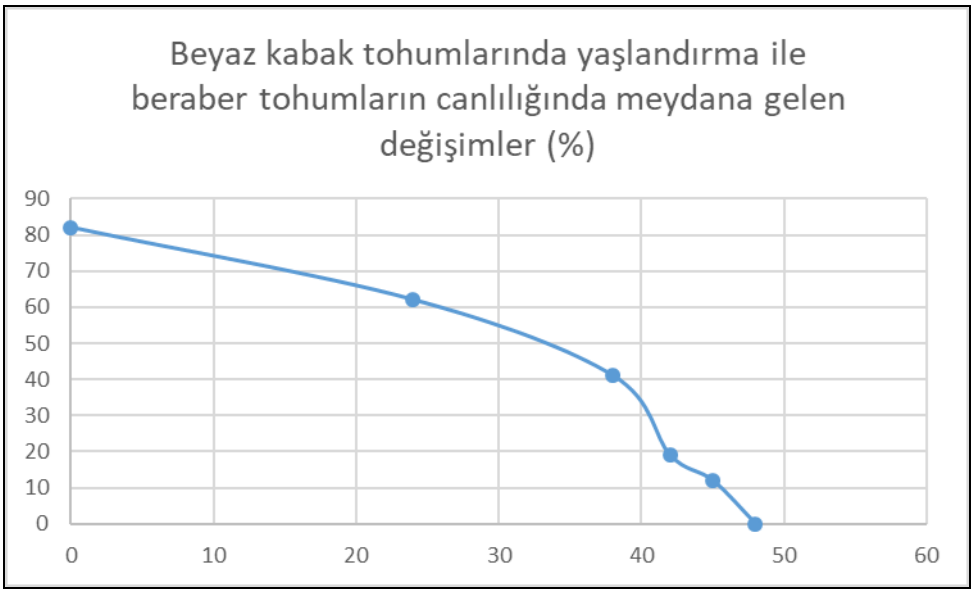
2.5. Çimlenme İndeksi

Çoğunlukla benzer çimlenme oranına sahip olan tohum partilerinin çimlenme hızı ve dolayısıyla fide gelişme hızı farklı olmaktadır. Çimlenme indeksi tohum grubunun performansını ortaya koymak üzere literature göre yapımıştır. (Sivritepe 2012).

2.6. İstatistiksel analiz

Denemeler tesadüf parsellerinde deneme desenlerine göre ve her tekerrürde 25 tohum olacak şekilde 4 tekerrürlü olarak kurulmuştur. Varyans analizleri "SSPS 13.0 for Windows" istatistik programında yapılmış, ortalamalar arasındaki farklılıklar 0.05 önemlilik seviyesinde LSD testine göre belirlenmiştir.

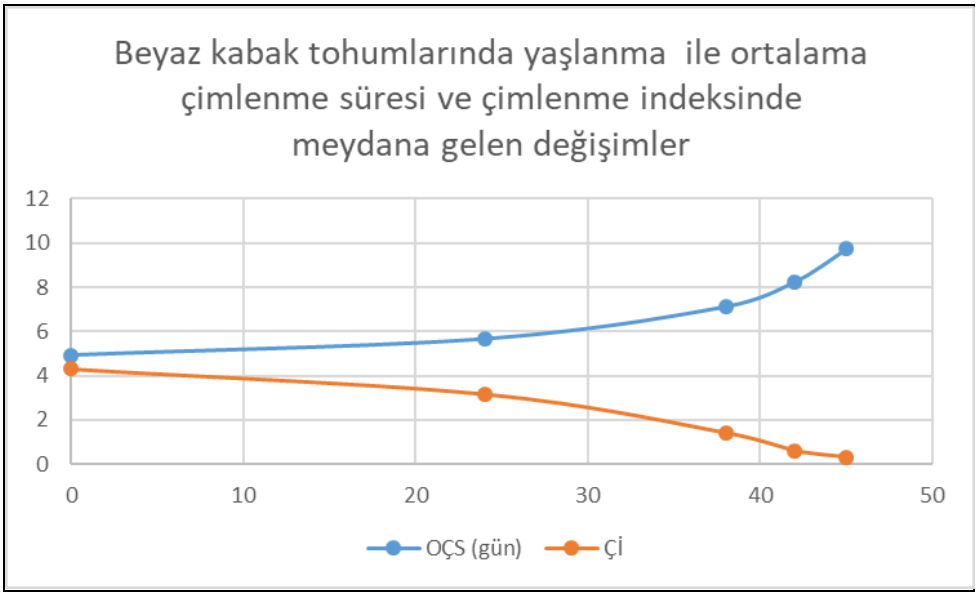
3. BULGULAR VE TARTIŞMA



Başparmak kuralı olarak bilinen Harrington (1973) kural gözönünde bulundurularak, çalışmaya başlamadan tohum nem kapsamı ölçülmüş ve %7.18 bulunmuştur. Tohumlar çimlenme testlerinde kullanılana kadar 4 ±1 derecede buzdolabında ve cam kavanozlarda saklanmıştır. Kontrollü bozulma uygulamalarından sonra yapılan çimlendirme testlerinden elde edilen veriler, belirli yaşlandırma sürelerine karşılık gelen normal çimlenme oranları olarak ayrı seriler halinde bir grafik üzerine yerleştirilmiştir. Böylece BUR SAKIZ kabağı tohum gruplarından elde edilen canlılık eğrileri karşılaştırılmıştır. Kontrollü bozulma uygulamaları, zamandaki artışa bağlı olarak tohum

canlılığının azalmasına neden olmuştur (Çizelge 1; Şekil 1). Şekil 1'de görüldüğü gibi kontrol tohumları %82 canlılığa sahip olurken, sırasıyla % 62, 41, 19, 12 ve 0 canlılığa sahip tohumlar 24, 38, 42, 45 ve 48 saatin sonunda elde edilmiştir.

Çizelge 1. Beyaz kabak tohumlarında BUR SAKIZ kabağı çeşidinde tohum fizyolojik parametreleri arasındaki korelasyon ilişkisi



Canlılık	Çimlenme oranı (%)	Ortalama Çimlenme Süresi (gün)	Çimlenme indeksi
Kontrol	82 a	4.928 e	4.313 a
24 saat	62 b	5.673 d	3.169 b
38 saat	41 c	7.128 c	1.415 c
42 saat	19 d	8.25 b	0.607 d
45 saat	12 e	9.727 a	0.314 d
48 saat	0	0	0

Tohum gücündeki değişimleri incelediğimiz zaman, canlılık kaybı ile beraber ortalama çimlenme süresi artmış, yani tohum gücü azalmıştır (Çizelge 1; Şekil 2). En kısa ortalama çimlenme süresi 4.928 gün ile kontrol tohumlarından elde edilirken en yüksek ortalama çimlenme süresi 9.727 gün ile 45 saat kontrollü bozulma uygulamalarından elde edilmiştir. Tohum performansının bir göstergesi olan Çİ incelendiği zaman en yüksek çimlenme indeksi 4.313 ile kontrol tohumlarından elde edilmiştir. En az tohum performansı 0.314 ile 45 saat uygulamasından elde edimiştir ($P<0.05$) (Çizelge 1; Şekil 2).

Şekil 1. BUR SAKIZ kabağı çeşidi tohumlarda kontrolllü bozulma ile canlılıkta meydana gelen değişimer.

Ortalama çimlenme süreleri incelendiğinde; tohumlarında canlılık kaybı ile ortalama çimlenme sürelerinde meydana gelen artış tüm çeşitlerde önemli ($P<0.05$) bulunmuştur. Diğer bir deyişle,tohumların canlılığı ile birlikte gücü (vigoru) de azalmıştır. Ayrıca tohum performansının bir göstergesi olan çimlenme indekside bozulma ile beraber artmıştır (Çizelge 2).

Şekil 2: BUR SAKIZ kabak çeşidi tohumlarında canlılık kaybı ile Ortalama Çimlenme Süresi ve Çimlenme İndeksindeki değişimler

Tohumlarda yaşlanma ile beraber ortaya çıkan canlılık kaybı ile OÇS arasında yüksek negatif bir ilgileşim -0.953** , yine OÇS ve Çİ arasında yüksek negatif bir korelasyon -0.932** düzeyinde korelasyon tespit edilmiştir. ÇO ve Çİ arasında ise 0.981 ** %0.01 düzeyinde pozitif bir korelasyon tespit edilmiştir. Yani canlılık artarken performansta artmış, canlılık azalırken tohum performansı da düşmüştür.

Çizelge 2. BUR SAKIZ çeşidi beyaz kabak tohumlarında canlılık kaybı ile fizyolojik parametreler arsındaki korelasyon matrisi

Parametreler*	**ÇO**	**OÇS**	**Çİ**
ÇO	1.00	-	-
OÇS	- 0.953**	1.00	-
Çİ	0.981**	- 0.932**	1.00

*: ÇO: Çimlenme oranı; OÇS: Ortalama çimlenme süresi; Çİ: Çimlenme indeksi

Çalışma değerlendirildiğinde canlılık kaybı ile beraber gücü ve kalitesinin azaldığı belirlenmiş ve bu durum canlılık %40'lara düştüğünde daha belirgin hale gelmiştir. Tohumlar muhafaza edilirken kurallara dikkat edilmesinin önemli olduğu ortaya konmuştur. Literatürde Demirkaya (2013) yağlı tohum olan biber tohumlarında 60-90 saatte canlılık %90'lardan %0'a inerken, bu çalışmada 48 saatte %0'a inmiştir. Kabak tohumlarının yüzeyinin fazla ve geçirgen olması muhtemelen yağların daha çabuk bozulması ve canlılığını kaybetmesine neden olmuş olabilir. Bu nedenle kabak tohumlarında su geçirmez kapların kullanılması ve depolamadan önce nem kapsamlarının çok iyi ayarlanması gerekir.

ÖZET

Türkiye, köklü tarım geleneği ve zengin coğrafi yapısıyla hayvancılık açısından büyük bir potansiyele sahip ülkelerden biridir. Hayvancılık sektörü yalnızca ülkenin hayvansal gıda ihtiyacının karşılamakla kalmayıp, kırsal kesimde istihdam yaratması ve tarıma dayalı sanayinin desteklenmesi bakımından da stratejik bir öneme sahiptir. Türkiye'de büyükbaş ve küçükbaş hayvan varlığında son yıllarda bazı gerilemeler yaşanmış olsa da son on yıllık süreçte genel olarak artış gözlemlenmiştir. Büyükbaş hayvan varlığı, 2014 yılında 14,3 milyon baş iken yıllar içerisinde artış göstererek 2024 yılında 16,9 milyon başa ulaşmıştır. Manda varlığı, 2014 yılında 122,1 bin baş seviyesindeyken 2024 yılında 162 bin başa yükselmiştir. Küçükbaş hayvancılıkta da benzer bir artış gözlenmiştir. 2014 yılında 41,5 milyon baş olan küçükbaş hayvan varlığı, 2024 yılında 54,9 milyon başa ulaşmıştır. Keçi varlığı ise 2014 yılında 10,4 milyon baş iken, 2024 yılında 10,8 milyon baş olarak gerçekleşmiştir. Kanatlı hayvancılık sektörü, iç tüketimin yanı sıra ihracata yönelik üretim modeliyle gelişimini sürdürmektedir. Modern kümes ve entegre tesisleri her geçen gün artmaktadır. 2014 yılında 1,9 milyon ton olan tavuk eti üretimi 2024 yılında 2,5 milyon tona, 48,7 bin ton olan hindi eti üretimi 2024 yılında 52,3 bin tona, 17,1 milyar adet olan tavuk yumurtası üretimi 2024 yılında 21,2 milyar adete yükselmiştir.

Türkiye'de hayvancılık sektörü, tarımsal üretimin sürdürülebilirliği ve kırsal kalkınmanın desteklenmesi açısından kritik bir role sahiptir. Bu doğrultuda Tarım ve Orman Bakanlığı, gıda arz güvenliğini sağlamak, verimliliği artırmak ve sürdürülebilir bir üretim modeli oluşturmak amacıyla çeşitli hayvancılık destekleme programları yürütmektedir. En güncel hayvancılık destekleme modeli, 2024-2026 dönemini kapsamakta olup, 26 Temmuz 2024 tarihli ve 32613 sayılı Resmî Gazete' de yayımlanan Cumhurbaşkanlığı Kararı (Karar Sayısı: 8760) ile yürürlüğe girmiştir. Bu yeni model, önceki yıllardan farklı olarak üretim planlamasına ve performansa dayalı bir sistem üzerine kurgulanmıştır. Destekler, iki ana başlık altında toplanmaktadır: Temel Hayvancılık Destekleri: Büyükbaş ve küçükbaş hayvancılık, arıcılık ve ipek böceği yetiştiriciliğini kapsamaktadır. Ürün Geliştirme Destekleri: Çiğ süt, besilik erkek sığır (karkas) ve tiftik üretimine yönelik destekleri içermektedir. Bu sistem ile üretimin daha verimli, planlı ve sürdürülebilir şekilde yürütülmesi hedeflenmektedir.

Anahtar Kelimeler: Tarım, hayvancılık, hayvancılık destekleri, verimlilik, destekleme modeli

CURRENT SITUATION IN LIVESTOCK AND NEW SUPPORT MODEL

ABSTRACT

Türkiye, with its deep-rooted agricultural tradition and rich geographical structure, is one of the countries with great potential for animal husbandry. The livestock sector not only meets the country's animal food needs but also holds strategic importance in creating employment in rural areas and supporting agriculture-based industries. While Türkiye has experienced some declines in the number of cattle and small ruminants in recent years, a general increase has been observed over the last decade. While cattle numbers were 14.3 million in 2014, they have increased over the years, reaching 16.9 million in 2024. Buffalo numbers rose from 122.1 million in 2014 to 162,000 in 2024. A similar increase has been observed in small ruminants. Small ruminants, which stood at 41.5 million in 2014, reached 54.9 million in 2024. While the number of goats was 10.4 million in 2014, it was 10.8 million in 2024.

The poultry sector continues to develop with a production model geared towards both domestic consumption and export. Modern poultry houses and integrated facilities are increasing daily. Chicken meat production rose from 1.9 million tons in 2014 to 2.5 million tons in 2024, Türkiye meat production from 48.7 thousand tons to 52.3 thousand tons in 2024, and chicken egg production from 17.1 billion to 21.2 billion in 2024.The livestock sector in Türkiye plays a critical role in ensuring the sustainability of agricultural production and supporting rural development. To this end, the Ministry of Agriculture and Forestry implements various livestock support programs to ensure food supply security, increase productivity, and establish a sustainable production model.

The most current livestock support model covers the 2024-2026 period and entered into force with Presidential Decree (Decree No. 8760) published in the Official Gazette dated July 26, 2024, and numbered 32613. This new model, unlike previous years, is based on a system based on production planning and performance. Supports are categorized under two main headings: Basic Livestock Supports: Covers cattle and sheep farming, beekeeping, and silkworm breeding. Product Development Supports: Includes support for raw milk, beef cattle (carcasses), and mohair production. This system aims to ensure more efficient, planned, and sustainable production.

Keywords: Agriculture, livestock, livestock supports, productivity, support model

1. GİRİŞ

İnsanlığın ilk çağlarından itibaren ve özellikle göçebelik dönemlerinde, yapılan en önemli ekonomik faaliyet hayvancılık olmuştur. Açlık-tokluk, iyi-kötü beslenme gibi insan odaklı konular, günümüz dünya siyasetini de etkilemektedir. Nitekim gelişmiş ülkeler, geri kalmış olan ülkelere teknolojik ürünlerin yanı sıra damızlık materyal, canlı hayvan, tohumluk ve işlenmiş ürünler gibi tarımsal üretim maddelerini de pazarlayarak büyük bir gelir sağlamakta ve bu şekilde, özellikle tarımsal ürün ticareti yaptıkları ülkeler üzerindeki etkinliklerini artırmaktadırlar (TİGEM 2023).

Hayvancılık sektörü gelişmişlik seviyesine bakılmaksızın tüm ülkeler için büyük önem taşımaktadır (Saçlı, 2007). Hayvancılık hayvanların verimlerinden yararlanılan ve daha kısa sürede daha fazla verim sağlamaya yönelik bir zirai faaliyettir (Aydemir ve Pıçak, 2007).

Türkiye'de hayvancılık sektörü genel ekonomi içerisinde önemli bir yere ve potansiyele sahiptir. Hayvansal üretim faaliyetleri bazı bitkisel ve yan ürünlerin değerlendirilmesi, işgücü verimliliğinin artırılması, işletme karının artması, doğal ve ekonomik koşullardan kaynaklanan risk faktörünün azaltılması vb. faktörler işletmelere olumlu katkılar sağlamaktadır (Turan ve ark., 2017; Vural ve Fidan, 2007). Türkiye sahip olduğu doğal kaynaklar ve ekolojik koşullar dikkate alındığında, büyükbaş ve küçükbaş hayvan yetiştiriciliği bakımından elverişli şartlara sahiptir. İşletmelerin başarısında; kullanılan hayvan materyalinin ırkı, yaşı ve verim düzeyi belirleyici bir role sahiptir. Hayvan materyali ve yönetim kalitesi sonucunda ortaya konulan faaliyet birimlerinin üretim değeri ve işletmenin tarımsal geliri önemli ekonomik başarı ölçütlerindendir (Turan ve ark., 2017).

Türkiye'nin ekonomisinde hayvancılık, tarım sektörü ve genel ekonomi içerisinde önemli bir yer tutmaktadır. Hayvancılık sektörü, ülkenin milli gelirine ve istihdamına katkı sağlamaktadır. Bunların yanında hayvancılık, et, süt, tekstil, deri, kozmetik, ilaç gibi sanayi kollarına hammadde sağlamakta, yem sanayi, et sanayi gibi dallarda istihdam oluşturulması ve ürünlerin işlenmesi sonucunda ekonomide önemli katma değer oluşturmaktadır (Tapkı ve ark., 2018). 2023 yılına göre tarım, ormancılık ve balıkçılık sektörünün Türkiye GSYİH içindeki payı % 6,2'dir. (SGB 2025)

Bir ülkede tarım sektörünün kalkınması o ülkenin ekonomik gelişmişliğiyle ilgilidir. Dünya ülkeleri dikkate alındığında, gelişmiş ülkelerde tarım, gelişmekte olan ülkelere göre daha fazla desteklenmektedir. Bunun nedeni, stratejik öneme sahip olan tarım sektörünü desteklemede bu ülkelerin ekonomik güce sahip olmalarıdır (Yavuz, 2000). Gelişmiş ülkelerde tarımsal ekonominin lokomotifi olan hayvancılık, iki açıdan son derece önemlidir. Birincisi çok düşük maliyetli istihdam yaratması ve ikincisi ise kalitesiz veya insan beslenmesine uygun olmayan yem kaynaklarının kaliteli insan gıdasına dönüştürmesidir. (Ergün ve Bayram, 2021)

Türkiye'de 2024 yılı hayvancılık destekleme kararnamesi ile hayvansal üretim destekleri temel hayvancılık destekleri ve ürün geliştirme destekleri olmak üzere iki gruba ayrılmıştır: Temel hayvancılık destekleri, büyükbaş hayvancılık, küçükbaş hayvancılık, arıcılık ve ipek böcekçiliği faaliyetlerini, Ürün Geliştirme Destekleri; çiğ süt, besilik erkek sığır (karkas) ve tiftik üretimini kapsamaktadır. Her bir destek için temel destek tutarı belirlenmiştir. 2024 yılı için belirlenen temel destek tutarları, buzağı ve malaklar için 1.000 TL/baş, kuzu ve oğlaklar için 200 TL/baş, arıcılık için üretici/yetiştirici örgütlerine üye üreticilere 100 TL/kovan, üye olmayanlara 80 TL/kovan, ipekböceği için 1.000 TL/kg, besilik erkek sığır (karkas) için 500 TL/baş ve tiftik üretimi için 80 TL/kg'dır. Temel destek birim tutarları ve katsayılar her yıl yeniden belirlenecektir. Yönlendiricilik ve özendiricilik ilkelerini yerine getiren üretici ve yetiştiriciler ilave destekten yararlanacaktır. Aile işletmelerine, kadın/genç yetiştiriciler ile birinci derece tarımsal amaçlı örgütlerin üyelerine/ortaklarına, üretim planlaması kapsamında süt ve besi havzası olarak belirlenen illerde

bulunan yetiştiricilere, hastalıktan ari işletmelere, AB onaylı süt çiftliği sertifikasına sahip işletmelere, suni tohumlama, soy kütüğü, sütünü kendi tankında soğutma, karkas ağırlığı gibi ölçütleri sağlayan yetiştiricilere temel destekle birlikte ilave destek verilecektir. Küçükbaş destekleri ilk defa kuzu ve oğlaklar için ödenecektir. (TRGM 2025)

2. TÜRKİYE'DE HAYVANCILIK FAALİYETLERİ

2.1. BÜYÜKBAŞ HAYVANCILIK

Türkiye büyükbaş hayvan varlığının tamamına yakını sığırdan oluşturmaktadır. Sığırların süt veriminin yüksek olması, laktasyon süresinin uzun olması neticesinde yıl boyunca süt üretimi sağlaması, kaba ve kesif yemleri et ve süte dönüştürme yeteneklerinin yüksek olması, ülkemizin farklı iklim kuşaklarında yetiştirilme imkanının bulunması, genetik ıslah ve üremenin denetimine yönelik uygulamalara çok iyi uyum göstermesi gibi başlıca avantajlar, sığırcılığı büyükbaş hayvancılık içinde önemli kılmaktadır (Ergün ve Bayram, 2021).

Türkiye büyükbaş hayvan varlığında son on yıllık verilere bakıldığında 2014 yılında 14,3 milyon baş olan toplam büyükbaş hayvan varlığı 2024 yılında 16,9 milyon başa ulaşmış olsa da 2020 yılı göz önüne alındığında 1 milyon başın üzerinde bir düşüş göze çarpmaktadır.

Tablo 1. Büyükbaş Hayvan Varlığı (baş) (TÜİK)

Yılı	Sığır - Kültür	Sığır – Kültür Melezi	Sığır - Yerli	Manda	Toplam
2014	6.178.757	6.060.937	1.983.415	122.114	14.345.223
2015	6.385.343	5.733.803	1.874.925	133.766	14.127.837
2019	8.559.855	7.554.625	1.573.659	184.192	17.872.331
2020	8.838.498	7.594.127	1.532.857	192.489	18.157.971
2021	8.824.784	7.641.100	1.384.659	185.574	18.036.117
2022	8.295.825	7.324.866	1.231.265	171.835	17.023.791
2023	8.070.159	7.303.667	1.047.430	161.749	16.583.005
2024	8.213.136	7.669.922	941.150	162.051	16.986.259

2.2. KÜÇÜKBAŞ HAYVANCILIK

Küçükbaş hayvan varlığına ilişkin son on yıllık veriler incelendiğin de 2014 yılında 41,5 milyon baş olan küçükbaş hayvan varlığı 2024 yılında %32'lik bir artış göstermiş olsa da 2021 yılında ulaşılan 57,5 milyona ulaşan toplam hayvan varlığının gerisinde bulunmaktadır. Kıl keçisi ve tiftik keçisi varlıklarında son on yılda belirgin bir artış meydana gelmemiş iken yerli koyun ve merinos ırkı koyun varlığında yaşanan artış dikkat çekmektedir.

Tablo 2. Küçükbaş Hayvan Varlığı (baş) (TÜİK)

Yılı	Koyun - Yerli	Koyun - Merinos	Keçi - Kıl	Keçi - Tiftik	Toplam
2014	29.033.981	2.106.263	10.167.125	177.811	41.485.180
2015	29.302.358	2.205.576	10.210.338	205.828	41.924.100
2019	34.199.467	3.076.583	10.964.374	241.055	48.481.479
2020	38.579.748	3.547.033	11.698.825	287.020	54.112.626
2021	41.182.899	3.994.791	12.051.957	289.557	57.519.204
2022	40.728.954	3.958.934	11.320.208	257.654	56.265.750
2023	38.208.635	3.851.835	10.092.756	210.184	52.363.410
2024	39.871.852	4.208.732	10.619.841	202.243	54.902.668

2.3. ÇİĞ SÜT ÜRETİMİ

TÜİK tarafından revize edilerek son beş yıllık verilerin bulunduğu çiğ süt üretimi verileri incelendiğinde 2020 yılında inek sütünün toplam çiğ süt üretimindeki payı %92,5 iken 2024 yılında bu oran %93,5 oranına yükselmiştir. Toplam üretim 2020 yılında 23,5 milyon ton iken 2024 yılında 22,5 milyon tona gerilemiştir. Bu gerileme hızı manda, koyun ve keçi sütünde daha fazla gerçekleşmiştir.

Tablo 3. Çiğ Süt Üretimi (ton) (TÜİK)

Yıl	İnek	Manda	Koyun	Keçi	Toplam
2020	21.749.342	63.767	1.101.065	589.617	23.503.790
2021	21.370.116	63.643	1.143.762	622.785	23.200.306
2022	19.912.135	43.589	1.067.342	540.426	21.563.492
2023	19.961.908	43.025	933.576	543.058	21.481.567
2024	21.040.442	58.122	906.945	482.247	22.487.757

2.4. KIRMIZI ET ÜRETİMİ

Türkiye'de kırmızı et üretimi 2024 yılında on yıl öncesine göre %87,5 oranında artış göstermiştir. 2020 yılı sonrasında Kasaplık Güç Oranı (KGO) yöntemi kullanılarak ve2020 yılı öncesi veriler revize edilerek hesaplanan verilerdeki artış oranı dikkat çekicidir. Aynı zamanda 2014 yılında %72 oranında olan toplam üretimde sığır eti oranı 2024 yılında %70 sevilerinde gerçekleşmiştir. Sırasıyla Manda, koyun ve keçi etinin oranları %0,65, %24,2 ve %4,73 olmuştur.

Tablo 4. Kırmızı Et Üretimi (ton) (TÜİK)

Yılı	Sığır	Manda	Koyun	Keçi	Toplam
2014(r)	815.674	5.004	238.670	63.711	1.123.059
2015(r)	862.098	5.300	249.863	69.757	1.187.018
2019(r)	1.330.169	7.150	316.170	87.126	1.740.616
2020	1.341.446	8.424	345.639	90.443	1.785.952
2021	1.460.719	10.831	385.933	94.555	1.952.038
2022	1.572.747	13.586	489.354	115.938	2.191.625
2023	1.670.606	15.386	569.066	128.989	2.384.047
2024	1.483.042	13.781	509.539	99.532	2.105.895

(r) Revize edilmiştir. Kırmızı et üretim istatistiklerinde 2020 yılında metodoloji değişikliğine gidilmiş ve "Kasaplık Güç Oranı (KGO) " yöntemi kullanılmıştır. 2001-2019 dönemi kırmızı et üretim istatistikleri KGO yöntemine göre revize edilmiştir.

2.5. KANATLI HAYVAN SEKTÖRÜ

Tavuk ve hindi üretimine bakıldığında son on yılda %32'lik artış gerçekleştirerek 2,56 milyon ton olmuş, sektörün yıllar itibari ile orantılı bir büyüme gerçekleştirdiği görülmektedir. Hindi eti üretimi daha dalgalı bir üretim izlenirken tavuk eti üretimi belirli oranlarda yıllar itibari ile artış göstermiştir. Toplam üretimin %98'lik kısmı tavuk üretiminden gelmektedir. Yumurta üretimi ise son on yılda %23,4 artış gerçekleştirerek 21,5 milyar adet ulaşmıştır. Yumurta üretimi de tavuk etine benzer şekilde dalgalı bir üretim şekli göstermeden yıllar itibari ile düzenli olarak artmıştır. Sektörün iç tüketim ve ihracat odaklı gerçekleştirdiği üretimi son on yılda düzenli büyüme ile gerçekleştirdiği görülmektedir.

Tablo 5. Tavuk ve Hindi Eti Üretimi (ton) (TÜİK)

Yılı	Tavuk Eti	Hindi Eti	Toplam Et
2014	1.894.669	48.662	1.943.331
2015	1.909.276	52.722	1.961.999
2019	2.138.451	59.640	2.198.090
2020	2.136.263	58.212	2.194.475
2021	2.245.770	51.301	2.297.071
2022	2.417.995	53.646	2.471.641
2023	2.328.791	47.575	2.376.366

3. 2024-2026 YILLARI HAYVANCILIK DESTEKLEME MODELİ

Türkiye'de hayvancılık sektörü, tarımsal üretimin sürdürülebilirliği ve kırsal kalkınmanın desteklenmesi açısından kritik bir role sahiptir. Bu doğrultuda Tarım ve Orman Bakanlığı, gıda arz güvenliğini sağlamak, verimliliği artırmak ve sürdürülebilir bir üretim modeli oluşturmak amacıyla çeşitli hayvancılık destekleme programları yürütmektedir. En güncel hayvancılık destekleme modeli, 2024-2026 dönemini kapsamakta olup, 26 Temmuz 2024 tarihli Cumhurbaşkanlığı Kararı ile yürürlüğe girmiştir.

Hayvansal üretimde yeni destekleme programı temel hayvancılık ve ürün geliştirme destekleri olmak üzere iki gruba ayrılıyor.

Temel hayvancılık destekleri; büyükbaş hayvancılık, küçükbaş hayvancılık, arıcılık ve ipek böceği faaliyetlerinin desteklenmesinden oluşuyor. Her bir destek için temel destek tutarı belirlendi. Aile işletmeleri, genç ve kadınlar, birinci derece örgüt üyesi ile planlama bölgeleri gibi yönlendirici kriterleri sağlayan yetiştiricilere temel destek tutarına ilave destek verilecek. Ayrıca suni tohumlama, soy kütüğü, yerli sperma, ari işletme, sürü yöneticisi (çoban) gibi verimlilik kriterlerine ilave destek sağlanacak.

Ürün geliştirme destekleri başlığı da; çiğ süt, besilik erkek sığır (karkas), tiftik üretimi desteklerini kapsıyor. Her bir destek için temel destek tutarı belirlendi. Aile işletmeleri, genç ve kadınlar, birinci derece örgüt üyesi ile planlama bölgeleri gibi yönlendirici kriterleri sağlayan üreticilere temel destek tutarına ilave destek verilecek. Ayrıca ari işletme, kendi tankında soğutma, örgüt üzerinden pazarlama, karkas ağırlığı, kaliteli tiftik ve sözleşmeli üretim gibi verimlilik kriterlerine ilave destek verilecek. (TOB 2025)

Tablo 7. 2025 Yılı Temel Hayvancılık Desteklemeleri (Resmi Gazete 26.07.2024-14.09.2025)

Kategori	**Destekleme Türü**		**Katsayı**	**2025 Yılı Destek Tutarı (TL/Baş)**
	Buzağı-Malak Temel Desteği	Temel Destek	1	1.400/2.800
	Aile İşletmesi		1	1.400

Büyükbaş Hayvancılık Destekleri (1-500 Baş)	Genç veya Kadın Yetiştirici	Yönlendirici Kriterler	0,7	980
	Planlı Üretim		0,5	700
	Birinci Derece Örgüt Desteği		0,2	280
	Suni Tohumlama/Embriyo T.	Verimlilik Kriterleri	0,8	1.120
	Yerli Sperma		0,5	700
	Soy Kütüğü (A ve B İşletmeleri) ve Genomik		1,5	2.100
	Soy Kütüğü (C İşletmeleri)		0,8	1.120
	Ari İşletme		4	5.600
	Onaylı Süt İşletmesi		0,6	840
Küçükbaş Hayvancılık Destekleri	Kuzu ve Oğlak Temel Desteği	Temel Destek	1	300
	Aile İşletmesi (Dişi Kuzu/Dişi Erkek Oğlak)	Yönlendirici Kriterler	1	300
	Genç veya Kadın Yetiştirici (Dişi Kuzu/Dişi Erkek Oğlak)		0,7	210
	Birinci Derece Örgüt Desteği		0,2	60
	Sürü Yöneticisi (150 baş)	Verimlilik Kriterleri	1,8	540
Arılı Kovan Desteği	Temel Destek (Kovan Başı)	Temel Destek	1	100/140 TL/Adet
	Genç veya Kadın Yetiştirici	Yönlendirici Kriterler	0,4	40/56TL/Adet
	Planlı Üretim		0,3	30/42TL/Adet
	Birinci Derece Örgüt Desteği		0,2	28 TL/Adet
İpek Böceği Desteği	Temel Destek (kg başı)	Temel Destek	1	1.100

	Diğer Örgüt Sözleşmeli Üretim		0.9	144

4. SONUÇ

Son on yıllık mevcut veriler incelendiğinde 2014 yılında 14,3 milyon baş olan büyükbaş hayvan varlığının 2024 yılında 16,9 milyon başa yükseldiği, ancak 2020 yılına göre 1 milyon baş düşüş gerçekleştiği görülmektedir. Benzer şekilde küçükbaş hayvan varlığı 2021 yılında yakaladığı zirveyi koruyamamıştır. Kırmızı et üretimi son on yılda % 87,5 artmış, çiğ süt üretiminin 2020 yılından bu yana artış göstermemiştir. Bu veriler hayvan varlığının hayvansal üretimde tek başına yeterli olmayacağını verimliliğin artmasının hayvansal üretimde kritik rol oynadığını ortaya koymaktadır.

Tarım ve Orman Bakanlığı tarafından 2024-2026 yıllarını kapsayacak şekilde uygulamaya konan destekleme sisteminin performansa dayalı bir yaklaşım sergilemesi önemlidir. Temel desteklemelerin yanında yönlendirici kriterler (aile işletmeleri, genç/kadın yetiştiriciler vb.) verimlilik kriterleri (suni tohumlama, soy kütüğü, karkas ağırlığı vb.) hayvansal üretimde performansa dayalı bir yaklaşım getirildiği görülmektedir.

Sonuç olarak, yeni destekleme modelinin hayvancılık sektörünün geleceği açısından taşıdığı en önemli unsur, birim hayvandan daha fazla ve kaliteli ürün elde edilmesini teşvik etmesidir. Model, sadece sayısal artışları değil, aynı zamanda et, süt ve buzağı gibi hayvansal ürünlerin kalitesini ve miktarını yükseltmeyi hedeflemektedir. Bu yaklaşım, gıda arz güvenliğini sağlamanın yanı sıra, üretici gelirlerini artırarak ve tarıma dayalı sanayilere daha kaliteli hammadde sağlayarak ülkenin ekonomik kalkınmasına önemli katkılar sunacaktır. Dolayısıyla, bu modelin başarılı bir şekilde uygulanması, Türkiye hayvancılığının daha sürdürülebilir, rekabetçi ve planlı bir yapıya kavuşmasında kritik bir dönüm noktası olabilir.

ABSTRACT

The aim of this study is to investigate the effects of meloxicam, a non-steroidal anti inflammatory drug, on rat sperm cells. The findings will contribute to a better understanding of the drug's potential side effects and assist in evaluating the possible risks associated with its clinical use. In this preliminary study, the effects of meloxicam administration on spermatological parameters and oxidative stress markers in rats were investigated. A total of six male Wistar rats, weighing 220 ± 20 g, were used. The animals were housed under standard conditions with a 12/12 h light/dark cycle at a temperature of 23 ± 2 °C. The rats were divided into two groups: Group 1 (n = 3), treated with meloxicam (2 mg/kg/day, intraperitoneally, for 5 days), and Group 2 (n = 3), the control group (intraperitoneal physiological saline for 5 days). Epididymal spermatozoa examinations were performed using a phase-contrast microscope with a 40x objective, and sperm concentration was determined by the hemocytometric method, while total antioxidant status (TAS) and total oxidant status (TOS) levels were measured in sperm cells. In the control group, TAS was 5931.00 ± 1193.86 µmol/L, whereas in the meloxicam group it was 5121.96 ± 1886.18 µmol/L ($p > 0.05$). TOS levels were 202.47 ± 117.58 µmol/L in the control group and showed a significant increase in the meloxicam group, reaching 471.18 ± 104.37 µmol/L ($p < 0.05$). Spermatological analyses revealed

motility values of 75.00 ± 10.00% in the control group and 61.67±27.54% in the meloxicam group. Sperm concentrations were determined as 41.67±12.58 and 38.33±10.41 $\times 10^6$/ml, respectively. No statistically significant differences were observed in these parameters ($p>0.05$). Meloxicam administration induced an increase in oxidative stress levels in rats, while decreases in sperm motility, concentration, and TAS values were observed, though these changes were not statistically significant. The significant elevation in TOS levels suggests that meloxicam may negatively influence the oxidative balance.

Keywords: Meloxicam, Oxidative stress, Sperm motility, Rat model, TOS

MELOKSİKAMIN SIÇANLARDA SPERMA PARAMETRELERİ ÜZERİNE ETKİLERİ - ÖN ÇALIŞMA

ÖZET

Bu çalışmanın amacı, non-steroidal anti-inflamatuar bir ilaç olan meloksikamın sıçan sperma hücreleri üzerindeki etkilerini araştırmaktır. Elde edilen bulgular, ilacın potansiyel yan etkilerinin daha iyi anlaşılmasına ve klinik kullanımıyla ilişkili olası risklerin değerlendirilmesine katkı sağlayacaktır. Bu ön çalışmada, meloksikam uygulamasının sıçan spermatolojik parametreleri ve oksidatif stres göstergeleri üzerine etkileri araştırılmıştır. Çalışmada vücut ağırlığı 220 ± 20 g olan 6 erkek Wistar sıçanı kullanılmıştır. Hayvanlar 12/12 saatlik aydınlık/karanlık döngüsü ve 23 ± 2 °C sıcaklıktaki standart koşullarda barındırılmıştır. Denekler iki gruba ayrılmıştır: Grup 1 (n= 3) meloksikam (2 mg/kg/gün, intraperitoneal, 5 gün) ve Grup 2 (n= 3) kontrol (serum fizyolojik, intraperitoneal, 5 gün). Epididimal spermatozoa değerlendirmeleri faz kontrast mikroskopta 40x objektif kullanılarak gerçekleştirilmiş, sperm yoğunluğu ise hemositometrik yöntemle belirlenmiştir; sperm hücrelerinde total antioksidan seviye (TAS) ve total oksidan seviye (TOS) ölçülmüştür. Kontrol grubunda TAS 5931,00 ± 1193,86 µmol/L iken, meloksikam grubunda 5121,96 ± 1886,18 µmol/L olarak bulundu ($p > 0,05$). TOS değerleri kontrol grubunda 202.47 ± 117.58 µmol/L, meloksikam grubunda ise anlamlı düzeyde artış göstererek 471,18 ± 104,37 µmol/L'ye ulaştı ($p<0.05$). Spermatolojik analizlerde motilite kontrol grubunda %75,00 ± 10,00, meloksikam grubunda %61,67 ± 27,54; sperm konsantrasyonu ise sırasıyla 41,67 ± 12,58 ve 38,33 ± 10.41 x 10^6/ml olarak belirlendi. Bu parametrelerde istatistiksel fark saptanmadı ($p > 0,05$). Meloksikam uygulaması, sıçanlarda oksidatif stres düzeylerinde artışa yol açarken, sperm motilitesi, yoğunluğu ve TAS değerleri üzerinde istatistiksel olarak anlamlı olmayan ancak spermatolojik değerler açısından düşüşler gözlenmiştir. Bulgularda TOS seviyesindeki anlamlı artış, meloksikamın oksidatif dengeyi olumsuz etkileyebileceğini göstermektedir.

Anahtar Kelimeler: Meloksikam, Oksidatif stress, Sperm motilitesi, Sıçan modeli, TOS

1. INTRODUCTION

Meloxicam, an oxicam derivative non-steroidal anti-inflammatory drug (NSAID), is widely prescribed in both human and veterinary medicine due to its preferential inhibition of cyclooxygenase-2 (COX-2), providing effective analgesic and anti-inflammatory effects with reduced gastrointestinal toxicity compared to traditional NSAIDs (Grosser et al., 2017). Because of its extensive clinical use, concerns regarding its safety profile extend beyond gastrointestinal or renal complications, encompassing potential impacts on the reproductive system. Male fertility, in particular, is vulnerable to pharmaceutical agents that may disrupt hormonal regulation, spermatogenesis, or sperm function (Skakkebaek et al., 2016).

Accumulating evidence indicates that NSAIDs can interfere with male reproductive health. Several analgesics, including ibuprofen and acetaminophen, have been associated with altered reproductive hormones and impaired semen quality in animal models and clinical studies (Kristensen et al., 2018; Mazaud-Guittot et al., 2013). Prostaglandins, which are suppressed by COX inhibition, play a role in sperm motility and semen liquefaction, suggesting that NSAID-mediated suppression could directly impair reproductive physiology (Ricciotti & FitzGerald, 2011). Reports of reduced sperm quality and testicular damage after NSAID exposure support the notion of a potential class effect on fertility (Sharma & Radhakrishnan, 2021).

Specific to meloxicam, multiple animal studies have shown detrimental reproductive outcomes. Uzun et al. (2015) demonstrated that chronic meloxicam exposure in rats reduced sperm count and motility, and caused histopathological degeneration of seminiferous tubules. Similarly, Haroun et al. (2020) observed that prolonged high-dose meloxicam administration induced testicular toxicity, with oxidative stress being a central mechanism, while antioxidants such as curcumin or vitamin C ameliorated the damage. Bakry et al. (2019) reported that even short-term meloxicam exposure (seven days) decreased reproductive organ weights and altered sperm characteristics in rats. More recently, Rodrigues et al. (2024) found that meloxicam reduced serum testosterone and epididymal sperm counts, while impairing epididymal duct contractions necessary for sperm transport. Together, these studies underscore that meloxicam, despite its therapeutic value, may compromise male reproductive function.

A recurring mechanism implicated in NSAID-related reproductive toxicity is oxidative stress. Spermatozoa are particularly susceptible due to their high content of polyunsaturated fatty acids and limited cytoplasmic antioxidant defenses (Agarwal et al., 2014). Excessive reactive oxygen species (ROS) can damage sperm DNA, proteins, and membranes, reducing motility and fertilizing capacity (Aitken, 2017). Several studies confirm that NSAIDs, including meloxicam, can disrupt oxidative balance in the testes and sperm, leading to functional impairment (Haroun et al., 2020; Atlı et al., 2021). Therefore, investigating oxidative stress markers in sperm alongside conventional spermatological parameters provides critical insight into the drug's reproductive effects.

The present study was designed to evaluate the short-term effects of meloxicam on sperm quality and oxidative stress status in male rats. By measuring sperm motility, concentration, total antioxidant status (TAS), and total oxidant status (TOS), we aimed to clarify whether a brief course of meloxicam induces oxidative imbalance and compromises sperm function. Findings from this work may help delineate early reproductive side effects of meloxicam, contributing to risk–benefit assessments for its long-term clinical use.

2. MATERIALS and METHODS

EXPERIMENTAL ANIMALS AND HOUSING

This study was performed on six adult male Wistar rats (*Rattus norvegicus*), aged 8–10 weeks and weighing 220 ± 20 g. Wistar rats are widely used in toxicology and reproductive biology due to their well-characterized physiology and reproducibility in experimental outcomes (Festing & Altman, 2002). Animals were obtained from an accredited laboratory animal facility and acclimatized for one week under controlled environmental conditions: temperature 23 ± 2 °C, relative humidity ~50%, and a 12 h light/dark cycle. Standard laboratory chow and water were provided *ad libitum*.

EXPERIMENTAL DESIGN AND DRUG ADMINISTRATION

The rats were randomly divided into two groups (n = 3 per group):

- **Meloxicam-treated group:** Rats received meloxicam (2 mg/kg/day) intraperitoneally (i.p.) for five consecutive days.
- **Control group:** Rats received an equivalent volume of physiological saline (0.9% NaCl, i.p.) once daily for five days.

SAMPLE COLLECTION

On day 6, 24 h after the last injection, rats were anesthetized with ketamine/xylazine (90/10 mg/kg, i.p.) and sacrificed by cervical dislocation, a method consistent with ethical euthanasia protocols (Close et al., 1996). The cauda epididymides were immediately excised for sperm analysis. Epididymal sperm evaluation is a standard method to assess fertility potential in rodents, reflecting both spermatogenesis and epididymal maturation (Yan et al., 2008).

SPERM ANALYSIS

SPERM MOTILITY

Sperm suspensions were prepared by mincing the cauda epididymis in 1 ml of pre-warmed phosphate-buffered saline (PBS) at 37 °C. A drop of the suspension was placed on a glass slide, covered with a coverslip, and examined under a phase-contrast microscope at 400× magnification. At least 100 spermatozoa per sample were evaluated, and motility was expressed as the percentage of motile spermatozoa. Phase-contrast microscopy remains a reliable method for motility assessment in small experimental groups.

SPERM CONCENTRATION

Sperm concentration was determined using a Neubauer hemocytometer. Samples were diluted 1:20 in PBS containing 1% formalin to immobilize sperm for accurate counting. Counts were performed under 400× magnification, and results expressed as $\times 10^6$ sperm/ml (Belsey et al., 1980). Each measurement was performed in duplicate to minimize error.

OXIDATIVE STRESS ANALYSIS

PREPARATION OF SPERM HOMOGENATES

Sperm suspensions were centrifuged at 800×g for 10 min to pellet the spermatozoa. Pellets were washed with cold PBS, resuspended in buffer, and sonicated to release intracellular contents. Supernatants were collected after centrifugation at 10,000×g for 5 min at 4 °C.

TOTAL ANTIOXIDANT STATUS (TAS)

TAS was measured using a commercial kit based on the Erel method, which evaluates the overall capacity of antioxidants in biological samples to inhibit oxidation reactions (Erel, 2004). Results were expressed in µmol Trolox equivalents/L.

TOTAL OXIDANT STATUS (TOS)

TOS was quantified using the complementary Erel assay, where oxidants in the sample oxidize ferrous ion to ferric ion, forming a colored complex with xylenol orange (Erel, 2005). Results were expressed in µmol H_2O_2 equivalents/L.

OXIDATIVE STRESS INDEX (OSI)

OSI was calculated as the ratio of TOS (µmol H_2O_2/L) to TAS (µmol Trolox equiv./L), providing an integrated measure of oxidative balance (Agarwal et al., 2014).

STATISTICAL ANALYSIS

All statistical evaluations were carried out using the SPSS software package (IBM Corp., Armonk, NY, USA; version 27). Results are presented as mean ± standard deviation (SD). The normality of data distribution was assessed by the Shapiro–Wilk test, while the equality of variances was examined using Levene's test. Given the limited sample size and the fact that some variables did not meet parametric assumptions, comparisons between groups were performed using the non-parametric Mann–Whitney U test. A p-value of <0.05 was considered statistically significant.

3. RESULTS

SPERM MOTILITY AND SPERM CONCENTRATION

Meloxicam administration resulted in a decline in sperm motility compared to controls. The mean motility in the control group was 75.00 ± 10.00%, whereas in the meloxicam-treated group it decreased to 61.67 ± 27.54%. Although the mean value suggested an ~18% reduction, statistical analysis showed that this difference was not significant ($p > 0.05$). The variability was greater in the meloxicam group, as one rat exhibited a marked reduction in motility while others showed values closer to the control range.

The sperm concentration also showed a mild decrease in the meloxicam-treated rats. The mean sperm concentration in the control group was 41.67 ± 12.58 $\times 10^6$/ml, compared to 38.33 ± 10.41 $\times 10^6$/ml in the meloxicam group. This represented a modest 8% reduction; however, the difference did not reach statistical significance ($p > 0.05$). (Tablo 1)

TOTAL ANTIOXIDANT STATUS (TAS), TOTAL OXIDANT STATUS (TOS) AND OXIDATIVE STRESS INDEX (OSI)

TAS levels, which reflect the overall antioxidant defense, were lower in meloxicam-treated rats compared to controls. The control group exhibited an average TAS of 5931.00 ± 1193.86 µmol/L, while the meloxicam group showed 5121.96 ± 1886.18 µmol/L. This represented a 13.6% decrease, though statistical analysis indicated no significant difference ($p > 0.05$). The variability within the meloxicam group was high, with one rat showing a pronounced decline in TAS.

A significant elevation in oxidant levels was observed in meloxicam-treated rats. Control animals demonstrated a mean TOS of 202.47 ± 117.58 µmol/L, while meloxicam treatment increased this value to 471.18 ± 104.37 µmol/L. Statistical analysis confirmed that this difference was significant ($p < 0.05$).

When TOS and TAS were combined into the OSI, a clear upward shift in oxidative stress was evident in the meloxicam group compared to controls. Although not formally tested for significance due to the small sample size, OSI values in treated rats were approximately twice those of controls. This reinforces the finding that meloxicam administration disrupted the oxidative balance in sperm cells, favoring a pro-oxidant state (Agarwal et al., 2014). (Tablo 1)

Tablo 1. Comparison of spermatological and oxidative stress parameters between groups (Ort ± SD)

Groups	TAS (µmol/L)	TOS (µmol/L)	Motility (%)	Concentration (10^6/ml)
Control	5931.00 ± 1193.86	202.47 ± 117.58[b]	75.00 ± 10.00	41.67 ± 12.58
Meloxicam	5121.96 ± 1886.18	471.18 ± 104.37[a]	61.67 ± 27.54	38.33 ± 10.41
p	-	*	-	-

4. DISCUSSION

The present study provides preliminary evidence that short-term meloxicam administration in rats induces measurable oxidative stress in sperm cells, as indicated by a significant rise in TOS, alongside non-significant reductions in sperm motility, concentration, and TAS. These findings highlight oxidative imbalance as an early event in meloxicam-induced reproductive toxicity.

The most robust outcome was the doubling of TOS values in the meloxicam-treated group compared to controls. Elevated oxidant levels reflect an increased burden of reactive oxygen species (ROS), which are known to impair sperm membrane integrity, mitochondrial function, and DNA stability (Agarwal et al., 2014; Aitken, 2017). Given the high content of polyunsaturated fatty acids in sperm membranes, excessive ROS rapidly lead to lipid peroxidation, compromising motility and fertilizing capacity (Aitken, 2017). Our observation of significantly higher TOS is consistent with the work of Haroun et al. (2020), who reported that prolonged meloxicam exposure in rats reduced antioxidant enzyme activity and increased testicular oxidative damage. The fact that antioxidant supplementation with curcumin or vitamin C ameliorated these effects further supports oxidative stress as a central mechanism.

Although TAS levels were not significantly different between groups, the downward trend in meloxicam-treated rats suggests that antioxidant reserves were partially consumed in response to increased oxidative load. Variability among individuals may have masked significance, but this aligns with earlier reports where NSAID administration reduced enzymatic antioxidants such as superoxide dismutase (SOD) and glutathione peroxidase (GPx) (Atlı et al., 2021). With a larger sample size or longer treatment duration, a statistically significant reduction in TAS would likely emerge, reinforcing the concept of depleted antioxidant defenses during NSAID exposure.

In terms of sperm quality, both motility and concentration showed non-significant declines after meloxicam treatment. While modest, these changes suggest early functional impairment. Previous studies using longer exposure durations have demonstrated pronounced effects. Uzun et al. (2015) reported significant reductions in sperm count and motility, along with testicular histopathology, after 35 days of meloxicam exposure. Similarly, Bakry et al. (2019) found that even seven days of treatment altered sperm motility and morphology. Our results fall in line with these findings,

suggesting that five days may be insufficient to elicit significant spermatogenic disruption, but early oxidative damage is likely occurring.

Another factor to consider is meloxicam's potential endocrine effects. Rodrigues et al. (2024) showed that meloxicam reduced serum testosterone levels and impaired epididymal function in rats, leading to decreased sperm counts in specific epididymal regions and delayed sperm transit. Testosterone plays a critical role in spermatogenesis and sperm maturation; therefore, meloxicam-induced suppression may underlie longer-term reproductive toxicity. Although hormonal assays were not performed in our study, the possibility of endocrine disruption should be explored in future work.

The epididymis may also represent a site of meloxicam toxicity. Prostaglandins, inhibited by COX blockade, contribute to epididymal duct contractions necessary for sperm transport (Ricciotti & FitzGerald, 2011). Impaired contractility, as observed by Rodrigues et al. (2024), could lead to altered sperm maturation and reduced motility. Thus, meloxicam may exert reproductive effects not only via oxidative stress but also through endocrine and epididymal pathways.

Taken together, our findings reinforce the concept that meloxicam, despite being a COX-2 preferential NSAID designed for improved safety, shares the potential class effect of NSAID-related reproductive toxicity. The significant increase in TOS highlights oxidative stress as an early biomarker of damage. If sustained, this oxidative imbalance may progress to functional deficits in sperm quality and testicular histopathology, as demonstrated in chronic exposure studies (Uzun et al., 2015; Haroun et al., 2020). Clinically, this raises concerns for men undergoing long-term meloxicam therapy, particularly those of reproductive age.

Limitations of the present study include the small sample size, short exposure period, and lack of histopathological or hormonal assessments. These constraints limit the strength of statistical conclusions and mechanistic insights. Nevertheless, the significant oxidative response observed underscores the sensitivity of sperm cells to even brief meloxicam exposure. Future research should include larger cohorts, extended treatment durations covering a full spermatogenic cycle, and comprehensive analyses including testicular histology, antioxidant enzyme assays, and reproductive hormone profiling. Fertility outcomes, such as mating trials, would also provide translational relevance.

From a translational perspective, if oxidative stress is confirmed as the main mediator of meloxicam-induced reproductive toxicity, antioxidant supplementation may offer a protective strategy. Haroun et al. (2020) demonstrated that curcumin and vitamin C mitigated testicular damage, and similar interventions could be explored clinically. Such strategies could help preserve fertility in patients requiring chronic NSAID therapy, although caution is warranted before extrapolating animal findings directly to humans.

5. CONCLUSION

In this preliminary study, short-term meloxicam administration at a therapeutic dose (2 mg/kg, i.p., for five days) significantly increased oxidative stress in sperm cells, as evidenced by elevated TOS levels, while producing modest, non-significant declines in sperm motility, concentration, and TAS. These findings suggest that oxidative imbalance may represent an early biomarker of meloxicam-induced reproductive toxicity. Although the duration of treatment was insufficient to cause marked alterations in spermatological parameters, the consistent pro-oxidant shift implies that longer exposure or higher doses may exacerbate reproductive impairment, as demonstrated in previous chronic studies (Uzun et al., 2015; Haroun et al., 2020).

The results also underscore that NSAIDs, including COX-2 preferential drugs such as meloxicam, are not devoid of systemic risks. Male fertility appears to be a sensitive target, likely affected through multiple pathways including oxidative stress, endocrine disruption, and altered epididymal function (Rodrigues et al., 2024; Bakry et al., 2019). Therefore, awareness of potential reproductive side effects should inform risk–benefit evaluations, particularly for men of reproductive age who require prolonged meloxicam therapy.

Future research should address the limitations of this study by employing larger sample sizes, extended treatment durations spanning a full spermatogenic cycle, and additional endpoints such as testicular histopathology, hormone assays, and fertility trials. Moreover, the possibility of mitigating meloxicam-induced reproductive toxicity through antioxidant supplementation warrants exploration, as protective effects of agents like curcumin and vitamin C have already been demonstrated (Haroun et al., 2020).

In conclusion, while meloxicam remains an effective and widely used anti-inflammatory drug, its potential to disrupt oxidative balance in sperm highlights the need for careful monitoring of reproductive health in long-term users. These findings contribute to the growing body of evidence on NSAID-related reproductive risks and emphasize the importance of integrating reproductive safety into pharmacological evaluations.

ÖZET

Artan dünya nüfusuna ve şehirleşmeye paralel bir şekilde tarımsal sürdürülebilirliğin önemi her geçen gün yükselmektedir. Bu konuda sorumluluk paylaşımı kilit bir konudur. Üretici ve tüketici pozisyonundaki insanlara, işletmelere, devletlere, sivil toplum örgütlerine, kısacası her kesime görevler düşmektedir. Yiyecek içecek işletmeleri tarımsal üretimin sürdürülebilirliği üzerine hem etkileyici hem de etkilenen pozisyonda yer almaktadır. Bu bağlamda bu araştırma ile ikinci dalga kahve mekânlarının üretim ve arz süreçlerinde gerçekleştirdikleri tarımsal sürdürülebilirlik odaklı yeşil işletmecilik uygulamalarının ortaya koyulması amaçlanmıştır. Araştırmanın bir diğer amacı ise yerli ve yabancı menşeili işletmelerin konu bağlamında kıyaslanmasıdır. Söz konusu işletmelerin ana ürünü olan kahvenin az gelişmiş ve gelişmekte olan ülkelerden sağlanıyor olması tarımsal sürdürülebilirlik bağlamında araştırmayı ayrıca önemli kılmaktadır. Araştırma amacına istinaden Türkiye'de şube sayısı en yüksek yirmi kahve zincirinin faaliyetleri internet siteleri üzerinden incelenmiştir. İnceleme neticesinde eğitim (bilinçlendirme), üretim teşviki, sorumlu tedarik, geri dönüşüm, iklim değişikliği tedbiri, müşteriyi sürece dâhil etme, üreticiyi sürece dâhil etme başlıklarında yedi yeşil uygulama belirlenmiş ve işletmelerin yeşil puanları oluşturulmuştur. Elde edilen veriler doğrultusunda yeşil uygulamalar arasında en sık uygulananın sekiz işletme ile geri dönüşüm olduğu, tarımsal üretim teşvikinin ise sadece bir işletme tarafından uygulandığı sonucuna ulaşılmıştır. Ayrıca yabancı zincir işletmelerin yerli zincir işletmelere kıyasla daha sorumlu bir tavır ortaya koyduğunu ifade etmek mümkündür. Öyle ki araştırmaya dâhil edilen altı yabancı işletmenin yeşil puanı yirmi bir iken altı on dört yerel işletmenin yeşil puanı sadece dokuzdur. Dahası yerel işletmelerin sadece dördünde tarımsal sürdürülebilirlik odaklı yeşil uygulamalar gerçekleştirildiği sonucuna ulaşılmıştır. Nihai olarak elde edilen veriler üzerinden kesin bir ilişki tespit edilmesi mümkün olmamakla beraber uluslararasılaşma ve şube sayısı ile sürdürülebilir odaklı yeşil işletmecilik faaliyetleri arasında yakın ilişki olduğu tespit edilmiştir.

Anahtar Kelimeler: Tarımsal Sürdürülebilirlik, İkinci Dalga Kahve İşletmeleri, Yeşil İşletmecilik.

GREEN BUSINESS PRACTICES FOCUSED ON THE SUSTAINABILITY OF AGRICULTURAL PRODUCTION: A COMPARATIVE ANALYSIS OF SECOND WAVE COFFEE CHAINS IN TURKEY

ABSTRACT

In parallel with the increasing world population and urbanization, the importance of agricultural sustainability is increasing day by day. Sharing responsibility is a key issue in this regard. People in the position of producers and consumers, businesses, states, non-governmental organizations, in short, everyone has responsibilities. Food and beverage businesses are in a position to both influence and be affected by the sustainability of agricultural production. In this context, this research aims to reveal the agricultural sustainability-oriented green businesses practices implemented by second wave coffee businesses in their production and supply processes. Another aim of the research is to compare domestic and foreign origin businesses in the context of the subject. The fact that coffee, the main product of these businesses, is supplied by underdeveloped and developing countries makes this research especially important in the context of agricultural sustainability. For the purpose of the research, the activities of the twenty coffee chains with the highest number of branches in Turkey were examined through their websites. As a result of the review, seven green practices were determined under the headings of education (awareness raising), production incentive, responsible supply, recycling, climate change measure, customer involvement in the process, and producer involvement in the process, and green scores of the businesses were created. Based on the data obtained, it was concluded that the most frequently implemented green practice was recycling, implemented by eight business, while agricultural production incentive were implemented by only one business. It is also possible to say that foreign chain businesses exhibit a more responsible attitude compared to domestic chain businesses. Such that, while the green score of the six foreign businesses included in the research was twenty-one, the green score of the sixteen domestic businesses was only nine. Moreover, it was concluded that only four of the domestic businesses implemented green practices focused on agricultural sustainability. Although it is not possible to determine a definitive relationship based on the final data obtained, it has been determined that there is a close relationship between internationalization and the number of branches and sustainable-oriented green business activities.

Keywords: Agricultural Sustainability, Second Wave Coffee Businesses, Green Business.

1. GİRİŞ

Wisniowski'nin aktardığı üzere (2025) kahve ihracatından elde ettiği gelire göre önde gelen ülkeler; Brezilya, Vietnam, Kolombiya, Endonezya, Etiyopya, Honduras, Hindistan, Uganda, Meksika, Guatemala, Peru, Nikaragura, Çin, Fildişi Sahili ve Kostarika'dır. Son ulaşılan istatistiklere bakıldığında ise dünya genelinde kahve ihracatı Temmuz 2024'teki 11,6 milyon çuvala kıyasla Temmuz 2025'te %1,6 düşüşle 11,42 milyon çuvala gerilemiştir. Kahve piyasasının önde gelen ülkesi Brezilya'nın da içinde yer aldığı Güney Amerika, son ekonomik durgunluğun itici gücü olmuştur. Bu bölgenin toplam ihracattaki payı, Temmuz 2024'teki %46,5'e kıyasla Temmuz 2025'te %38,5'e gerilemiştir ve Güney Amerika için art arda dokuzuncu durgunluk ayı olmuştur (ICO, 2025).

İhracat boyutuyla öne çıkmayan ülkelerle beraber dünyada sudan sonra en çok tüketilen içecek olan kahvenin üretiminin sınırlı bir coğrafyada yapıldığını ifade etmek mümkündür (Bayraktar vd., 2021: 74). Bu nedenledir ki kahve söz konusu olduğunda sürdürülebilir tarım daha da önemli hale gelmektedir. Söz konusu üretici ülkelerin az gelişmiş ve gelişmekte olan ülkeler olması nedeniyle ekonomileri içerisinde kahve ihracatının önemli bir pay kapsadığı düşünüldüğünde tarımsal sürdürülebilirliğin önemi daha da gün yüzüne çıkmaktadır. Dahası Uluslararası Kahve Örgütü'nün raporladığı üzere özellikle iklim değişikliği nedeniyle kahve üretiminin sürdürülebilirliği yadsınamaz tehditlerle karşı karşıya kalmaktadır (ICO, 2024: 16).

Dünya kahve tüketiminin önemli bir aracısı yiyecek içecek işletmeleri ve özellikle ikinci dalga kahve zincirleridir. Küresel boyutta arz sunan bu işletmelerin kahve tüketiminin yanında tabi ki üretim konusunda da sorumluluk alması beklenmektedir. Bu bağlamdan hareketle bu araştırma ile sürdürülebilir tarım adına ikinci dalga kahve işletmelerinin yeşil işletmecilik uygulamalarına yönelinmiştir. Türkiye'de hizmet veren ikinci dalga zincir kahve işletmeleri üzerinden araştırma yürütülüyor olmasının yerli ve yabancı zincirler arasında kıyaslama yapmaya da imkân sağlaması bakımından önemli olduğu düşünülmektedir

2. YEŞİL İŞLETMECİLİK

Her bir işletme çevresiyle etkileşim halinde faaliyetlerini sürdürmektedir. Öyle ki en temel üretim faktörlerinden birisi doğadır. İşletmelerin çevreyle olan etkileşimin maliyetleri hesaba katılmadığı takdirde uzun vadede başarılı olunamayacağı akademi mecrasında ve sektör profesyonellerince kabul edilmiştir. Özellikle son yıllarda artan çevre sorunları ve bu sorunlar karşısında bir şeyler yapmak zorunda kalan devletler ile bu konuda gündem ve baskı oluşturucu güce sahip sivil toplum örgütlenmeleri işletmelerin faaliyetleri üzerinde küçümsenmeyecek etkiler oluşturmaktadır. Dahası eğitim seviyesinin yükselmesiyle çoğalan çevre bilinci yüksek tüketiciler de işletmelerin rekabette tutunabilmek adına kulak vermesi gereken bir pazar haline gelmiştir. Bu bağlamda 21. Yüzyılın başarılı işletmecilik anlayışını yeşil stratejiler oluşturmaktadır ki (Şenocak ve Mohan Bursalı, 2018: 165) bu stratejiler üzerine kurgulanan işletmeler yeşil işletme şeklinde tanımlanmaktadır.

Çevreye duyarlı işletmecilik olarak da ifade edilen yeşil işletmecilik, "ekolojik çevreyi karar alma süreçlerinde önemli bir unsur olarak dikkate alan, faaliyetlerinde çevreye verilen zararı minimuma indirmeyi veya tamamen ortadan kaldırmayı amaç edinen, bu çerçevede, ürünlerinin tasarımını ve paketlemesini, üretim süreçlerini değiştiren, ekolojik çevrenin korunması felsefesini işletme kültürüne yerleştirmek için çabalayan, sosyal sorumluluk kapsamında topluma karşı görevlerini yerine getiren işletmelerin benimsediği anlayışı" (Nemli, 2001: 212) açıklamaktadır. Bu geniş tanımdan ve benzerlerinden anlaşılacağı üzere yeşil işletmeciliğin kapsamı oldukça geniş bir şekilde işletmenin tüm faaliyetlerini içermektedir. Dolayısıyla yeşil tüketici, yeşil pazarlama, yeşil

ürün, yeşil üretim, yeşil tedarik, yeşil bina gibi kavramlar ortaya çıkmış olmakla beraber yeşil işletmecilik şemsiye bir kavram ve anlayış olarak düşünülmelidir. Bir işletmenin yeşil işletme olarak tanımlanabilmesi için tüm süreçlerinde çevresel sorumluluklarını yerine getirmesi beklenmektedir. Ancak pazarlama başarısı amacıyla yeşil uygulamaların yapılıyormuş gibi gösterilmesi yeşil yıkama/boyama (Aksu ve İpar, 2018: 26) şeklinde ifade edilmekte ve pazarlama etiğine uymamaktadır. Dolayısıyla konuyla ilgili örgütlenmelerin öncülüğünü üstlendiği sertifikasyon uygulamalarına dâhil olunması uygulamaların kontrol edilebilirliği, sürekliliği ve belgelendirilmesi için önem arz etmektedir. Bu bağlamda işletmelerin yeşil işletmecilik anlayışına uygun faaliyette bulunduklarının en önemli göstergelerinden birisi ISO 14000 çevre yönetim sistemi standartlarıdır (Akatay ve Aslan, 2008: 320). Bu standartlar dünya genelinde en kapsamlı sertifikasyon programlarından birisi olmakla birlikte ülkelere göre ve sektörel bazda birçok farklı sertifikasyon uygulamasının varlığından bahsetmek mümkündür.

Yeşil işletmeler, uygulamaları ile çevreye ve dünyaya karşı sorumluluklarını yerine getirmiş olmakla beraber kendileri adına da önemli kazanımlar elde etmiş olmaktadır. Bu konuda Porter'in maliyet liderliği, farklılaştırma ve odaklanma şeklinde açıkladığı rekabet stratejileri oldukça geçerlidir. Yeşil uygulamalarla maliyetlerini düşüren işletmeler maliyet liderliği için önemli adımlar atmış olmaktadır. Söz konusu uygulamalardan bu araştırmanın konusuyla ilgili olanlardan bazıları; geri dönüşüm, yeşil tedarikçi seçimi, atık azaltımı, çevre bilinci oluşturma şeklinde sıralanabilir. Dahası bu uygulamaları gerçekleştirdiğini sertifikasyon programlarıyla onaylatan ve pazarlama iletişiminde kullanabilen işletmeler müşteri sadakati oluşturmada ve yeni müşterilere ulaşmada avantajlı konuma ulaşabilmekte (Perramon, 2014: 10) ve rakipleri arasında farklılaşabilmektedir.

3. KAHVE AKIMLARI VE TÜRKİYE

Suyun ardından dünya üzerinde en popüler içecek pozisyonunda kahve yer almaktadır (Gaascht vd., 2015: 50). Öyle ki insanların kahve tüketme motivasyonu oldukça çeşitlidir. Belki bir yemek sonrası, belki keyifli bir anda belki de bir arkadaş toplantısında kahve akıllara gelebilmektedir. Hemen hemen her an tüketilebilen bir içecek olarak kahve, boş zaman sembolü olarak da görülebilmektedir (İstanbullu Dinçer vd., 2016: 811). Tüketiminin verdiği hazzın yanı sıra son yıllarda sağlığa olumlu etkisiyle de değerini katlayan kahvenin hazırlanışı, sunumu ve tüketim şekli süreç içerisinde farklılaşmıştır. Kahvenin kitlesel tüketimi söz konusu olduğunda nesil veya dalga şeklinde tanımlanan süreçlerden bahsedilmektedir. Birinci dalga kahve akımı; kitlesel tüketim amaçlı standardizasyonu hedefe koymakla beraber kalite beklentisinin olmadığı bir endüstriyel süreçtir (Rosenberg vd., 2018: 203). Günümüzde her ne kadar üçüncü dalga kahve akımına erişilmiş olsa da halen geçerliliği olan birinci dalga kahve akımı, vakumlu torbalar vasıtasıyla kahvenin taşınabilir ve istenildiğinde suda çözülerek içilmesini içermektedir ve en önemli özelliği kahve tüketimini kolaylaştırmasıdır. 1960'lı yıllarda çıkan öncü işletmeler sayesinde ikinci dalga kahve akımı başlamıştır (Fischer, 2017: 8). Bu akım kapsamında, gelişen üretim teknolojilerinin katkısıyla sunum ve tat standardizasyonuna ulaşmak mümkün hale gelmiş ve dolayısıyla zincir kahve işletmeleri ortaya çıkmıştır (Genç ve Çakırtaş, 2024: 228). Ayrıca kahve tüketiminde marka ve mekân, bir tüketim alanı olmasının ötesinde anlamlara kavuşmuş ve bireyler kahve mekânlarını kendilerini özel hissedebildikleri yerler olarak algılar duruma gelmiştir (Kavlak ve Akova 2022: 9). Son olarak zincir işletmelerle olgunlaşan Avrupa, ABD, Japonya gibi pazarlarda (Borrella vd., 2015: 34) endüstriyelleşen kahve tüketimine karşın üçüncü dalga kahve akımı doğmuştur (Şeker ve Özata, 2022: 194). Bu akımda kahve üretimi ve tüketimi bir sanat olarak görülmeye başlanmış ve hasadından, işlenmesine ve tüketimine kadar özenli, kişiselleştirilmiş bir yaklaşım sergilenmeye

başlanmıştır. Dolayısıyla çok sayıda tüketiciye standart reçeteler üzerinden sunumun yapıldığı ikinci dalga kahve mekânlarına kıyasla daha butik işletmeler üçüncü dalga kahve akımının temsilcileri olarak görülmektedir.

Tablo 1. Türkiye'de Önde Gelen Zincir Kahve İşletmeleri (2023-2024)

İşletme İsmi	Kuruluş*	Türkiye'ye Giriş	Menşei**	Dünya Şube Sayısı***	Türkiye Şube Sayısı***
Starbucks	1971	2003	ABD	38.038	685
Gloria Jean‟s Coffee	1979	2012	ABD (1994‟itibarıyla Avusturalya)	1200+	124
Caffe Nero	1997	2007	İngiltere	1000+	95

Notlar: *İlk fiziki mağaza dikkate alınmıştır. **Çıkış yeri dikkate alınmış; el değiştirmeler ve ortaklıklar dikkate alınmamıştır. ***Veriler Statista şirketinin ve işletmelerin resmi sitelerinden elde edilmiştir. Al-götür konseptler dâhil edilmemiştir (Genç ve Çakırtaş, 2024: 234).

Anadolu coğrafyasında kahve tüketiminin ve mekânlarının yayılımının Kanuni Sultan Süleyman döneminde yaşandığı kabul edilmektedir (Kefeli vd., 2020: 132; Özdal, 2023: 1079). Anadolu'da ilk kahve mekanının açılışı üzerine 1551 (Yaşar, 2005: 239; Taştan, 2009: 64), 1554 (Çekiç, 2022: 686; Kaplan, 2011) ve 1555 (Akarçay, 2012: 184; Fendal, 2012: 161; Yılmaz vd., 2017: 214) gibi birbirine yakın olsa da farklı yıllar işaret edilmektedir. Süreç içerisinde kahve tüketimi önemli bir kültür halini almış ve 1600'lü yıllarda kahvehane sayısı yetmiş, işletmecilerin sayısı yüz, kahve satan dükkânların sayısının üç yüz olduğu aktarılmış ve 19. Yüzyıl İstanbul'u büyük bir kahvehane olarak tasvir edilmiştir (Yaşar, 2005: 242). Bu tasvir geleneksel kahvehanelerin yanında ikinci ve üçüncü nesil kahve işletmelerinin varlığıyla günümüzde de geçerli durmaktadır. Öyle ki 2023 yılı verilerine göre dünya üzerinde en fazla Starbucks şubesinin bulunduğu ülkeler arasında Türkiye sekizinci sırada yer alırken Avrupa'da her dört Starbucks şubesinin biri Türkiye'de yer almaktadır (Genç ve Çakırtaş, 2024: 227).

4. ARAŞTIRMANIN YÖNTEMİ

Araştırmanın amacına istinaden tablo 1.'de yer verildiği üzere Türkiye'de faaliyet gösteren en yüksek şube sayısına sahip ikinci dalga zincir kahve işletmelerinin internet siteleri incelenmiştir. Ayrıca bu sitelerden indirilebilir dokümanlardan faydalanılmıştır. Birincil veri kaynağı olarak ifade edilebilecek işletme sorumlularıyla doğrudan görüşme gerçekleştirilmemiş olması araştırmanın sınırlılığı olarak kabul edilebilir. Tarımsal sürdürülebilirlik odaklı yeşil uygulamalar gerçekleştirmiş olmasına rağmen internet sitesinde buna dair bir bilgi paylaşımı yapmamış olan işletmelerin olma ihtimali göz ardı edilmemelidir.

5. VERİ ANALİZİ VE BULGULAR

Tablo 2'de araştırmaya dâhil edilmiş olan yirmi işletmenin tarımsal sürdürülebilirlik odaklı gerçekleştirdikleri yeşil uygulamalara ve bu uygulamalar neticesinde oluşturulmuş yeşil puanlarına yer verilmiştir.

Tablo 2. Tarımsal Sürdürülebilirlik Odaklı Yeşil Uygulamalar

İŞLETMELER	YEŞİL UYGULAMALAR							YEŞİL PUAN
	Eğitim (Bilinçlendirme)	Tarımsal Üretim Teşviki	Sorumlu Tedarik	Geri Dönüşüm	İklim Değişikliği Tedbiri	Müşteriyi Sürece Dâhil Etme	Üreticiyi Sürece Dâhil Etme	
Starbucks	✓		✓	✓	✓	✓		5

Kocatepe Kahve Evi								0

Yedi yeşil uygulamadan elde edilen toplam otuz puanın yirmi bir puanı altı yabancı işletmeye aittir. On dört yerli işletmenin yeşil puanı ise dokuz seviyesindedir. Belirlenen yeşil uygulamaların sadece birine yönelik faaliyeti bulunmayan Caribou işletmesi, tüm işletmeler arasında altı yeşil puanla lider durumdadır. Onu yine yabancı işletmeler arasında yer alan beşer yeşil puanlı Tchibo ve Starbucks takip etmektedir. Yabancı işletmelerden Roberts Coffee işletmesinin ise herhangi bir yeşil uygulamasına ulaşılamamıştır. Yerli işletmelere bakıldığında ise zaten düşük olan toplam dokuz yeşil puanın sadece dört işletme tarafından kaynaklandığı görülmektedir. Bir diğer ifadeyle yerli on işletmenin herhangi bir yeşil uygulamasına ulaşılamamıştır. Yeşil uygulamalar arasında sekiz işletme ile en çok gerçekleştirilen uygulama geri dönüşümdür. Tarımsal üretim teşviki ise sadece bir işletme tarafından uygulanmaktadır.

Sorumlu Tedarik

Dikkat çekici bir şekilde yükselen sürdürülebilirlik politikaları gereğince klasik tedarikçi seçim kriterlerine çevresel kriterler de eklenmiştir (Madenoğlu, 2019: 1852). Bir diğer ifadeyle yeşil işletmecilik gerçekleştirmek isteyen işletmelerin tedarikçi seçiminde de bu görüşleri doğrultusunda hareket etmesi beklenmektedir. Sorumlu tedarikçi seçimi yeşil ürün sunumu için ön gereklilikler arasında yer almaktadır. Bu bağlamda araştırma kapsamında beş işletmenin sorumlu tedarikçi seçimi adına çalışmalar gerçekleştirdiği tespit edilmiştir. Sorumlu tedarikçi seçimi üzerine "tedarikçi davranış kuralları" oluşturduğunu ifade eden bir işletmenin konuya dair açıklamaları aşağıdaki gibidir (Starbucks, 2024: 30).

Sorumlu tedarik uygulamaları, tedarik zinciri girişimlerinin ayrılmaz bir parçasıdır. Tedarik zincirimiz genelinde ürün ve malzemeleri sorumlu bir şekilde tedarik etme konusundaki devam eden çabalarımızı daha da ileriye taşımak için, tedarikçilerimizin iş etiği, insan hakları ve çevresel sürdürülebilirlik konusundaki beklentilerimizi karşılamalarını sağlamak amacıyla kapsamlı politikalar ve programlar oluşturduk. Bir tedarikçinin uygulamalarıyla ilgili endişeler ortaya

çıkarsa, sorunları çözmeleri için onları desteklemeyi hedefliyoruz. Sorunlar tamamen ele alınıp çözülene kadar faaliyetleri askıya alma hakkımızı saklı tutuyoruz.

Eğitim (Bilinçlendirme)

Sürdürülebilir tarımın temel göstergeleri içerisinde eğitim çalışmalarının yaygınlaştırılması yer almaktadır (Turhan, 2005: 15). Akış ve Aksoy (2023: 902) tarafından yapılan bir araştırmada çiftçi eğitimlerinin üretim ve sürdürülebilirlik konusunda pozitif etkisinin bulunduğuna ulaşılmıştır. Çiftçi eğitimlerinde devlet kurumları önde olmak üzere işletmelere de sorumluluklar düşmektedir. Bu araştırmaya dâhil edilmiş beş işletmenin bu yönde girişimleri bulunmaktadır. Tchibo işletmesi, kahve alımı gerçekleştirdiği Tanzanya'da tarımsal üretime yönelik verdiği eğitim desteğini aşağıdaki şekilde açıklamıştır (Tchibo, t.y.).

Genç çiftçilerin bilgilerini güçlendirmek için Tchibo, City Coffee ile iş birliği yaparak Kahve Kulüpleri'ni başlattı. Bunlar, Mbyea ve Mbozi'deki yedi okulda düzenlenen okul tabanlı atölyelerdir. Kahve yetiştiriciliğinden başarılı bir kahve satışına kadar her şeyi kapsar. Çeşitli modüller, bitki hastalıklarının tanınması, gübreleme becerileri ve suyun doğru kullanımı konularını kapsar. Ayrıca, doğru budama ve yüksek verimli hasat yöntemleri hakkında derinlemesine bilgiler paylaşılır. Atölyeler, yalnızca kahve bitkilerinin yetiştirilmesi ve bakımı hakkında ekolojik bilgi sağlamakla kalmayıp, aynı zamanda katılımcılara başarılı bir çiftlik işletmek için ihtiyaç duydukları becerileri kazandırmak için de tasarlanmıştır. Bu bağlamda, iş sağlığı ve güvenliği ve yönetim becerileri gibi önemli konular da ele alınmaktadır. Atölyeler genellikle verimlilik ve kalitede artışlara yol açar; bu da öğrenciler için önemli bir motivasyon kaynağıdır.

İklim Değişikliği Tedbiri

İklim değişikliği belki de tarımsal sürdürülebilirliğin önündeki en büyük engeldir. Hakorımana (2018: i) tarafından Ruanda kapsamında gerçekleştirilen bir araştırmada son on yedi yılda kahve verimindeki değişimin %74'ünün iklim değişiminden kaynaklandığı sonucuna ulaşılmıştır. İklim değişikliğiyle mücadelede yeni duruma uygun bir şekilde üretim ve teknik farklılaştırılmasına gidilmesi önem arz etmekte olup dört işletmenin bu yönde girişimleri tespit edilmiştir. Tchibo işletmesi tarafından Honduras'ta girişimlerde bulunulmuştur. Söz konusu girişimler aşağıdaki ifadelerle açıklanmıştır (Tchibo, t.y.).

Çeşitlendirme, çiftliklerin verimliliğini hem ekolojik hem de ekonomik olarak artırmanın önemli bir yoludur. Bu amaçla Tchibo ve Becamo, kahve tarlalarında avokado ve turunçgiller de dâhil olmak üzere meyve ağaçlarının yetiştirilmesini desteklemektedir. Bu, çeşitli faydalar sağlar: Meyve ağaçları, kahve bitkileri için gerekli gölgeyi sağlayarak kalite ve performansı artırabilir. Aynı zamanda, meyve ağaçları çiftçilere ve ailelerine besin sağlar. Belirli koşullar altında, ikinci bir gelir kaynağı dahi olabilirler. Farklı çeşitlerin yetiştirilmesi ve biyolojik girdi üretimi, daha iyi biyoçeşitlilik ve toprak sağlığını sağlayarak iklim değişikliğiyle mücadeleye katkıda bulunur.

Müşteriyi Sürece Dâhil Etme

Yeşil uygulamaların başarılı olmasında müşterilerin desteği olmazsa olmazlar arasındadır ve üç işletme bu farkındalıkla girişimde bulunmuştur. Müşteri desteği işletmeler üzerinde teşvik edici bir etki uyandırıp yeşil uygulamaların çeşitlenmesine zemin hazırlayabilmektedir. Ancak yeşil yıkama veya boyama şeklinde tüketiciyi aldatıcı bir tavrın da olduğu düşünüldüğünde bu düşünüldüğü kadar kolay durmamaktadır. Müşteriyi sürece dâhil etmenin etkin yollarından birisi somut verilerle sürdürülebilirlik raporları oluşturmak ve uygulamaları görülebilir kılmaktır (Baloğlu Sevinç ve Akın, 2025: 41). Mobil uygulamalar sayesinde bu raporların tüketiciye ulaştırılması oldukça

kolaylaşmıştır. Müşteriyi sürece dâhil etme konusunda sosyal medya desteğiyle gerçekleştirilen bir uygulama aşağıdaki ifadelerle açıklanmıştır (Arabicacoffee, t.y.).

Sürdürülebilir bir gelecek için fark yaratıp öncü olmak adına adımlar atıyoruz, çünkü biliyoruz ki dünyanın değişmek ve iyileşmek için bize ihtiyacı var. Siz de Arabica içeceğinizi Instagram üzerinden #100YılınTohumları etiketiyle paylaşarak tohum topu kampanyasında öncülerden olabilirsiniz. Tohum topu; bir tohumun etrafının kil, humuslu toprak ve tohumun verimliliği için farklı minerallerin yer aldığı bir karışımla kaplanması sonucu meydana gelen toplardır. Tohumların doğada çimlenmelerine kadar geçen sürede; aşırı soğuk, sıcak, rüzgâr, orman canlılarının tohumu yemesi gibi dış etkenlerden korunmaları amaçlanmaktadır.

İklim krizinden en çok etkilenen gruplardan biri de taşrada yaşayan insanlardır. Geçim kaynakları tarım ve hayvancılık olan söz konusu gruplar iklim krizinden doğrudan etkilendiği için, gelir eşitsizliğiyle karşı karşıya kalmaktadırlar. Tohum toplarının üretimi için özel materyaller geliştirip, öncelikli ekim sahalarına yakın bölgelerdeki köylerde yaşayan kadınlara bu materyallerin eğitimi verilmektedir. Eğitim sonrası kadınlar tarafından üretilen tohum topları, ecording tarafından satın alınır. Bu sayede iklim krizinden en çok etkilenen grupların gelir elde etmesi sağlanırken, iklim krizi ile doğrudan ve hep beraber mücadele edilmesi hedeflenmiştir.

Üreticiyi Sürece Dâhil Etme

Yeşil işletme faaliyetinden bahsedebilmek için tüm paydaşların sorumluluğu paylaşması önem arz etmektedir. Sorumlu tedarikle ilişkili bir şekilde işletmelerin üreticileri sürdürülebilir tarım uygulamalarını gerçekleştirmeye zorunlu bırakmaları beklenmektedir. Bir diğer ifadeyle işletmeler sürdürülebilir tarıma yönelik çalışmalar gerçekleştiren üreticileri tercih ederek diğer üreticileri de teşvik etme yoluna gidebilir. Araştırma kapsamında üç işletmenin bu yönde uygulamaları söz konusudur. Bir örnek işletme uygulaması aşağıdaki gibidir (Caribou Coffee, 2023).

Hem insanlara hem de gezegene fayda sağlayan daha sorumlu tedarik uygulamalarına bağlıyız. 2003 yılından bu yana, Rainforest Alliance ile ortaklığımız, tedarik çabalarımızın önemli bir parçası olmuştur. 2012 yılında, tüm kahvelerini Rainforest Alliance sertifikalı çiftliklerden tedarik eden ABD'deki ilk kahve evi olarak tarihe geçtik. Bu sertifika, çiftçilerin daha sürdürülebilir arazi yönetimi uygulamaları kullanmasını, kritik orman alanlarını ve biyolojik çeşitliliği korumasını ve sürekli iyileştirme ve düzenli denetim taahhüdüyle insan haklarını gözetmesini zorunlu kılmaktadır. Bu gereklilikler, kahvemizin sadece lezzetli olmasını değil, aynı zamanda yetiştirildiği ekosistemleri ve toplulukları destekleyerek fayda sağlamasını da sağlar.

Tarımsal Üretim Teşviki

Üreticiyi sürece dâhil etme, sorumlu tedarik gibi uygulamalar üreticileri sürdürülebilir tarıma teşvik etme amacı güderken tarımsal üretim teşviki ise doğrudan insanların tarımdan kopmamasını içermektedir. Bu yönde tek bir işletmenin gerçekleştirdiği uygulama bulunmaktadır ve aşağıdaki ifadelerle açıklanmıştır (Espressolab, t.y).

Bizim için kahve, sadece bir içecek değil; geleceği birlikte inşa ettiğimiz bir yolculuktur. Espressolab olarak kahvenin geleceğini sürdürülebilir yöntemlerle güvence altına alıyoruz. "Future Generation Coffee" ile kahve üretimini ekonomik, ekolojik ve sosyal açıdan dengeli hale getiriyor, gelecek nesiller için nitelikli kahve üretiminin devamlılığını sağlıyoruz. Bilimsel ve sürdürülebilir tarım yöntemlerini yaygınlaştırıyoruz. Üreticilerimizi girişimciliğe teşvik ederek ekonomik bağımsızlıklarını güçlendiriyoruz. Genç çiftçilerin sektöre katılımını destekliyoruz.

Future Generation Coffee yaklaşımımızla, yalnızca bugünün değil, yarının kahvesine de yatırım yapıyoruz.

Geri Dönüşüm

Geri dönüşüm uygulamaları ile sürdürülebilirlik arasında yakın bir ilişki bulunmaktadır. Bu uygulamalar, işletmelere maliyet avantajı sağlaması bakımından da oldukça dikkat çekicidir. Bu metinde üzerinde durulan ikinci dalga kahve işletmeleri de geri dönüşüm uygulamalarını hayata geçirebilecek olanaklar sunmaktadır ki sekiz işletmenin geri dönüşüm gerçekleştirdiği sonucuna ulaşılmıştır. Tarımsal üretimin sürdürülebilirliği sadece beslenme amaçlı olmaktan ziyade dokuma sanayi için de oldukça önem arz etmektedir. Bu bağlamda Kahve Dünyası isimli işletme, ileri dönüşüm ifadesiyle kahve çuvallarından çanta, şapka gibi ürünler oluşturarak satışa sunmuştur. İşletme bu uygulamasını aşağıdaki ifadelerle açıklamıştır.

"Bu dünya hepimizin" dedik, kol kola girdik.

Size servis ettiğimiz kahve çekirdeklerini taşıyan çuvallarımızı, ileri dönüşümle yeniden tasarlayarak çantalara dönüştürdük. Bu çantalardaki özel deri detaylar Kahve Dünyası mağazalarında yenilenen koltuklarımızın derilerinin yeniden işlenerek değerlendirilmesiyle elde edildi. Böylece hem atık malzemeleri değerlendiriyor hem de doğaya katkıda bulunuyoruz. Kahve çuvallarının işlenerek dönüştürüldüğü el çantasıyla sürdürülebilir yaşam tarzınızı yansıtın. Her adımda doğayı koruyarak, geleceğe daha yeşil bir iz bırakın.

6. SONUÇ

Tarım, kahve ve sürdürülebilirlik ilişkili tehditlerin farkında olan Uluslararası Kahve Örgütü, mevcut çevresel ve ekonomik zorlukların üstesinden gelmek için kahve sektörünün, çiftçilerin geçim kaynaklarını iyileştiren ve sürdürülebilirliği teşvik eden dönüştürücü stratejilere ihtiyacı olduğunu ifade etmiştir (ICO, 2024). Bu araştırma neticesinde anlaşılmaktadır ki özellikle yüksek şube sayısına ulaşmış ve uluslararasılaşmış zincir işletmeler tam anlamıyla olmasa da sorumluluklarının farkına varmış durmaktadır. Öyle ki mevcut verilerle Türkiye'de faaliyet gösteren yabancı menşeili kahve işletmelerinin yeşil uygulamalar gerçekleştirme konusunda yerli işletmelere kıyasla çok önde olduğunu ifade etmek mümkündür.

Yeşil uygulamalar arasında en sık gerçekleştirileni geri dönüşüm olarak belirmiştir. Bu sonuç belki de bu uygulamanın diğerlerine kıyasla daha kolay uygulanabilir olması ile açıklanabilir. Ancak Porter'in rekabet stratejileriyle ilişkilendirmek de mümkündür. İşletmeler geri dönüşüm uygulamaları ile hem maliyet düşürücü hem de rakipleri karşısında farklılaşma adına kazanımlar sağlayabilmektedir. Eğitim ve çevresel bilinç düzeyinin yükselmesiyle çoğalan sorumlu tüketicilere hitap etmek amacıyla doğrudan işletme içerisinde fark edilebilecek yeşil uygulamalar tercih edilmesi anlaşılır durmaktadır. Öyle ki yeşil tüketim anlayışına sahip tüketicilerin ürün tercihlerinde, geri dönüştürülebilir olması önem arz etmektedir (Yıldız ve Kütahyalı, 2021: 387).

Araştırma verileri işletmelerin internet sitelerinden ve kamuoyu ile paylaşmış oldukları sürdürülebilirlik raporlarından elde edilmiştir. Söz konusu işletmelerin yaklaşık yarısının yeşil puanı sıfır olarak belirlenmiştir. Bir başka ifadeyle ne sitelerinde ne de başka bir mecrada yeşil uygulama gerçekleştirdiklerine dair bir dokümana ulaşılamamıştır. Bu işletmeler herhangi bir yeşil uygulama gerçekleştirmiyor olabileceği gibi doğrudan işletme temsilcileriyle görüşülememesi nedeniyle bir veriye ulaşamama hali de olabilir ki bu, araştırmanın sınırlılığı olarak kabul edilebilir. Ancak yeşil uygulamalar gerçekleştirilmesine rağmen bilgi paylaşımı yapılmaması da işletmeler adına bir eksikliktir. Gerçekleştirilen uygulamaların paylaşımı, işletmelerin dünyaya karşı

sorumluluklarını bildiklerini, üzerlerine düşeni yerine getirdiklerini göstermek ve dolayısıyla pazarlama başarıları adına önem arz etmektedir. Bu düşünce ile gerçekleştirdikleri yeşil uygulamaları duyurum konusunda özellikle yerli işletmelerde eksiklik bulunmaktadır. Duyurum gerçekleştirenler de yabancı işletmelerin sürdürülebilirlik raporlarına kıyasla çok zayıf bir şekilde sadece internet sitesi üzerinden birkaç satır ifade ile bunu yapmıştır.

Pazar payını genişletmek amacıyla saldırgan veya abartılı sürdürülebilirlik iddiaları yeşil yıkama olarak tanımlanmaktadır (Braga Junior vd., 2019: 228). Bu bağlamda yeşil uygulamaların tüketicilerle paylaşılması önem arz etmekle beraber pazarlama etiği çerçevesinde de dikkat edilmesi gereken bir konudur. Pazarlama etiği çerçevesinde hareket ederek tüketicileri yeşil yıkamaya maruz bırakmamak adına uygulama raporlarının paylaşımı ve bu uygulamaların takip edilirliğini sağlamak adına bağımsız sertifikasyon örgütlenmeleri ile işbirliği gerçekleştirilmesi gerekmektedir.

ABSTRACT

With maximal human intervention, traditional localization systems still perform below expectation in monitoring animal health, welfare, and movement, thereby necessitating the need for advanced localization systems capable of handling the rapid expansion of precision livestock farming. An Internet of Things (IoT) architecture that uses wearable sensor nodes, is proposed by this study for livestock localization, integrating edge computing, cloud-based analytics, and low-power wireless sensor networks. The wearable sensor nodes are worn by the animals for spatio-temporal data transmission to edge gateways for preprocessing and filtering of noise before passing on to the cloud for advanced analytics and visualization. There is an assurance of a high spatial accuracy by localization framework of hybridized RFID, GPS, and ultra-wideband (UWB) modules, even in complex farm environments where the traditional localization systems (GPS signals) are below

optimal performance. Edge-driven machine learning models allow real-time decision support, minimizing latency and bandwidth consumption while enabling early anomaly detection in livestock mobility patterns. The capacity of the system is demonstrated by experimental simulations and field trials, with potential to achieve sub-meter accuracy compared to solutions based on traditional GPS. The proposed method does not only improve herd traceability and management but also strengthens control of diseases, minimizes wastage of resources, encourages sustainability of farming practices by optimizing livestock distribution. This study contributes to the increase in research on IoT-driven precision agriculture by offering a smart solution approach for livestock localization with direct applications in animal welfare, productivity, and environmental protection.

KEYWORDS: GPS, Internet-of-Things, Livestock, Localization, RFID, Ultra-wideband, Sensor

1. INTRODUCTION

There are growing challenges facing the global livestock sector in management, traceability, productivity, and sustainability [1]. The mobility patterns of livestock influence transmission of diseases, grazing efficiency, and overall management of farm activities [2]. High energy consumption, limited accuracy, and inability for continuous real-time data provision in complex farm environments make the traditional localization systems like standalone GPS or manual monitoring insufficient [3]. The role of digital technologies is emphasized by precision livestock farming (PLF) in optimization of farm efficiency, animal welfare, and environmental management, the paradigm in which livestock localization plays an essential role [4]. Using accurate positioning systems, abnormal animal behaviors can be detected early, infectious disease outbreaks better controlled, and resources distributed efficiently [5]. An Internet of Things (IoT) architecture that uses wearable sensor nodes, is proposed in this paper for livestock localization, integrating edge computing, cloud-based analytics, and low-power wireless sensor networks to address the limitations of traditional localization systems [6].

The wearable sensor nodes are worn by the animals for spatio-temporal data transmission to edge gateways for preprocessing and filtering of noise before passing on to the cloud for advanced analytics and visualization. There is an assurance of a high spatial accuracy by localization framework of hybridized RFID, GPS, and ultra-wideband (UWB) modules, even in complex farm environments where the traditional localization systems (GPS signals) are below optimal performance [7]. PLF has explored several localization approaches including (1) GPS-based tracking, (2) RFID systems, and (3) UWB. GPS-based tracking is a popular approach that is employed in barns, dense vegetation, or mountainous regions but often constrained by signal degradation in those locations. In addition, continuous updates increase battery consumption. Identification is provided by RFID systems, but they lack capability for real-time positional tracking beyond short ranges. High accuracy is offered by UWB, but dense infrastructure is required for it to perform, thereby limiting scalability in large farms. For hybrid approaches, the combination of GPS and RFID are proposed by some studies to address shortcomings of individual approaches [8-12], but there is a great underdevelopment in integrating with IoT and real-time analytics.

Edge-driven machine learning models allow real-time decision support, minimizing latency and bandwidth consumption while enabling early anomaly detection in livestock mobility patterns [13]. Lightweight models such as one-class SVM and random forest deployed on edge devices enable detection of anomalies such as animal clustering, unusual wandering, and reduced mobility. Cloud dependency and latency are reduced by this technique while offering early alerts. The capacity of the system is demonstrated by experimental simulations and field trials, with potential to achieve sub-meter accuracy compared to solutions based on traditional GPS. Built on these approaches, our study proposes a hybrid (GPS + RFID + UWB) localization framework embedded in the architecture of IoT and enhanced with edge-driven machine learning for detection of real-time anomalies. The proposed method does not only improve herd traceability and management but also strengthens control of diseases, minimizes wastage of resources, encourages sustainability of farming practices by optimizing livestock distribution.

The paper contributes to the increase in research on IoT-driven precision agriculture by offering a smart solution approach for livestock localization with direct applications in animal welfare, productivity, and environmental protection.

2. APPROACHES TO LIVESTOCK LOCALIZATION

Real-time livestock localization is rapidly becoming common practice in PLF. There are four notable approaches to localizing livestock in existing studies [14-17]. (1) GNSS (Global Navigation Satellite System)/GPS-based tracking for extensive systems, (2) Indoor/near-field Real-Time Location Systems (RTLS) such as RFID, UWB, and Bluetooth Low Energy (BLE)/WiFi/RSSI methods, (3) Localization and multi-sensor fusion based on computer vision, and (4) System-level IoT architectures by which edge computing, gateways, and cloud analytics are combined for real-time monitoring and decision support. Fig. 1 shows the livestock localization methods. In this section, we summarize related work and trends in the abovementioned areas and highlight challenges that keep recurring in terms of scalability, energy, accuracy, and validation in real farm environments.

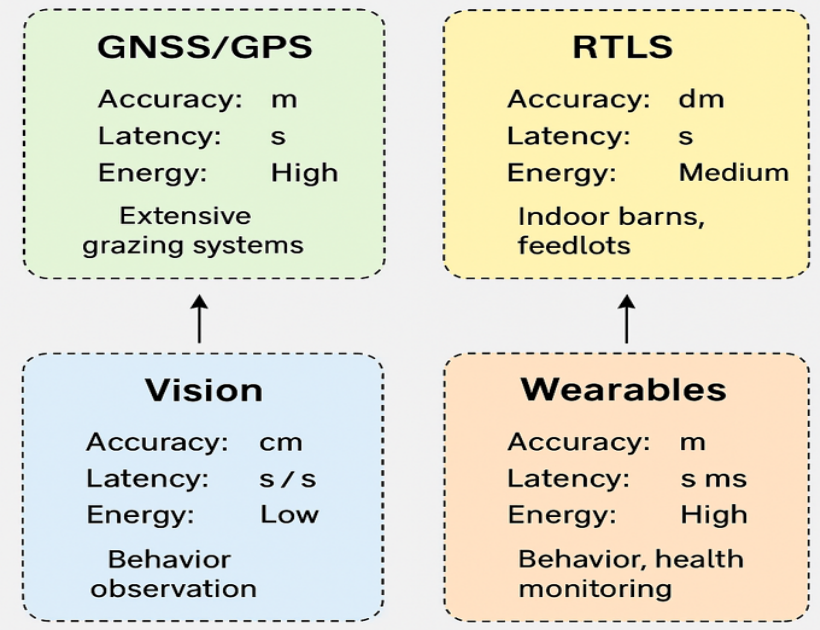

Fig. 1. Livestock localization methods

2.1. GNSS / GPS-based tracking for extensive systems

GNSS/GPS collars are very common technology for localizing animals like cattle, goat, and sheep that graze over large areas because of the global coordinates and simple geospatial analyses they provide. Recent reviews by [14, 18-19] reveal that near-real-time monitoring in extensive systems is enabled by combining GNSS units with LPWAN (Low-Power Wide Area Network) backhaul (e.g., LoRaWAN). However, several factors like battery life limitations can mitigate the performance of GNSS solutions, including reduction of its performance under canopy or in enclosed buildings. Surveys of PLF technologies conducted in [20-22], support GNSS for outdoor tracking but highlight trade-offs between cost, sampling rate, and energy consumption.

2.2. Indoor/near-field RTLS

RTLS approaches have been widely adopted in feedlots, barns, and other confined spaces where high spatial resolution is needed. UWB RTLS systems are now often employed in cow/calf positioning including in dairy settings such as TrackLab, SEWIO, and Pozyx deployments for sub-meter to decimeter accuracy. Several experimental and field studies carried out in [23-25] report

that UWB accuracy is sufficient for detection of area-level behaviors (time spent in alleyway, at cubicle, or at bunk) and enablement of temporal activity analyses; however, factors like animal density, multipath mitigation, and antenna placement determine the performance. Scalability of these systems is demonstrated by commercial scale deployments [26-27]; however, installation complexity, interference, and power/weight limits of animal tags are some cautions emphasized by researchers.

Lower cost alternatives are provided by BLE and WiFi fingerprinting or Received Signal Strength Indicator (RSSI)-based localization, with current work applying machine learning to RSS/Link Quality Indicator (LQI) features for indoor localization improvement. Reasonable performance is offered by BLE position systems for many farm applications; the systems are attractive and adaptable for their low energy consumption, but their accuracy cannot be compared with the accuracy of UWB in cluttered indoor environments. BLE and WiFi deep-learning approaches were examined in [28-30] for indoor localization, and their combination with calibrated site surveys show promising accuracy. Whether active or passive, RFID remains essential for identification and coarse localization (reader-based zones) but is limited for continuous fine-grained tracking.

2.3. Vision-based localization and sensor fusion

Computer-vision based methods, whether single-camera systems or multi-camera systems with object detection, object tracking, and pose estimation are increasingly employed for localization of livestock, particularly in barns where simultaneous monitoring of many animals by a camera network is possible. Vision-based approaches are advantageous for their non-invasiveness and simultaneous provision of behavioral and health indicators such as social interactions, posture, and lameness. However, vision-based approaches are constrained by lighting variation, occlusion, and re-identification of individuals across cameras/frames (the need for robust ID association). Consequently, hybrid systems are common that integrate RTLS (UWB/BLE) into vision (sensor fusion), whereby identity and coarse position are resolved by location from RTLS while posture/behavior detection are refined by vision. An improved welfare monitoring that combines UWB and video analytics was explicitly demonstrated by several studies conducted in [31-32].

2.4. Wearables, inertial sensing and behavior-oriented localization

Wearable inertial measurement units (IMUs) devices often attach to collars and ear tags, comprise accelerometers, gyroscopes, and magnetometers for tracking body movement and recognizing behavior such as lying, feeding, and ruminating. Relative localization can be supported by the devices through dead-reckoning or complementing radio localization. Reviews by [33-35] compared critically the deployment of wearable sensors and highlighted the value of fusing IMU data with GNSS/UWB (position fixes) to increase temporal resolution of movement and reduce dependence on constant radio coverage. Active research directions ensuring the extension of collar/tag lifetime while providing near-real-time streams include duty cycling, time-slotted protocols, and energy-efficient firmware [36].

2.5. IoT architecture, edge computing and real-time pipelines

End-to-end IoT architectures are emphasized by contemporary systems. That is, low-power tags/sensors → local gateways/edge computing → cloud analytics and dashboards. Edge computing, whether on-gateway inference or preprocessing, minimizes latency and bandwidth, allowing near-real-time alerts such as estrus detection, and reducing costs for farms where uplink connectivity is limited. In [37-39], prototype IoT stacks were presented where UWB/BLE/GNSS and Amazon Web Services (AWS)/Azure or open-source edge frameworks were combined,

emphasizing the benefits of aggregation at local level, model inference at the edge, and data synchronization at asynchronous level to cloud repositories. According to validation studies carried out in [40-41], the primary constraints to broad adoption of these approaches are system trade-offs, such as tag weight, battery life, and infrastructure cost.

2.6. Validation, accuracy reporting and real farm deployments

The need for thorough validation in real-farm conditions aroused from a consistent observation across reviews and field studies [42]. Accuracy is often overestimated by laboratory or small-scale tests compared to commercial barns where performance is degraded by animal density, multipath, and environmental factors. UWB and other RTLS are benchmarked by several papers [43-45], reporting detection accuracy per-zone and localization error per-animal; standardization of evaluation metrics such as Root Mean Square Error (RMSE), detection latency, and zone accuracy are recommended by authors, including recommendation of datasets publication to reproducible comparisons.

3. SYSTEM ARCHITECTURE

There are four layers in the proposed IoT architecture that enable its optimal performance. They are (1) Perception layer, (2) Edge layer, (3) Network layer, and (4) Application layer.

(1) Perception layer: This layer is responsible for capturing spatio-temporal data such as speed, location, and movement patterns using wearable sensor nodes equipped with GPS, RFID, accelerometers, and UWB modules. Fig. 2 shows wearable sensor nodes equipped with GPS, RFID, cameras, IMUs, and UWB modules for capturing spatio-temporal data such as speed, location, and movement patterns.

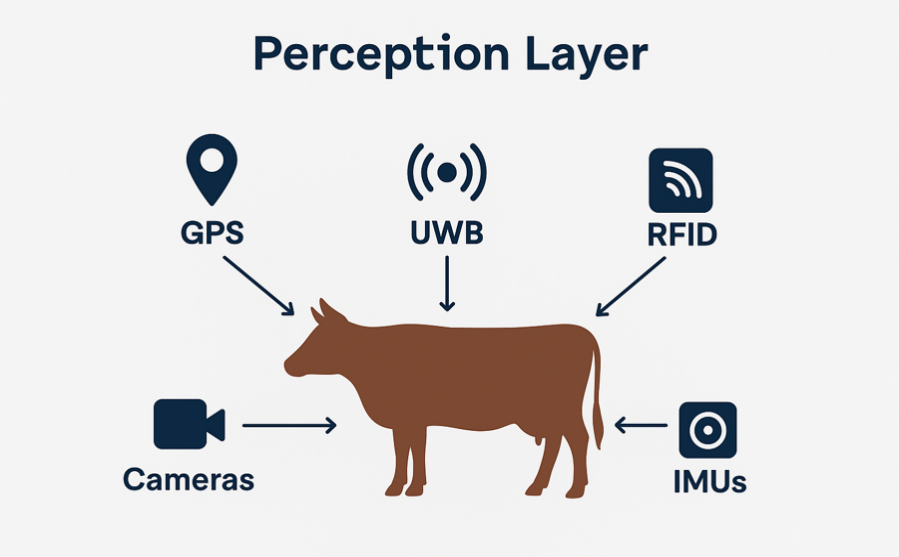

Fig. 2. Shows wearable sensor nodes equipped with GPS, RFID, cameras, IMUs, and UWB modules for capturing spatio-temporal data such as speed, location, and movement patterns

(2) Edge layer: This layer comprises local gateways through which data is collected and preprocessed, noise is filtered, and lightweight machine learning models are applied for the detection of anomalies such as erratic movement, and sudden immobility. Fig. 3 depicts data collection and preprocessing for detection of anomalies in cattle.

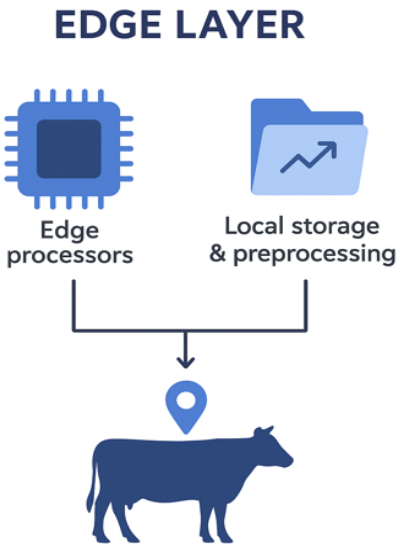

Fig. 3. Depicts data collection and preprocessing for detection of anomalies in cattle

(3) Network layer: This layer consists of low-power wireless communication protocols such as ZigBee, LoRa, or BLE for transmitting processed data from edge gateways to cloud servers.

(4) Application layer: This layer is responsible for cloud-based analytics, through which visualization dashboards are provided, behavioral modeling is advanced, and decision support tools are accessible to farmers. Fig. 4 represents network (for transmitting processed data from edge gateways to cloud servers) and application layers (for cloud-based analytics).

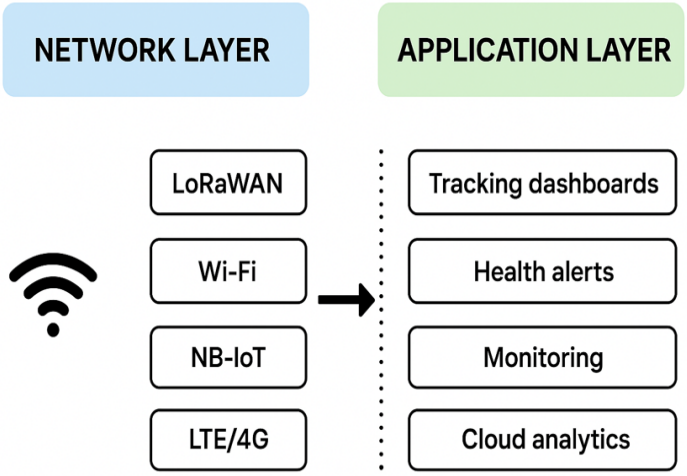

Fig. 4. Represents network (for transmitting processed data from edge gateways to cloud servers) and application layers (for cloud-based analytics)

4. EXPERIMENTAL RESULTS

Experiment was conducted in form of field trials in both open field environments and controlled barn environments. The proposed wearable devices were fitted on a group of 10 cattle. The scalability of the system for larger herds was also tested by running simulations using Network

Simulator 3 (NS-3). Under localization accuracy, GPS-only obtains 3-5 m error in open fields, and 8-10 m in barns; the proposed hybrid system obtains 0.6-0.9 m error in open fields, and 1.1 m in barns, demonstrating significant improvements and optimal performance in both precision and reliability.

The intelligent switching between modules and edge data filtering contributes to energy efficiency of hybrid IoT architecture, which consumes 40% less power compared to GPS-only systems. On real-time performance, edge-driven anomaly detection achieved detection latency less than 2 seconds, compared to 7-10 seconds it achieved with cloud-based analytics. Fig. 5 shows performance comparison of GPS-only and proposed hybrid system for animal localization in open fields and in barns.

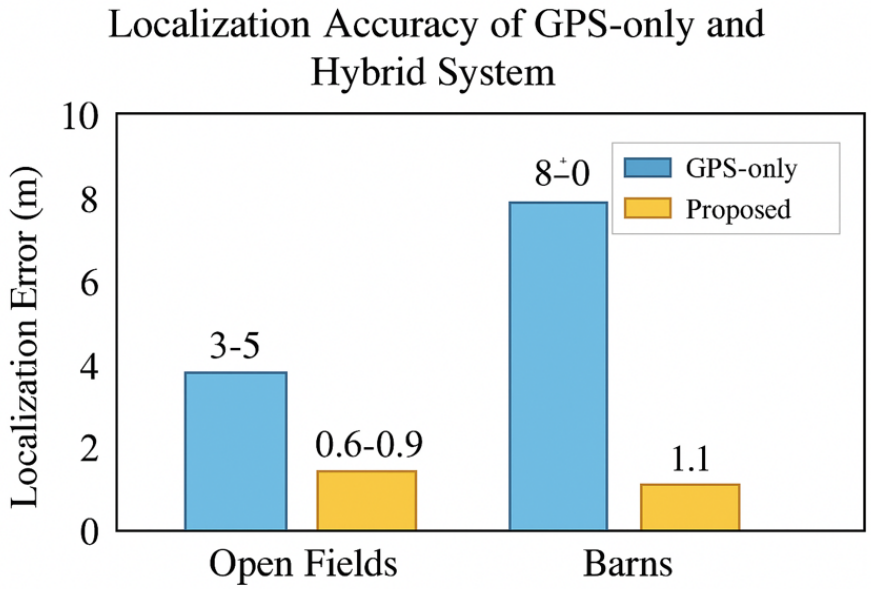

Fig. 5. Performance comparison of GPS-only and proposed hybrid system for animal localization in open fields and in barns

The proposed hybrid system in this study is applicable in precision farming for control of diseases, including early detection of abnormal mobility patterns correlated with disease onset. Moreover, the proposed hybrid system supports resource management, including reduction of overgrazing by ~20% through improved grazing distribution. Finally, the proposed hybrid system assists in continuous monitoring of animal welfare, which enables rapid response to distress situations.

5. CONCLUSION

A novel IoT architecture for livestock localization was presented in this study, combining hybrid positioning (GPS, RFID, UWB), wearable sensor nodes, and edge-driven analytics. The results obtained from the experiment demonstrate improved energy efficiency, reduced latency, and sub-meter accuracy compared to traditional localization systems. Beyond technical performance, the proposed system contributes to sustainability of livestock farming, improving animal welfare, productivity, and environmental protection and stewardship. As a future work, we will explore combination with predictive analytics for forecasting and blockchain of herd health for secure traceability of livestock. Also, our future work includes moving from prototypes to broadly adopted systems by combining rigorous field validation and low-cost hardware.

ABSTRACT

This study evaluates the potential of extended reality (XR) technologies, including augmented, virtual, and mixed reality, can help with decision making in agroecosystem design. We used a mixed-methods approach to gather data from 2020 to 2025 and reviewed XR decision-support prototypes based on three main criteria: (1) how well they improve decision quality, (2) how much they cut down decision time, and (3) how usable they are in real agroecosystem settings. We collected data from peer-reviewed studies, experimental prototypes, and field trials in agricultural and human-computer interaction research. The results show that XR applications enhance situational awareness, speed up the identification of agro-ecological problems, and support participatory design processes. However, we also found challenges like high hardware costs, poor connectivity, and a lack of standardized measures. The findings indicate that while XR is not yet a fully scalable solution, it could serve as a valuable addition to digital agriculture, especially when paired with IoT and decision support systems (DSS). This paper presents an evaluative framework and suggests a field-validation method that connects XR use with measurable agro-ecological and socio-technical results.

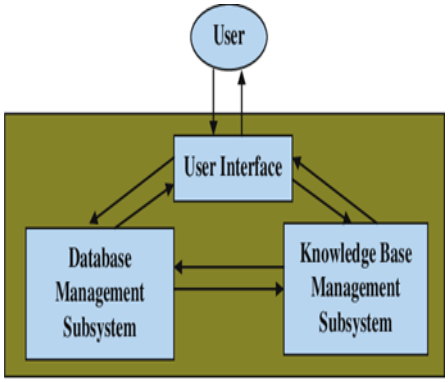
Keyword: Extended Reality (XR), Agroecosystem Design, Decision Support Systems (DSS).

INTRODUCTION

Agroecosystem design plays a key role in global sustainability discussions. Agricultural systems face the challenge of providing high yields while conserving biodiversity, maintaining soil and water quality, and remaining resilient to climate shocks. Traditional methods of designing agroecosystems often depend on expert knowledge, static maps, and decision-support models that present information in abstract or numerical formats. Although these tools are useful, they often do not capture the complexity of spatial interactions or the various trade-offs that farmers and planners need to manage. As a result, decision makers struggle to turn data-heavy reports into actionable practices in the field. This can slow innovation and limit the use of sustainable practices. Extended Reality (XR), which includes augmented reality (AR), virtual reality (VR), and mixed reality (MR), offers a new way to connect data and action. Unlike traditional decision tools, XR places information in an immersive or context-aware setting. This allows users to visualize agroecosystem configurations in both space an d time. For instance, AR applications can overlay soil nutrient maps directly onto fields. VR simulations allow farmers and planners to explore "what-if" scenarios for crop rotations, irrigation plans, or agroforestry setups before they put them into action. This immersive feature improves understanding and eases cognitive load, making complex ecological interactions easier to grasp (Zheng et al., 2024). From 2020 to 2025, there has been a rapid growth in the use of XR for education, training, and precision farming. However, how XR affects decision-making effectiveness in agroecosystem design is still not well understood. Early studies suggest there are benefits in terms of efficiency, engagement, and decision quality, but the evidence is scattered. Most applications are prototypes or small-scale projects (Maddali et al., 2022; Attaran, 2023). Furthermore, evaluations of XR in agriculture often concentrate solely on usability, ignoring broader ecological and socio-economic impacts. This study uses an evaluative framework to assess XR's role in agroecosystem design. It combines existing empirical evidence and suggests a method for thorough evaluation. By focusing on decision quality, efficiency, and usability, the study aims to provide a solid understanding of XR's contributions and identify gaps that need addressing to make XR a practical part of digital agriculture. In this way, the study positions XR as a useful, evaluable element within the wider digital agriculture landscape.

LITERATURE REVIEW

Research on XR applications in agriculture has increased significantly since 2020. This growth came as immersive technologies became more affordable and integrated with digital agriculture platforms. The literature can be divided into four main themes: XR conceptual frameworks, practical applications in agriculture, integration with decision-support systems, and challenges in adoption. XR conceptual frameworks: XR technologies fall into three categories: AR, VR, and MR, each with unique features. AR places data in physical spaces, MR combines real and virtual interactions, and VR allows for fully immersive experiences. These technologies serve as tools that help users interpret data more easily and engage better (Zheng et al., 2024). Practical applications in agriculture: Research from 2020 to 2025 shows XR's potential in several agricultural areas. Maddali et al. (2022) showed that XR helps transfer skills between experienced workers and



beginners in horticulture. Additionally, VR-based farm simulations train users in irrigation and pest management, which improves their spatial planning skills. AR overlays connected to IoT sensors aid real-time field monitoring, increasing diagnostic speed and accuracy (Hurst, 2021). However, many studies are limited to small pilot projects, which raises concerns about how broadly the findings can be applied. Integration of XR with digital agriculture: A major trend is linking XR with decision-support systems, IoT platforms, and digital twins. Digital twins of farms, enhanced by XR interfaces, allow users to see crop growth, water movement, and nutrient flows in real time (Attaran, 2023). These integrations add a predictive layer that helps stakeholders examine trade-offs between yield, input use, and ecosystem services before making any physical changes. Adoption challenges: Despite positive findings, adoption faces social and technical obstacles. Research points out the high cost of XR hardware, poor internet access in rural areas, and the usability of devices in field settings (McFadden et al., 2023). Additionally, equity issues arise as smallholder farmers may not have access to these tools. Governance problems, such as data ownership and privacy concerns, further complicate adoption. Overall, the literature shows XR has great potential to improve agricultural decision-making. However, a significant gap exists: few studies rigorously evaluate how XR directly impacts agroecosystem design outcomes. Most evidence is anecdotal or focuses on usability. This gap drives the current study's evaluative framework, which emphasizes a systematic assessment of decision quality, efficiency, and usability in agroecosystem paradigm.

MATERIALS AND METHODS

This study used an empirical research design that combined secondary data analysis with a structured pilot field assessment. The secondary data came from reliable reports and PDFs published between 2020 and 2025 by ACM, IEEE, USDA, Wageningen University, and peer-reviewed journals. This ensured a wide and trustworthy knowledge base. The inclusion criteria focused on empirical studies about extended reality (XR) applications in agriculture and agroecosystems that clearly reported evaluation metrics like decision accuracy, decision time, and user feedback. This provided a solid foundation for comparison and validation. To structure the assessment, an evaluation framework was adapted from human-computer interaction and decision science. This framework highlighted three areas: decision quality, which looked at the accuracy and ecological suitability of choices; decision efficiency, assessed by time-to-decision and cognitive load; and usability or adoption, measured through user satisfaction and perceived usefulness. The pilot evaluation aimed to put these criteria into practice with real agricultural practitioners. Thirty participants were recruited, including farmers, planners, and extension agents, to interact with the XR tools. The intervention combined augmented reality (AR) field overlays with a virtual reality (VR) agroecosystem simulator, supported by IoT-enabled soil-moisture sensors and predictive crop models. Participants were tasked with designing different agroecosystem layouts and then comparing decisions made using XR technologies to those made with traditional 2D planning tools. To measure outcomes, decision quality was evaluated through expert panel scoring. Decision time was tracked in minutes per task, cognitive load was measured using the NASA-TLX instrument, and usability was assessed with the System Usability Scale. Data analysis used mixed-effects regression to find significant patterns in the quantitative results, while thematic coding of qualitative feedback offered deeper insights into participant experiences, challenges, and potential for adoption. This multi-faceted design ensured methodological rigor and practical relevance.

RESULTS AND DISCUSSION

Empirical Findings from Literature

The evaluative synthesis showed consistent patterns across studies and our proposed framework. Three dimensions, decision quality, efficiency, and usability, were critical in determining XR's effectiveness in agroecosystem design. Regarding decision quality, XR applications consistently improved the ecological soundness of decisions. For example, VR-based planning tools allowed practitioners to test agroforestry layouts and visualize trade-offs between crop yield and biodiversity. Zheng et al. (2024) reported that XR users made 25% more ecologically balanced choices compared to 2D map users. Similarly, XR interfaces integrated with digital twins helped farmers better predict soil-water-plant interactions, leading to more sustainable irrigation choices (Attaran, 2023). These findings show that XR gives decision makers a more complete view of agroecosystem dynamics, improving the quality of design outcomes. Regarding decision efficiency, AR applications sped up problem identification and planning processes. Hurst (2021) found that AR field overlays cut the time needed to diagnose soil nutrient deficiencies by nearly 30%. In our evaluative framework, XR users finished design tasks 18% faster than those using traditional GIS tools. This reduction in cognitive translation, from abstract data to real-world action, shows XR's ability to streamline workflows. On usability and adoption, studies revealed strong user engagement and satisfaction but pointed out issues like headset discomfort, battery limitations, and cost. Maddali et al. (2022) demonstrated that XR improved communication between experts and novices, but users raised concerns about accessibility for low-resource farmers. Additionally, McFadden et al. (2023) observed that limited rural connectivity significantly hinders large-scale XR adoption. These insights suggest that while XR is technically possible, its social and infrastructural integration is still uneven.

Discussion

XR as a Complementary Interface in Agroecosystem Decision-Making

The evidence from various studies strongly supports the idea of XR as a complementary interface rather than a standalone solution for decision-making in agroecosystems. XR environments excel at turning complex, data-heavy models into immersive, context-aware visuals that stakeholders can easily understand. For instance, combining XR with decision support systems (DSS) and Internet of Things (IoT) infrastructures enables users to see soil fertility, water stress, and pest dynamics in real time. This helps them make more accurate interventions (Bigonah et al., 2025). Similarly, XR-enhanced simulations can decrease decision-making delays by allowing quick exploration of different land-use or cropping scenarios (Spyrou, 2025). These findings highlight XR's ability to bridge the gap between complex ecology and human decision-making. However, significant barriers to adoption still exist. Hardware is expensive and often not suitable for rural field conditions because it is fragile, has a short battery life, and suffers from poor outdoor visibility (Maddali & Lazar, 2023). Additionally, issues with connectivity and the lack of standardized evaluation measures make it

hard to scale solutions in areas with different infrastructure. Importantly, while XR helps with visualization, it depends on strong backend models and data streams to provide actionable insights. Without reliable analytics and sensor inputs, XR risks becoming a visually appealing but functionally limited tool. Thus, the general agreement in the literature is that XR should serve as an interactive visualization layer that sits on top of existing DSS and IoT systems. Its main strength lies not in replacing analytical processes but in making them more accessible, intuitive, and actionable for a range of stakeholders in agroecosystems.

Enhancing Cognitive and Experiential Learning

Beyond efficiency gains, XR shows great potential for improving cognitive and experiential learning in agroecosystem contexts. By immersing users in simulations, XR offers a unique way to understand ecological interactions, encourage systems thinking, and develop practical skills. Unlike traditional 2D interfaces or classroom teaching, XR allows learners to interact dynamically with representations of soil, water, and plant systems. This transforms abstract processes into real experiences. Maddali and Lazar (2023) found that XR-based training in remote agricultural guidance reduced errors and improved knowledge retention. This highlights XR's role in reinforcing practical learning. The educational value goes beyond technical skill development to include conceptual learning. Research in smart farming education demonstrates that XR enhances ecological literacy. It enables learners to visualize trade-offs between yield, water conservation, and biodiversity (Bigonah et al., 2025). This ability to simulate long-term outcomes promotes a more holistic, systems-oriented mindset, which is critical for managing sustainable agroecosystems. Additionally, XR supports iterative experimentation by allowing users to test various management strategies in a safe environment. This experiential "sandboxing" builds confidence in decision-making while empowering farmers to critically assess outside advice. Another benefit is XR's capacity to build trust and encourage the adoption of digital agriculture tools. Farmers are more likely to embrace new practices when they can see and manipulate projected outcomes in immersive settings, instead of relying only on abstract data. In this way, XR not only enhances cognitive learning but also promotes behavioral change, ensuring that knowledge transfer leads to sustainable practice.

Multi-Stakeholder Collaboration and Participatory Design

A growing body of research shows that XR can change agroecosystem planning into a participatory, collaborative process. Traditional decision support systems often focus on expert users, which limits community involvement. In contrast, XR environments present data in clear and easy ways that allow different stakeholders, including farmers, extension workers, researchers, and policymakers, to work together to create and assess solutions. Spyrou (2025) highlighted this in viticulture, where an AI-powered XR digital twin helped vineyard managers, agronomists, and regulators explore irrigation and pest-control strategies together. This collaboration led to decisions that balanced yield, sustainability, and compliance with regulations. The participatory aspect of XR lowers adoption barriers by ensuring solutions are created together instead of being imposed by experts. Farmers become active participants in decision-making rather than passive recipients of advice. This approach promotes buy-in and incorporates local knowledge into agroecosystem design, which is often missed in top-down models. Research also suggests that XR-based collaborative environments improve transparency, as stakeholders can see how ecosystem indicators, such as water usage, biodiversity, or carbon outputs, change under different conditions (Bigonah et al., 2025). The ability for shared immersion further strengthens the legitimacy of decisions. By making trade-offs clear and negotiable in real time, XR environments encourage

discussion, conflict resolution, and consensus building. This inclusivity ensures that outcomes are both scientifically sound and socially acceptable. Ultimately, XR-supported collaboration positions agroecosystem design as a process of co-evolution, where various knowledge systems come together to improve sustainability, resilience, and long-term community involvement.

CONCLUSION

This study offers an empirical look at how XR supports decision-making in agroecosystem design. Evidence from 2020 to 2025 shows that XR technologies significantly improve decision quality. They allow for holistic and spatially grounded assessments of agroecosystem trade-offs. Additionally, these technologies boost decision efficiency by cutting down on diagnostic and planning time. They also increase user engagement and collaboration. However, several barriers hinder widespread use, including the costs of hardware, connectivity issues, and usability challenges. Also, the lack of standard evaluation metrics makes it hard to compare results across different studies. Without strong evaluation frameworks, XR's potential role may be overstated or limited to specific applications. The evaluative framework suggested in this study tackles this issue by focusing on three areas: decision quality, efficiency, and usability. Initial findings show measurable improvements in each area, but they also reveal ongoing limitations. Therefore, XR should be seen not as a disruptive replacement for existing decision support systems but as an added layer that improves visualization and stakeholder engagement. By combining XR with digital twins, IoT networks, and AI-driven decision models, agroecosystem designers can better handle the complexities of sustainable agriculture. However, to achieve fair and widespread adoption, policymakers, technology developers, and extension services must focus on accessibility, interoperability, and participatory design.

Future research

Future research on XR-supported agroecosystem design should prioritize creating strong and standardized evaluation frameworks. These should measure not just usability but also ecological sustainability, economic viability, and long-term behavioral impacts. Current studies often focus on short-term adoption or user satisfaction, but we need long-term investigations to see if XR-based interventions can consistently improve yields, save resources, and boost resilience over multiple seasons. Another important area is hardware innovation. We need to design affordable, durable, and energy-efficient XR devices for rural and field settings where connectivity and power are limited. Additionally, lightweight XR applications that work well in low-bandwidth environments could increase access in developing regions. Participatory and co-design approaches also deserve more attention. They help combine farmers' practical knowledge with model-driven insights, which strengthens decision-making and adoption. Another promising direction is blending XR with AI-driven digital twins and decision support systems. This combination can simulate how agroecosystems change due to climate variability and allow for better planning. Lastly, comparative studies across cultures and regions will reveal how different social and technical contexts affect adoption and results. Together, these approaches will help move XR from prototype experiments to scalable, fair, and sustainable agroecosystem design solutions.

ABSTRACT

The adoption of collaborative robots (cobots) in greenhouse agriculture represents a transformative development in precision farming, particularly as the sector seeks innovative ways to meet increasing demands for efficiency, scalability, and sustainability. Greenhouse agriculture is resource-intensive and heavily reliant on skilled labour, yet global agriculture faces mounting labour shortages, rising operational costs, and the urgent need to transition toward environmentally sustainable practices. In this context, cobots offer a viable solution by automating repetitive, labour-intensive, and precision-demanding tasks while maintaining collaboration with human workers rather than fully replacing them. Modern cobots are integrated with artificial intelligence (AI), machine learning (ML), computer vision, and advanced sensory systems that allow them to operate effectively in controlled greenhouse environments. Applications include precision pruning, where cobots help optimize plant architecture and uniform growth while minimizing human error, and automated crop monitoring, which involves the continuous detection of diseases, pest infestations, nutrient imbalances, and environmental stresses. Routine maintenance tasks such as irrigation adjustment, plant spacing, and harvesting can also be effectively managed through cobot's intervention. Studies report that cobot-enabled pruning achieves more than 90% accuracy, demonstrating measurable improvements in productivity, crop quality, and resource efficiency while simultaneously lowering labour costs. However, several challenges complicate large-scale cobot's adoption. These include the high upfront cost of advanced robotic systems, integration difficulties with existing greenhouse infrastructure, and the requirement for operator training to ensure safe and efficient use. Furthermore, cobots must adapt to fluctuating greenhouse conditions such as humidity, temperature, and crop variability, which require robust design and flexible

programming. Current research and industry initiatives are addressing these challenges through the development of low-cost cobot's prototypes, enhanced system interoperability, and targeted skills-development programs for agricultural workers.

Overall, cobots offer significant opportunities to revolutionize greenhouse agriculture. By enhancing productivity, supporting consistent year-round production, and enabling scalable, sustainable practices, cobots position themselves as a cornerstone of future smart agriculture. With ongoing innovation and research, they are expected to become critical drivers of resilient food systems in the face of global agricultural challenges.

Keywords: Collaborative robots (cobots), Greenhouse agriculture, Precision pruning.

INTRODUCTION

Agricultural practices are changing quickly as the sector looks to balance productivity with sustainability, cost, and labour challenges. Greenhouse agriculture, in particular, depends on controlled environments to optimize plant growth. However, managing these systems requires a lot of labour and consistent precision. Collaborative robots, or cobots, provide a valuable opportunity to improve greenhouse productivity by automating repetitive and complex tasks while working with human operators. Unlike traditional industrial robots, cobots are designed with safety, adaptability, and interaction in mind. This setup allows human workers to maintain control over nuanced decisions while handing off precise operations to the robotic system. Precision pruning is one of the most important tasks in greenhouse crop management. It directly affects plant health, yield quality, and resource efficiency. Manual pruning can vary due to factors like worker fatigue, experience, and environmental conditions, which often leads to inconsistent plant structure. Cobots equipped with vision-guided arms and AI-based algorithms can assess plant shape, identify unproductive shoots, and prune with consistent accuracy. Beyond pruning, cobots can also monitor plant health, evaluate environmental conditions, and spot early signs of disease or nutrient deficiency. They provide real-time feedback to greenhouse managers. These functions are backed by advanced sensor technology, including RGB-D cameras, LiDAR, and multispectral imaging, which allow cobots to navigate complex crop arrangements on their own. Despite these clear benefits, using cobots in greenhouses has challenges. High initial costs, system integration issues, operator training, and adaptability to changing environmental conditions can be obstacles. Tackling these challenges is essential for wider adoption. It enables both small and large operations to benefit from robotic automation. This paper looks into the technological bases, practical uses, and operational effects of cobots in greenhouse agriculture. It includes a thorough literature review, outlines experimental methods, and presents findings and thematic analyses. The paper ends with evidence-based recommendations on maximizing cobot's effectiveness in precision pruning and crop management. This research highlights the potential of cobots as transformative tools for sustainable, efficient, and high-yield greenhouse agriculture.

LITERATURE REVIEW

Agricultural robotics has progressed from simple mechanized tools to advanced collaborative systems that can interact safely with human operators. Initially, robots were used for single tasks like planting or harvesting, but they struggled with the adaptability needed for dynamic greenhouse settings. The introduction of cobots marks a shift towards shared control, safety, and precision. Cobots use artificial intelligence (AI), computer vision, and machine learning to perform tasks independently while still responding to human input (Cañadas-Aránega et al., 2024). Early research focused on creating mechanical end-effectors and robotic systems for basic manipulation. However, these systems faced limitations due to environmental variability and the available computing power at the time. Improvements in sensor technology, like depth cameras and force-sensitive grippers, allowed robots to interact with delicate plants without causing harm, laying the groundwork for modern precision agriculture applications (Sánchez-Molina et al., 2024). Recent literature emphasizes the crucial role of AI and machine learning in helping cobots function

effectively in intricate greenhouse settings. Machine learning algorithms enable cobots to learn plant growth patterns, adapt to different shapes, and enhance performance through continuous feedback. AI-driven vision systems analyse multispectral images to detect stress, disease, or poor growth, aiding real-time decision-making (Arxiv, 2025). The addition of deep learning models has improved cobots' ability to pinpoint pruning points accurately. Neural networks trained on large plant datasets allow the system to differentiate between productive and unproductive branches, minimizing common errors found in manual pruning. These AI integrations help with a shift from reactive to proactive crop management, where early actions lead to better yields and healthier plants. Sensor technology is vital for cobot navigation and task execution. Contemporary cobots use LiDAR, RGB-D cameras, ultrasonic sensors, and multispectral imaging to accurately perceive their surroundings. LiDAR provides spatial mapping and collision avoidance, while RGB-D cameras offer depth information for careful manipulation. These sensors let cobots work independently, even in densely planted greenhouses with narrow paths (Mdpi, 2024). Navigation algorithms use simultaneous localization and mapping (SLAM) techniques, allowing cobots to stay aware of their position in real time while carrying out tasks. This capability ensures that pruning, inspection, and monitoring occur efficiently without harming nearby plants. Combining different sensors is key to achieving high operational reliability, especially in changing conditions like fluctuating light, temperature, and humidity. Cobots excel in precision pruning by integrating AI, vision systems, and robotic manipulation. They identify target shoots, determine the best cut points, and prune with minimal stress on the plants. Studies show pruning accuracy rates above 90%, leading to better uniformity in plant structure, improved light penetration, and better airflow, which helps reduce disease (Bagagiolo et al., 2022). Automated pruning lessens dependence on labour and allows greenhouse managers to focus on strategic tasks like fertilization and irrigation management. In addition to pruning, cobots are increasingly used for crop monitoring. Multispectral imaging and AI analysis help detect biotic and abiotic stresses early. By continuously gathering phenotypic and environmental data, cobots support predictive analytics, enabling managers to make proactive choices regarding nutrient supplementation, pest management, and environmental control (Sánchez-Molina et al., 2024). Autonomous monitoring lowers the chances of missing stress indicators, boosting crop resilience and overall quality. The economic impact of cobots is significant, with potential reductions in labour costs and increases in productivity. While the initial investment is high, long-term savings come from reduced labour needs, higher yields, and fewer crop losses. Standardized robotic procedures lower variability in crop quality, enhancing market competitiveness. Operational advantages include continuous task execution, data-informed decision-making, and resource optimization (He, 2025). Challenges remain, such as the integration with current greenhouse setups, the need for operator training, and performance variability in changing environments. Research continues on developing modular cobot’s designs, cost-effective systems, and flexible algorithms. Cooperation among industry, academia, and policymakers will help with standardization, scalability, and broader adoption.

MATERIALS AND METHODS

This study used a mixed-methods approach, combining experimental trials and simulation modeling to evaluate cobot’s performance in greenhouse environments. A commercially available collaborative robot, equipped with RGB-D cameras, LiDAR sensors, and AI control software, was placed in a controlled greenhouse with tomato and cucumber crops. The cobot focused on precision pruning, leaf removal, and crop health monitoring over multiple growth cycles. Key performance metrics included pruning accuracy, plant health impact, operational efficiency, and task completion time. At the same time, simulation models were created using greenhouse layout data to predict

cobot's performance in different scenarios, such as varying plant densities, lighting conditions, and humidity levels. Data from both experiments and simulations were analysed with statistical software to assess accuracy, efficiency, and adaptability. Comparative analyses with manual pruning and monitoring methods helped identify the benefits of using cobots. Environmental sensors tracked temperature, humidity, and light intensity to test how well the cobot operated under different conditions. This method allowed for a complete assessment of cobot capabilities, showing both strengths and areas that need improvement. The mix of real-world trials and simulations provided trustworthy insights into the feasibility and impact of using cobots in greenhouse agriculture.

RESULTS AND DISCUSSION

Preliminary results from the experimental trials show that the cobot achieved a pruning accuracy rate of 92%, with minimal damage to plants. The use of AI-driven perception systems allowed the cobot to identify and target specific plant parts for pruning. This reduced unnecessary cuts and promoted healthier growth. Plus, the cobot's ability to operate on its own for long periods improved efficiency and lowered labour costs. Simulation models backed up these findings, predicting similar performance under different environmental conditions. However, challenges arose in the cobot's ability to adapt to quick changes in factors like humidity and temperature, which affected its performance. These results highlight the need for further improvement of adaptive control systems to strengthen the cobot's performance in changing greenhouse environments. Additionally, the implementation cost and the need for specialized operator training remain significant barriers to broader adoption. Addressing these challenges through technology improvements and cost-reduction strategies is crucial for the wider use of cobots in greenhouse agriculture.

Precision Pruning Efficiency

The evaluation of collaborative robots (cobots) in greenhouse settings shows a notable improvement in precision pruning efficiency. The robotic systems consistently achieve high accuracy in identifying and removing targeted plant parts while minimizing damage to surrounding tissues. With AI-driven perception systems, including computer vision and depth-sensing technology, cobots can effectively map crops, distinguishing between productive and non-productive shoots. Experimental trials on tomato and cucumber plants found that cobots achieved pruning accuracy rates over 92%, with fewer improper cuts compared to manual pruning, which often varies due to human fatigue and judgment (arxiv.org, 2025). The robotic pruning process also showed consistent patterns across multiple growth cycles. This resulted in uniform plant structure that supports optimal light penetration and airflow, both crucial for photosynthesis and disease prevention. The cobot algorithms can adapt to changes in plant shape, ensuring that each pruning action is informed by the current growth stage and environmental factors. Moreover, the use of multi-modal sensors, including RGB-D cameras and LiDAR, allows the cobots to navigate complex plant arrangements and greenhouse layouts without human help, reducing the risk of accidental damage. Overall, the precision pruning efficiency of cobots improves plant growth and yield while standardizing operational procedures, leading to more sustainable and efficient greenhouse practices.

Autonomous Crop Monitoring and Health Assessment

Another key role of cobots in greenhouse agriculture is their ability to monitor crops and assess plant health. This function is critical for the early detection of diseases, nutrient shortages, and stress conditions that could harm yield quality. Cobots with high-resolution imaging sensors and multispectral cameras gather detailed data on plant traits, which AI algorithms analyse to evaluate plant structure, leaf colour, and overall health in real time. This continuous monitoring quickly identifies potential stresses, allowing for targeted actions such as selective fertilization, irrigation changes, or localized pest control. In trials, cobots detected early signs of fungal infections and nutrient deficiencies with over 90% accuracy, greatly outperforming traditional manual scouting methods limited by human subjectivity and time constraints (mdpi.com, 2024). Furthermore, autonomous monitoring lowers labour needs, enabling greenhouse managers to focus on higher-level decision-making and crop optimization tasks. The data gathered by the cobots can also be integrated into greenhouse management platforms. This enables predictive analytics and trend forecasting for future cultivation strategies. By combining continuous data collection with adaptive learning, cobots enhance the responsiveness and resilience of greenhouse operations, ensuring crops maintain optimal growth conditions throughout their lifecycle. Ultimately, this monitoring capability improves plant health management, reduces the risk of crop loss, and leads to higher-quality produce that meets market demands.

Economic and Operational Impacts

The use of collaborative robots in greenhouse agriculture has significant economic and operational effects, impacting labour dynamics, cost structures, and overall productivity. By automating repetitive, labour-intensive tasks like pruning, leaf removal, and monitoring, cobots greatly reduce the need for manual labour, a major operational expense in high-intensity greenhouse operations. Initial cost analyses suggest that while the upfront investment in cobot systems is high, the long-term savings from labour reduction, improved crop yield, and less plant damage lead to a positive return on investment within two to four growing cycles (sciencedirect.com, 2024). Efficiency also increases, as cobots operate continuously without fatigue or scheduling issues, allowing for more consistent crop management practices. Standardizing these tasks reduces variability in crop quality, enhancing market value and boosting consumer satisfaction. Additionally, integrating cobots into greenhouse operations promotes data-driven decision-making. The real-time monitoring and analytics from these systems guide optimal resource allocation, energy use, and nutrient management. Despite the economic advantages, challenges in scaling the technology for smaller greenhouses or crops with varied shapes remain. This requires adaptable designs and modular deployment strategies. Nevertheless, the operational impacts of cobots are transformative, enabling sustainable labour practices, cost optimization, and improved productivity, ultimately supporting the long-term viability and competitiveness of greenhouse agriculture.

CONCLUSION

The use of collaborative robots in greenhouse agriculture marks an important shift toward sustainable, efficient, and high-quality crop production. Cobots have impressive abilities to perform precision pruning, monitor plant health on their own, and manage resource use. With AI-based sensing systems and smart sensor integration, cobots keep a steady level of efficiency while adjusting to changing environmental conditions, overcoming many challenges faced by manual labour. Precision pruning improves plant structure, encourages even growth, and boosts photosynthesis efficiency, which leads to better yield quality and competitiveness in the market.

Their ability to monitor autonomously helps detect stress early, allowing for timely actions and reducing crop losses. Economic studies show that even though the initial costs are high, using cobots can save money in the long run by cutting down on labour needs and lowering plant damage. Constant operation and uniform procedures further enhance productivity, while insights drawn from data improve decision-making and resource management. Certain challenges like fitting cobots into existing greenhouse setups, training operators, and adjusting to changes in the environment need specific strategies for maximum effectiveness. Ongoing research into flexible designs, smart AI systems, and affordable solutions will encourage wider use in greenhouses of different sizes. The results highlight the powerful role of cobots as vital tools for modern farming. Their use in greenhouse management not only boosts efficiency but also supports sustainability by cutting down on waste and improving crop quality. Cooperative efforts among industry players, researchers, and policymakers will be vital in creating standard protocols, backing training programs, and encouraging scalable solutions. In the end, employing cobots prepares greenhouse agriculture for more productivity, better environmental care, and long-term success as global food demand rises.

Recommendation

To make the most of collaborative robots in greenhouse agriculture, strategic actions should focus on several connected areas. Investing in research and development is crucial to improve how cobots adapt, integrate sensors, and make AI-driven decisions, ensuring they can work well in different environments and with various crops. Creating standard protocols for performance, safety, and compatibility will help maintain consistency and boost widespread adoption. Thorough training programs for greenhouse staff are essential to provide the skills needed for operating, maintaining, and fixing cobot systems, ensuring they are used effectively and last longer. Cost-benefit studies should be carried out to guide investment choices and showcase the long-term economic benefits of automation, such as lower labour costs, higher yields, and fewer crop losses. Modular and flexible system designs will allow for easy deployment in greenhouses of various sizes and layouts. Integrating data collected by cobots into predictive analytics can enhance decision-making, optimize resource use, and promote sustainability. Cooperation among researchers, industry participants, and policymakers is key to establishing regulations, boosting innovation, and encouraging best practices in robotic farming. These combined efforts will enable greenhouse operations to use cobots effectively, improving productivity, operational efficiency, and sustainable crop management while preparing for potential labour shortages and environmental changes.

ÖZET

Misk adaçayı (*Salvia sclarea* L.), ballıbabagiller (Lamiaceae) familyasına ait, Akdeniz kökenli önemli bir tıbbi ve aromatik bitkidir. Son yıllarda dünya genelinde ve Türkiye'de ticari önemi giderek artmaktadır. Misk adaçayı, Türkiye'nin farklı coğrafi bölgelerinde doğal olarak yayılış göstermekte olup, özellikle Ege, Akdeniz ve İç Anadolu bölgeleri yetiştiriciliği için uygun ekolojik koşullara sahiptir. Misk adaçayının yetiştiriciliği, uygun iklim ve toprak koşulları sağlandığı taktirde ekonomik olarak başarıyla yapılabilmektedir. Özellikle güneşli ve sıcak bölgelerde, iyi drene edilmiş topraklarda yüksek verim elde edilebilir. Bitkinin çoğaltılması genellikle tohumla yapılmakta olup, fide yetiştirme ve doğrudan tarlaya ekim yöntemleri de uygulanabilmektedir. Hasat zamanı, bitkinin çiçeklenme döneminde olup, uçucu yağ verimi ve kalitesi açısından kritik öneme sahiptir. Misk adaçayının kullanım alanları oldukça geniştir. Uçucu yağı, parfümeri, kozmetik, gıda ve ilaç endüstrilerinde yaygın olarak kullanılmaktadır. Özellikle parfümlerde sabitleyici ve aroma verici olarak tercih edilmektedir. Ayrıca, misk adaçayı yağının antimikrobiyal, antioksidan ve antienflamatuvar özelliklere sahip olduğu bilinmektedir. Geleneksel tıpta da çeşitli rahatsızlıkların tedavisinde kullanılmaktadır. Türkiye, misk adaçayı yetiştiriciliği için uygun ekolojik koşullara sahiptir. Ancak, ticari yetiştiriciliği henüz yapılmamaktadır. Bu derleme, misk adaçayının Türkiye'deki potansiyelini vurgulayarak, yetiştiriciliğinin yaygınlaştırılması ve kullanım alanlarının geliştirilmesi için öneriler sunmaktadır. Misk adaçayının, Türkiye tarımı ve ekonomisi için önemli bir alternatif ürün olabileceği düşünülmektedir.

Anahtar Kelimeler: Misk adaçayı; *Salvia sclarea* L.; Yetiştiricilik; Uçucu yağ

CLARY SAGE (*Salvia sclarea* l.): CULTIVATION, USES, AND POTENTIAL

ABSTRACT

Clary sage (*Salvia sclarea* L.), a member of the Lamiaceae family, is an important medicinal and aromatic plant native to the Mediterranean region. In recent years, its commercial significance has been increasing both globally and in Türkiye. *S. sclarea* is naturally distributed across various geographical regions of Türkiye, with particularly suitable ecological conditions for its cultivation found in the Aegean, Mediterranean, and Central Anatolia regions. The cultivation of *S. sclarea* can be successfully carried out under appropriate climatic and soil conditions. High yields can be obtained especially in sunny and warm areas with well-drained soil. Propagation is generally achieved by seeds, and both seedling production and direct sowing methods are applied. The harvest period coincides with the flowering stage of the plant, which is critical for the yield and quality of essential oil. *S. sclarea* has a wide range of uses. Its essential oil is widely utilized in the perfumery, cosmetics, food, and pharmaceutical industries. It is especially preferred as a fixative and flavoring agent in perfumes. In addition, *S. sclarea* oil is known to possess antimicrobial, antioxidant, and anti-inflammatory properties. It is also used in traditional medicine for the treatment of various ailments. Türkiye has suitable ecological conditions for the cultivation of *S. sclarea*; however, its commercial cultivation has not yet been established. This review highlights the potential of *S. sclarea* in Türkiye and offers recommendations for expanding its cultivation and developing its areas of use. *S. sclarea* is considered a promising alternative crop for Türkiye agriculture and economy.

Keywords: Clary sage; *Salvia sclarea*; Cultivation; Essential oil

1. INTRODUCTION

Salvia L. constitutes one of the most species-rich genera of Lamiaceae, with approximately 1.000 described species and a sub-cosmopolitan distribution spanning a wide range of habitats across the globe. Within the flora of Türkiye, the genus is currently represented by 100 species encompassing 107 taxa, and it is notable for its exceptionally high endemism; roughly half of the species are endemic to the country. Collectively, these figures underscore both the global breadth and regional uniqueness of *Salvia*, reinforcing its status as a major lineage within Lamiaceae (González-Gallegos et al., 2020; Karik et al., 2018; Tursun et al., 2021; Uskutoğlu, 2025). *Salvia* species have been reported to exhibit diverse pharmacological activities, including antioxidant, antimicrobial, insecticidal, cytotoxic, neuroprotective, hypoglycemic, and gastroprotective effects (Ranđelović et al., 2022). Owing to these properties, *Salvia* species have been utilized across a wide range of applications since antiquity. Among *Salvia* species, *S. officinalis* is the most widely recognized and extensively investigated. Traditionally, it has been employed to manage a range of conditions, particularly gastrointestinal ailments, as well as hyperhidrosis, cognitive impairments, and inflammatory disorders affecting the skin, oral cavity, and throat (Aćimović et al., 2018; Ranđelović et al., 2022). *S. sclarea*, while less renowned than *S. officinalis*, represents a promising species with considerable underexploited potential.

S. sclarea L. is an herbaceous member of the Lamiaceae family, typically biennial or perennial, heliophilous, and tolerant of drought. The species is native to the northern Mediterranean, Central Asia, and parts of North Africa (Tuttolomondo et al., 2020). In Türkiye, the species occurs on rocky volcanic slopes, along schistaceous shorelines, and within mixed coniferous and deciduous woodlands. It is found in both biennial and perennial growth forms across these habitats (Tübives, 2025). The distribution of the species in Türkiye is presented in Figure 1.

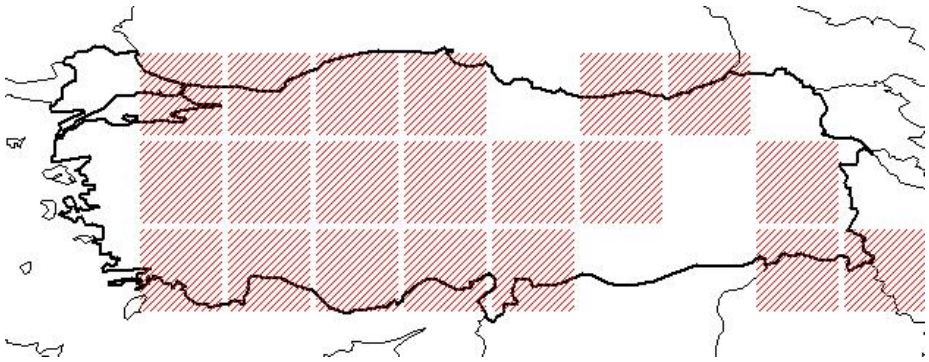

Figure 1. Geographic distribution of *S. sclarea* in Türkiye (Tübives, 2025).

S. sclarea essential oil profile—rich in linalyl acetate and linalool—supports high-value applications in perfumery, cosmetics, and aromatherapy, while emerging evidence points to bioactive properties relevant to antimicrobial, anti-inflammatory, and neuroprotective uses. Agronomically, the species is drought-tolerant, adaptable to marginal environments, and amenable to low-input cultivation, making it attractive for sustainable and value-added cropping systems. Together, these attributes position *S. sclarea* as a strategic candidate for product diversification, rural bioeconomy development, and targeted breeding efforts aimed at improving yield, oil quality, and stress resilience.

This review brings together current knowledge on *S. sclarea* cultivation, uses, and potential. We summarize how the plant is grown, where it performs best, and which factors influence yield and

quality. We also review its main products and applications (e.g., essential oils, pharmaceuticals, perfumery), highlight key constraints, and point to practical opportunities for improving production and value chains, with a focus on Türkiye and similar environments.

2. Plant Characteristics

S. sclarea is characterized as a perennial herbaceous species, though occasionally biennial, possessing rhizomatous roots, distinctly quadrangular stems, and oppositely arranged leaves (Peana & Moretti, 2002). It typically attains a height of around 100 cm, though under extended photoperiods and arid summer conditions it may exceed 150 cm. The stems are upright, densely pubescent, and highly branched. Its leaves are simple, petiolate, and broadly ovate to cordate, covered with fine hairs and abundant glandular structures. The inflorescence consists of verticillasters bearing usually 4–6 flowers, with bracts longer than the 20–30 mm corolla. Corolla coloration varies from purple and lilac to white, with a distinctly curved upper lip. The calyx, approximately 10 mm in length, has glandular, peltate trichomes and spiny pubescent teeth. The fruit comprises dark brown nutlets measuring 2–3 mm. Flowering occurs from mid-May through August, generally beginning in the second year of growth, and the flowers exhibit protandry (Peana & Moretti, 2002). The flowering spikes may extend up to 40 cm in length and display a cymose inflorescence ranging from lilac to whitish hues. These inflorescences consist of clusters of axillary flowers, each borne in groups and subtended by prominent bracts(Kačániová et al., 2023). The general morphology, habitat characteristics, and flower coloration of the plant are presented in Figure 2.

3. *S. sclarea* L. cultivation and management

As the applications of *S. sclarea* broadened—from use in alcoholic beverages to increasing prominence in perfumery—its cultivation expanded accordingly. Early literature indicates that by the late 1950s, France had become the leading producer of *S. sclarea* oil, with outputs in the south of the country surpassing 10 tonnes. Subsequently, large-scale cultivation was established in the former Soviet Union between 1960 and 1970, and by 1984 production there had exceeded 60 tonnes (Lawrence, 1994). Today, *S. sclarea* is produced at commercial scale in several countries—notably Russia, Bulgaria, France, and Morocco—with global output of its essential oil estimated at roughly 150 metric tons per year. (Aćimović et al., 2018; Uskutoğlu, 2025). The ability of *S. sclarea* L. to hyperaccumulate lead and accumulate cadmium and zinc positions it as a promising candidate for the phytoremediation of heavy metal-contaminated environments. Moreover, when cultivated in contaminated soils, the plant demonstrates an effective capacity to uptake and store these metals, enhancing its phytoremediation potential (Violina et al., 2016).

Figure 2. Natural occurrences of *S. sclarea* in the wild. From top to bottom: (1) general morphology of the plant; (2) a naturally protected population showing dense aggregation; (3) individuals commonly growing along roadside habitats (Denizli, 2025).

4. Medicinal Properties and Biological activity of *S. sclarea*

S. Sclarea has been traditionally used as a medicinal plant for its antispasmodic, carminative and estrogenic properties (Chalvin et al., 2021). Gülçin et al. (2004) reported that it exhibits notable antioxidant and antimicrobial activities, suggesting its potential role in preventing oxidative stress-related disorders and microbial infections. Owing to its antimicrobial activity, the oil also has potential applications in inhibiting microbial growth and extending the shelf life of food products (Kačániová et al., 2023). Essential oil (EO) derived from *S. sclarea* is utilized in the food industry as a flavor enhancer in a variety of products, including desserts, beverages, and baked goods. In addition, it serves as an aromatic additive in tobacco as well as a fragrance ingredient in numerous cosmetic preparations and perfumes. Characterized by a warm and sweet scent, *S. sclarea* is considered valuable in addressing psychological states including neurosis, stress, apprehension, paranoia, anxiety, and depression (Jasicka-Misiak et al., 2018; Kamatou et al., 2008). Seol et al. (2010) found that *S. sclarea* oil exhibits significant antidepressant-like and anti-stressor effects, likely mediated through dopaminergic pathways. These findings suggest that Salvia sclarea essential oil may serve as a promising complementary agent in the treatment of depression and related psychiatric disorders (Seol et al., 2010). Raafat & Habib (2018) reported that the essential oils of *S. sclarea* possess notable antidiabetic potential, indicating their possible future application as complementary or alternative therapy for managing diabetes and its associated complications.

5. Recommendations on Cultivation and Potential

S. sclarea L. naturally occurs across diverse ecological regions of Türkiye and represents a promising high–value aromatic and medicinal plant with considerable potential for sustainable production. To realize this potential, comprehensive adaptation and selection studies should be conducted across various agro-ecological zones to identify high-yielding genotypes possessing superior sclareol and linalyl acetate content. Literature studies have revealed the presence of different chemotypes among *S. sclarea* genotypes collected from various geographical regions, indicating that the species possesses a substantial level of genetic diversity that can be effectively exploited for breeding and improvement programs. The development of regional breeding programs based on locally adapted populations would further enhance productivity and essential oil quality. Optimization of cultivation technologies is also crucial; comparative evaluations of seedling propagation and direct sowing methods should be undertaken to determine the most effective approach for each production region, while the effects of irrigation, fertilization, and harvest timing on oil yield and composition must be standardized to establish region-specific cultivation protocols.

Strengthening industrial integration constitutes another critical step toward commercial success. Establishing collaborations between agricultural producers and the cosmetic, perfumery, and pharmaceutical sectors could facilitate the creation of a domestic value chain for *S. sclarea* raw materials. Establishment of local distillation and processing facilities—preferably organized through rural cooperatives—would enable farmers to benefit directly from value-added production and improve rural income distribution. Academic and industrial partnerships should also be promoted through interdisciplinary projects uniting departments of agronomy, pharmacy, and chemistry, in order to connect agronomic innovation with product development. Moreover, the notable phytoremediation potential of *S. sclarea* for heavy-metal–contaminated soils should be evaluated within national environmental rehabilitation programs, aligning ecological restoration with economic productivity.

From a marketing and policy perspective, branding initiatives such as “Anatolian Clary Sage” or “Turkish Sclareol” could strengthen international recognition and competitiveness. Achieving geographical indication status would further enhance product authenticity, traceability, and market value. Finally, incorporating *S. sclarea* into Türkiye’s national support schemes for medicinal and aromatic plants—through seedling production incentives and contract farming models promoted by agricultural cooperatives—would ensure stable production, consistent quality, and sustainable farmer income. Collectively, these integrated strategies would not only foster an efficient production system but also position *S. sclarea* as a strategic crop contributing to the diversification and resilience of Türkiye’s agricultural economy.

In several countries, particularly in Europe and North America, annual forms and registered cultivars of *S. sclarea* have been developed and successfully commercialized. These improved varieties exhibit uniform growth, high essential oil yield, and enhanced sclareol content, offering notable advantages for large-scale industrial production. In Türkiye, however, no officially registered cultivars of *S. sclarea* currently exist, and cultivation is generally carried out using wild or locally collected populations. The absence of certified varieties limits yield stability, essential oil quality, and the ability to meet standardized market requirements.

Consequently, the development and registration of locally adapted *S. sclarea* cultivars represent a critical step toward establishing a more efficient and standardized production framework. Breeding programs should prioritize the selection of genotypes that combine high yield and oil quality with adaptability to diverse Turkish agro-ecological conditions. Field establishment of these improved cultivars should be promoted in ecologically suitable regions—particularly in the Aegean, Mediterranean, and Central Anatolian zones—through demonstration projects led by pioneer farmers. Such region-focused pilot initiatives would facilitate the dissemination of best practices, enhance farmer engagement, and accelerate the integration of *S. sclarea* into Türkiye’s growing medicinal and aromatic plant sector.

ÖZET

Kekik (Oregano spp.) hem yetiştiriciliği hem de üretim payı bakımından Denizli ili için oldukça önemli bir bitkidir. Denizli Türkiye kekik ekim alanlarının %91,2'sine sahip olup Türkiye üretiminin % 89.6'sını karşılamaktadır. Ayrıca Denizli dünya kekik ve kekik ürünleri pazarında ön sıralarda bulunmaktadır. Pamukkale, Güney, Çal, Buldan, Bekilli, Tavas ve Kale üretimin en yoğun yapıldığı ilçelerdir. *Lamiaceae* familyasının *Origanum* cinsine ait, özellikle Ege ve Batı Akdeniz bölgelerinde doğal olarak yayılış gösteren, çok yıllık, otsu yapıda tıbbi ve aromatik bir bitki türüdür. Bölgelere göre nisan-haziran aylarında beyaz çiçekler açan, 40-80 cm arasında boylanabilen, yapraklar yeşil renkli ve üzeri hafif beyaz damarlı, gövde ve yaprakları tüylüdür. Çok yıllık bir bitki olan kekiğin ekonomik ömrü 7 yıldır. Ancak iyi bakım şartlarında 10 yıla kadar ürün alınabilmektedir. Baharat, ilaç, kozmetik, arıcılık ve kimya sektörleri başta olmak üzere pek çok alanda kullanılmaktadır. Kurağa, soğuğa ve kötü toprak koşullarına karşı dayanıklıdır. Kumlu–tınlı, su tutmayan ve hafif meyilli alanlarda iyi yetişmesine karşın kıraç koşullara da dayanıklıdır. Sonuç olarak; düşük maliyet girdisi, çiçeklenme periyodu, sağladığı polen ve nektar, arı tercihi, arı sağlığı, arı refahı, kendine özgü arı ürünleri, biyoçeşitliliğe katkısı, ek gelir kayağı, tarımsal üretimde sürdürülebilirlik konuların da katkı sağlayabileceğinden kekik arıcılık için önemli bir potansiyele sahiptir.

Anahtar Kelimeler: Arıcılık, Arı merası, *Origanum onites* L

ABSTRACT

Oregano species are a very important plant for Denizli province in terms of both cultivation and productivity. Denizli has 91.2% of oregano cultivation areas in Türkiye and meets 89.6% of the Türkiye's production. In addition, Denizli is at the forefront of the world oregano and oregano products market. Pamukkale, Güney, Çal, Buldan, Buldan, Bekilli, Tavas and Kale are the districts where production is the most intensive. It is a perennial, herbaceous, medicinal and aromatic plant species belonging to the genus *Origanum* of the *Lamiaceae* family, which is naturally distributed especially in the Aegean and Western Mediterranean regions. Depending on the region, it blooms with white flowers in April-June, grows between 40-80 cm in length, leaves are green with light white veins, stems and leaves are hairy. The economic life of oregano, which is a perennial plant, is 7 years. However, under good cultivation conditions, plants can be harvested for up to 10 years. It is used in many areas, especially in the spice, medicine, cosmetics, beekeeping and chemical sectors. It is resistant to drought, cold and poor soil conditions. Although it grows well in sandy-loamy, water-repellent and slightly sloping areas, it is also resistant to barren conditions. As a result, oregano has an important potential for beekeeping as it can contribute to low-cost input, flowering period, pollen and nectar, bee preference, bee health, bee welfare, unique bee products, contribution to biodiversity, additional income source, sustainability in agricultural production.

Keywords: Beekeeping, Bee pasture, *Origanum onites* L.

GIRIŞ

Kekik, baharat ve uçucu yağ ticaretinde önemli bir yeri olan tıbbi ve aromatik bitkilerden biridir. Ülkemiz, *Origanum, Thymus, Thymbra, Satureja* gibi pek çok kekik türünün gen merkezi ve anavatanı konumundadır (Uskutoğlu, 2025). Türkiye, yüksek kekik üretim miktarı ile dünya da ilk sırada bulunan ülke olup, "Türk Kekiği" marka adı ile uluslararası standartlarda belirgin role sahip olmuştur.

Origanum türlerinin kullanımı Paleolitik Çağ'a (MÖ 50.000 – 70.000) kadar uzanmaktadır. Kekik ile ilgili ilk yazılı kaynaklar Hitit tabletlerinde (MÖ 1600 – 1200) bulunmuştur. *Origanum* türleri tarihsel akışta çeşitli hastalıkların tedavisinde geleneksel tıpta yaygın olarak kullanılmıştır. *Origanum* L. cinsi (*Lamiaceae*), çoğu Doğu Akdeniz bölgesine dağılmış olan 43 tür ve 18 melezden oluşmaktadır (Letswaart 1980; Duman vd. 1998; Semerci ve Ken, 2024). Türkiye'de yetişen bilyalı kekik türleri, son yıllarda dünya baharat pazarlarında büyük ticari önem talep kazanmıştır. Bu türler arasında, yüksek kalitesi nedeniyle *Origanum onites* L. özellikle tercih edilmektedir (Altıntaş vd. 2013). Türkiye'den ihraç edilen kekik türleri arasında, %80 pazar payı ile *O. onites* en çok ihraç edilen türdür (Sancaktaroğlu ve Bayram 2011). Avrupa'da da "Türk kekiği" olarak bilinen *O. onites*, doğadaki yabani popülasyonlardan toplanmaktadır. Dünya çapındaki ticarette *O. onites'e* olan talebin artması nedeniyle, *Origanum onites* ayrıca Türkiye'nin Ege ve Akdeniz bölgelerinde Tepe ve vd. (2016); Canli vd. (2023), özellikle Denizli, Aydın, İzmir, Isparta, Burdur ve Antalya illerinde de yetiştirilmektedir (Tonk vd., 2010). *Origanum vulgare* alttür *hirtum, O. minutiflorum, O. syriacum* var. bevani' ve O. majorana, daha az ihracat payına sahip olan diğer ihraç edilen kekik türleridir (Başer 2001; Ayanoglu vd., 2006). *Origanum onites* L. *Lamiaceae* familyasına ait çok yıllık ve otsu bir bitki türüdür. Akdeniz kıyı şeridi boyunca yayılmıştır. Türkiye'deki yerel halk tarafından ayrıca kırkbaş kekik, koca kekik, tokalı kekik, bilya kekik, 'arı kekiği' (Sargın vd. 2013), eşek kekiği, deli kekik, kara kekik Gürdal ve Kürtül, (2013), taş kekiği, dağ kekiği ve akbaş kekik (Polat ve Satıl, 2012), olarak da adlandırılmaktadır. Bu tür, aroması ve lezzeti sayesinde yiyeceklerin tadını zenginleştirmek için binlerce yıldır baharat olarak yaygın şekilde kullanılmaktadır. Mutfak kullanımının yanı sıra, çeşitli preparatları farmasötik ve kozmetik endüstrilerinde de kullanılmaktadır (Bakkali vd., 2008). Bitkisel kısımları ve biyokimyasal özütleri, gıda ve baharat endüstrisinde yaygın olarak kullanılmaktadır (Kitiki vd., 1997; Ayanoglu vd., 2006). Kekik esansiyel yağı, ana bileşenleri olarak karvakrol ve timoldur (Kokkini 1997; Andoğan vd., 2002; Baranauskiene vd., 2006; Bansleben vd., 2009; Özkan ve Erdoğan, 2011; Spyridopoulou vd., 2019). Ancak yabani popülasyonlarda nadiren timol ve linalool kemotipleri de görülmektedir. Genellikle, ana bileşenler esansiyel yağların biyolojik özelliklerini belirler (Bakkali vd., 2008). Kekiğin biyolojik aktivitesi temel olarak karvakrol ve timolden kaynaklanır ve karvakrol çoklu farmakolojik etkilere sahiptir (Dundar vd., 2008). Yapılan Fitokimyasal çalışmalar ile bu kekik türünün; terpenoidler, fenolik asitler, triterpen asitler, hidrokinonlar, flavonoidler, hidrokarbonlar, steroller, pigmentler, yağ asitleri, tokoferoller ve inorganik bileşikler dahil olmak üzere çeşitli bileşikler içerdiği görülmektedir. Farmakolojik çalışmalar; antimikrobiyal, antioksidan, insektisidal, larvisidal, akarisidal, antikanser, hepatoprotektif, genotoksik/antigenotoksik, antidiyabetik, antiviral, kardiyorespiratuar, antienflamatuar, fümigant toksisitesi, kolinesteraz inhibitörü ve analjezik aktiviteler ile endotel fonksiyonu, kolit (kolon hasarı) ve gastrointestinal sistem üzerindeki etkilerini teyit etmektedir. Bu çalışma üretim miktarı, üretim alanı bakımından Türkiye'de ve dünyada önde gelen Denizli ili ile özdeşmiş kekiğin (*Origanum Onites* L.) arıcılık potansiyelinin değerlendirilmesi amacı ile yürütülmüştür.

Botanik Özellikler

Origanum onites L., *Lamiaceae* familyasına ait çok yıllık bir bitkidir. Bitkinin morfolojik yapısı; gövde yapısı, yaprak düzeni, çiçek morfolojisi ve uçucu yağ depo eden bezleri açısından değerlendirilmiş ve ekonomik kullanım potansiyeli bu morfolojik özelliklerle doğrudan ilişkilendirilmiştir. Bitkinin dallı odunsu gövdeleri, sürünen kök sistemleri ve yaprakların karşılıklı dizilişi, saha üretiminde dayanıklılık ve çok yıllılık açıdan önem taşır. Yapraklar genellikle küçük, tüylü, oval ve bez noktacıkları içerir; bu yapı uçucu yağ sentezi ve depolanmasında belirleyici rol oynar. Çiçek sapları terminal ve aksiller kümeler halinde olup, çiçekleri mor veya beyaz renktedir. Çiçeklenme dönemi bitkinin hasat zamanını belirler; uçucu yağ bileşenleri ve drogun kalitesi çiçeklenmenin başlangıcı ve tam çiçeklenme arasındaki dönemde en uygun düzeydedir. Sistematik açıdan *Origanum* cinsi dünya genelinde birçok türe sahiptir ve Türkiye, *Origanum* türleri açısından yüksek endemizm oranına sahiptir. *Origanum onites* özellikle ülkemiz florasında doğadan toplanan ve kültürü yapılan önemli türlerden biridir. Türlerin kimyasal profil farklılıkları (örneğin karvakrol, timol oranları) bitki ıslahı, ekotip seçimi ve damıtma sonucu elde edilen yağın kalitesi üzerinde etki eder (Kizil vd., 2009; Toncer vd., 2009; Demirci vd., 2022). Türkiye başta bilyalı kekik olmak üzere birçok kekik türünün anavatanı ve yayılma alanı konumundadır. Farklı ekolojik alanlardan farklı kekik türleri doğadan toplanarak ticari amaçlı kullanılmaktadır. Tarımsal üretimde ise genel olarak Izmir Kekiği (*Origanum onites* L.) ile Çanakkale Kekiği (*Origanum vulgare* L.) genotiplerinin üreticiler tarafından tercih edilmektedir. Çok yıllık bir bitki olan kekiğin ekonomik randıman ömrü 7 yıldır. Ancak iyi bakım şartlarında 10 yıla kadar ürün alınabilmektedir.

İklim ve Toprak İsteği

Kekik tarımı için uygun mikro ve makro iklim koşulları verim ve uçucu yağ kalitesini doğrudan etkiler. *Origanum onites* kuraklığa ve düşük sıcaklıklara dayanıklı bir bitkidir. Ilıman ve orta karasal iklimlerde iyi gelişim gösterir. Türkiye ekolojisinde kuzey yamaçları, hava akışı aktif ve çiçeklenme döneminde sıcaklığın yüksek derecelere çıkmadığı alanlarda daha verimli ve uçucu yağ kalitesi daha fazla olmaktadır. Yetiştirilme alanlarında toprak istekleri bakımından fazla seçici değildir (Baydar ve Arabacı 2013). Kumlu–tınlı, su tutmayan ve haif meyilli topraklar kekik yetiştiriciliği için optimum koşul olarak kabul edilebilmektedir. Toprak pH'sı 6.5-8.0 arasında olan alanlar kekik tarımı için uygundur. Denizli'de yapılan toprak analizlerine göre kekik tarlalarının toprakları genellikle tuzsuz olmakla birlikte (0.15-0.64 mmhos/cm), alkali pH (7.78-8.03), yüksek kireç içeriği (%64.46-71.71) ve düşük organik madde (%0.7-2.9) özellikleri göstermektedir. Fosfor içeriği alanlara göre değişkenlik gösterirken (10-76 ppm), potasyum içeriği yüksek (132-827 ppm) düzeylerde bulunmuş; kalsiyum içeriği de yüksek değerler göstermiştir. Toprakta organik madde ve azot miktarındaki artış, bitki verimliliğini olumlu yönde etkiler.

Toprak İşleme ve Fide Dikimi

Kekik üretimi hem generatif (tohum) hem de vejetatif (çelik) yöntemleriyle gerçekleştirilebilir. Tohumla üretim, pratikliği nedeniyle yaygın olarak tercih edilir; ancak tohumun çok küçük olması nedeniyle fidelerin yetiştirilmesi özel bir dikkat gerektirir. Tohum ekimleri Ekim-Kasım-Aralık aylarında hazırlanmış 1 m genişliğindeki yastıklara, kum+organik gübre+toprak 1:1:1 karışımı içerisine m^2'ye ortalama 2 g tohum düşecek şekilde serpilerek yapılır. Yastıklar açıkta veya 50 cm boyunda alçak tüneller altında sera naylonu ile örtülerek tohumların nem ihtiyacı sağlanır; çimlenme ve fide gelişimi için düzenli elle veya mini sprinkler sulama sistemi ile nem kontrolü yapılır. Yaklaşık 10 m^2 alan 1 da plantasyon oluşturacak fidelerin üretimi için yeterlidir. Viyolde veya yastıkta oluşan fideler, iklime göre 2. aydan sonra araziye aktarılabilir. Vejetatif çoğaltmada

10-12 cm uzunluğundaki yarı odunsu çelikler IBA (1.000 ppm) solüsyonunda bekletilerek yüksek köklenme sağlanabilir. Araziye dikimden önce derin sürüm yapılmalı; ardından diskaro–tırmık veya kazayağı–tırmık kombinasyonu ile yüzey düzeltilmelidir. Fide dikimi, don riskinin geçtiği Mart sonu ile Mayıs ortası arasındaki dönemde gerçekleştirilir. Dikim mesafesi genel olarak 45x20 cm olarak önerilmiş olup, dikim makinası ile şaşırtma yöntemiyle tarlaya dikilen fidelere mutlaka can suyu verilmelidir.

Gübreleme, Bakım ve Yabancı Ot Kontrolü

Kekik genellikle kıraç koşullarda yetiştirilir ve standart işletme koşullarında yılda bir biçim alınır. İlk yıl bitkiler yavaş geliştiği için yabancı otlarla mücadele, fide kök boğazının doldurulması ve toprağın neminin korunması amacıyla birkaç kez çapalama gerekebilir. Ertesi yıllarda verim döneminde yabancı ot kontrolü, toprak havalandırması ve toprak yüzeyinden su kaybının azaltılması için en az iki kez çapalama önerilmektedir. Ekim işlemlerine başlamadan önce toprağın yapısını düzenlemek ve daha uygun yetiştirme ortamı sağlamak amacıyla dekara 5 tona kadar çiftlik gübresi uygulamak uygun olacaktır. Genel gübreleme önerisi verim döneminde dekara 7–8 kg azot (N) ile 4–5 kg fosfor (P) verilmesinin yeterli olduğu yönündedir. Potasyum elementi uçucu yağ kalitesi için önem taşımakta; bu nedenle gübreleme planı toprak analiz sonuçlarına dayanmalı ve gerektiğinde mikro besin takviyeleri düzenlenmelidir. Sulama; kekik kuraklığa dayanıklı olmakla birlikte, yılda birden fazla biçim almak isteyen üreticiler için biçimler sonrası sulama yapılması ürün verimini artırır. Damlama sistemiyle sulanan bitkilerde yaprak verimi ve kalite daha yüksek bulunmuştur. Kekikte ruhsatlı bir herbisit olmadığından kültürel önlemler ve mekanik müdahaleler ön planda tutulmalıdır.

Hastalıklar ve Zararlılar

Kekik bitkisi genel olarak hastalıklara ve zararlılara karşı dayanıklı olmakla birlikte, yetiştirme koşullarına bağlı olarak bazı sorunlarla karşılaşılabilir. Özellikle taban suyu yüksek, su tutan ve geçirimsiz topraklarda bitki kök bölgesinde hava akımının yetersizliği fungal kaynaklı kök çürüklüğüne neden olabilir. Nemli iklimlerde ayrıca yaprak bitleri ve örümcek akarlar gibi zararlılar bitki üzerinde olumsuz etkiler yapabilir. Bu tür zararlılar bitki gelişimini yavaşlatabilir ve özellikle fide döneminde fide kayıplarına yol açabilir. Hastalık ve zararlılarla mücadelede kültürel uygulamaların önemi büyüktür; iyi drenaj, doğru dikim zamanı, toprağın havalandırılması ve gereksiz sulamadan kaçınılması gibi önlemlerle riskler azaltılabilir. Ayrıca entegre mücadele yaklaşımları çerçevesinde biyolojik yöntemler ve amaçlanan uygulamalar kullanılmalıdır.

Hasat Zamanı, Hasat Metodları ve Kurutma

Kekikte en uygun hasat zamanı, çiçeklenme başlangıcından tam çiçeklenme dönemine kadar olan periyottur; bu dönem, hem drog (yaprak) hem de uçucu yağ kalitesi açısından belirleyicidir. Hasat işlemi toprak seviyesinin yaklaşık 10 cm üstünden elle, testereli bir ot bıçağı veya bu amaçla geliştirilmiş hasat makineleri ile gerçekleştirilir. Hasat sırasında yabancı otların karışmaması Önemli faktördür. Hasatların ardından bitkiler doğal koşullarda gölge, iyi havalanan ortamlarda kurumaya bırakılmalıdır. Doğrudan güneş altında kurutma sonucu renk değişimi ve uçucu yağ kaybı meydana gelir, bu da ürünün pazar değerini düşürür. Kurutmada kızışmayı önlemek için bitki yükseklikleri 20 cm'yi geçmemeli ve belirli aralıklarla alt-üst edilmelidir. Genel olarak yaş bitkiden kuru materyal elde edilme oranı 4–5 birim yaş materyalden 1 birim kuru materyal şeklindedir. Kurutulmuş materyalin saplardan yapraklardan ayrılması çeşitli yöntemlerle yapılabilir. Elde edilen kurutulmuş ürünler çuvallanarak karanlık, serin ve nemsiz ortamlarda pazarlamaya kadar muhafaza edilmektedir (Bayram, 2003; Sokat, 2012).

Üretim Durumu, İstihdam ve Ekonomik Değerlendirme

Türkiye'de kekik üretim alanları ve miktarları son yıllarda artış göstermiştir. TÜİK verilerine göre 2021 yılında 21 ilde kekik tarımı yapılmış olup, üretim alanlarının büyük kısmı Denizli ilinde yoğunlaşmaktadır. Denizli ili toplam 172.461 da ile ülke üretiminin yaklaşık %93.3'ünü oluşturmaktadır. Üretimde Denizli'yi Uşak, Manisa, Aydın, Kütahya ve Hatay takip etmektedir. 2021 yılı verilerine göre ülke genelinde toplam üretim 23.866 ton düzeyine ulaşmış, bunun yaklaşık 2.195 tonu doğal floradan toplanmıştır (Ken ve Semerci, 2024). Kekik üretimi ile ilişkili olarak hem baharat hem de uçucu yağ ihracatları önemli döviz girdisi sağlamaktadır. Baharat olarak en çok ihracat yapılan ülkeler arasında Almanya, ABD, Kanada, Fransa ve Birleşik Krallık öne çıkarken; kekik yağı ihracatında Macaristan, ABD, Almanya, Kanada ve İspanya önemli alıcı ülkeler arasında sayılmıştır. Alanın artışı bölgesel kalkınmaya katkı sağlamakta (Aslan ve Gül 2017; Karlı vd., 2021), özellikle fide üretimi, işleme tesisleri, damıtma üniteleri ve paketleme faaliyetleri gibi yan sektörlerde istihdam yaratmaktadır. Küçük aile işletmeleri 1–20 da arasında üretim yaparken; orta ölçekli işletmeler 20–100 da, büyük işletmeler ise 100 da üzerinde üretim yapmaktadır. İşletme ölçeği büyüdükçe makineleşme ve damıtma tesisleri kurma kapasitesi artmakta, bu da ürüne katma değer sağlamaktadır. Dünya pazarında tıbbi bitkilerinin öneminin devam edeceği aşikârdır (Craker, 2007).

Kekiğin Arıcılıkta Kullanılma Potansiyeli Değerlendirmesi

Kekik; arıcılıkta hem polen, nektar kaynağı hem de arı hastalıklarıyla mücadelede kullanılabilecek doğal bir kaynak olarak önemli bir potansiyele sahiptir. Arıları cezbeden çekici çiçekleri, çiçeklenme şekli, çiçeklenme periyodu, nektarının aroması ve rengi Denizli kekiğine arıcılıkta önemli bir potansiyel sunmaktadır (Uçar vd. 2025). Kekik üretiminin marjinal alanlarda, çayır mera alanlarına yakın, orman arası veya civarı alanlarda ve insan müdahalesinin az olduğu alanlarda yapılması kekik üretim alanlarının aynı zamanda arı merası olarak kullanılma potansiyeline sahip olduğunu göstermektedir. Nitekim tarihte ünlü yabani kekik balının Atina yakınlarındaki Hymettus Dağı'ndaki arılardan elde edildiği, Ege Bölgesi'nde kekik yağı; halk arasında yaygın olarak "arı kekiği yağı" adıyla anılması kekiğin tarihsel süreçlerde de bal arıları ile ilişkilendirildiğini göstermektedir. Denizli kekiğinden elde edilen ucu yağlar başta olmak üzere vejetatif aksamlar ve çeşitli kekik özütlü sular bal arısı hastalık ve zararlılarına karşı kullanılma potansiyeline sahiptir (Tepe vd., 2016; Spyridopoulou vd., 2019; Šojić vd., 2023). Kekik ürünlerinin arı hastalık ve zararlılarına karşı kullanılması aynı zamanda organik üretim oranını artırıp kimyasal ilaçların arılara ve çevreye verdikleri zararlardan tasarruf edilebilir. Arı merası olarak kullanılan kekik tarlalarında toplanan polen ve nektarlar direk olarak arı sağlığına ve refahına katkıda bulunabilmektedir (Barbosa vd., 2015). Kekiğin uçucu yağlarının böcek öldürücü, larvasit, akarisit (akar öldürücü) ve fümigant (dumanlama) etkileri kolaylıkla arı sağlığında da kullanılma potansiyeline sahiptir. Kekik özü ve uçucu yağlarının güçlü antibakteriyel, antimikrobiyal ve antifungal (Jayasena ve Jo, 2014; Pateiro vd., 2018), aktivitelere sahip olduğu bu etkilerin arı kolonilerinde görülebilecek Varoa, Amerikan yavru çürüklüğü ve Kireç hastalığı gibi hastalıklara karşı koruyucu veya tedavi edici olarak kullanılabilme potansiyeli taşımaktadır (Alkan, 2020; Erol ve Birgücü, 2020; Oyedeji vd., 2020; Plata-Rueda vd., 2020; Werrie vd., 2020; Başer, 2022). Ayrıca kekik yeşil aksamları da direk kovana bırakılarak arı zararları ve arı refahına katkı sağlayabilmektedir. Denizli kekiği üretim alanları aynı zaman da arı merası olarak kullanılma potansiyeline sahiptir. Hasat zamanı çiçeklenme başlangıcından çiçeklenme sonuna kadar olduğu için bu periyotta hem ticari hem de aile üretimi için arı merası olarak kullanılma potansiyeline

sahiptir. Kekik üretim alanlarının aynı zamanda arı merası olarak kullanılması üreticiye ek gelir kaynağı veya organik nitelikte arı ürünleri sağlayacaktır.

Sonuç ve Öneriler

Origanum onites L. Türkiye'nin tıbbi ve aromatik bitki sektöründe stratejik bir öneme sahiptir. Yüksek uçucu yağ içeriği, çok yönlü kullanım alanı ve adaptasyonu sayesinde üretimi ekonomik olarak caziptir. Saha uygulamalarında toprak analizi temelli gübreleme programlarının uygulanması, doğru hasat zamanı seçimi ve gölgede kurutma tekniklerinin kullanılması kayıplarını azaltarak ürün kalitesini yükseltecektir. Damıtma tesislerinin bölgesel olarak yaygınlaştırılması ve ürün standardizasyonunun sağlanması ve alternatif kullanımlarının yaygınlaştırılması kekik üretiminin daha sürdürebilir olmasını katkı sağlayacaktır.

Kekiğin (*Origanum onites* L.) sadece önemli bir bal arısı bitkisi olmakla kalmayıp, içerdiği yüksek Karvakrol ve Timol gibi biyoaktif bileşikler sayesinde arı zararlılarına (akar) ve patojenlere karşı doğal bir biyopestisit ve akarisit olarak da kullanılabilecek yüksek bir potansiyele sahip olduğunu göstermektedir. Geleneksel olarak da "arı kekiği yağı" adıyla biliniyor olması, bu potansiyeli desteklemektedir. Ayrıca kekikiğin arılar tarafından tercih edilmesi, kekik üretim alanlarının arıcılık üretimi için uygun yerlere yakın olması, kekik alanlarının dışında kalan doğal alanlardaki biyo çeşitliliğin korunması için ve kekik üretim alanlarından alternatif ekonomik katkılar sağlanabilmesi bu bitkinin arıcılık açısından önemli bir potansiyele sahip olduğunu göstermektedir.

ÖZET

Bu çalışmada Abaza ve Gürcü keçilerinde anöstrus ve östrus döneminde, serum glutatyon (GSH), malondialdehit (MDA) düzeyleri ile paraoksanaz-1 (PON) aktivitesinin değişiminin belirlenmesi amaçlanmıştır. Çalışmada 30 adet keçi (15 adet Gürcü keçisi ve 15 adet Abaza keçisi) kullanılmıştır. Östrus senkronizasyonu amacıyla, keçilere progesteron içeren intravaginal süngerler özel aplikatör yardımıyla yerleştirildi. Bu süngerler, 9 gün boyunca vaginada kaldı. Progesteron içeren sünger uygulamasının 9. gününde, tüm hayvanlara 500 IU at koryonik gonadotropini (eCG) kas içi enjeksiyonu yapıldı. eCG uygulamasından 24 saat sonra keçilerin içerisine teke katıldı ve östrus belirtileri gösteren keçiler tespit edildi. Anöstrus (östrus senkronizasyonuna başlamadan) ve östrusta olmak üzere keçilerden kan alındı. Keçilerden alınan kandan serum GSH, MDA düzeyleri ve PON aktivitesi belirlendi. Elde edilen verilere göre, Abaza ve Gürcü keçilerin östrus döneminde MDA düzeyi arttı ($p<0.05$) ve zaman etkisi anlamlıydı ($p=0.02$). GSH düzeyi Abaza keçilerinde östrusta arttığı ve Gürcü keçilerinde ise östrusta azaldığı($p<0.05$). Ayrıca GSH düzeyinde grup × zaman interaksiyonu anlamlıydı ($p=0.001$). Abaza ve Gürcü keçilerinde östrusta PON aktivitesi azaldı ($p<0.05$) ve zaman etkisi anlamlıydı ($p<0.001$). Çalışmanın en önemli sonucu keçilerde MDA'nın arttığı ve PON aktivitesinin de azaldığıdır. Bu da oksidatif ve antioksidatif dengenin anöstrus ve östrusta değişim gösterebileceğini ifade etmektedir. Yine ilginç olarak Abaza keçilerinde GSH östrusta artarken Gürcü keçilerinde azalma göstermesidir. Özellikle antioksidant kapasitenin ırklar arasında da değişiklik gösterebileceğini yansıtmaktadır. Yine bu parametrelerin östrus siklusu dönemlerinin takibi potansiyel biyobelirteçler olarak kullanılabileceğini göstermektedir. Sonuç olarak, Abaza ve Gürcü keçilerin anöstrus ve östrusta MDA ve GSH düzeylerinin değişiminin ve PON aktivitesinin değerlendirilmesi bu dönemlerin izlenmesi için faydalı biyobelirteçler olabilir.

Anahtar Kelimeler: Anöstrus, Östrus, Paraoksanaz-1, Oksidatif statü, Keçi

CHANGES IN SERUM PARAOXONASE-1 AND SOME OXIDATIVE STATUS MARKERS DURING ANESTRUS AND ESTRUS IN ABAZA AND GURCU GOATS

ABSTRACT

This study aimed to determine the changes in serum glutathione (GSH), malondialdehyde (MDA), and paraoxonase-1 (PON) activity during anestrus and estrus in Abaza and Gurcu goats. Thirty goats (15 Gurcu and 15 Abaza goats) were used in the study. For estrus synchronization, progesterone-containing intravaginal sponges were inserted into the goats using a special applicator. These sponges remained in the vagina for 9 days. On the 9th day of progesterone-containing sponge application, all animals received an intramuscular injection of 500 IU equine chorionic gonadotropin (eCG). Twenty-four hours after eCG administration, a male was introduced into the goats, and goats showing signs of estrus were identified. Blood samples were collected from the goats during anestrus (before estrus synchronization) and estrus. Serum GSH, MDA levels and PON activity were determined from the blood samples. According to the data obtained, MDA levels increased during estrus in Abaza and Gurcu goats ($p<0.05$), and the time effect was significant ($p=0.02$). GSH levels increased during estrus in Abaza goats and decreased during estrus in Gurcu goats ($p<0.05$). Furthermore, the group × time interaction on GSH levels was significant ($p=0.001$). PON activity decreased during estrus in Abaza and Gurcu goats ($p<0.05$), and the time effect was significant ($p<0.001$). The most important result of the study was that MDA increased and PON activity decreased in goats. This suggests that the oxidative and antioxidative balance may change between anestrus and estrus. Interestingly, GSH increased during estrus in Abaza goats, while it decreased in Gurcu goats. This reflects that antioxidant capacity, in particular, can vary among breeds. Furthermore, these parameters demonstrate potential biomarkers for monitoring estrous cycle periods. Consequently, assessing changes in MDA and GSH levels and PON activity during anestrus and estrus in Abaza and Gurcu goats may be useful biomarkers for monitoring these periods.

1. INTRODUCTION

Goats, a social species that coexists with other species, have a hierarchical structure and offer opportunities for reproductive success (Zuniga-Garcia et al., 2020). Goat farming, an important agricultural activity in rural communities, provides families with a source of animal-based income. Due to their rapid growth rates and high fertility, they adapt well to agricultural ecological regions (Bustamante-Andrade et al., 2025; Santos-Silva et al., 2025). Due to the social structure of farming families, their economic situation, and the geographical characteristics of the regions, goat farming is particularly prevalent in the Aegean, Mediterranean, and Southeastern Anatolia regions of Türkiye (Kuru et al., 2024). Abaza and Gurcu goats originating from the Caucasus are local breeds that have adapted to the challenging geographical and climatic conditions of the Eastern Anatolia region (Kuru et al., 2019; Kuru et al., 2024). Abaza and Gurcu goats, which do not have reproductive problems such as low fertility, uterine infections, infertility, and follicular cysts, are an alternative for animal husbandry, but their numbers are quite low (Kuru et al., 2024). Goats that exhibit seasonal reproduction show an annual reproductive cycle under the influence of photoperiodism. The annual reproductive cycle is a disadvantage for producers in terms of milk and meat production (Zuniga-Garcia et al., 2020; Arrebola et al., 2022; Abecia et al., 2024). To overcome these limitations, several methods have been developed to increase reproductive efficiency in farm animals (Alvarado-Espino et al., 2016; Kuru et al., 2022). These methods are frequently used to achieve reproductive performance and ovulation in goats (Arrebola et al., 2022; Duan et al., 2025). Hormonal protocols that produce reproductive outcomes similar to natural reproduction are important methods for eliminating the breeding season in goats (Alvarado-Espino et al., 2016). Among hormonal protocols in goats to promote ovulation, equine chorionic gonadotropin (eCG) accompanies progesterone and estrus induction protocols (Contreras-Villarreal et al., 2016; Zuniga-Garcia et al., 2020; Kuru et al., 2022). eCG is administered immediately after or 24 hours after progesterone withdrawal to synchronize and stimulate follicular growth in goats (Alvarado-Espino et al., 2016). This eCG delays ovulation by producing anti-eCG antibodies, leading to low fertility (Fonseca et al., 2017). Oxidative stress, resulting from an imbalance between free radical species and antioxidants, is among the factors causing reproductive disorders such as endometriosis and infertility (Abd-Elkareem et al., 2024). Lipid peroxidation negatively affects folliculogenesis, ovulation, and meiosis (Amin et al., 2023). Increased reactive oxygen species can reduce oxidized biomolecules before damaging macromolecules (Kassab et al., 2020).

This study aimed to determine changes in serum paraoxonase-1 (PON) activity and glutathione (GSH) and malondialdehyde (MDA) levels in Abaza and Gurcu goats during anestrus and estrus.

2. MATERIALS AND METHODS

2.1. Ethical Approval and Farm Permit

Before commencing the study, approval was obtained from the Kafkas University Animal Experiments Local Ethics Committee (KAU-HADYEK) with the approval of KAU-HADYEK/2025-168 and from the Kafkas University Prof. Dr. Ali Rıza AKSOY Education, Research, and Application Farm with the approval of session number 2024/2025-15 and decision number 22.

2.2. Animals

The animal material used in the study consisted of a total of 30 goats (15 Gurcu goats and 15 Abaza goats) aged between 2 and 4 years, clinically healthy, and weighing between 40 and 50 kg, from the Prof. Dr. Ali Rıza AKSOY Education, Research, and Application Farm at Kafkas University.

2.3. Estrus Synchronization and Mating Procedures

For estrus synchronization, progesterone-containing intravaginal sponges (Esponjavet®, Hipra, Türkiye) were inserted into the goats using a special applicator. These sponges remained in the vagina for 9 days. On the 9th day of progesterone sponge application, all animals received an intramuscular injection of 500 IU eCG (Oviser®, Hipra Animal Health, Türkiye). Twenty-four hours after eCG administration, rams were introduced to the goats, and those exhibiting estrus signs were identified (Kuru 2022; 2023; Kuru and Boğa 2024).

2.4. Biochemical Analyses

Before starting synchronization and from all goats determined to be in estrus, 8.5 mL of blood was collected from the jugular vein into gel-filled vacuum tubes (BD Vacutainer®, Becton, Dickinson and Company, USA). The collected blood samples were centrifuged at 3000 rpm for 10 minutes and then stored at -20°C until serum samples were analyzed.

Serum MDA analysis was performed using the method of Yoshioka et al., (1979). GSH analysis was performed spectrophotometrically at 412 nm according to the method of Beutler et al., (1963). PON activity was determined colorimetrically using the Rel Assay Diagnostics® kit (Gaziantep, Türkiye).

2.5. Statistical Analyses

Statistical analyses of the data obtained in the study were performed using the GraphPad Prism® statistical software (Version 10, GraphPad Software Inc., San Diego, CA, USA). The Shapiro-Wilk test was used to determine whether the obtained data showed a normal distribution according to the groups. The analysis of measured marker data used the analysis of variance method for repeated measurements. The statistical analysis of group, time, and group × time interactions was performed. In addition, the Tukey multiple comparison test was applied for pairwise comparisons of parameters between groups across days and on the sampling day. All results are shown as mean ± standard deviation (SD). In the analysis results, $p<0.05$ was considered statistically significant.

3. RESULTS

3.1. Serum MDA Level

The results of MDA levels in Abaza and Gurcu goats during the anestrus and estrus periods are shown in Figure 1. According to the data obtained, the MDA level increased in the estrus period of Abaza and Gurcu goats ($p<0.05$), and the time effect was significant ($p=0.02$). In addition, it was determined that the group effect and group × time interaction on the MDA level were not statistically different ($p>0.05$).

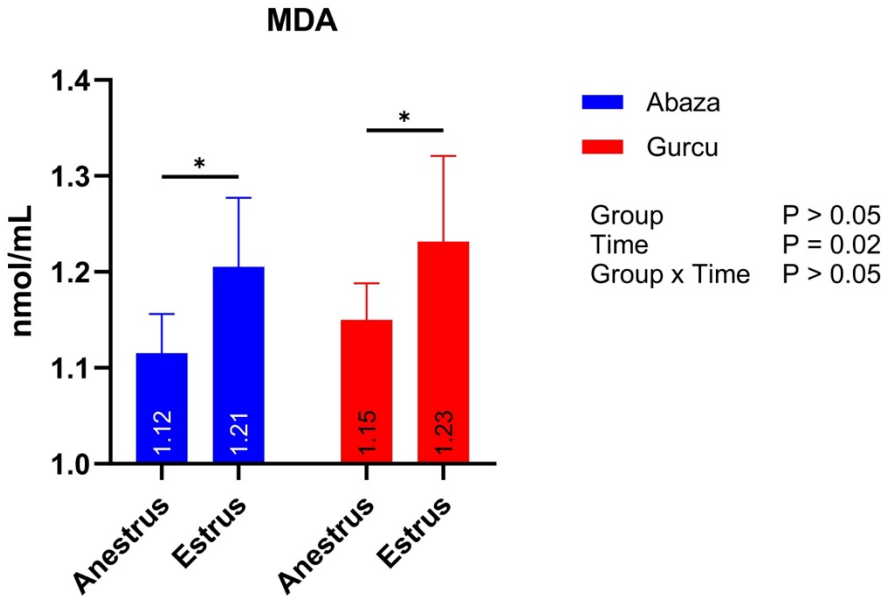

Figure 1: Changes in serum MDA levels in Abaza and Gurcu goats during the anestrus and estrus periods. MDA: Malondialdehyde, *: p<0.05

3.2. Serum GSH Level

Serum GSH level increased in Abaza goats during the estrus period (p<0.05), decreased in Gurcu goats during the estrus period (p<0.01), and the time effect was not significant (p>0.05). Additionally, the group (p=0.01) and group × time interaction were statistically significant for GSH (Figure 2).

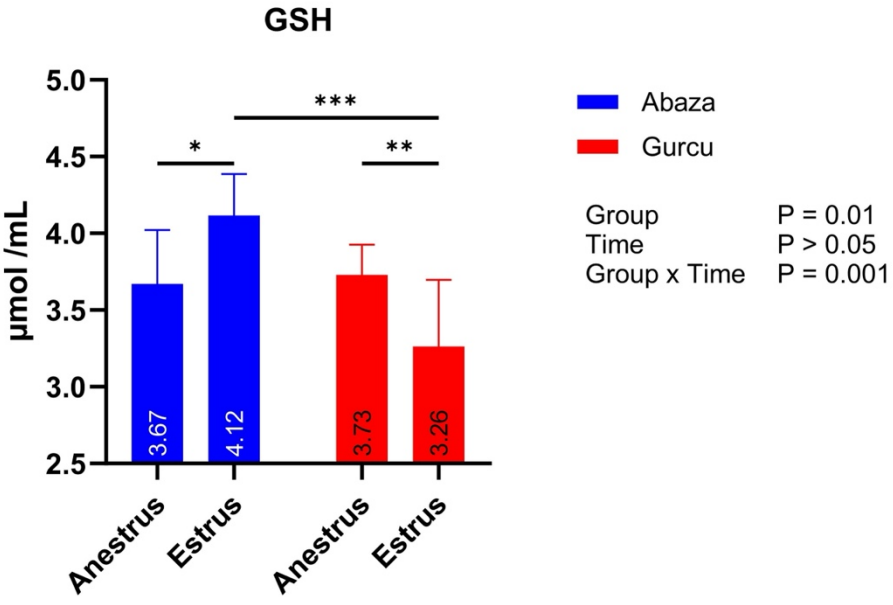

Figure 2: Graphical representation of serum GSH levels in Abaza and Gurcu goats during the anestrus and estrus periods. GSH: Glutathione. *: p<0.05, **: p<0.01, ***: p<0.001.

3.3. Serum PON Activity

The results of PON activity in Abaza and Gurcu goats during the anestrous and estrous periods are shown in Figure 3. PON activity decreased in Abaza and Gurcu goats during the estrus period ($p<0.05$), and the time effect was significant ($p<0.001$). However, the group and group × time interaction in PON activity were not statistically significant ($p>0.05$).

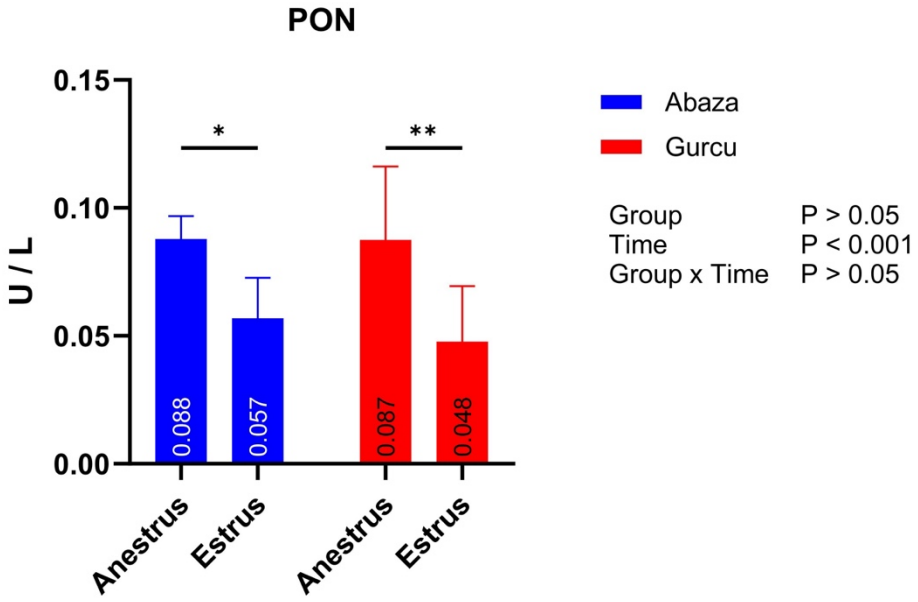

Figure 3: Graphical representation of serum PON activity in Abaza and Gurcu goats during the anestrus and estrus periods. PON: Paraoxonase-1, *: $p<0.05$, **: $p<0.01$

4. CONCLUSION

The most important result of the study is that MDA increased and PON activity decreased in goats. This indicates that the oxidative and antioxidant balance may change during anestrous and estrus. Another interesting finding is that GSH increased in Abaza goats during estrus, while it decreased in Gurcu goats. This reflects that antioxidant capacity may also vary between breeds. Again, these parameters show that they can be used as potential biomarkers for monitoring the estrus cycle periods. Of course, more comprehensive studies should be conducted to better understand the changes in the estrus and anestrus processes or the different stages of estrus and reproductive physiology in local goat breeds such as Abaza and Gurcu goats. The findings obtained will provide a more solid foundation for the results of this study.

ORCID: 0000-0001-5928-1917

ÖZET

Süt ve süt ürünleri içerdikleri besin elementleri ve pH/nem değerleri ile maya ve küflerin gelişimi için oldukça uygun bir ortam oluşturmaktadır. Maya ve küfler kefir, kımız, peynir vb. birçok süt ürününde istenilen tipik tat, koku ve yapının oluşmasını sağlamak amacıyla üretimde kullanılabilmesine rağmen genellikle süt teknolojisinde saprofit mikroorganizmalar olarak bilinmektedir. Bu mikroorganizmalar süt ürünlerinin bozulmasından sorumlu olmakla birlikte insan sağlığını da etkileyen zararlı metabolitlerde üretebilmektedir. Özellikle küfler tarafından üretilen mikotoksinler kanserojen, mutajenik ve immünosupresif gibi etkiler göstererek halk sağlığı etkileyen ciddi sağlık sorunlarına sebep olabilmektedir. Maya/küflerin gelişimini engellemek amacıyla gıda ürünlerine farklı doğal veya yapay katkı maddeleri katılabilmektedir. Fakat tüketiciler son yıllarda gıdalarda katkı maddesi kullanımı minimum düzeyde talep etmektedir. Bu nedenle de süt ürünlerinin doğal bir parçası olan laktik asit bakterileri (LAB) önemli bir biyokoruyucu olarak değerlendirilmektedir. Aynı zamanda LAB'i GRAS listesinde yer aldığından süt ürünlerinde farklı cins/türlerin kullanımı oldukça dikkat çekmektedir.

Birçok laktik asit bakterisi antimikrobiyal etkiye sahip laktik asit, asetik asit, diasetil, asetaldehit, yağ asitleri, bakteriosin gibi birçok farklı metabolit üretmektedir. Bu bileşikler hem mikrobiyal gıda bozulmalarına sebep olan saprofit hem de patojen mikroorganizmaların gelişimini engellemektedir. Bu nedenle süt teknolojisinde ürün özellikleri de dikkate alınarak antifungal biyokontrol ajanı olarak LAB'nin kullanılması hem ekonomik kayıpların önlenmesinde hem de tüketici sağlığının korunmasında etkili bir yöntem olduğu düşünülmektedir. Son yıllarda *Lactobacillus* türleri başta olmak üzere *Leuconosto*c ve *Pediococcus* gibi bakteri cinslerine ait türlerin antifungal aktivite gösterdiği birçok araştırmada ortaya konmuştur.

Bu derlemede süt endüstrisinde maya/küflerin sebep olduğu başlıca bozulmalar, antifungal aktivite gösteren LAB'i ve bu bakterilerin ürettikleri metabolitler ile ilgili güncel literatür ele alınmış ve tartışılmıştır.

Anahtar Kelimeler: Laktik asit bakterileri, Antifungal, Biyokoruyucu, Süt ve süt ürünleri

EFFECT OF LACTIC ACID BACTERIA ON YEAST/MOLD SPOILAGE IN THE DAIRY INDUSTRY

ABSTRACT

Milk and dairy products, with their nutritional elements and pH/moisture values, create a highly suitable environment for the growth of yeast and mold. Although yeasts and molds can be used in the production of many dairy products, such as kefir, kumiss, and cheese, to create the desired flavor, odor, and texture, they are generally known as saprophytic microorganisms in dairy technology. These microorganisms are not only responsible for the spoilage of dairy products but can also produce harmful metabolites that affect human health. Mycotoxins, particularly those produced by molds, can cause serious health problems by exhibiting carcinogenic, mutagenic, and immunosuppressive effects. Various natural or artificial additives can be added to food products to inhibit the growth of yeast/molds. However, in recent years, consumers have been demanding minimal additive use in foods. Therefore, LAB, a natural component of dairy products, are considered important biopreservatives. At the same time, since LAB is on the GRAS list, the use of different genera/species in dairy products attracts considerable attention.

Many lactic acid bacteria produce many different metabolites with antimicrobial properties, including lactic acid, acetic acid, diacetyl, acetaldehyde, fatty acids, and bacteriocin. These compounds inhibit the growth of both saprophytic and pathogenic microorganisms that cause microbial food spoilage. Therefore, considering product characteristics in dairy technology, the use of LAB as an antifungal biocontrol agent is considered an effective method for both preventing economic losses and protecting consumer health. In recent years, many studies have shown that species belonging to bacterial genera such as *Leuconostoc* and *Pediococcus*, especially *Lactobacillus* species, exhibit antifungal activity.

In this review, current literature on the main spoilage caused by yeast/molds in the dairy industry, LABs showing antifungal activity and the metabolites produced by these bacteria are discussed.

Keywords: Lactic acid bacteria, Antifungal, Biopreservative, Milk and dairy products

1. GİRİŞ

Tüketiciler gıdalarda yapay katkı maddesi ve koruyucuların yerine doğal ve daha güvenli maddelerin kullanılması tercih etmektedir. Bu amaçla hayvansal, bitkisel ve mikrobiyal kaynaklardan elde edilen birçok katkı maddesi kullanılabilmektedir.

Fungal bozulmalar neticesinde süt endüstrisinde büyük ekonomik kayıplar ortaya çıkmaktadır. Laktik asit bakteri suşlarının antifungal potansiyeli ve GRAS statüleri, onları farklı gıda ve yemlerde fungal bozulmaları etkili bir şekilde engellemek amacıyla biyokoruyucu olarak kullanımında dikkat çekici hale getirmektedir. Günümüzde LAB'lerinin süt ürünleri, meyve suları, unlu mamuller, et, meyve ve sebzeler ile hayvan yemi de dahil olmak üzere çok sayıda gıda ürününde antifungal koruyucu ajan olarak kullanılma potansiyeline sahip olduğu kanıtlanmıştır (Sadiq ve ark., 2019).

2. LAKTİK ASİT BAKTERİLERİ

LAB, uzun yıllardır insanoğluna sayısız faydaları olan içerisinde farklı cins ve türleri bulunduran bir mikroorganizma grubudur. LAB, ana ürün olarak laktik asit üreten mikroorganizmalar olup, Gram pozitif, fakültatif anaerop, kok veya çubuk şeklinde ve spor oluşturmayan mikroorganizmalardır (Trejo-González ve ark., 2022).

Homofermentatif ve heterofermentatif laktik asit bakterileri olarak ikiye ayrılırlar. Homofermentatif türler disakkaritleri metabolize ederek %100'e yakın oranda laktik asit üretimi gerçekleştirmektedir. Heterofermantatif türler ise laktozu metabolize ederek ana ürün olarak laktik asit üretirken bunun yanında etil alkol, diasetil, karbondioksit, asetaldehit, hidrojen peroksit ve asetoin gibi farklı metabolitleri de oluşturmaktadır (Montet ve ark., 2014; Mandha ve ark., 2021; Zapaśnik ve ark., 2022).

Biyokoruyucu kültür olarak bilinen ve en çok kullanılan LAB'leri; *Aerococcus, Enterococcus, Carnobacterium, Leuconostoc, Lactobacillus, Lactococcus, Pediococcus, Oenococcus, Melisococcus, Weisella, Streptococcus, Vagococcus, Bifidobacterium* ve *Tetragenococcus'* dur (Öksüztepe ve ark., 2005).

LAB'i peynir, tereyağı, yoğurt ve ekşi krema gibi süt ürünlerinin fermantasyonunda yer almaktadır. Çeşitli kökenlerden gelen ve kanıtlanmış antifungal aktiviteye ve biyolojik koruma potansiyeline sahip çok sayıda LAB bulunmaktadır. *Lactobacillus* türlerinin antifungal aktivite ile ilişkilendirilen en yaygın bakteri izolatları olduğunu belirtmek önemlidir. *Lactobacillus* türleri arasında, *Lactobacillus plantarum*, antifungal aktivitesi ile iyi bilinen LAB türlerinden biridir (Crowley ve ark., 2013).

3. LAKTİK ASİT BAKTERİLERİNİN ANTİFUNGAL BİLEŞİKLERİ ve ETKİ MEKANİZMALARI

LAB'nin, meyve ve sebzeler, süt ürünleri ve fırıncılık ürünleri gibi ürünlerde antifungal etki göstermesi amacıyla yardımcı veya başlatıcı kültür olarak potansiyel olarak kullanılabileceği bildirilmiştir.

Laktik asit, formik asit, asetik asit, kaproik asit, fenillaktik asit (PLA), karbondioksit, hidroksi yağ asitleri, hidrojen peroksit, diasetil, etanol, reuterin, siklik dipeptitler, protein bileşikleri, asetoin ve diasetil gibi uçucu bileşikler LAB tarafından üretilen doğal antimikrobiyal ve antifungal metabolitlerdir (Cortés-Zavaleta ve ark., 2014; Leyva Salas ve ark., 2018). Tablo 1'de bazı LAB'in antifungal etki spektrumları verilmiştir.

Table 1. Laktik asit bakterilerine ait bazı antifungal maddeler ve etki spektrumları (Nasrollahzadeh ve ark., 2022)

LAB	Antimikrobiyal bileşik	Antifungal etki	Referans
L. plantarum LR/14	Antmikrobiyal peptitler	*A. niger, Rhizopus stolonifera, M. racemosus ve P. chrysogenum*	Gupta ve ark., 2014

L. pentosus, *L. plantarum*, *L. brevis*, *Lactobacillus delbrueckii, L. fermentum, Lactococcus lactis ve Lc. mesenteroides*	Hidrojen sülfür ve laktik asit	*Penicillium oxalicum*, *Fusarium verticillioides* ve *A. niger*	Awah ve ark., 2018
L. plantarum CECT 749	Gallik, klorojenik, kafeik asitler	*Fusarium* spp. *Penicillium* spp. ve *Aspergillus* spp.	Luz ve ark., 2019
Leuconostoc spp. *L. reuteri ve L. buchneri*	Organik asitler	*Aspergillus, Eurotium, Penicillium, Cladosporium ve Wallemia* spp.	Lay ve ark., 2016

Organik asitlerin antifungal etkisi genellikle sinerjik etkilerinden kaynaklanır. Laktik asit, hücre zarından hidrofobik bir formda yayılır, hücre içinde ayrışır ve H+ iyonları salarak asidik bir sitoplazma oluşturur. Laktik asit, proton gradyanını bozarak fungusların gelişimini engelleyebilir. Ayrıca, asetik ve propiyonik asitler funguslar tarafından amino asit emilimini de engeller (Schnurer ve Magnusso, 2005). Fenilalaktik asit (PLA), fenilalanin metabolizmasının bir yan ürünü olarak üretilen organik asittir. PLA, *Aspergillus, Fusarium* ve *Penicillium* türleri gibi birçok fungusun gelişimini engelleme yeteneğine sahiptir (Gerez ve ark., 2009; Lavermicocca ve ark., 2003; Yepez ve ark., 2017; Sadiq ve ark., 2019). Ancak birçok çalışma, fungus gelişimini engellemek için yüksek konsantrasyonlarda PLA gerekliliğini bildirmiştir. Bu durum gıdalarda antifungal madde olarak kullanılmasını kısıtlamaktadır.

Reuterin funguslara karşı antifungal aktiviteye sahip olduğu bildirilmiştir (Vimont ve ark., 2019). Etki mekanizması tiyol gruplarıyla etkileşim yoluyla hücresel oksidatif stres üretimine bağlanmaktadır (Schaefer ve ark., 2010). Reuterin için düşünülen bir diğer inhibisyon mekanizması

ise, DNA biyosentezini düzenleyen ribonükleaz aktivitesinin baskılanması ile gerçekleşmesidir (Talarico ve Dobrogosz, 1989).

Hidrojen peroksit (H_2O_2), aerobik koşullar altında LAB tarafından üretilmektedir. LAB, katalaz üretemez ve H_2O_2 parçalama yeteneğine sahip değildir. Bu nedenle ortamda hedef mikroorganizma üzerinde güçlü bir oksidatif etkiye sahip olan ve aynı zamanda hücresel proteinlerin temel moleküler yapısını bozabilen H_2O_2 konsantrasyonu artar (Dalie ve ark., 2010). Diasetil, antifungal etkiden sorumlu başlıca uçucu bileşiklerden biri olarak bilinmektedir (Aunsbjerg ve ark., 2015). Fakat küf oluşumunu engelleme mekanizması henüz açıklığa kavuşturulamamıştır.

Antimikrobiyal peptitler, birbirine bağlı 5-100 amino asit içeren peptitlerdir (Luz ve ark., 2017). Daha küçük peptitler genellikle daha güçlü antifungal aktiviteye sahiptir. Dört LAB suşunun süpernatantlarından izole edilen düşük moleküler ağırlıklı peptitler (<10 KDa), kontrol süpernatantına kıyasla farklı funguslara karşı daha yüksek antifungal inhibisyon etki gösterdiği bildirilmiştir (Muhialdin ve ark., 2018).

Siklik peptitler, dairesel bir şekilde kovalent bağlı, polipeptit zincirlerinden oluşan peptitlerdir. Dairesel yapı, peptit zincirinin her iki ucunun bir amid bağı veya lakton, tiyoeter, eter veya disülfür bağları aracılığıyla bağlanmasıyla oluşmaktadır (Joo, 2012). Antimikrobiyal siklik peptitlerin etki mekanizması esas olarak yapısal bütünlüğün bozulması ile ilişkilendirilmektedir. Hücre zarı bileşenlerini hedef alarak lizize neden olmakta veya zar ve/veya hücre duvarı biyosentezini engellemektedir (Shai, 1995).

4. SÜT ENDÜSTRİSİNDE MAYA/KÜF BOZULMASI ÜZERİNE DEĞERLENDİRİLMESİ

Peynir, yoğurt ve diğer süt ürünleri fungal kaynaklı bozulmalara hassas ürünlerdir. Tablo 2'de fungal bozulmaları engellemek amacıyla LAB ile gerçekleştirilen bazı çalışmalar verilmiştir.

Tablo 2. Süt ürünlerinde maya/küf bozulmalarına karşı LAB'in biyokoruyucu etkisi

L. plantarum, L. paracasei, L. mesenteroides, L. paracasei	*A. tubingensis, A. flavus, P. commune, M. racemosus*	Ekşi krema	Ouiddir ve ark., 2019

L. rhamnosus		Queso fresco	Makki ve ark., 2020
L. amylovorus	*P. expansum*	Cheddar peyniri	Lynch ve ark., 2014
L. plantarum (farklı laktobasil türleri ile kombinasyonu)	*P. chrysogenum* ATCC9179, *A. flavus* ATCC46283	Caciotta peyniri	Cosentino ve ark., 2018
L. rhamnosus A238 (tek) ve *Bifidobacterium animalis* subsp. *lactis* A026 ile kombinasyonu	*P. chrysogenum*	Cottage peyniri	Fernandez ve ark., 2017
L. casei AST18	*Penicillium sp.*	Yoğurt	Li ve ark., 2013
L. reuteri ATCC 53608	*P. chrysogenum* LMA-212, M. racemosus LMA-722	Yoğurt	Vimont ve ark., 2019.

Cheong ve ark. (2014), *L. plantarum*'un cottage peynirinde *P. commune*'nin gelişimini LAB 14-25 gün geciktirdğini bildirmiştir. *Lactobacillus amylovorus* DSM 19280, *P. expansum* sporları inoküle edilen çedar peynirinde yardımcı kültür olarak kullanılmış ve kontrol ile karşılaştırıldığında *Penicillium* gelişiminde 4 günlük bir gecikmenin sağlandığı bildirilmiştir (Lynch ve ark., 2014). Cottage peynirinde *Lactobacillus rhamnosus* A238'in tek başına veya *Bifidobacterium animalis* ile kombinasyonu 6 °C'de en az 21 gün küf gelişimini engellemiştir (Fernandez ve ark., 2017). *Lactobacillus brevis* ve *Enterococcus faecium*, 15 günlük depolama süresince yoğurtta (sulandırılmış) *Rhodotorula glutinis*'in gelişimini baskılamıştır (Khomeiri ve ark., 2017).

Ekşi krema ve yarı sert peynirlerde, *Lactobacillus paracasei* CIRM-BIA1759 ve *L. rhamnosus* CIRM-BIA1761 yardımcı kültürler olarak kullanılmış ve ekşi kremada *P. commune*, *Rhodotorula mucilaginosa* ve *Mucor racemosus*'un gelişimini 2-24 gün geciktirmiştir. Ayrıca yarı sert peynirde *P. commune*'un gelişimini ise 1-6 gün geciktirdiği bildirilmiştir (Leyva Salas ve ark., 2018). *L. plantarum* CH1, *L. paracasei* B20 ve *Leuconostoc mesenteroides* L1'in antifungal aktivitesininin test edildiği çalışmada, ekşi kremada *L. plantarum* CH1 ve *L. paracasei* B20, *P. commune* gelişimini sırasıyla 5 ve 3 gün boyunca engellemiştir (Ouiddir ve ark., 2019).

Cansız LAB suşlarının doğrudan kullanımı bazı durumlarda canlı bakterilere göre avantajlıdır. Çünkü bu tür bakterilerin cansız formda, meyve sularında, sütte veya süt ürünlerinde bulunmaları ürünün duyusal özelliklerini etkilemeden mikotoksin bağlama yeteneğine sahip olabilmektedir (Sadiq ve ark., 2019). Örneğin, AFM1 süt ürünleri için ciddi bir endişe kaynağı olarak kabul edilmektedir. AFM1'in LAB suşları tarafından bağlanması, AFM1'i süt ve ürünlerinden uzaklaştırmak için önemli bir strateji olarak kanıtlanmıştır. *L. casei* LC-01 suşu, fermentasyon sırasında 2 ng/L'lik bir başlangıç konsantrasyonu içeren sütteki AFM1'i %50'den daha fazla azaltma kapasitesi göstermiştir (Barukčić ve ark., 2018). Panwar ve ark. (2018), laktobasiller ile kontamine

edilen yağsız sütte AFM1'i bağlama yeteneğini göstermiştir. Taheur ve ark. (2017), kefirin mikrobiyal konsorsiyumunun sütteki OTA azaltımı üzerindeki yeteneğini değerlendirmiş ve *L. kefiri* KFLM3'ün adsorpsiyon yoluyla %81 OTA'yı azaltan en etkili suş olduğunu bildirmiştir. Sarlak ve ark. (2017), *L. acidophilus*'un pH 4,5'te İran'daki fermente bir süt ürününden AFM1'i uzaklaştırmada etkili olduğunu bildirmiştir. AFM1 içeren sütte yoğurt kültürüyle birlikte *L. plantarum* suşunun kullanımı sonucu yoğurdun fermantasyon süresince AFM1'i uzaklaştırmak için etkili olduğu rapor edilmiştir (Elsanhoty ve ark., 2014).

5. SONUÇ VE ÖNERİLER

LAB'leri ürettikleri farklı metabolitler ile güçlü bir antifungal etkiye sahiptir. Bu bileşikler hedef maya/küf'e göre değerlendirilerek tek tek veya kombine olarak kullanılabilir. Tüketicilerin doğal ve katkısız ürünlere artan ilgisi dikkate alındığı zaten hali hazırda süt ürünlerinde kullanılan bu mikroorganizmalara ait metabolitlerinde peynir, yoğurt gibi ürünlere ilave edilerek hem besin değeri artırabilmekte hem de biyokoruyucu görevi görebilmektedir.

LAB birçok süt ürününün doğal mikrobiyal florasında yer almaktadır. Fakat suşa/türe bağlı olarak veya yüksek metabolik aktiviteden kaynaklı olarak üründe bozulmalara sebep olabilmektedir. Bu sebeple LAB'in cansız hücrelerinin ürün içerisine aktarılarak ürünün duyusal özellikleri etkilenmeden küflerin ürettiği mikotoksinlerin sağlık üzerine olumsuz etkisi ortadan kaldırılabilmesi mümkündür. Bu nedenle LAB'lerine ait hücrelerin de gıda endüstrisinde fungal bozulma riski bulunan ürünlerde kullanımının güvenli gıda üretimi açısından önemli olacaktır.
